Regarding the first principle, pressure, gas should not be used under a greater pressure than that required to insure a steady and uniform flow from the burner, just enough to spread the flame and no more. For gas of ordinary quality this should be  $\frac{1}{10}$  inch on a water gauge. Consumption is increased while the light is decreased by using gas at a pressure beyond this. The following table gives the results from an actual test made by "The Refereea," as embodied in their report to the London (England) Board of Trade:

Relation of Gas Pressure and Itlumination.

Pressure at fairner.	Number of feet used per hour.	Huminating power (can- dle).	What illumi- nating power should be.	Loss. Per cent.
4/10 8/10	5 feet. 7.80	16.00 8 67 21.77	25.05 32 00	25 32 50
12/10 17/19 21/10	10.09 11.66 13.33	18 66 17,06	37.31 42.65	50 60
$\frac{21}{10}$	15.00	16.80	48.00	65

The foregoing figures tell their own story. The pressure at the burner is governed, first, by the amount of pressure maintained at the works. Gas companies usually deliver gas at the lowest pressure that will enable them to send the gas to the furthest points covered by their system of mains. It is to their interest to do this, as it lessens their percentage of loss from leaks, which is alwaya large. But this pressure may be higher than it is desirable to use at the burner.

The pressure at the burners may be regulated in several ways: 1. By partially shutting the main cock at the meter. 2. By adjusting the cock at the burner. 3. By fitting an automatic governor at the meter. 4. By using automatic governing burners. The automatic governing burners.

Copyrighted, 1894, by David Williams.

regulation of pressure by the first and second methods is always unreliable and annoying, as the pressure in the msins is always varying, owing to the constant shutting off and turning on of gas in the neighborhood or even in the house, and cannot be depended on to give anything like satisfactory results. The automatic governor at the meter answera the purpose admirably, but care must be taken in selecting a suit able governor. Many of those in the market, while excellent as regards their governing properties, are thoroughly unreliable in the materials of which they are constructed, and cause annoyance from leakage after being a short time in use. Governors that have the time in use. Governors that have the valve worked by a metallic or glass float, scaled in mercury, are the best, not being liable to get out of order. Very high buildings should be so piped that a governor could be placed on each atory for controling the lights that supply it, as the higher the building the greater the pressure will be at the top, the increase in pressure for hightfor ordi-

Gas and Gas Fitting.—Fig. 28.—Globe with Contracted Openings.

nary illuminating (coal) gas being about one tenth for every 10 feet of additional hight. For domestic purposes it is best to use some form of governor burner that is automatic in its action. There are a number of them in the market, one of which the writer knows to be thoroughly reliable.

The second heading, sizes of pipes and freedom from obstruction, has been treated in previous chapters. The third treated in previous chapters. The third refers to the sort of burner to be used, and it is very essential that a proper burner should be used. The results of a test made some time ago in Birming-ham, England, of over 50 different kinds of burners proved beyond question that the worst burner gave a light equal to 6.44 candles, and the best equal to 20.32 candles—that is, the best burner gave over three times the light of the worst, using exactly the same quantity of gas and under the same conditions. Another common error is the supposition that small burners must of necessity be more economical than larger ones, the object, of course, being to get the largest amount of light at the lowest rate, and it becomes of exceeding importance to use the proper size and kind of burner. The following table of the result of tests made with the latest improved argand burner tells the tale:

tias Consumption and Candle Power. d Candle Fover. Number of enndles (Fight). 2.01 5.47 8.25 12.00 13.77 16.00 Gas per hour.
Feet.
2.1
2.8
3.3
4.0
4.4
5.0

The foregoing shows that the burner using 5 feet of gas per hour is the most | Ground opal.

economical, when the quantity of light derived from the gas consumed is congerived from the gas consumed is considered. It is by no means to be supposed that there is economy in using a 5-foot argand in a place where a 2-foot lava tip would give all the light required, but the principle is what I want the reader to understand. Quoting from an eminent authority.

an eminent authority:
"People feeling the pressure of the times and wishing to economize in their expenses put on small burners, thinking if they reduce the flame they will keep down the gas account. Never were they more mistaken, for instead of decreasing their bills they only decrease their light and normal for the Land their light and pay more for it. Instead of doing that, if they would reduce the number and use larger burners and burn their gas at a low pressure they would accomplish their purpose."

Burners require to be kept clean, and when the flame shoots up several points it indicates that dirt has become lodged in the opening, and unless it is cleaned the amount of light is diminished, while the quantity of gas consumed may remain the same. Rubbing with a brush will sometimes remove obatructions, or it may be necessary to employ a wire. A hair pin answers the purpose admirably for burners having circular openings. For burners having a alit opening a piece of thin cardboard or thick paper may be used in the absence of a complex based in the sence of a regular burner cleaner. A flame rather aluggish in appearance gives the greatest amount of light, as it allows the carbon in the gas, which is the light giving medium, time to come the light giving medium, time to come thoroughly in contact with the blue or heat portion of the flame and be rendered incandescent. A flame that has a very large proportion of dark (blue) in it is a good flame for heat, but a poor flame for light. A first-class heating flame gives little or no light

flame gives little or no light.

Fourth.—The kind of globe or shade used has an important bearing on the light question. The shape, material, color and method of support are each imcolor and method of support are each important factors. The diameter of the bottom opening should never be less than 4 inches. It must be large enough to allow plenty of margin for the free play of air without causing a flicker in the flame and with a full sized opening on the top. The object is to prevent a draft of air being brought in contact on the top. The object is to prevent a draft of air being brought in contact with the flame, which will cause it to flicker and give an unsteady and annoying light. Globes with a large bottom opening and parallel sides, as in Fig. 29, are the best. A very poor style of globe, once very common, is shown in Fig. 28. Massive globe holders or supports must be avoided, as they obstruct the light and free passage of air as weil the light and free passage of air as well as throw shadows. The simple threeas throw shadows. The simple three-pronged wire holder is the best for bot-tom support, as shown in Fig. 29. All globes or shades obstruct the light. The following table is the result of actual tests by an eminent expert:

Loss of Light by Shades.

		Loss of ligh	ıt.
Description of gla	88.	Per cer	nt. .57
Clear glass		2.	.48
Ground glass		52	.83
Double German gro	mud		

These figures show the loss of light horizontally through the globe from the flame and need no comment.

Fifth.—The temperature of the gas also has an important bearing on its light

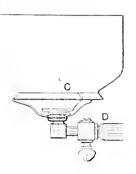

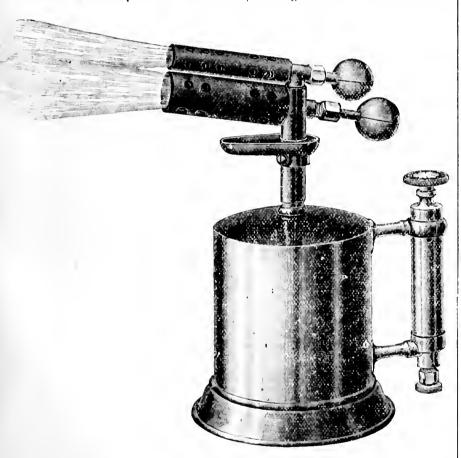

Fig. 29.-Globe with Parallel Sides.

giving properties. When the temperature falls below 60° F, it is injuricu-, proving the necessity of care in selecting warm positions for the different pipes and mains. Experiment has demonThere are many points of interest in connection with the practice of gas fitting that might have been alluded to in the foregoing chapters, but it was not the intention to write an exhaustive scientific treatise on gas and gas fitting, but only to touch upon such points as were likely to be of use to the ordinary gas fitter in the daily practice of his trade. If I have succeeded in helping one weak brother over a rough place I am amply repaid.

(THE END.)

## The Imperial Hot Blast Blow Pipe.

The White Mfg. Company, 40 and 42 State street, Chicago, Ill., have just put on the market a gasoline blow pipe, which is herewith illustrated. The manufacturers offer it as a complete tool for soldering, brazing, burning paint, melting metals, heating soldering coppers, thawing frozen pipes, making heavy soldered joints, &c. It will run for four hours. The burner has a generator of double the usual

Hol Blast Blow Pipe.

strated that a reduction of temperature from 60° to 32° reduces the illuminating power of the gas from 20 to 25 per cent., and when the temperature falls as low as 5° the light is reduced 60 to 70 per cent.

Sixth.—The presence of air in gas reduces its light giving properties very much, proving the necessity of having all pipes and fixtures tight, as the following table shows:

Loss of Light from Air Admixture.

Per cent.	Per cent. of
of air.	loss of tight.
1	6
2	11
4	26

	93

strength, which can be regulated to furnish a flame of any size by a turn of the knob. The needle valve has a patent renewable seat which can be rethe bottom of the pump, conveniently placed, dispensing with outside tubes and fixtures. The pump is very simple, supplying a strong blast and draining every drop of gasoline. The reservoir is tested to 30 pounds pressure and warranted.

## Defective Plumbing in Australia.

The following instances of defective plumbing are given in the annual report of the Sydney Metropolitan Board of Sewerage and Water Supply: The Inapector's notes of inspection of some of the city buildings reveal a state of things hardly creditable. These notes are of interest to show the necessity of careful inspection of places used for residential purposes. In one case, in one of the oldest residential hotels, the following defects were found: Lead traps of water closets with slip joints into lead soil pipe; in another place the branch from soil pipe was partly open; the soil pipe was made of galvanized iron and completely eaten away, and a disused closet was found with the water seal evaporated—this was situated near a bedroom. In a large boarding house a 4-inch east iron soil pipe laid diagonally near bedroom windows, with an opening on top of pipe 18 inches long and 1 inch wide. In a block of buildings where typhoid fever had broken out, the soil pipe was found to be of gal-vanized iron, unventilated, and whole of sanitary fittings in a very bad state. In a large assembly room the soil pipe inside building was found to have open joints. On several eccasions the drain was choked and sewage backed up and leaked through open joints. eases have been found where plumbers have fixed the vent pipe on the house aide of bath trap, and vent pipes from water closets have been carried up and left open between ceiling and roof. The foregoing are only a few of the cases which have been dealt with and clearly show the necessity of proper supervision in this important work.

#### Plumbers' Earth Auger.

The accompanying cut shows an earth auger which Job T. Pugh, Thirty-first and Ludlow streets, Philadelphia is putting on the market. It is designed especially for the use of plumbers in making connections of gss and water pipes with mains and enables them to quickly and easily bore a hole under a pavement, large enough to admit a pipe, without disturbing the pavement. The screw leading to the twist or worm is claimed to be of sufficient size and taper to allow of quick and clean boring with very little labor. The auger is made in sizes running from 2 inch to 4 inch.

IN A RECENT ISSUE of one of the Milwaukee papers appeared an interesting history of the Hoffman & Billings Mfg. Company, who are engaged in

Plumbers' Earth Auger.

placed when worn out at a cost of only 10 cents, making the torch equal to new. The reservoir is made of one piece of specially rolled brass of heavy gauge, rendering it leak proof, and yet the construction is such that the entire apparatus is light. The air valve is at

making Iron and brass goods for plumbers, steam and gas fitters. The article states that the business was founded in 1855 by J. C. Hoffman and was incorporated in 1832, with a capital of \$240,000. Mr. Hoffman dted in January, 1892, and the present officers are:

Fred, Haffman, president; C. H. Katvelage, vice president, and J. B. Kalvelage, secretary and treasurer. The company carry, at their sample room and offices, 111 and 147 West Water street, a complete line of plumbers' goods, belting, packing and supplies for plumbers, steam and gas fitters, &c. Their works are located on Becher street, having side tracks running from the Chicago, Milwaukee & St. Paul and the Chicago & Northwestern railways. A three-story brick structure is utilized as a machine shop, brass finishing works and also for the manufacture of plumbers' goods; a one story brick structure for a pipe foundry, an iron foundry and a brass foundry; a twostory and basement structure for warehouse purposes, and an eight story brick building for pattern storerooms. It is stated that employment is given to 389 skilled workmen and that the sales aggregate fully \$1,000,000 a year.

#### TRAPS AND VENTS.

Dubois & Darrow, 61 Gold street, New York, are showing on their sample floors an aluminum bathtub of the French pattern that is something of a novelty. The tub is made of a single thickness of material, and is supported on ornamented cast iron lega. It is provided with a wood rim, and is arranged for the use of No. 4½ Fuller bath cocks, unless otherwise ordered. The firm have arranged for the Eastern agency with the Aluminum Buthtub Mig. Company, Indianapolis, Ind.

Steele & Johnson Mfo Company, Waterbury, Conn., are making a specialty of brass goods for the plumbing supply trade, such as machine screws, nuts, closet screws, basin bolts, plug rings, jack chains and plumbers' chains. They also make a large line of brass goods for manufacturers of gas and electric light fixtures and metal work for electric switches, sockets, & >.

UNDER THE NEW LAW, which requires all plumbers doing business to be registered, the selectmen of Whitman, Mass., have appointed on the examining board, Andrew R. McCallum and J. C. Gilbert, to act with the chairman of the board of health, Edward Keating.

THE SMITH & ANTHONY COMPANY AND ALBERENE STONE COMPANY, 217 Lake street, Chicago, are to furnish the plumbing specialties for St. Mary's Home, Cincinnati, Ohio.

A VISIT to the showrooms of E. Aspinall, 98 Beekman street, is generally made by plumbers from out of town, the attraction being some imported porcelain bath tube, Mr. Aspinall representing some of the largest sanitary porcelain ware manufacturers on the Continent. One of the tubs is a large roll rim French pattern, white on the inside and a rich chocolate on the outside. It is full size and a very fine specimen. The other is of the Roman pattern, roll rim and white inside and out. A very large porcelain lavatory is another attraction, the slab and bowl being in one piece, the bowl being 18 x 24 inches. It is fitted with secret waste and overflow and soap cups are a part of the slab.

HENRY E. WIEBER of Kingston, N. Y., is about to open a branch plumbing shop at Tannersville.

THE GENESEE AUTOMATIC CLOSET COMPANY have been incorporated to manufacture closets and closet valves in Rochester, N. Y., with a capital of \$10,000. The directors are Daniel H.

Sulltvan, Henry G. Booth, Etizabeth P. Booth and Mary T. Sullivan of Rechester.

P. F. and M. T. Howley have withdrawn from the firm of Howley Bros. and opened a plumbing establishment at 223 Wyoming avenue, Scranton, Pa.

Horace C. Brown is soon to open a store at Billerica, Mass., to carry on business as tinsmith and plumber.

Chas. M. Sauer & Bro. of Chestnut street, Allegheny, Pa., died last week of typhoid fever. Mr. Sauer was 33 years of age and a member of several societies. A wife and four children survive him.

J. J. Wade & Son, 279 Dearborn street, Chicago, have the contract for the plumbing, gas fitting and sewerage in the two residences of Mr. Seamans, Ione place, and residence of Mr. Von Hofstein, Woodlawn avenue.

THE ALUMINUM BATHTUR MOF. COM-PANY, Indiauapolis, Iud., have issued a six-page folder showing the different patterns of their new " bright and noncorrosive bathtubs. Aluminum bronze is used on the lettering of the name of the company and on the cuts showing the interior of the baths, with pleasing Gold bronze is used on the effect. ornamental supports of the tubs. The claims of the merits of the tubs are not less attractively presented, and as a new plumbing fixture it is interesting. One picture shows what is termed the American system. A kitchen boiler arranged so that it can be heated by either gas or gasoline is connected with a pump. so that where there is no water supply from tank or city mains water can be pumped from a well or cistern into the boiler, forcing the hot water into the tub.

Bruno Beck, 2512 Cottage Grove avenue, Chicago, who handles beer pumps and supplies, makes a specialty of the products of the Clevetand Faucet Company, whose new illustrated catalogue he is now distributing to plumbers.

THE PLUMBING DEPARTMENT run by William L. Whipple, at 45, 47, 49 Manton avenue, Providence, R. I., in connection with his house furnishing business, has been increased to nearly double its former capacity. He now employs a force of seven men, and has contracts which will last until spring. Mr. Whipple is an active member of the Providence Association of Master Plumbers, and was three years one of the vice presidents of the National Astion, representing Rhode Island in th body at Deer Park, Md., in 1886, Chicago, 1887, and Boston, 1886. The plumbing in some fine residences and public buildings in his vicinity has been done under his supervision. Mr. been done under his supervision. Whipple is progressive, and has in stock plumbing material such as is recommended by sanitary experts.

AT A RECENT MEETING of the Plumbing Board of Yonkers, N. Y., a certificate of competency was granted to Andrew E. Seiss of Dobba Ferry.

Nash & Van Scov, South Norwalk, Conn., are putting a heater and bathtub in the house recently purchased by Fred. B. Coleman on High street. They are also placing the tin roof on Sarah Larrigan's new building on the Washington street bridge.

J. ALVIN STRUSE has removed his plumbing and gas fitting establishment to 4457 Main street, below Green street, Manayunk, Pa.

WATSON & TOSSELL have been awarded the contract for plumbing a new hose house at Bay City, Mich.

NASH & HAMA, 2216 Michigan avenue, Chicago, have the contract for the plumbing, gas fitting and sewerage in the residence of Geo. A. Seaverns, 2819 Michigan avenue.

To B. H. HILLIAR, the stove dealer and plumber, says the New Haven Record, belongs the credit of being the first person in New London to put in an individual plant for electric lighting. Mr. Hilliar has connected a small dynamo with his engine, and while he obtains power to operate his lathes, &c., he generates enough electricity to produce 35 lights of 16 candle-power each.

GEO. L. BOTTUM, 34 Clark atreet, Chicago, general agent for the John Douglas Company of Cincinnati, is distributing that company's handsome catalogue of the Douglas noiseless tank. The company are also manufacturers of fine hardwood acats, pipe boards, bath and laundry tub rims and all other kinds of plumbers' wood work specialties and brass and nickel plated flush and supply pipes.

R M. Wilson, proprietor of the bathtub factory, Rome, N. Y., has in course of crection an addition 100 x 60 feet, three stories high, and expects to have it completed by December 1. He now employs 115 hands, and in the spring will increase that number to 250 or 300, when he will put on another addition of 75 feet, csrrying the plant to within 10 or 15 feet from the street.

WM. BOWDEN, 238 Twenty-fifth street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the store and flat building corner of Wentworth avenue and Twenty-sixth street.

BENJAMIN F. SHAW, 315 Orange street, Wilmington, Del., has completed negotiations for the purchase of the Springer, Morley & Gause property, 82 x 86 feet, at the northwest corner of Third and Orange streets. He intends to put up a three-story building on part of the property, placing a French roof on the Third street end. A pipe shop 25 feet in the clear is to be erected on Orange street. He will continue to occupy his present quarters as office and salesroom.

#### Steel Cylinder Head.

The Cleveland Stamping & Tool Company of Cleveland, Ohio, have just completed a large contract for steel

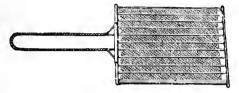

Steel Cylinder Head.

cylinder heads of the peculiar shape shown by the engraving. These heads are drawn from No. 14 gauge metal and are 17 inches in diameter by 14 inches deep.

# THE RETAIL STORE.

Sir Humphrey Davy Toaster | and Broiler.

Silver & Co., 304-310 Hewes street, Brooklyn, N. Y., are manufacturing the Sir Humphrey Davy toaster and broiler, as illustrated in Figs. 1 and 2. The toaster and broiler, made both single and double frame, in two sizes of each, is 4½ x 6 inches and 7½ x 9 inches.

Sir Humphrey Dary Toaster and Broiler. -Fig. 1.-Toaster or Broiler Closed.

On both sides of the frame work and on the outside are sheets of wire gauze held by a frame work of tin and wired at the corners to the broiler proper. The wires are tinned and a loop provided to keep the handles together when in use. The broilers are intended for chops, steaks, toast and kindred sittles to be cooked over the flame of a gas, gasoline, oil or and bottom strips. It is also supplied with adjustable legs of different lengths on the ends, to allow of standing it in an inclined position. It is divided into compartments of suitable sizes to accommodate dollars, half dollars, quarters, dimes, nickels and cents, with a marked plate at the left of each compartment to show the amount of coin in the register at any time. The capacity of each compartment is shown in the cut, holding \$90 in coin. The manufacturer remarks that the register is useful, simple, convenient, compact and ornamental; that it combines two articles in one, a coin register and a coin holder; that it is a great time and labor saver, avoiding mistakes; that when the cash is in place it is counted and registered in stantaneously, a glarce showing the

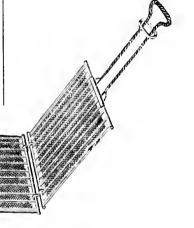

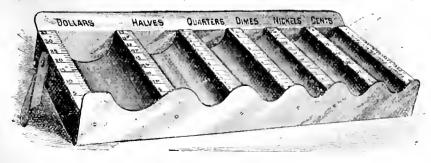

Fig. 2.-Tooster or Broiler Open.

spirit stove, without, the manufacturer says, the risk of burning. The discovery made by Sir Humphrey Davy early in this century, which led to the invention of the safety miners' lamp, has been utilized in this production, it being impossible for flame to pass through the gauze.

#### The Universal Cash Register.

The Universal cash register shown in the accompanying illustration is put on

amount; that it acts as a check on those left in charge of the cash while the proprietor is absent; that the registering plates are arranged to count new and worn coin as commercially received and paid out; that it is so adjusted that it can be used in an ordinary cash, "nwer, placed on a desk, or when position into the safe occupies but little space, and that when wrapping coins they are already arranged to pick out and wrap up. The maker recommends the register for use in all kinds of business, it

The Universal Cash Register.

the market by Samuel Chittick, 130 | East Twenty-third street, New York. The body of the register is of maple wood, well finished, about  $5 \times 9\frac{1}{2}$  inches in well finished, about  $5 \times 9\frac{1}{3}$  inches in will be delivered to any point in the size, with nickel plated metallic top United States, when prepaid, for \$1.

being specially useful to bookkeepers and cashiers making up pay rolls, and for all who handle coin. The register The Merk Christmas Tree Holder.

The cut here shown represents a Christmas tree holder offered by the Allentown Hardware Works, Allen-town, Pa. The holder is made of iron

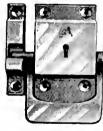

The Merk Christmas Tree Holder.

neatly finished in gold bronze or japan. By an ingenious centrivance the tree is held secure by strong arms which ex-tend upward from the main body of the receptacle in which it is placed. If desired the tree may be revolved.

#### Refrigerator Door Fastener and Lock.

P. J. Conrcy & Co., Philadelphia, Pa., are offering a refrigerator door fastener and lock, as here shown. It is explained that in closing the door the

Refrigerator Door Fastener and Lock.

top part of the cam strikes a curve at the back of the catch and ferces the handle down, automatically making a tight joint, so essential to refrigerators. When opening the door the handle is lifted a quarter of a circle, and the top of the cam strikes the curve in the catch and forces the door open. It is pointed out that the door shuts or opens with ease and that no springs are used in the construction of the fastener. The fastener is also provided with a service-able lock of new design. The fasteners are made in different sizes and styles in brass and bronze metal. The makers state that the good's are simple, strong and durable, and that as their business is confined to the manufacture of hardware for refrigerators their energies are devoted to producing new and desirable articles in this line.

#### Sensible Mincing Krives.

The accompanying cuts relate to improvements in the handles of Sensible

Fig. 1.-Sensible Mincing Knife No. 10.

mincing knives, manufactured by N. R. Streeter & Co., Groton, N. Y.; New York office, W. H. Jacobus, 90

Fig. 2.—Sensible Mincing Knife No. 40.

Chambers street. The new features of the multiple bladed mincing knives are enlarged and bowl shaped handles and

Fig. 3.-Sensible Mincing Knife No. 60.

the mode of fastening the blades. The blades are of tempered steel, nickel plated, and can be removed when they require sharpening. The company's plan of numbering the knives is such that the first figure indicates the number of blades; thus No. 10 has one blade, No. 20 has two blades, &c. The company remark that the knives are easy to clean.

#### The Columbia Lifter.

A. C. Williams, Ravenua, Ohio, is offering a lifter as illustrated herewith.

for use on ordinary roads, an exercise, it is stated, that brings into use every muscle of the legs, back, neek and arms: also, that any one familiar with the use of ordinary roller skates can put them on and with little practice can skate on the road at the rate of 6 or 7 miles an hour. The point is made that the skates are less expensive and more convenient than the bicycle, and that the use of them is more easily learned. The msnu-

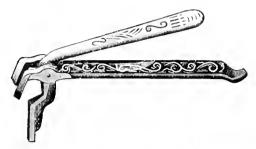

Fig. 1 .- The Columbia Lifter.

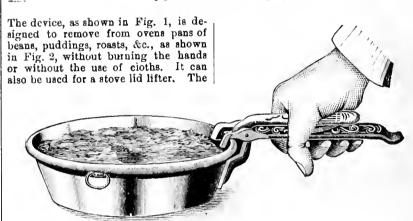

Fig. 2.—Lifter in Use.

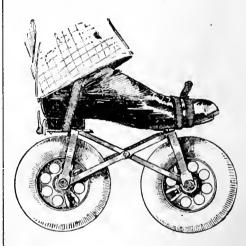

lifters are furnished japanned, also full nickel plated.

THE DEATH IS ANNOUNCED at Dover, Del., on September 17, of Alden B. Richardson, a prominent citizen of that town and an ex State Senator of Delaware, at the age of 70 years. Mr. Richardson was born in South Reading, Mass., and was descended on both sides from old Puritan settlers of New England, his mother being a direct descendant of John Alden, who came over in the "Mayflower." Marrying a lineal descendant of William Penn, he went to Dover, Del., in 1849, and opened a stove store with his brother-in law, George M. Stetson, as partner. The firm were the first to send out tinware peddlers through the State. The partnership was dissolved some years ago, and Mr. Richardson started a cannery at Dover, which, under the name of Richardson & Robbins, has grown to be one of the largest in the country. At the time of his death Mr. Richardson was president of the Dover Gas Light Company, and a director of the First National Bank of Dover. He leaves a wife and one son.

#### The Skacycle.

The Skacycle Mfg. Company, 3103-3105 Ludlow street, Philadelphia, Pa., are introducing a roller skate with a pneumatic tire, as here shown. The skacycle, it is stated, is an American invention, patented some years ago, but not useful until now on account of the failure to secure pneumatic tires that would be servicable. It is designed

facturers claim that the skates are made throughout of the best material, with pneumatic tires of the highest grade; that the wheels run and are adjusted on ball bearings and that every part is per-

The Skacycle.

fect. The skates are finished in nickel and retail for \$25 per pair.

The report of the Comptroller-General of Patents in Great Britain, just lasued for 1893, shows great activity in invention. The total number of British psteats applied for during the year was 25,120, an increase on the previous year of 951. The number of applications under the International Convention was

174. Gross receipts on account of petents and trade-marks were \$839,375, against a gross expenditure of \$440,500.

#### Sunset Rule Gauge.

The cut shown herewith represents the Sunset adjustable rule gauge and finger protector offered by J. J. McManus, 75I-753 Market street, San Francisco, Cal. The device is made of brass, of the shape and size shown in the cut, and is applicable to any ordinary 2-foot pocket rule, is easily ad-

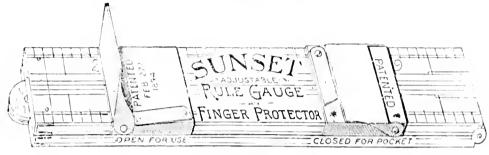

so that the rivet on either side of the gauge from the end of the rule to the measurement of the radius of the circle gives the center or revolving point, a pencil or awl giving the marking point.

#### A Trick Knife.

C. J. Healy, 121 Chambers street, New York, is effering a trick knife, as herewith shown. It is a one-bladed, brass lined, genuine stag handled knife. The knife requires a different method blade is pushed home with the forefinger, when the end of the knife is struck, jarring the lug back into the hole in the blade, holding it securely closed. The blade cannot be opened or closed in the ordinary manner. Samples will be sent, prepaid, by mail at \$t per de zeu.

#### Ohio Knock Down Stove Pipe.

The Gesuga Foundry & Mfg. Company of Painesville, Ohio, are introducing to the trade a form of stove pipe

Sunset Rule Gauge,

justed, and is to be carried on the rule in the pocket when not in use. As a ninger protector, when on the rule, it protects the finger from splinters or a rough surface when acribing a line parof handling to open and close it from an ordinary knife, and herein consists the trick. In the shoulder of the blade is a hele into which a lug drops when the knife is held in a certain position,

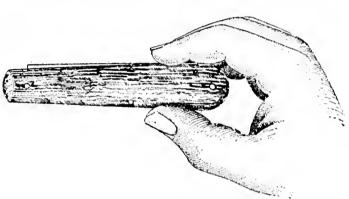

Fig. 1.—Opening the Knife.

allel to the edge. As an adjustable gauge it can be placed at any required position on the rule simply by sliding. It may also be used as a marking gauge, and it is stated that with a pencil or

and from which it drops out when the position is reversed. To open the knife it is held as in Fig. 1, with the shield down and with the forefinger pressing against the blade. The free end of the

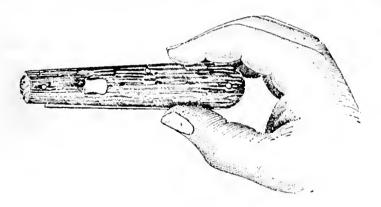

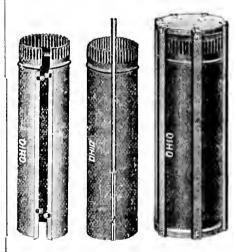

Fig. 2.-Closing the Knife.

scratch awl all work usually done with a marking gauge, mortise gauge or panel gauge can be performed. It can also be set in an instant as a hinge gauge for marking the cuts on doors and casings in fitting butts or hinges. It is explained that it may be used as a compass or divider by aliding the gauge

knife is then struck lightly on a counter or some solid substance, which jars the lug out of the hole in the blade and back into a hole in the handle. The finger is removed as the knife is atruck and the blade flies open of its own accord. To close the knife it is held as in Fig. 2, with the shield up, and the

known as the Ohio. It is referred to by the makers as being practical, durable and amoke proof, and of such construction that no specific directions are necessary for putting it together or taking it apart. It is stated that a number of the Ohio stove pipe joints can be put together so as to make a perfectly firm smoke tight pipe 46 feet in length if desired. The joints can be knocked down and nestedso as to be readily shipped in crates of 25 joints cach. The illustration which we pre-

Ohio Knock Down Stove Pipe.

sent herewith shows the manner of putting the pipe together, and also the appearance of a crate ready for shipment.

An advertisement for tinners in New York City says "bring tools." Such a condition, observes the Sun, would exclude many workmen from employment at this time, because hundreds of mechanics pawned their kits during the worst of the depression, and many have not yet got them out. The skilled mechanic buys the best tools of his trade, and comes to have an affection for them and for their familiar handmarks. There is nothing more pathetic and significant in the windows of the pawnbrokers than such tools, eloquent of the skilled hands, now idle, that recently wielded them.

# THE TIN SHOP.

#### Pattern for Gore in Ball.

From W. S. G., Penbrook, Pa.—Inclosed find plan and profile of ball formed of sections, with part in plan indicated by J K L cut away. I can obtain the pattern for the section A I K J, but fail to get a correct pattern for the gore J K L. Will The Metal Worker inform me how the pattern is to be obtained.

Answer.—The manner in which the pattern for section A I K J is obtained

N M into any convenient number of equal parts, and from the points thus obtained carry lines parallel with M H cutting the miter lines I A, I K and K J. Extend the center line I I', on which lay cut a stretchout derived from N M, all as shown by S S'. Through the points in the stretcheut line draw the usual measuring lines, and, with the T-square placed parallel with S S', bringing it successively against the points

successively against the points in M Q carry lines cutting P Q. From point K on J K erect a perpendicular, upon which lay out a stretchout derived frem P Q, all as shown by W W'-that is, make the distance 65 in W W' equal to 65 in PQ, 54 of WW' equal to 54 of PQ, &c. Through the points thus obtained in W W' draw the usual measuring lines, and with the T-square placed parallel with W W' and brought successively against the points in J K cut corresponding measuring lines. A line traced through these points of intersection, as shown by W X W', will form the pattern of one-half of the gore indicated by J K L of plan. If the pattern for J K L is desired in one piece extend the measuring lines through W W' and with the dividers set off the same distance on lines of similar number in W X W'; or use W X W' as a pattern for marking W X' W'. If the ball is composed of narrow sections the pattern for gore can be obtained as follows: With I as center and I J as radius strike the arc J g e and extend J K until it intersects the arc at the opposite side, as Y. Then biscct J Y in Z and use J Z for the radius for striking the arcs W X W' and W X' W'. Thus with J Z as radius and X of pattern as center strike a small arc at x', then with the same radius and with x' as center strike the arc W X W'. The arc W X' W' can be struck in a similar manner.

# 

PLAN

Pattern for Gore in Ball.

is as follows: For convenience draw a circle, as shown, which divide into the number of parts of which the ball is to be constructed—in the present instance eight, as indicated by A B C D E F G II. From the center I draw miter lines, as indicated by I A, I II, &c. Extend II A, and erect the perpendicular M O, and from the center I draw I R parallel with II M. With R as center and R M as radius strike the arc O N M. Divide

in the miter lines I A, I K and K J, cut corresponding measuring lines, as indicated by the dotted lines drawn from I A, I K and K J. Lines traced through the points of intersection, as indicated by S T S' U' V U, will be the desired pattern.

For the pattern of gore proceed as follows: From point K draw K P parallel with II M, and with the T-square placed parallel with M O and brought

## The O H One Piece Stove Pipe Elbow.

In the accompanying illustration we present a general view of what is known as the O H one piece stove pipe elbow

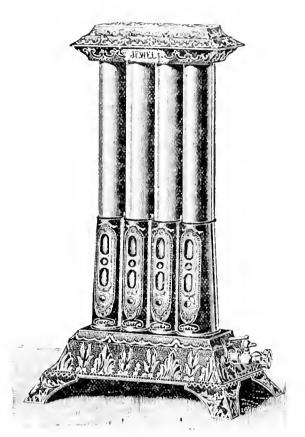

The " O H" One Piece Store Pipe Elbow.

manufactured by the Lawrence-Letts Nibow Company, Limited, of Waverly, E. Y. The engraving so clearly indicates the construction that very little description seems to be necessary. The clbow is made both plain and of planished iron, it being offered in two sizes—namely, 5 and 6 inch. The manufacturers refer to the extreme durability and strength of this elbow, as well as to the precision in size, quality of material and attractiveness of design.

#### Jewel Gas Radiators.

George M. Clark & Co., 149 to 161 Superior street, Chicago, have just brought out a line of gas heating stoves presenting decidedly novel features. They say somewhat facetiously that the time has passed when people were satis iron V shaped chamber directly over the burner and discharge it at the top back into the room at a temperature so high that it will light a match, as witnessed by the writer. It is seen from this description that there is no mingling of the products of combustion with the air heated for circulating in the room. The space about the inner flues is pur-

Jewel Gas Radiators.-Fig. 1.-General View of a Four-Tube Radiator.

fied with a gas heating stove made from a piece of gas pipe with holes drilled in it at the bottom of a section of 9-inch stove pipe. Improvements have been necessitated to conform with modern ideas of constructive beauty, sanitary principles and highest fuel efficiency. The Jewel gas radiators have been devised to meet the requirements of this advanced age. In Fig. 1 of the illustra-tions herewith given is shown a four-tube radiator. These radiators are constructed with a cast iron base and top, while the tubes are of cast iron for nearly half their hight and Russia sheet iron the remaining distance. The burners are in the base and are ignited by means of a pilot light. The tubes are constructed with cast iron bottoms, because it has been found that sheet iron tubes get overheated and discolored or misshaped, soon rendering the stove unfit for use. The tubes are not separately made, but are corrugated from a single piece, strongly overseamed at the end. Thus there is no portion of the stove which cannot be easily reached and dusted or otherwise cleaned.

The inside construction of these radiators is a special point of merit. It will be best understood by referring to Fig. 2, which represents a vertical cross section. This shows that the tubes are double. The outer tubes carry the products of combustion from the burner to the chimney connection, and radiate their heat through the sides and top. The inner tubes take cold air from the room through the openings shown at the right of the cut, heat it in the cast

posely small, so as to check the upward passage of the products of combustiou and more highly heat that portion of the stove intended to diffuse heat by radiation. Either atmospheric or illuminating burners are furnished with these radiators. The atmospheric, or blue flame, burner is a hollow cored casting slotted throughout its length, and so constructed that the flame from end to end is perfectly even and intensely hot. Care has been taken in the construction of the base to guard against the danger of deflecting heat downward and thus igniting carpet or floor. This point has been thoroughly covered, and the radiator can be placed anywhere without fear.

These radiators are beautifully finished in three styles. They are made with tubes enameled in blue and top and bottom ename'ed in white and gold or nickeled, or neatly stove blacked. Mica windows are inserted in the bottoms of the tubes, with a row of ruby jewels extending across below them. These radiators are furnished in four sizes, with 4, 6, 8 or 12 tubes. They are adapted to either manufactured or natural gas.

A decision of the United States Circuit Court of Appeals in Philadelphia, which was given last week in favor of the Westinghouse Electric Company, reversing the decision of Judge Green of the United States Circuit of New Jersey on the Edison-Westinghouse infringement case, is one of the most important patent rulings ever given.

The General Electric Company claimed that the E iison fee fer and main patent covered almost all the large electric lighting plants that have been erected by the Westinghouse Company, and that the enforcement of the patent would give them—the General Electric Company—a practical monopoly of central station lighting, whether by the direct or alternating system. This patent, by the present ruling, is declared to be void for lack of invention, leaving the Westinghouse Company a clear field.

Warren Webster & Co., Canden, N. J., report considerable activity at their works. Among recent orders received for Webster vacuum feed water heaters and purifiers of large size were the following: B. & O. Tunnel Plant, Baltimore, Md., 3000 horse power; Westinghouse Electric & Mfg. Co., Brinton, Pa., 2500 horse-power; Pennsylvania Bolt & Nut Company, Lebanon, Pa., two 1000 horse power; Clucinnati Street Railway Company, 1000 horse-power; the City of Boston, a special machine; Fairfield Paper Company, Fairfield, Mass., 600 horse-power; Chicago Edisson Company, North Side Station, Chleago, 2000 horse-power; the Johnson Company, Lorain, Ohio, 3000 herse-power; Philadelphia Gas Company, two 600 horse-power, and one 500 horse-

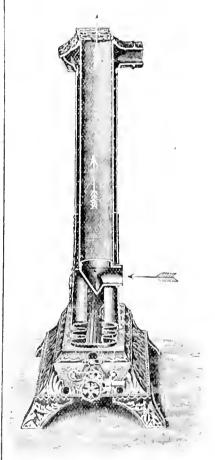

Fig. 2.—Vertical Cross Section of the Radiator.

power. The firm have also received a number of orders for Webster separators and for the Williames vacuum system of steam heating.

The William Cramp & Sons Ship & Engine Building Company have just paid a 2 per cent. quarterly and a 10 per cent. extra dividend.

## HOT WATER. STEAM AND

American Society of Heating and Ventilating Engineers.

In response to a call is ued by an or ganizing committee appointed at a previous informal meeting, there assembled at the Broadway Central Hotel, New York, last week, a large number of men interested in the heating trade, and effected a permanent organization of the American Society of Heating and Ventilating Engineers. The earnest interest taken in building up the society on a high plane is readily seen from a perusal of the following taken from the Constitution:

#### ARTICLE 1.

Section 1. The name of this association shall be the American Society of Heating and Ventilating Engineers.

Sec. 2 The headquarters of the society shall be located in the city of New York.

Sec. 3. The officers shall consist of a president, three vice-presidents, a secretary, a treasurer, a board of managers and a council.

council.
Sec 4. The objects of the society shall

be:
1. The promotion of the arts and sciences connected with heating and ventilation, and to encourage good fellowship among

its members.
2. Improvement in the mechanical con-

Improvement in the mechanical construction of the various apparatus used for heating and ventilation.
 The maintenance of a high professional standard among heating and ventilating entities.

standard among heating and ventratives gineers.

4. To establish a clearly defined minimum standard of heating and ventraliation for all classes of buildings.

5. To favor legislation compelling the ventraliation of all public buildings in accordance with the standard of this society.

6. To encourage legislation favorable to improvement in the arts of heating and ventilation, and to oppose legislation inimical to the business of the eogineer.

7. The reading, discussion and publication of professional papers, and the interchange of knowledge and experience among its members.

its members. To establish a unform scale of prices

8. To establish a divices, for all professional services, SEC 5. Fifteen members at any meeting shall constitute a quorum.

#### ARTICLE 2

SECTION I. The society shall consist of members, honorary members, associates,

members, honorary members, associates, and judiors.

Sec 2. A member shall be a heating or ventilating engineer or expert, or a mechanical, civil, electrical, mining, naval or military englueer, or an architect, who has been professionally engaged in the work of heating or ventilating for at least five years, and he shall be at the time of his admission to membership not less than 27 years of age. Graduation from a school of engineering of recognized repute shall be considered as equivalent to two years of active practice. He must be qualified to design as well as to take charge and direct that branch of heating and ventilating work he has made his specialty.

well as to take charge and direct that branch of heating and ventilating work he has made his specialty.

SEC. 3. To be eligible as a junior the candidate must be at least 23 years of age, and must have been actively engaged in the work of heating and ventilating for three years, or a graduate of a technical school of recognized repute with at least one year's active practice in heating and ventilating.

SEC. 4. To be eligible as an associate the candidate must have such a knowledge of, or connection with, the applied science of heating and ventilating as to qualify him, in the opinion of the council, to co operate with heating and ventilating engineers in the advancement of professional knowledge.

SEC. 5. Honorary members shall be distinguished persons elected by the society.

SEC. 6. All members, honorary members, juniors, and associates, shall be equally en

titled to the privilege of membership, except that honorary members, jumors, and associates shall not be entitled to vote nor to hold any office of the society.

SEC. 7. Jumors and associates may become eligible for membership.

#### ARTICLE 4.

Section 1. The initiation fees of members and associates shall be \$15 and their annual dues shall be \$10, payable in advance. The initiation fee of juniors shall be \$10, and their annual dues \$10, payable in advance. A junior, being promoted to full membership, shall pay an initiation fee of \$5.

of 85. A notice of 60 days will be given of the date and place that the first regular meeting will be held, which will be in New York some time in January, 1895.

#### List of Officers.

The officers elected to serve until the first regular election at the January meeting are:

President, E. P. Bates, Syracuse,

First vice-president, W. M. Mackay, New York City.

Second vice president, W. F. Wolfe, Boston, Mass.

Third vice-president, Charles Onderdonk, Philadelphia, Pa.
Secretary, L. II. Hart, New York

Treasurer, J. A. Goodrich, New York

Board of Mauagera: F. P. Smith, New York City; A. A. Carey, New York City; H. J. Barron, New York City; Henry Adams, Washington, D. C.; James A. Harding, New York City; also President Bates and Secre-

tary Hart. Council on Membership: C. W. Newton, Baltimore, Md.; Prof. R. C. Carpenter, Ithaca, N. Y.; F. W. Foster, Boston, Mass.; A. A. Cryer, New York City; U. G. S. collay, Brooklyn, N. Y.

The formation of the society is largely

due to the efforts of L. H. Hart, who proposed it to a number who would be interested, and secured the preliminary meetings. That such a society can be meetings. made a valuable institution is cause for congratulation on the excellent start

Some idea of its strength can be gained from the number of members enrolled at the first meeting and given

#### The American Boiler Company,

of Bcaton, New York and Chicago, have issued a handbook of useful information and price-lists for steam and water fitters. The book is a handy volume of pocket size, bound in stiff covers with rounded corners, and contains 120 pages. The first 25 pages are devoted to illustrations, descriptions and price-lists of the various styles of hot water heaters and ateam boilers for heating and for power manufactured by this company. The next 17 pages treat of various patterns of radiators, with full lists of sizes and capacities. Valves and fittings take up 30 pages, in which the most improved devices in these lines are illustrated and described and prices are given. Among these are expansion tanks, thermometers, floor and ceiling tanks, thermometers, illor and ceiling plates, floor sleeves, pipe hangers, gauges, registers, automatic regulators, &c. Tools require 10 pages and comprise pipe wrenches, pipe tongs, pipe cutters, screw plates, atocks and dies, taps and reamers, pipe vises, pliers, &c. Then follows miscellaneous information of value relating to weights of iron of va'ue relating to weights of iron, consumption of coal, evaporation of water, expansion of pipe, properties of saturated steam, a table of extreme variations of temperature at numerous points in the United States, a table of areas of circles, measurements of valves from center to end, data blanks in preparing for estimates, steam estimate blank, matter estimate blank, form of specification and contract for steam heating apparatus, suggestions for hot water heating, practical points on direct and indirect radiators and piping, plans and diagrams for house heating by hot water on the two-pipe and one-pipe system, &c. Not the least important feature of the book is the reduction made in list prices of steam boilers and hot water heaters.

#### The Greenhouse.

The sheltering of plants from severe weather by what are known as green-houses is an old device. At first it was practiced merely as an adjunct of luxurious living. In modern times the cultivation of flowers, fruits and even vegetables under glass has become a large and important industry. There are many, however, who assist in the construction of greenhouses, who supply them with heating apparatus, or who use them for pleasure or profit, who do not understand the principles that are in this way made to play a part in supplying the wants of mankind. In the first place, there are many who, if asked to explain the uses of glass in a greenhouse, will answer: "It gives the plants light and draws heat." When asked to explain how glass draws heat, they will reply, substantially, that on sunny daya a greenhouse does not require so much heat to warm it to the required temperature as the same sized building would need if built of brick and provided with the usual number of windows; and, as the sun shines upon brick buildings and glass houses alike, it proves to their satisfaction that glass really does draw heat.

Now in this attempted explanation both the premises and the conclusion are wrong. In no case does a glass house require less heat to warm it to a given temperature than an equally impervious brick building of the same size, exposed to the same weather, whether the day be dark or sunny Glass has no more power to "draw" heat, in any sense of compelling heat to pass through it, than has wood, stone, or even ice. In fact, glass, like wood, stone or ice, is obstructive to the passage of heat, though to a less extent than the materials named. Heat passage is in no wise helped by the glass.

When the sun shines upon a greenhouse, solar heat passes in faster than the interior heat can escape until such time as the temperature rises to a point where the transmission becomes equalized both ways. The fact that until the temperature reaches the point of equal transmission in and out, the exterior heat goes through the glass faster than the interior heat goes out, is what gives rise to the popular impression that glass has some mysterious power which draws heat through it. Of course, this fact means that some of the heat which enters through the glass from the outside is temporarily imprisoned, and thus there is an accumulation of heat But this curious action also needs explanation.

What is there about glass that allows heat to pass through it faster in one direction than in the other? Nothing whatever. Turn the panes inside out and the same thing happens as before. Solar heat, even on a cloudy day, passes into a greenhouse more rapidly than the heat thus admitted passes out, even

though the total outward transmission of heat derived from the heating apparatus be much greater than the heat derived from the sun; but the reason sought is not to be found in any poculiarity of the glass. All white glass is alike in this respect. The reason is found in the quality of the heat itself.

It is a curious fact that the quality of heat varies much according to the source whence it comes. In the facility of its passage through different materials radiant heat from a luminous source like the sun, or a mass of metal heated to whiteness, far exceeds that of heat obtained from a non-luminous source, and when it has been absorbed by non luminous bodies, that is to say, when the latter have been warmed by it, this heat, in passing off, is no longer heat from a luminous source. It, therefore, gets out through the glass much more slowly then it got in.

The action may be illustrated somewhat by a large tank containing molasses into which, through a small hole, hot molasses is allowed to flow. If a hole be bored in the side of the tank, having the same size as that through which the hot molasses runs in, a less quantity of liquid will escape from this hole than runs in. The molasses is molasses all the same, but in the tank is becomes thicker by cooling, and it flows through the same size hole less freely. In other words a change of condition has produced a change in action.

A popular lecturer, in speaking of windows, once made use of the expression "glass is a hole to heat." In the sense which this lecturer intended, all substances are holes to heat; that is, heat passes through all substances without distinction, but it passes at different rates through different bodies; heat from luminous sources and heat from non-luminous sources have each their own "tricks and manners" in this respect.

But a far more important function of glass in greenhouses than admission of solar heat is the admission of light. Too much solar heat may be injurious to plants in greenhouses. To lessen its force the panes are coated with a wash of whitening which obstructs the passage of heat, while yet a sufficiently free passage of light is permitted. Plants can no more thrive without light and air than men or animals; and a successful constructor of greenhouses cannot disregard these points. In all greenhouses artifical heat must be relied upon to keep up temperature to the required point in cold weather; and the manner in which this heat is applied and regulated is a prime element of success in greenhouse management.

#### HEATING NOTES.

THE LARGE STOCK of hot water heaters made for John A Scollsy, 72 Myrtle avenue, Brooklyn, N. Y., and which accumulated at the foundry of John Davies, has all been delivered, and snorder placed for about 100 more. Mr. Davies reports an increasing trade in making castings for hot water heaters, which he is successful in turning out smooth and free from leaks.

THE INSTANTANEOUS WATER HEATING COMPANY of 141-143 O Mario street, Chicago, Ill., and 838 Broadway, New York, have issued a supplement to catalogue No. 2, illustrating three sizes of their new series of Instantaneous water heaters. The latter are specially designed to meet the requirements for which the construction of the company's

other heaters are not adapted. Special attention has been given to the construction of the new goods, with a view to delivering the water in a pure and wholesome condition. Every part of the water surface is thoroughly tinued and scaled from the gas and products of combustion, which is most important when the water is used for making tea, colleg. A

THE RICHARDS IN A MORGAN COM-PANY, 94 Beekman street, New York, report a lively trade in their Cyclone steam and hot water apparatus. It is being pushed with energy this year, as those set last year have proved highly satisfactory.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, have the contract for steam heating in the store and flat building of J. W. Utesch, Fortieth street and Ashland avenue.

THE L. H. PRENTICE COMPANY, 203-205 Van Buren street, Chicago, are to install a steam heating plant in the Masonic Orphans' Home, Fulton and Ada streets.

Among the contracts recently taken by the John Davis Company, 69 to 79 Michigan street, Chicago, can be mentioned the following: Power plant for the Chicago Telephone Company, Lake and Franklin streets; piping and connections for power plant for the Chicago City Railroad Company, Fifty-second street and Wabash avenue; new power plant for the Calumet Elevator Company, South Chicago.

ARTICLES OF ASSOCIATION Were recently filed with the County Clerk at Detroit, Mich., by the McRac & Roberts Company, organized for the manufacture and sale of steam brass goods and steam supplies generally. The capital stock is placed at \$125,000, of which sum practically one half is sald to have been actually paid in. The incorporators are Wm. D. McRae, Wm. Dobie, Albert G. Laird, all of Wallaceburg, O.t., and Daniel Dobie and D. H. Roberts of Detroit.

THE RICHMOND STOVE COMPANY Of Norwich, Conn., favor us with a copy of an attractive 40-page pamphlet, which they have just issued, bearing the imprint of George T. Barnes, heating and ventilating engineer and con-tractor, Newburgh, N. Y. The introductory pages are devoted to the subject of steam and hot water heating, following which are illustrated notices of the Richmond steam and hot water heaters. There are also given engravings of radiators of various kinds, as well as of Richmond heaters for use in small dwellings, offices and the like, and of the Richmond hot water laundry range. Nearly half of the pamphlet is given up to engravings made direct photographs of buildings heated by the company's goods. There are numerons testimonials showing the satisfaction which the Richmond heaters have given wherever used.

Col. W. C. Mowry of Norwich, Conn., well and favorably known to the trade as a manufacturer of steam and hot water boilers, was nominated for Scretary of State by the Republican State convention, held at Hartford, September 18 and 19. Colonel Mowry has served his district in the Legislature of Connecticut and has long been prominent in politics. If elected, the genial colonel will bring to the office distinguished ability and the rare courtesy for which he is justly celebrated.

# TIN PLATES.

#### Tin Plate Wages.

John Jarrett, secretary of the Tinned Plate Manufacturers' Association of the United States, has been notified by M. M. Garland, president of the Amalgamated Association, that the vote among the members employed in tin plate and black plate mills on the prop osition of the manufacturers to make an average reduction of 25 per cent. in wages on account of the reduction in the duty on tiu plates and black plates has been finished. The men voted unanimously not to accept the reduction, but will offer a counter proposi tion in a few days agreeing to accept a cut of about 10 per cent. The manucut of about 10 per cent. The manufacturers insit that they must have a reduction of fully 25 per cent., and un less they secure it they will operate with non-union men. A few plants in Ohio and Indiana are closed pending adjustment of the wage scale and to make repairs. A meeting of the tin plate manufacturers will be held in Pittsburgh in a few days to take action on the rejection of their proposition. At present it looks very much as though a strike will take place.

## Atlanta Steel & Tin Plate Company.

The Indiana Tin Plate Mfg. Company of Atlanta, Ind., were reorganized on the 11th inst., and the following officers elected: C. A. Ford, president; F. D. Morgan, vice president and gen eral manager; Dan Goodykoonty, treasurer; E. S. Walten, secretary and assistant treasurer. The company were chartered under the name of the Atlanta Steel & Tin Plate Company. Capital authorized \$150,000. This company were originally incorporated in October, 1892, an eight stack washhouse was built, and in the spring of 1893 the company commenced tinning, but owing to an impossibility to reconcile existing differences between the manager and the company a receiver was appointed, and the plant was recently sold for the benefit of the creditors. It is the intention of the new management to put in three stands of hot and three stands of cold rolls, ample capital having been raised for that purpose. The contracts for the engines, boilers, mill building, tinning machines, pickler, doublers and other machinery have already been let to Ford & Donnelly of Kokomo, Ind. This company will have the advantage of free natural gas for fuel, and will own 2000 acres of gas territory southwest of Elwood, Ind., being the very best gas territory in the Indiana gas belt. The mill will be arranged on the plan of the New Castle, Pa., plant. The mill building will be 80 x 280 feet; the wash or tin house, 50 x 100 feet; pickling room, 30 x 80 feet, and the assorting and packing room, 50 x 80 feet. All brick and iron work will be commenced at once.

#### SCRAP

FORD & DONNELLY, Kckomo, Ind., have just completed a battery of eight 125 horse-power boilers for the Moutpelier Sheet & Tln Plate Company, and are building for that concern ten Thomas & White tinning machines, one pickler, doublers, bran machines, elemers, furnace castings, &c. They are just completing a battery of boilers for the Irondale Rolling Mill Company, at Middletown, Ind.

THE AMERICAN TIN PLATE COMPANY, at Elwood, Ind., and Molewood & Co., at Gas City, Ind., have served notices on the employees of their hot mills department that a cut of 25 to 30 per cent. in wages will be made on October 1, when the reduced tariff on tin plate goes into effect.

A London PRESS DISPATCH of September 19 states that the announcement has been made by a wealthy American iron and steel manufacturer now in England, that he, with a number of other capitalists, is about to begin the manufacture of tin plate in the United States on a scale that will add largely to the American output.

R. NEVILLE & Co, of Lianelly, South Wales, have just completed the erection of a three-mill tin plate works near Bilbao, Spain. W. P. Lewis of Cynon Tin Plate Works, Aberdare, has left Wales to take charge of the new plant. The works are well arranged and fitted with the latest appliances, and a successful start was made last week. A wealthy Spanish company are the proprietors.

The opinion of the London Iron and Steel Trades Journal in regard to the prospects of American tin plate manufacturing under the new tariff is expressed as follows: "It is confidently asserted that the tin plate works in the United States can hold their own against Wales under the new tariff, and we have no doubt that some of the works producing good roofing plates and other apecialtics will go on as usual, but for the ordinary run of cheap plates we expect the American demand will now be as good as ever."

Saunders, Fielding & Bond, 108 Fulton street, New York, inform us that their tin plate works in Jersey City, N. J., will be closed. Their special brand of roofing plates—"Snow-drop"—will in future be imported from Wales.

The New Rolling Mill for making black plates, which is being added to the Pittsburgh Tin Plate Works, New Kensington, Pa., will, we are advised, be in operation in about five or six weeks, when the manufacture of bright charcoal and coke plates will be undertaken. Hitherto the output of these works has been confined to roofing ternes.

THE TIN PLATE WORKS of Marshall Bros. & Co., 1156 Beach street, Philadelphia, are running with four sets on double turn.

Somerton Tin Plate Works, Brooklyn, are reported to be busy. Three black plate mills and three tinning sets are in regular operation.

THE STATISTICS of the New York Custom Honse for the month of August,

1894, just issued, piace the amount of tin and terne plates in the bonded warehouses of this port on the last day of the month at 15,990,670 pounds, valued at \$383,867, as compared with 14,776,116 pounds, of the value of \$360,418, on the last day of July, 1894, and 10,228,208 pounds, valued at \$253,208, on August 31, 1893.

The tin plate works of the P. II. Laufman Company, Limited, Apolio, Pa., are kept busy in the production of Laufman's Apollo large sized terne and leaded sheets, for which the concern have a very satisfactory demand. A circular issued by the company calls attention to these sheets as being coated with a mixture of tin and desilverized lead, hand double dipped, with oil finish. The sheets are made from 20 to 36 inches wide, and 60 to 120 inches long, and of No. 17 to No. 30 gauge. They are specially recommended for car roofing, eave troughs, conductor pipe and cornice work. It is claimed for them that they are an ounce lighter to the square foot than galvanized sheets and that they possess the advantage of not sealing off in working, the affinity of the metal being perfect.

Rumors from several quarters of the projected building of black sheet mills and tin plate plants seem to indicate that there are plenty of capitallsts who possess a lively faith in the atahllity of the American tin plate industry and its ability to exist with profit under the new tariff conditions. The Pittsburgh Dispatch has interviewed an Eastern business man of reputation and financial solidity, who was last week in the Smoky City looking for a site to locate a complete plant for the manufacture of tin plate from the billet. He had the command of \$200 000 for investment in the business, and, it is said, had already let a contract for the construction of the plant, which is to have a capacity of 2,400 boxes a week. The Dispatch mentions that several other enterprises of a similar character are contemplated.

HUGHES & PATTERSON, Incorporated, Philadelphia, have closed down their tin plate works indefinitely.

HENDERSON TIN PLATE COMPANY, Norristown, Ps., have arranged their works for the accommodation of five tinuing machines. They have now in operation one Morewood set and are turning out a "Worcester" grade terne. Another machine, for coke tins, is about to be installed.

MONTPELIER SHEET & TIN PLATE COMPANY, Montpelier, Ind., advise us that the work on their extensive rolling mill and tin plate plant is progressing actively, and that they expect the works to be running in about three months' time. They are heing built under the direction of Superintendent Harry Herbert, formerly of New Castle, Pa., who is putting in an entirely new design of furnaces, and building a six-mill plant, which, when completed, will be one of the finest in the country. Twelve the ning stacks are ready, and the necessary machines have been oldered. The

mill is very favorably situated on high ground, with excellent water and gas facilities. The following are the names of the officers of the company: M. Selberiling, president; C. A. Ford, vice president and secretary; Harry Herbert, superintendent, and J. H. Shoemaker, treasurer.

THE ELWOOD TIN PLATE COMPANY, Elwood, Ind., are adding a tinning bouse to their rolling mill plant, with the view of coating their own black sheets.

#### HEATING & PLUMBING.

#### NEW WORK AND CONTRACTS.

HERBERT BAKER, a Brunswick, Ga., plumber, has been awarded the contract for putting in the sewerage at the Mansfield street, Oglethorpe Preparatory and Risley school buildings. The contract calls for 50 closets and the job is a big one and an important one.

G. L. GARDNER has closed a contract with Geo. F. Ma'oncy, Adams, N. Y., for a steam apparatus complete for his hotel. There will be 39 radiators.

THE CARTON FURNACE COMPANY, Utica, N. Y., have been awarded the contract for the heating by steam of the new St. Luke's Parish House and Church. Two brick set boilers set in battery will be used. This job will be an elaborate one in every detail, as the company propose to show a perfect church steam plant.

W. H. MEEKER & Co, South Norwalk, have the contract for putting the heating apparatus in the new school house at Rowayton, Conn.

ROCHE & McGuire of New London, Conn., are engaged in plumbing Giles Bishop's new residence on the Boulevard. The bathroom will be lined with Tennessee marble and the plumbing fixtures will be of the finest. Newman & Cronin have the heating of the house and will put in a Mahony steam beater.

Two No. 26 Gorton patent side feed hot water boilers will be used for heating the Fogg Lodging House, recently erected on Fifty-third street, near Eleventh avenue, New York. The installation is being made by Gillia & Geoghegan of the city named, and is worthy of note on account of the great \$123 of the boilers.

BAILEY & STOTHART, Middletown, Conn., are putting a Gurney hot water heater in the residence of Capt. Geo. L. Dickinson, at Essex.

JAS DONOVAN, Middletown, Conn., is putting a Boynton steam heater in N. C. Stiles' residence, two hot water heaters in M:ss Alsop's house on Lincoln street, and a Boynton hot air furnace in Oscar Leach's house at Durham.

Proposals will be received up to September 29 for a ateam heating plant for the city offices at Sandusky, Ohio.

A NEW HEATING APPARATUS is to be purchased for the almahouse at Trenton, N. J.

William G. Heath & Co., Providence, R. I., have received from the city the contract for putting in gas pipes, setting up the old boilers and connecting the radiators at Hose Station No. 3, on Pond street. The contract for plumbing has been awarded to Phillips & Paillips.

THE CONTRACT to equip the new school house at North Franklin, Maine,

for steam heating, has been awarded to the Carman-Thompson Company of Lewiston.

TRACY BROTHERS have received the contract for the plumbing of the new Wiswall Building, on Washington street, Saratoga Springs, N. Y.

WM. E PAUL Portsmouth, N. H., has the contract for heating the Pickering Block, and will use a carload of Exeter radiators, which were also used in the Rockingham National Bank.

#### Trade Notes.

STRANSKY & Co of 27 Murray street, New York, favor us with a copy of an illustrated price-list, bearing date of September, 1894. The 54 pages of which it consists show illustrations and give prices of Stransky Steel Ware, which is referred to as being very durable, absolutely pure, quick cooking and easily cleaned. It is said that in boiling, stewing, roasting or baking one thing will not taste of another, nor will the enamel be affected by the acids in vegetables and fruits. The ware consists of an extensive assortment, offered for the most part under the name Cameo. In connection with the goods we find in addition to prices, the number of various sizes made and their respective capacities.

THE CORTRIGUT METAL ROOFING COMPANY of Philadelphia, Pa., direct the attention of the trade to the lower rate of duty on Tin Plate, which takes effect on October 1. In their advertising space this week they state that they have arranged to give their customers and every one desiring metal shingles the immediate benefit of the reduction, and prices based on the new duty can be obtained by addressing the company at their main office, at Broad and Hamilton streets, Philadelphia, or at their Western office, 134 Van Buren street, Chicago, Ill.

THE SHUSTER FOUNDRY, Franklin and Willow streets, Philadelphia, have, during the aummer, made some large shipments of the Shuster Patent Ca'ch Box and Fresh Air Inlet. These articles have been in good demand at seashore resorts and other places where sand and gravel are the chief materials us d in the construction of roads.

W. C. Hine, receiver for the Youngatown Stamping Company, Youngatown, Ohio, has just issued his seventeenth statement of affairs of the above concern. It shows that on September 1 there was the sum of \$10,611.87 on hand, while the business was reported to be in good condition.

THE CENTRAL STAMPING COMPANY, with office at 25 Chif street, New York, are about erecting a five story brick Tinware factory, 75 x 45 feet, estimated to cost \$20,000.

WILLIAM MACHERT & Co, Reading, Pa., manufacturers of Hardware and the Machert patent Chimney Cap, have taken possession of their new plant.

Byram & Co. of Detroit, Mich., report business steadily picking up. They recently shipped the third Collian Furnace to the Plano Mfg. Company, West Pu'lman, Ill., and the third Collian to the McNeal Pipe & Foundry Company, Burlington, N. J. They equipped the new shops of the Howard & Bullough American Machine Company, Pawtucket, R. I., with two Col-

haus, and one 76 inch Farusce went to the Johnston Harvester Company, Butavia, N. Y.

WHITING FOUNDRY EQUIPMENT COMPANY, Chreago, have shipped a No. 8 Whiting Cupola to the Abram Cox Stove Company, Philadelphia, and a No. 6 Cupola to the United States Radiator Works, Dankirk, N. Y.

THE E W. BLES COMPANY Of Brooklyn report that their European business has been very large. They have shipped to Switz cland within the last two months a special watchmakers' Drop Hammer, several Punching Presses titted with sub-presses for watch work, and a No. 14 Toggle D.a ving Press. A large shipment of tools and machinery for the manufacture of clocks and their cases has gone to Germany, to one of the largest clock making concerns in the world. France has also received a large shipment of tools for the making of granite enameled ware and kitchen utensils. Several watch factories have also been supp'ied with tools from the E. W. Biss Company. Austria has received Nov 12 and 31 Toggle Drawing Presses, Nos. 18 19, 20 and 21 ad j istable Power Presses, and Nos 383 and 39 Power Presses with a number of dies, and a No. 161 double action Press with dies and special feed for making primers. A large improved automatic Perforating Press is now nearly completed, and will be shipped to England for the manufacture of perforated metals up to 50 inches in width.

THE DALLAS TINWARE MFG COMPANY, Dallas, Texas, have been placed in the hands of the Sheriff on an attachment in favor of the American National Bank of that city. The firm have teen in business five years.

To facilitate the transmission of orders during the rush season, and to render their patrons the most prompt service passible, the American Radiator Company have had placed in their general offices, at Chicago, a direct Postal Telegraph wire. This is merely another illustration of the enterprise of this well managed company.

EDWARD MILLER & Co, Meriden, Conn., call attention in their advertlaement this week to the Miller oil heaters, which are said to be just the thing for all time and everyday use. The heaters are illustrated and sufficient descriptive particulars presented to enable the reader to obtain a comprehensive idea of the general construction and operation.

The Charles Willy Mfg. Company. Bay Shore, L. I., are offering Burr's Gunoleum, a lubricant for protecting and preserving metals from rust and tarnish. It is recommended by the manufacturers for use on guns, rifles, revolvers, cutlery, bright steel goods, typewriters, fine machinery, dog chains and collars, metal trimmings on fishing rods, bicycles, stove pipe, carpenters' tools, skates, brass plates, brass railing, brass work on yachts, &c. The preparation is about the consistency of vaselene, and it is stated that heat or cold does not effect its consistency, and that it never gums or drips. The manufacturers state that the preparation prevents pits in shot gun and rifle barrels, and that a light coat of it on any unprotected metallic surface will prevent rust, corrosion or tarnish and will preserve its finish. The Gunoleum is put up in collapsible tubes of two sizes, also in 14, 12, 1 and 5 pound cans. Samples will be sent free by the manufacturers upon application.

# STOVE TRADE NOTES.

The Open Fire Place, Past and Present.

The above is the title of a paper read by John Ward before the Birmingham Architectural Association in Birmingham, England. The subject discussed is one in which our readers are in terested, and we therefore present what Mr. Ward had to say:

By using the open fire place we adopt the best known method of warming our dwellings. The system is the one taught by the great solar system itself.
By the rays of the sun the whole earth is warmed and nourished, and all nature made joyous and healthy. It is only when the great center of heat is partially hidden from us that we have to look for an artificial substitute, and that substitute is best found by following, as far as possible, the sun's principle of radiation and reflection. By direct radiated heat from the fire place we get warmth for our bodily comfort. while the air we breathe may remain cool and refreshing. With hot air it is different; the atmosphere is always more or less oppressive, and in such warmth we feel none of the exhilaration obtained from the genial warmth of the open fire place. That is the difference between convected heat and radiated heat-radiated heat having the peculiar property of passing through the air without warming it." illustrated by the heat accumulated in objects near a fire, while no such in-convenient heat is felt in the air around them. The atmosphere of a room ultimately becomes warmer from the air coming in contact with the objects warmed by the rays of the fire; but this is in so mild a form as not to destroy the health giving properties of the air. The open fire place is the oldest of all methods for warming our dwelling places, although, like every-thing else, it has been subjected to many changes, and some improvements. No modern scientific method has yet been found to supersede its popularity or its hygienic qualities. From its similarity in principle to Nature's great source of heat, it is doubtless destined to remain the only satisfactory method. Its main drawbacks are its waste of heat generated and its curtailed venti lation as now used, although in this respect it is better than other methods.

#### Smoky Chimneys.

If we could make the opening into the flue higher without incurring the risk of smoky chimneys, and retain more of the heat generated, it would leave nothing to be desired. Our forefathers evidently did not mind a little amoke, judging from the immense openings in some of the old fire places. Most modern attempts at imitating these large openings have proved failures, and all sorts of schemes and devices seem to have been tried to remedy this without success. Plate glass blowers are sometimes used to remedy the evil, but these, while perhaps retaining some of the breadth of treatment as far as appearances are concerned, do not assist the ventilation It is possible our fore

fathers did not suffer so much from smoke, as they doubtless had more numerous and stronger currents of air to feed the flues, thus avoiding any necessity for a down draft, for a smoky chimney after all means defective venti-What is wanted is an open fire place where the opening into the flue is about 4 feet or 4 feet 6 inches in hight from the hearth, so that we may sit, if not stand, in an atmosphere that does not become stagnant and vitiated. This, unfortunately, at present does not appear to be obtainable with any degree of certainty. The earliest form of the open fire was made in the center of the hut or building, the smoke escaping through a hole in the roof, sometimes fitted with a louver. Uncivilized though this may appear to us, it undoubtedly claims some advantages which the modern fire place does not pessess. The whole of the radiated heat being thus available, and as a means of ventilation it must have been far ahead of the low openings of modern times, as no foul air could remain long in an apartment so warmed, nor would the drafts in such an apartment be neces. sarily concentrated upon those seated round the fire. The atmosphere may at times have been somewhat cloudy, but in those days there were no delicate decorations to apoil. The hole in the roof is still to be found in our poorer habitations, and in parts of Scotland it is considered a sign of advanced civilization, compared with those that allow the smoke to escape through the door or window, or any other outlet it can find.

#### The English Fire Place.

The English fire aide or fire place at the side of the apartment is supposed to date back to the time of the Norman Conquest; still retaining the hole in the roof to earry off the smoke. The roofs of the fortified eastles being constructed and used for defense, it became necessary to abandon the hole in the center, an oblique opening in the wall being used, which was succeeded by the chimney flue. A very early example of a chimney flue occurs in an old fire place in the guard room in Conisborough Castle. This would show that the principle of This would show that the principle of the modern chimney was understood as far back as the Norman period; but its use was so unusual that Leland, in the sixteenth century, speaking of Bolton Castle, in "Domestick Architecture," writes: "One thynge I much noted in the Hawle of Bolton how chimners were conveyed by tunnels made on the syds of the walls betwyxt the lights in the hall, and by this means and by no covers is the smoke of the harthe in the covers is the smoke of the harthe in the Hawle wonder strangely conveyed." And as late as Elizabeth's reign apologies were made to guesta lf they could not be accommodated with chambers provided with chimneys. The flues in the old times were of enormous dimen slons, being sometimes as much as 8 feet or 9 feet wide and 3 feet deep. They were usually provided with a large hood or canopy, which projected boldly into the chamber, and was gencrally fixed at a hight from 6 to 8 feet from the hearth, thus giving ample

space for radiation and ventilation. When later these hoods came into disuse, there was no proper conduct for the smoke to the flues, hence the lowering of the mantels. This was accomplished at first by means of a hanging screen of teather or other material, and finally by lowering the mantel itself, which, in the course of the eighteenth century, gave us the fire place as it practically gave us the fire place as it practically exists to-day. These hoods were recommended and used by Alberti, 1484; Phillbert Delorme, 1518-1577, and others. Speaking of the loss of these hoods, Herbrard wrote in his "Csminologic," in 1756: "It is aurprising that we should allow these old chimney pieces to be changed in order to follow pieces to be changed, in order to follow the fashion of the day, without taking the pains to examine whether the utility is as great as the novelty. It appears that it is not. It has been observed, on the contrary, that of the few old chimneys which have escaped remodeling, there is scarcely one which smokes. Old men testify to the same effect in regard to those which existed in their time, while we have no heaitatation in saying of the majority of our new chimneys that they do smoke." The open fire place in its early form consisted of a niche or recess ouilt in the walls, with side piers or jambs to support the hood. They were frequently circular ln plan, the hearth forming one half of the circle, while the hood formed the other half, this form of hearth being considered admirable for reflecting the rays of the fire into the chamber. The hoods were practically what our chimney breasts are now, and were made in wood and stone, and ornamented in various ways. At times they had brackets or shelves at the sides where n might be placed lamps. The old fire place recesses were frequently large enough to accommodate a number of persons with seats on the hearth, and the space contained within the acreens used as protections against drafts, together with the jambs of the fire place, formed an ante-chamber, apart from the large halls in which they were built, and here the family gathered in the winter evenings to listen to some famous legend of older times and the songs of the wandering minatrels. Sometimes when very large halls were to be heated the fire places were 30 feet or 40 feet wide in the recess. These were sometimes divided, or rather the mantel supported by columns, as in the case of a fire place at Linlithgow Palace. Sometimes instead of these columns there were piers extending from front to back, thus forming three distinct fire places in a row, each provided with its own separate flue. These piers not only supported the mantel, but enabled the amount of fire to be regulated as re-Wood was the crdinary fuel quired. till the seventeenth century, and huge logs, 6 feet to 8 feet long, were burnt on the capacious hearths, resting on two atandards or andirons—the word andlron either being a contraction from brand iron (brand isen, Anglo-Saxon) or a corruption of endiron. Tomlinson says: "In the hall, the ancient seat of hospitality, they were atrong and massive, to support the weight of the huge logs, but the standards were kept bright or ornamental with brass rings, knobs, rosettes, head and feet of animals and various grotesque forms. In the kitchens and in the rooms of common houses the standards were of iron; but in the halls, of copper, brass, or even silver."

(To be continued.)

## Thomas, Roberts, Stevenson Company

of Philadelphia have issued an eightpage supplement to their catalogue, descriptive of their new goods and improvements. A detailed view of the Ideal Fortune and Aome Fortune ranges is seen on the opening page, the difference noted in the two ranges being that the former has a large end ash pit and draw hearth plate, and the latter a front hearth the entire length of the range, with front ash pit door. The ranges have right or left wrought steel ovens, easily removed, and either triplex, duplex or improved flat grates. Page 3 illustrates the Acme Fortune range, and describes it as being suitable for hard or soft coal, coke, wood, or natural gas. It is handsome in appearance, and is shown with an ornamental pipe shelf. It has six holes and is supplied in two sizes, with or without pipe shelf, upper and lower hot closets, reservoir and water front. Another page shows a hot air arrangement for New Broadway, New Altoona and New Happy Choice ranges, whereby the entire back of the range is utilized for a healing surface. The remaining pages show the Sunbeam, a five hole range of neat design especially suited for burning wood; the True Fortune double heater, with heavy cast cylinder of improved shape, steel plate inner drum, large cold air supply, nickeled skirt, feet, foot rails, base, top corners and upper top ring, and Ransom's patent duplex or draw center grate; a powerful soft coal double heater called Our Fortune, having a brick lined cylinder extending to top of feeder door, upper hot air section of heavy material with inside draft cheek, large feeder and ash pit doors, nickeled trimmings and Rarsom's duplex or draw center grate; and the Coin Fortune, a high class single heater. The grates in these heating stoves may be changed or renewed through the ash pit doors without removing the brick.

#### The Union Stove Works.

We have just received from the Union Stove Works of 70 Beekman and 66 and 68 Gold streets, New York, copies of the six sections constituting their 1894-95 entalcane. The sections vary in the number of pages, the largest consisting of 48 and the smallest of eight. all being issued in white covers and printed in tinted ink upon good paper. Section No. I shows an extensive line of cook stoves and portable ranges of all grades and varieties. The goods are attractively decorated and embody the modern improvements. In connection with the cuts is to be found descriptive particulars, together with the sizes in which the goods are made, dimensions of oven and length of fire chamber. Among the more prominen ranges may be mentioned the Glen B Bon Bon B, Dover B, Colon. Palos Home Run, New Rival, Lakewood Durham B for 1894, New Paragont

Massens and the Paragon B. ond section of the catalogue relates to water back ranges, Franklin stoves, fire place heaters, hot air furnaces, &c. The water back ranges are the Astor, West End, New Beauty and the Royal. The furnaces are represented by the Commander Improved D, shown in portable form and also for brick setting. The back page of this pamphlet is embellished with a bird's eye view of the company's works at Peekskill The third section shows the company's line of sheet iron stoves, which includes the Dash, Flirt B and the Belmar. are attractive constructions and are made in sufficient variety to meet the demands of the trade. It is said that out of the assortment of the Flirt B it is possible to make a line of 112 different stoves. The fourth section of the cata'ogue shows heating stoves, which are offered under such names as the Rover, Dash, Red Cloud and Octagon. The fifth section of the catalogue relates to parlor stoves and presents illustrations of the Rush, a new square parlor in four sizes; the Invader, a new pattern heater with round tire pot, shakir g and dumping grate; the Goldenrod, effered in a variety of styles and sizes; the Durham square parlor for 1894, and the Belmar, made in three sizes. The sixth and last acction of the catalogue shows an extensive line of laundry stoves and tailors' heaters. Accompanying the catalogue is a price list consisting of 24 pages.

#### ODD PLATES.

Henry Gleason, 108 Beckman street, New York, has returned to stove ornaments, gas stove brass goods and his line of stove specialties after attending the political convention at Saratoga Springs, N. Y. He is mailing to stove manufacturers samples of his No. 10 damper knob that will hold a draft damper to its place by means of a spring. The letter which follows the samples is characteristically interesting from many points of view.

THE J. F. PEASE FURNACE COM-PANY, manufacturers of the celebrated Economy heaters and furnaces, have opened a new branch other at 86 Lake street, Chicago, two doors west of for-mer location. They have fitted up a tasty showroom and effice, in which are displayed samples of their complete line of warm air furnaces, stram beaters, hot water heaters and combination heaters. Their representative will be pleased to welcome the Western trade at all times. Storehouse facilities have been ar ranged from which orders for prompt shipments are being made. A well assorted stock of furnaces and repairs will be kept on hand. The reputation of their goods, already so thoroughly established, will undoubtedly be increased largely by this move.

RATHBONE, SARD & Co., Albany, N. Y., made exhibits of Acorn stoves and ranges at a number of county fairs held in the State during the past few weeks. Their goods were awarded first premiums in a number of instances, prominent among which may be mentioned the Johnstown Fair, where Acorn stoves and ranges were displayed by Frank Randall. In referring to the scheme of exhibiting samples of stoves on a wagon, as described in these columns last week, the company state that this plan has been followed by them since last spring, and that their New York City traveler has been using the scheme ever since.

"NEV GARLAND COURING GOODS" is the catch line of a lange poster reecived from the Michigan Stove Com-It gives illustrations of four tyles of the Champion Garland range, four styles of the Demestic Garland range, four styles of the Challenge Garbind range, four styles of the Family Garbied range, four styles of the Heine Garland range, three styles of the Home Garland cook, three styles of the Family Garland cook, three styles of the Monarch Garland wrought range, and three styles of the Columbian Garland wrought range. Among these will be found cooking goods to meet any requirements as to size, capacity or kind of fuel. The poster is lithographed in colors, so that it will form an attractive advertisement when hung up in a store, and will save constant reference to the company's catalogue for the purpose of making comparisons of styles.

The QUEEN STOVE COMPANY of Denver, Col., is the name of a concern recen ly incorporated, with a capital stock of \$50,000. The incorporators include Charles Kibler, Louisa Kibler and Milton Smith.

The Flant of the Auburn Stove Foundry Company, at Auburn, Maine, was slightly damaged by fire on the afternoon of Thesday, September 11. When discovered the roof was ablaze, and it is thought the fire caught in some way from the cupola. The building was only slightly damaged by fire, although the water caused some loss to the contents of the structure, fully covered, however, by insurance.

According to advices from Taunton, Mass., the business situation is showing signs of improvement. The Weir Stove Company and O. G. Thomas are working nearly full time, and are said to have a gratifying number of orders ahead. The Taunton Iron Works Company are running four days a week, but expect to increase this time very shortly. The Presbrey Stove faning Company have a sufficient number of orders on hand to keep them running for some time, and it is stated that other concerns are doing well.

THE MISSOURT GAS MACHINE COM-PANY of St. Louis, Mo., has just been incorporated with a capital stock of \$12,000 to manufacture and sell Ruthven's patent gas cooking, heating and lighting machine. The incorporators are E. J. Scalinis, J. H. Cordes and S. J. McKinley.

The Michioan Stove Company received a letter a week or two since from one of their custemers in Michiesota, in which an order was given for a fire pot for one of the largest size Garland base burners. In concluding his letter the customer said that he was using three Garland stoves and that this was the first "extra" he had been obliged to obtain, the stove baving been in use every winter for the past 14 years. Every manufacturer is naturally proud of the record made by his goods and the case referred to is one which cannot prove otherwise than gratifying to the Michigan Stove Company.

MICA OF ALL SIZES and in packages to fuit can be found at the Palermo Mica Company, 27 Peck Stip, New York. This is the season when assorted parcels are needed for fitting out stoves that have been kept on storage and for supplying the demands of customers.

The Portsmouth Stove & Range Company of Portsmouth, Ohio, have brought out a powerful furnace under the name of Mogul. This, we understand, is the company's old Mogul henter, gotten up in furnace form at a price which enables the small householder, storekeeper, &c., to secure a furnace at the cost of a stove. It has anti-clinker grate, coment joints and, as the manufacturers term it, "all the frills needed."

The Dippo Mfg Company of Chagrin Falls, Ohio, are vigorously pushing the sale of their Ferrosteel ranges for 1894, which possess many novel features that are fully set forth in a pamphlet which the manufacturers have issued. We understand that a copy of the publication will be sent to any one in the trade who may apply. The foundry and general offices are at Chagrin Fills, while their sample and sales rooms are at 63-64 Wade Building, Cincinnati, Onio.

THE EXTERPRISE STOVE COMPANY of Vincennes, Ind. are offering the trade in their Star Radiator a very attractive oak stove, rossessing many features of interest. The latter are fully described in a circular which the company have issued, and any dealer desiring a copy of it can obtain one upon application. The manufacturers refer to the Star Radiator as "the only stove of the kind made," and they anticipate for it a large and constantly increasing sale.

THE CRAIG REYNOLDS FOUNDRY COM-PANY of Daylon, Onio, are giving employment to a full force of hands and are in a position to make prompt shipments. Their Triumph furnace is of fered the trade in 34 sizes and any number of styles, adapted for warmair, how water and steam heating. The company state that the capacity of their works is over 6000 complete furnaces yearly.

THE ANSHUTZ-BRADBERRY COMPANY of Pittsburgh, Pa., are fairly busy in the manufacture of Tremont stoves and ranges and furnaces. In addition to contracts secured by the company, mention of which was made some time ago, they also have the contract for the hesting and ventilating of the new public school to be crected on East street, Allegheny, Pa., and the new addition to Charles Street and Woods Run schools in Allegheny. They also have the heating and ventilating for 18 dwellings in the East End, Pittsburgh, two in Bellevue, Pa., three in Tarentum, Pa., and contracts in Greensburg, Irwin and Zelicnople, Pa. The company note a continued increasing demand for their Tremont hot air furnace, which is giving excellent results to all users.

EDWARD MILLER & Co. of Meriden, Conn., favor us with copies of circulars illustrating the Miller oil heaters, intended for use in spring, summer, autumn and winter. They are made in several sizes and possess features of construction which cannot fail to interest the trade. The makers claim that there is no dirt, ashes, smoke or smell in connection with these heaters, and that they cook and bake in a perfectly satisfactory manner. The ovens have cast iron deor frames, cast iron racks or shelves and adjustable cast iron rack supports. Some sizes of the Miller oil heater have a font with a capacity of 4 quarts, and will burn 12 hours, while the No. 332 has a capacity of 7 quarts and will burn from 18 to 20 hours. We also have circulars of the Miller lamp, which is constructed on scientific principles and embodies features which have estab-

liahed for it a gratifying reputation. It is said that the construction is such that if any part becomes broken it can be replaced at small cost, thus making the lamp as good as new.

THE EXCELSION STEEL FURNACE COM-ANY, 38 and 4) West Monroe street, Chicago, are now extremely busy. They say that at present the only question which gives them any concern is, "How shall we get out the goods which are being ordered?" They do not know how long the rush will last, but hope it will continue indefinitely. willing to suffer a little inconvenience in the matter of overwork if their cus tomers will only continue to send in their orders. As our readers well know, the company not only manufacture hot air and combination furnaces and hot water boilers, but also make a complete line of furnace fittings, which so greatly expedite the work of the furnaceman.

The Star Coupler Company, St. Louis, Mo., who recently secured the contract for connecting the gas grates in the new Planters' House, St. Louis, have just completed the work. The total number of grates connected was 104. By the new system of using Star couplers this work was done in four days, two men only being employed. It is estimated that under the old system of connection with iron pipe and union it would take two men at least two weeks to have completed this work.

It is reported that the plant of the Rogers Foundry & Stove Company, Belleville, Ill., will soon be put in operation by a number of molders, who will operate it on the co-operative plan.

ONE OF THE INTERESTING EXHIBITS at the Tioga County Fair, held at Owego, N. Y., on Tuesday, Wednesday and Thursday of the week just closed, was that of Dr. J. B. Stanbrough, consisting of 15 different variable. etics of stoves and ranges made by the Fuller & Warren Company. The display was a very attractive one and visitors were greatly interested in the Splendid goods. Doctor Stanbrough carries at his store, 178 Front street, not only a full line of stoves but every thing in the hardware and builders' line. The statement is made that since 1876 he has sold over 1400 Splendid stoves, which is certainly a record of which he may justly be proud. Doctor Stanbrough was assisted at the fair by John M. Palmer, general agent for the company, this being his seventh year.

THE DETROIT STOVE WORKS, Detroit, Mich., are distributing a very attractive circular of the Imperial Jewel square parlor atove, which they manufacture in several sizes. The picture of the heater is printed in colors so as to give as nearly as possible the exact appearance of the stove when in operation. On the other side is a broken view of the stove showing the flue construction. Accompanying the circular is a card bearing the inscription "Please Close the Door." The picture represents a little miss dressed in white in the act of closing a door, in which effort she is obliged to use both hands. Upon the floor close by is her doll, and the general ides seems to be that she has passed from one room to another leaving the door open behind her, and has been requested by one in authority to close it. The card is further embellished with a tac simile of the company's trade-mark, the whole picture being executed in colors. Upon the opposite side of the card is a larger fac-simile of the com pany's trade-mark and a bird's eye view of their works.

THE QUICK MEAL STOVE COMPANY of St. Louis, Mo., have compiled their sales for the present season and they are embodied in the annual pie which the company are now sending to the trade. An inspection of the pie shows that 57,-118 stoves were sold during the season of 1894, which in comparison of 1893 is a slight falling off. Making a comparison of 1892, however, there is a gain of 41 per cent. Of course there must be some reason for this year's falling off, and another glance at the pie shows the company's explanation, as follows: Panic, coal strike, railroad strike and tariff tinkering. When these suggestive reasons are contemplated it is a matter of surprise that the sales of this concern did not show a more serious falling off. As . it was 57,118 is a very excellent showing, and the company have every reason to be satisfied with it.

BAR HARBOR, MAINE, and Nantasket Beach, Mass., were included in the vacation itenerary of E. J. Van Natter, and he has returned to the books of the Thatcher Furnace Company, 240 Water street, New York. He is as brown as a butternut, and possessed of a vigor that enables him to sum up a hard day's work to a total of pleasant reminiscences connected with the names in the accounts.

GEORGE M. CLARK & Co., 149 to 161 Superior street, Chicago, have issued a very tasteful catalogue of their Jewel gas radiators and heating stoves. It comprises 48 pages of illustrated and descriptive matter. The company's new productions, the Jewel radiators, are given the place of honor, which they deserve by reason of their specially meritorious festures in design and decoration. Four sizes are illustrated, and a sectional view is given to clearly explain the ingenious arrangement of the interior by which the heating power of the burning gas is greatly increased. Eight styles of heaters with fire place openings are next shown. These are new in their decorations, which are much more elaborate than in former seasons. They also have a new feature in the location of burners at the base of atove and between the reflectors, illuminating by reflection. The old reliable cylindrical stoves, with their copper reflectors below and passages for heated air above, are atill made by this company and are shown in the catalogue. A few pages are devoted to fittings, and a complete index with code words closes the book.

THE MARSHALL-WELLS HARDWARE COMPANY of Duluth announce in the local papers that they have received from the Michigan Stove Company, through Manager Fred. W. Gardner, two of the finest Garland stoves donated for the benefit of the forest fire sufferers. They were disposed of by raffle, in order to realize the largest sum possible, and the receipts handed over to the relief fund.

The July foreign trade statistics of the United States show, for the first time this year, an excess of imnorts over exports. The figures are: Value of domestic exports, \$51,639 463; value of imports, \$65,300,782. This excess, amounting to nearly \$14,000,000, is attributable largely to the enormous importations of sugar to avoid the increased duties under the new tarlif law. Nearly 50 per cent. of the imports were food products. For the first seven months of this year the excess of exports over imports amounts to nearly \$56,000,000.

# TRADE REPORT.

#### The Iron Market.

An undertone of disappointment is creeping into the market reports from the leading centers, and the outlook is again assuming a sember hue. We have nothing to do with the motives which induce one set of daily newspapers to torture every incident into a proof of unexampled business revival, while another set is industriously at work blackening everything to get a background for high lights in November. The business community wants the truth and that is bad enough without any squinting at polities. The sim ple fact is that consumption has not expanded enough lately in the Iron trade to keep the active mills from engaging in a continuous scramble for work. As soon as one has drawn back temporarily satisfied another rushes in to replenish an exhausted order book. Back of it all is the haunting fear of the coming winter. Winter work is inadequate, except in particularly good times. What will it be after a dull fall and summer?

It is curious to note that Wall street reckens as a good sign an expansion of production of Pig Iron, when the Iron producer looks longingly to that money center for the first indications of a demand for railroad rolling stock and permanent way. The Iron trade cannot hope for any sustained improvement until the railroad requirements come

One bright spot is the activity in the Cast Iron Pipe trade, the majority of the shops being busy. This is the result of the fact that municipal bonds have been about the only ones which have sold quite well. This has helped the Southern blast furnacemen particularly. In this connection the sale of a large block of Iron to a Birmingham rolling mill may be mentioned. But when the Pipe season is over, what

Pig Iron.—No improvement in the volume of the demand has yet come in the New York market, and the situation remains disappointing. We quote standard brands \$12 50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tide water. Southern Iron, same delivery. \$11.50 @ \$12 for No. 1; \$11 @ \$11.25 for No. 2; \$10.35 @ \$10.50 for No. 3; \$10.75 @ \$11 for No. 2 Soft, and \$11 @ \$11.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9 75 @ \$10.25

From Philadelphia it is reported that the Pig Iron market is not only dull, but in the majority of cases prices are a trific lower. Some furnaces are well sold up and are therefore independent of the market temporarily, but to effect sales in quantity there is no alternative but to shade prices. This is not due so much to any special falling off in consumption, but to an increase in the supply, which, it is feared, will be still more emphasized as the season advances. Large lots are not called for at present, although if they were it is probable that anything could be shaded 25¢ \$\pi\$ ton, and even small lots are hard to move at the full figures recently ruling. General quotations are given as

follows for Philadelphia and equivalent deliveries:

Chiesgo advices indicate that the local manufacturers of Pig Iron have scored another good week. Orders have been fairly numerous, and inquiries are still coming in from consumers over a wide stretch of territory. Makers are reported to be stiffen ing in their views, and some recent sales have been made at advances on previous rates. Orders are even being turned down on buyers' offers which would have been easily accepted only a short time since. A better demand is roted for Southern Coke Iron in small lots, but particularly from out of town consumers. Southern furnace agents report large inquiries from buyers outside of this immediate vicinity, and therefore a little remote from the in-fluence of local makers. Lake Superior Charcoal Iron still sells in only small lots. Makers' quotations on guaranteed brands and grades are firmly held. Quotations are given as follows for cash.

l ake Superior Charcoal. Local Coke Foundry, No. 1. Local Coke Foundry, No. 2. Local Coke Foundry, No. 2. Local Coke Foundry, No. 3. Local Scotch. Ohio Strong Softeners No. 1. Southern Silvery, No. 1. Southern Silvery, No. 2. Southern Coke, No. 2. Southern Coke, No. 3. Southern, No. 1. Soft. Southern, No. 2. Soft. Alabama Car Wheel. Jackson County Silvery.	10:25 @ 10:50 @ 2:50 @ 10:25 @ 10:25 @ 13:00 @ 10:75 @	10.50 10.25 10.00 11.00 13.50 11.25 10.75 11.25 10.75 18.00 16.00
	15 50 @ 14.25 @	16.00 14.50

In the Pittsburgh district there is a moderate demand for Foundry Irons, and prices are unchanged. Quotations as follows:

Our Cincinnati representative reports a fair volume of business in Southern Pig Iron during the week, but it was mainly in moderate quantities, seldom running as high as 500 tons from buyers in that district, but some good lots have been sold to the East of Southern Coke Iron and of Lake Superior Charcoal Iron for agricultural work and for Car Wheel works. The large and strong Coke furnsees in the South are reported to be holding prices up well, but some of the others are making concessions to effect sales; thus we hear of No. 3 Foundry selling as low as \$6.75, f.o.b. Birningham, or on that basis, but it ranges up to \$7. No. 2 Soft continues to be in good request and is selling at \$7.25, but the furnaces are so well sold already that they are not urging stock on the market. There appears to be a good prospect that all available stocks will be wanted for consumption in the early future. Quotatlons are as follows:

Southern Coke, No. 1	10.25 @	810.75
southern Coke, No. 2	9.75 @	10,00
Bouthern Coke, No. 3	9,00 @	9.25
Ohio Soft Stone Coal, No. 1	14.50 @	15.50
Ohio Soft Stone Coal, No. 2	14.00 %	14.50
Uske Superior Coke, No. 1	12.50 %	13.00
Lake Superior Coke, No. 2	11.50 @	12.00
Eanging Rock Chargoal, No. 1	16.00 @	17.00
Hanging Rock Charcoal, No. 2	15.50 @	16.00
WHIRIDS HOCK CHRICORY 140: 21	20.00	

Some improvement in the demand for Pig Iron has occurred in the St. Louis market, but prices have failed as yet to show any additional strength. No. 2F undry is quoted at \$10.25, f.o.b. cars St. Louis, and it is reported that this price is being shaded. No. 2 Saft is also referred to as being shaded for desirable orders. Consumers of Iron are not anticipating their wants and are satisfied to cover their requirements. 30 days shead. Quotations as follows for cash, f.o.b. cars St. Louis.

 Southern Coke, No. 1 Foundry
 \$11.00 \$11.25

 Southern Coke, No. 2 Foundry
 10.25 \$10.50

 Southern Coke, No. 3 Foundry
 9.75 \$10.00

 Southern Car Wheel
 16.50 \$17.00

#### Metal Market.

PIg Tlu.-Prices for Straits Tin have advanced sharply since last Saturday. For wholesale lots, September delivery, seller's option, the price is up about 0.60¢, October nearly as much and distant fut-ture deliveries 0.50¢ @ 0.60¢. Official records show transactions of about 500 tons. Quite as much if not more Tin has changed hands privately. In short, the week has been quite a lively one, and, while it is no secret that manipula. tion has kept a lively interest, convincing evidence is presented that fully if not more than the usual amount of stock has passed from importers' hands into the channels of consumption. Arrivals have been heavy, however, and doubtless close in line with rivals have been heavy, however, and doubtless close in line with the distribution. The shipments from the Straits during the first half of the month were quite large also, in-cluding 1700 tons to London, 450 tons to the United States and 360 tons to the Continent, against a total of 1475 tons during the corresponding period last year. This keeps the visible supply at or above 20,000 tons, and it is plain that the strength of the market is due more to speculative maneuvering than to statistical position, although helped to some extent by good purchases by dealers and consumers. Small lots of Straits Pig from store are quoted at 171# 7 lb.

Copper.—Prices have been raised to 9 ±0¢ for Lake Superior Ingots, 9.30¢ @ 9.35¢ for Electrolytic, and about 9.25¢ for common casting stock. It is asserted that all the Lake Ingot obtainable at 9.50¢ or under, for delivery during the balance of this year has been purchased and that quite extensive sales have been made of Wire Bars and other Electrolytic Copper. Sales of casting stock, it is also asserted, reach a liberal total. Another buillish feature comes out in the form of reports that the agreement to restrict production has been perfected, but convincing evidence in this connection is lacking. It would seem, however, that there is a "bull" interest in the market, but it is probably more in the nature of a speculative syndicate than a combination of pro-

ducers, with manipulations adjusted to govern prices on both sides of the Atlantic for purposes not difficult to imagine. Aside from speculative doings, it is clear that consumption is proceeding at a rate that helps the market considerably. Jobbers prices for small lots are unchanged at former quotations.

Sheef Copper.—While orders are still only moderate, inquiries show rather more life, indicating a better feeling among consumers. Prices for Manufactured Copper are firm, but no action has yet been taken in the direction of ratsing them.

Pig Lead -The situation at this writing is practically the same as it was a week ago. There is no chance for export business at prices that would not the shippers more than 2¢ ? lb. That fact, along with the rather large output, causes home consumers to be quite independent, and it is therefore difficult to secure bids above 3¢ for found lots of common Western for near future delivery. There are some sellers at 3.10¢ for October and later shipment, but 3.15¢ is generally asked. During the early part of the week under review quite a good business was put through at or near the lower rate quoted. Less interest has been manifested in foreign Lead, and the chances are against business at better prices than those quoted for domestic. The retail consumptive demand shows little sign of expansion. Small lots of American Pig are quoted at 31¢ @ 31¢ 3 lb, the lower figure being the more common. Manufactured lead is quiet at unchanged prices.

Spelter.—Higher prices for ores and alleged curtailment of production have, in connection with smaller offering, served to stiffen prices somewhat in the wholesale market. Jobbers' prices for small lots of ordinary Western brands aversge 414 Ph. Only routine business has been effected here, however, and the Eastern demand generally is spiritless.

Antimony.—A moderate business has been effected and prices are still rather easy.

Nickel.—Prices are about  $38\phi \oplus 40\phi$  for ordinary quantities and the market is slow.

Tin Plate. - The spot business passing is strictly of a retail character, since buyers will take nothing beyond what they are forced to purchase for the supply of pressing needs, in view of the fact of the new duty going into effect shortly. Some very fair purchases have been made for October and later delivery, but the volume of business is below expectations and prices have remained practically at their former level despite a firmer tone to foreign advices. One of the largest domestic Tin Plate manufacturing concerns have reduced prices along the whole line of their products to the extent of quite a considerable cut. Otherwise prices for demestic Plates show a radiesl change. The outcome of the negotiations now in progress between the American manufacturers and their workmen as to the wage scale will largely influence the future trend of the market for American Tin Plates in their competition with the imported article. For October and later deliveries, the prices now quoted for imdeliveres, the prices now quoted for imported Plates are as follows: Charcoal Time: Melyn Grade, ½ X, IC \$4.65, IX \$1.50 extra; Grange Grade, IC \$4.20, IX 90¢ extra; Allaway Grade, tull weight, IC \$4.15, IX 75¢ extra; Allaway Grade, 100 lb IC \$4.05, IX 75¢ extra. Siemens Steel (Squares,

© ): Full weigh, 10 \$4 10, 1X 75 ¢ extra; 100 lb basis, IC \$3.95, 1X 75 ¢ extra; 95 lb basis, IC \$3.95, 1X 75 ¢ extra; 95 lb basis, IC \$3.95, 1X 75 ¢ extra; 100 lb basis, IC \$4.05, 1X 75 ¢ extra; 100 lb basis, IC \$3.85, 1X 75 ¢ extra; 100 lb basis, IC \$3.80, 1X 75 ¢ extra; 95 lb basis, IC \$3.80, 1X 75 ¢ extra; 95 lb basis, IC \$3.80, 1X 75 ¢ extra; 101 weight, \$4.05; Siemens Steel, 100 lb, \$3.90; Bessemer Steel, \$3.95; Bessemer Steel, 100 lb, \$3.80; Bessemer Steel, 100 lb, \$3.80; Bessemer Steel, 100 lb, \$3.80; Bessemer Steel, 95 lb, \$3.67\frac{1}{2}; Bessemer Steel, 90 lb, \$3.60. Grade, 100 lb, IC 14 x 20 \$3.70, IC 20 x 28 \$7.60; D R. D. Grade, 100 lb, IC

A special London cable dispatch of September 19 to The Iron Age reports on the British Tin Plate market as follows: Tin Plate has been in active demand. The call was chiefly for light weight Cokes. Actual business has been disappointing, however, as buyers are hesitating, owing to uncertain course of the market. Where business has been done prices averaged 1½ pence lower, in the face of dearer Pig Tin. Bessemer Wasters have been in very fair demand. There has been a better demand trom Canada Swansea quotations are as follows:

follows:	
Bessemer Cokes, IC	10/6 @
	. 10/9 @
Charcoals, IC	. 11/6 @ 12/6

#### CONDITION OF THE

## Hardware Trade.

REPORTS received from the trade throughout the country reflect evident improvement in the different business centers. It is apparent that while business has not yet in most lines reached its normal volume, the trade are purchasing more freely to meet the demand which is setting in from their customers, and to prepare for the business of the next month or two. It is an encouraging sign that Mechanics' Tools are beginning to move more freely, and that general Hardware is also in increasing demand. Some manufacturers report the business of the menth thus far as being very satisfactory and larger in volume than they had reason to expect. In prices there is little improvement to note. Most goods continue low, and prices in many cases are somewhat irregular. In regard to collections little complaint is made.

Advices from Chicago. — Shelf Hardware keeps up fully to its former volume, and local jobbers are continuing to extend their territory. The demand is not so largely now for season goods as for general Hardware. Orders are covering the entire range of goods. Cutlery is in excellent demand. Tin Plates are slowly giving way in anticipation of the reduced duty on October 1. In a few cases purchases may be made at the full reduction expected after that time. Heavy Hardware runs along at about the same satisfactory gait. Carload orders for Iron and Steel are more numerous. The Wagon and Carriage trade is inclined to quietness, but a few contracts are being made for materials for delivery next year. Raiload companies are more liberal buyers now than for a year past. The supply houses report a steady gain. August showed a marked increase over July and this month is in the same manner showing an increase over August. Iron and steel merchauts also feel the influence of a better demand from their railroad customers. Still, as compared with trade two years back the volume of business of this character is comparatively light.

## Notes on Prices.

Wire Nails—There continues to be a good and increasing demand for Wire Nails, as the trade are evidently sending in their orders somewhat more freely. There is, however, little evidence of a speculative demand, most of the Nails ordered being required to meet the demands of current trade. There is also an increase in the production, as some mills which have been idle have started up again and others have increased their output. The tone of the market is not as strong as might be desired, and there contin-

ues to be a good deal of active competition among some of the makers. The market price is \$1.20 on dock, and \$1.25 to \$1.30 from store.

Advices from Chicago.—The situation the past week has been unsatisfactory from the manufacturers' standpoint. Some have been compelled to make concessions in order to hold their trade, but others have stood firm in the belief that matters will speedily right themselves. Something favorable is expected from the meeting held at Pittsburgh Tuesday, which was expected to take action calculated to maintain prices. Jobbers are selling small lots from stock at \$1.15 and carloads at \$1.10. They report far better sales the past week than for a long time.

Cut Nalls.—The Cut Nail market is not in a more satisfactory condition than Wire Nails. The demand is fair, though not especially heavy. In the matter of prices the market is not strong in tone, and there is some unevenness in quotations. Quotations from store in small lots, \$1.05 to \$1.10.

Advices from Chicago.—Buyers continue to take small lots and are not yet disposed to speculate on the future. Jobbers quote small lots from stock at \$1.10 to \$1.15.

Barb Wire.—There has been but little increase in the volume of business during the past week and prices are pretty well maintained at the following quotations for Four-Point Galvanized, delivered at the points named: Pittsburgh, \$2 to \$2.05; Cleveland, \$2 05 to \$2.10; Cincinnati, Allentown, Chicago, or New York, \$2 20 to \$2.25. The market though not especially active is fairly steady in the matter of price.

Advices from Chicago.—Manufacturers are still doing only a moderate business. Jobbers continue to quote small lots of Galvanized from stock at \$2.35 and for direct shipment from factory at \$2.25. The demand is not so good in proportion as that for Wire Nails, but still a slight improvement is noticed in the volume of business.

Rodgers' Cutlery.—Alfred Field & Co., 93 Chambers street, New York, sole agents for the United States for Joseph Rodgers & Sons' Cutlery, have issued a new price-list iu which there has been a revision of prices on account of the changes made in the new tariff. The result is that the effect of the change in duties has been to reduce somewhat the prices of many goods, some, however, remaining as before, while in some instances advances have been made. The list covers a large and varied line, and will be of interest to the trade.

Glass. -There is a noticeable improvement in the demand for American Window Glass, with a tendency toward lower prices. The decline in prices has come sooner than was expected, and it is a question in the minds of those con-nected with the Glass trade whether bottom figures have been yet reached. While orders are for larger quantities than during the summer months, they are to fill immediate requirements; and there is a marked absence of inquiries for estimates on stock lots, which are usually expected at this scason of the year. Quotations from Pittsburgh factories are given as 85 and 10 per cent. discount for single and 85 and 20 per cent. discount for double strength Glass. Single strength Glass is quoted in New York at from 80 and 20 to 80 and 20 and 5 per cent. discount, in small quantities. New York and New England prices for Ameri-

can Plate Glass are quoted as being 70 per cent, discount on sizes 5 feet and over, and 70 and 10 per cent, discount on sizes under 5 feet, on the Eastern list. Western prices are quoted as 70 and 5 per cent, discount on Glass over 10 feet, and 60 and 20 per cent, discount on Glass 10 feet and less from Western manufacturers' list.

Old Metals.—The demand for Old Metals continues moderate with little change in prices. The following quotations represent about the rates now paid by New York dealers:

Old Rubber.—Dcalers' purchasing prices, New York delivery, are about as follows:

Car Springs, ton lots, # 1b	Ø,	<b>\$</b> 0.03½
Rubber Shoes, carloads, de- livered at factory, & lb		.04%
Rubber shoes, less than car- loads, # lb	@	.04
Large Hose, #2 ton	(4)	15.00
White Wringer Rolls, # 15	(cg	.03¾
White Syringes, & lb	C	1,697.

L. L. Rowe, 18 Howard street, Boston, Mass., refers in his advertising card this week to a series of specialties of interest to the stove trade. Among the number may be mentioned a Pipe Crimper for crimping the end of stove and other sheet metal pipe so that it can be quickly and easily united with or inserted in another pipe of uniform diameter. Attention is also invited to Rowe's Improved Furnace Regulator and also to Rowe's Automatic Hot Soda Apparatus. Those who are interested are requested by the maker to write for circulars.

THE EFFECT of the new Tin Plate duty on prices is already illustrated in the radical cut made by N. & G. Taylor Company, Philadelphia, of from 75 cents to \$1 25 a box in the quotations of the domestic Tin and Terne Plates manufactured by them, for delivery after October 1.

## The Legal Aspect of Ventilation.

In times past the quality of ventilation has been determined by the desires of those who directly introduced or controlled it, but to-day legislative action is gradually leading from desires or whims to laws. It is no longer a question as to what a man thinks is good enough or cheap enough in the way of ventilation, but rather what the law says he must do regarding it. The State of Massachusetts began in 1888 a serious consideration of this subject and passed certain laws, requiring "proper" ventilation, but wisely no further defining as to the exact amount of air to be supplied per person, appointing furthermore State inspectors, independent of local boards of health, who should enforce the law. Lack of specific requirements for proper ventilation under the law threw upon them the burden of determining what should be understood by the term "proper ventilation." And wisely again, rather than attempt an extremely radical departure, they adopted the standard of 30 cubic feet of air supply per minute per person as necessary to fulfill the requirements of the law as they proposed to enforce it. This, while well in excess of the degree of ventilation then being secured in most buildings, was reasonably simple of accomplishment.

### Laws Defining Air Supply.

Slight changes have since been made in those laws, and last year in the new building laws of the city of Boston an attempt was made to clearly specify the exact amount of ventilation by requiring 50 cubic feet per head for each occupant and for each gas light. But, through the clerk's or the printer's mistake, a certain ambiguity exists in the law that practically makes it a dead letter—at least in certain known cases the inspector-in-chief has so chosen to consider it. This example of the State of Massachusetts may well

be followed by others that have as yet given no consideration to the subject. Although there was at first some opposition to the law in Massachusetts, its judicious enforcement has brought about good feeling and a readiness to comply with it that has been the best evidence of its success. It is a work that must be done gradually, the people must be educated up to it and the standard raised by degrees, until results may be assured that will fulfill the requirements of the most ardent supporters of the laws demanding "proper ventilation."

#### New Tin Plate Works.

During the past week or two numerous stories have been afloat respecting the establishment of new tin plate enterprises. Some of these are rumors of the vaguest sort, others are well founded reports of contemplated work, and still others relate to actual operations begun. Without trying to determine what has concentrated this activity apparently within so short and so recent a period, there are certain lines of thought suggested by this special activity that are interesting to follow. A satisfactory feature attaching to many of the reports is that they are coupled more or less directly with the names of large iron and steel making concerns. In a few instances the concerns are directly interested in the tin plate works, but in most cases the relationship is an indirect commercial one. The big steel works of the country which formerly depended for the consumption of their product on the demand for steel rails, structural materal and the like are becoming anxious for the future disposition of their enormous tonnage. For this reason they are taking up, or rather encouraging, various side enterprises, and the latest direction to which some of them have turn-d their attention is the manufacture of tin plates. We know an instance of a prominent steel works who are now negotiating with capitalists for the erection of tin plate works in the neighborhood of their plant, guaranteeing them steel at a certain low figure for a term of years. The steel works are among the most prominent in the country and the tin plate concerns that will feed upon them are being pushed by men of enterprise and ample capital.

# The Interest of Steel Makers in the Industry.

A single tin plate is a small piece of steel, but when the total consumption of the country is taken into consideration, the number of tons of metal that it represents is not inconsiderable. Assuming that the domestic consumption of tin plates is a quarter of

a million tons a year, it will be seen that the Bessemer and open hearth steel works can afford to cater to the tin plate mills, provided they will guarantee to use a sufficient quantity of steel. It would be inexpedient for the big steel works to manage their own tin plate mills. To do so they would have to put in sheet mills, and then attend to all the troublesome and delicate work of dipping, not to mention the extra labor involved in disposing of the finished plates. The end that they have in view is the establishment of independent tin plate works in their vicinity, to whom they can supply steel in the form of billets, or in some cases rolling them down to tinplate bars. The tin works have their own rolling mill plant for reducing steel to sheets, and their dipping works for putting them into the marketable form of tin plates. The present condition of the steel trade and the interest shown in the tin plate business by the steel manufacturers is, if not a guarantee, at least a good augury for the continued progress of the American tin plate industry. The price of steel now is almost on a parity with the Euglish market, and if the American manufacturer can get his black sheets even approximately as cheap as the Welshman buys his, there is not the shadow of a doubt but that the American works will prosper.

## Pattern Cutting Class at the Pratt Institute.

The new class in sheet metal pattern entting in connection with the trade school of the Pratt Institute. Brooklyn, was mangurated on Monday, September 21, with 13 scholars. Prof. C. R. Richards of the institute informs us that there is still sufficient room in the class for a few more students, and that he will be willing to receive applications from candidates up to Saturday, October 6. The class starts with every prospect of success. It is under the supervision of Louis Rouillion, one of the staff of the Department of Science and Technology of the Pratt Institute. The course will consist of four threemonthly terms, which will run concurrently with the regular trade school sessions. A fee of \$5 will be charged for each term, all tools and instruments being provided. It is proposed to pursue a thorough system of instruction in pattern cutting and every branch of sheet metal work.

English journals credit Hiram Maxim with the statement that, given the sum of \$250,000, which he estimates to be the cost of constructing a practical air ship, he will undertake to cross the English Channel by its means before August 31, 1895.

# THE LETTER BOX.

# Plumbers' Examination Questions.

From B. S. J., Charleston, S. C.—Will you please publish the questions asked by the Examining Board of Plumbers of New York and other cities.

Note .- If one set of questions were used exclusively little difficulty would be found in providing answers, so that any one could pass the examination. In The Metal Worker, November 25, 1893, there was a letter from a New York plumber who had kept a list of the questions that were given to him, and on December 30, 1893, were the questions asked at one of the London institutes. These questions attracted considerable attention among the younger plumbers at the time, and caused them to study the subject suggested by each one. We will be glad to hear from other plumbers who can give the list of questions that were asked of them.

# Furnace Experiences.

From R. C. L , New York .- Before this winter is through the skill of many a furnaceman will be taxed to overcome some of the troubles that will be brought to him, and I give a few incidents from my own experience that may prove useful. I was called to remodel a furnace job where the walls of the house were elegantly papered and a handsome cornice was at the edge of every ceiling, all of which had been put up before consulting the furnaceman. I found the pipes from the furnace too small and many of the registers only fit for bathroom use. The wall flues, lined with tin, seemed to be of good size, and when I got through I thought I had a good job. When the first cold weather came I was sent for and found that the dining room and the chambers over it on the second and third floors were quite cold. I investigated the flue more thoroughly and found it but 4 x 9 inches in size, and that the lining had rusted so that it had fallen apart and obstructed the flue. I knew such a flue was too small, but cutting the walls was out of the question. With much difficulty I relined the flue up to the dining room register and placed an air chamber 2 x 2 x 2 feet in the cellar at the base of the flue, and connected the flue at the top. I fed the chamber with a 14 inch pipe from the furnace, then made an air chamber at the register on each floor by taking out the register and cutting into the wall until there was an 8 x 18 inch enlargement 2 feet high. I then put a larger register in the main hall and fed it with a larger pipe. I never heard any more complaints from that job and I was well pleased with the results attending the use of air chambers. I have found furnaces that failed to properly supply all of the hot air pipes, even when the latter had a good pitch and the furnace was amply large. The trouble was due

to a lack of air chamber at the top of the furnace. By reducing the pitch of the pipes and raising the top of the furnace so as to provide an ample air chamber above the drums or radiator, I have secured a good flow in all of the pipes. Sometimes I have had to take the furnace down and dig out the cellar to make room for an air chamber at the An air chamber at the bottom is top. just as essential when the air comes from out of doors through a duct. I have found a good sized air duct, say 15 x 30 inches, led into a hole scratched -not dug-under the furnace that would not permit half that amount of air to enter readily; then the cellar is hot and the house is apt to be cool in some rooms. In order to prevent a waste of heat in the cellar I have put the heat pipe inside of another tin pipe which I run clear to the register. riveted tin extensions on the inside pipe to hold it central in the outer pipe. The result is all that could be desired, but the cost and labor of putting up is I find that a good, thick too great. I find that a good, thick fire proof felt costs less and is much easier put on, beside rendering quite as effective service in heat saving.

## Air Bound Pipes.

From O. B., New York.—Can you explain why hot water failed to run from the faucets in the system shown in the diagram herewith? When a pump was put on the supply to the boiler it was found that the pipes were not stopped up, but the water only run for a short time.

Answer .- The diagram of our correspondent has not been reproduced, as it shows a supply tank located only a few inches above the top of the boiler, thus giving but very little pressure. The pipes from the boiler turn down immediately after leaving it and run to and under the floor to the fixture. This arrangement makes an air trap in the piping at the top of the boiler, and the water pressure is not sufficient to overcome it. This trouble is not uncommon and can be removed by running a small pipe from the top of the air trap to the tank and turning the end over it. This will allow both air and steam to escape and avoid further trouble.

# Wiplng Solder for Tin Lined Pipe.

From Plumber, Peekskill, N. Y.—I would like to hear from the readers of The Metal Worker how to mix solder for wiping joints on tin lined lead pipe.

Note.—Any answers to this correspondent's query will be gladly given, but in the meantime the following information may be acceptable. As tin lined lead pipe is largely used for beer pumps and soda fountains a visit to the plumbers in these establishments finds

them using ordinary wiping solder and finer solder up to half and half according to their quickness in wiping a joint. In preparing the pipe for the joint common brown paper is rolled into a cylinder and slipped inside of the pipe to support the tin should it become overheated. The paper dissolves readily and is easily washed out of the pipe. A special solder that melts at a low temperature can be purchased of the Colwell Lead Company, 63 Centre street, New York. Solder composed of two parts of tin, two parts lead and one part bismuth melts at 290°, and one part tin, one part lead and one part bismuth melts at 250°. Half and half solder melts at  $330^{\circ}$ , while tin melts at  $440^{\circ}$ .

# Blanks for Contracts and Orders.

From J. M. H., Pennsylvania.-We have a great many disputes and lots of expense with people who make contracts and then change their minds, thus making their work cost us more to do it. We send our plumbers out and make contracts; then some other plumber comes along and upsets the whole We want to get some kind of a thing. contract book or blank which will enable us to bind our customer to the contract made, and will he glad to receive any help that will get us out of our trouble. We sell a general line of goods, as well as doing plumbing work, and have trouble with things which are or dered of some special kind by our customers, and three times out of six they are wrong.

Note.—In The Metal Worker of April, 1892, some forms of estimating blanks were given that might be useful to this correspondent, and during February and March of this year some suggestions were given for keeping account of stove repairs ordered by customers that may be useful. The subject is of interest to many of our readers, and we hope it will be freely discussed in the Letter Box.

# Sims Patent Gutter.

From W. J., Ridgedale, Tenn—Can you give me the address of Sims, the patentee of the Sims patent gutter, or of some one who has the right to manufacture that gutter?

Note.—If any reader of The Metal Worker can furnish the above address, the favor will be highly appreciated.

The longest distance message ever flashed by means of the heliograph was sent from Mount Uncomphagre, Col., and read at Mount Helena, Mont., lately, the two places being 183 miles apart. The feat was accomplished by Capt. W. A. Glassford, United States

# ROOFING AND CORNICE.

# Non-Condensing Corrugated Steel Roofing,

A new form of steel roofing has been put on the market by the Non-Condensing Corrugated Roofing Company, with office at 143 Liberty street, New York. The special feature of the roof is clearly indicated in the accompanying engraving, which shows a section of the material. It is described as non-condensing, fire proof and rust proof corrugated ateel roofing, and consists of corrugated sheet steel with a fire proof lining, firmly secured to the sheets by a special process, making, it is claimed, a perfect attachment to the metal. When used for roofing or siding it is put on in the same manner as ordinary corrugated iron directly upon the rafters or studding, and forming, it is said, a perfect and reliable protection, preventing sweating and the condensation of moist-

the Illinois Chapter of the American Institute of Architects. This concern have recently added another improved machine to their plant, making the third since they started in business three years ago.

SMITH & LEVERENZ, 9146 Houston avenue, Chicago, have contracts for the slate and cornice work for the residence of John Lorscheider, Ninety-third street and Garvin avenue; store building of Wm. Rundel, Ninety-seventh street and Commercial avenue; flat building of A. Wessberg, 9039 Superior avenue, and flat building of D. Sparrow, 9120 Eric avenue

Incensed by frequent interruptions of work, owing to strikes, and by the domineering spirit exhibited by the walking delegates of the various labor unions connected with the building

Non-Condensing Corrugated Steel Roofing.

ure or vapora of any kind, which have a destructive effect. It is alluded to as specially adapted for covering gas works, railroad stations and shops, power houses, warehouses, chemical works, machine shops, stables, &c. A sample of the roofing shows the lining to be \frac{1}{5} inch in thickness and firmly fastened to the metal.

#### FLASHINGS.

THE JERSEY CITY GALVANIZING COMPANY, 112 John street, New York, are sending out their 1894 catalogue with a discount sheet. In addition to doing all kinds of galvanizing work on wrought and cast iron and sheet metal they handle a large line of galvanized sheet metal goods. A few of their specialties are leader pipe and adjustable elbows, stove pipe and elbows, ventilators, chimney caps, corrugated sheetiron siding, ridging and solder.

THE PLANT of the Youngstown Iron & Steel Roofing Company, Youngstown, Onio, has been completed and the machinery was put in operation last week. The works are located near the plant of the Andrews Brothers Company, which concern will furnish the iron and steel sheets to the new firm. As previously announced, the new concern will manufacture iron and steel roofing of all kinds under patents granted to John O. Pew, general manager.

THE BOSTWICK STEEL LATH COMPANY, Niles, Ohio, have received a medal and diploma from the first annual Chicago Building Trades and National Exhibition, hald under the auspices of

trades, 120 firms engaged in various branches of building in New York City formed themselves last week into a Building Trades League. They have mutually resolved to employ in future such men as they please, whether the men belong to labor unions or not.

The London Statist publishes an authoritative estimate placing the world's coffee crop of 1894 at 12,500,000 bags, the largest in the history of the trade. As the maximum consumption of coffee is 10,500,000 bags the Statist thinks that a crash in the coffee market is in order next apring.

The President has signed an act aulhorizing the construction of a bridge across the Mississippi River from a point within the city of Dubuque, Iowa, known as Eagle Point, to the opposite bank of the river in Grant County Wis.

After the forest fires another element has been devastating some of the Western States. Northern Iowa and portions of Minnesota and Wisconsin were awept on Saturday by a terrific tornado, causing immense destruction of property and lamentable loss of life. Houses, barns, live stock, orchards and crops have been destroyed and great suffering imposed on the people.

Statistics prepared by the Comptroller of the Currency show that the national bank circulation of this country is now nearly \$4,000,000 greater than it was a year ago.

Weight and Horse-Power of Rain.

The following interesting calculations were presented before the Eugineers' Club of Philadelphia

One inch of rain falling upon an area of 1 square mile is equivalent to 2 323,-200 cubic feet, or nearly 17,500,000 gallons, and this quantity of water will weigh 145,200,000 pounds, or 72,600 short tons. If 1 inch of rain fell over the entire area of the city of Philadelphia, 129 square miles, the quantity of water which would be precipitated would be represented by 1,250,000,000 gallons, or 18,730,000,000 pounds, or 9,365,000 short tons. Therefore the quantity of water represented by 1 inch of rainfall distributed over 24 hours falling upon the area of Philadelphia would be nearly ten times the maximum pumping capacity of all our water works engines for a day, and is more than twice the total capacity of all the reservoirs now connected with the city water supply. Professor Loomis gives the hight of clouds as about 2 miles, and as the aqueous vapor always present in the atmosphere is suspended for a considerable time and carried for great distances by winds, it is highly probable that the great majority of the water which falls as rain has been elevated by the sun to a hight approximating 10,000 feet.

While it would be fair to assume this figure in calculations, there may be objection to it on the ground that the clouds from which much of our rain is precipitated are not more than ; mile above the earth, and, therefore, a hight of but 3000 feet will be estimated for, but those who desire to assume the greater elevation can readily calculate what the figures would be for 10,000 feet. As shown above, the weight of 1 inch of rain upon 1 square mile is 145,200 000 pounds, multiplying this by 3000 feet for the hight, and dividing by 60 on the assumption that this inch of rain fell in one hour, we have as a result 7,260,000,000 foot-pounds, representing the amount of work done by the sun per minute if the water was raised as rapidly as it fell. This is equivalent to 220,000 horse-power. If pumping machinery worked at the low economy of 2 pounds of coal per borsepower per hour, or if the pumps gave a duty of 100,000,000 foot pounds, 200 gross tons of coal would be required to raise to a hight of 3000 feet the water represented by 1 inch of rain on a square mile; now, multiplying this by 129 to represent the area of Philadelphia, we have 28,380,000 horse power and a coal consumption of 25,800 long tons.

According to a German scientific journal, a material called "flexible glass" is made by dissolving four to eight parts of gun cotton in one part of ether or alcohol, and adding to the solution two to four parts of a non-resinous oil, and four to ten parts of Canada balsam. The mixture is apread on a plate of glass and dried in a current of air at a temperature of 50°. The residuum is a hard, flexible, transparent mass, resisting alike acids, alkalies and salts.

# THE TIN SHOP.

Flange for a Smokestack.

From M. M., Newark, Ohio.—I would like to have published in The Metal Worker a method for describing the pattern of a flange to fit around a smokestack that comes through the ridge of a gable roof. The flange is to be the same distance from the stack at the bottom where it joins the roof as at the sides where it joins the ridge.

Answer.—In Fig. 1, let A B C D E represent the elevation of flange, and a b m k the elevation, and a b the pro

ELEVATION n

Flange for a Smokestack,—Fig. 1.—Plan and Elevation.

file of stack. E D C is the angle of roof. In the plan, K L M N represents the stack or opening in flange, and F G H J the outer line of flange, or where it joins the roof. The gable of roof is represented in elevation at D, and in plan by J G. The method to be followed in obtaining the pattern in the

present instance is that usually employed in such cases, that of triangulation. Referring to the plan it will be seen that the pattern for N M H J will answer for the three similar parts. Aceordingly we will obtain the pattern for this part, which can be used for marking cil the others if desired. If it was desired to make the article in two pieces, it is probable it would be con venient to have the scams or joints at J N and L G of plan. If the pattern was to be in one piece the joint could be located where desired, as at L G or M H. To obtain the location of sections in plan, which when constructed will give the width of the pattern be-

divisions in M N of plan, which represents one fourth of the circumference. For the purpose of avoiding a confusion of lines, the manner of obtaining the shape is shown in Fig. 2. In this figure A' B' C' D' E' is a duplicate of €levation shown in Fig. 1, as H J F is a duplicate of H J F. Divide H J' of Fig. 2 into the same number of parts as was H J of Fig. 1, and, with the Tsquare placed at right angles to F H', carry lines from the points in H J, cutting D' C', as shown. From the points in D' C' erect perpendiculars, as shown by 22, 33, &c. On the perpendiculars drawn from D' C', measuring from D' C', set off the length of correspond-

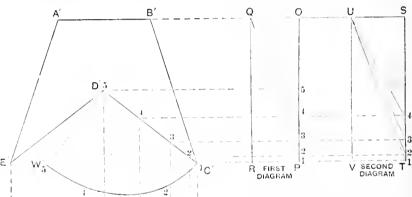

Fig. 2 — Method of Constructing Diagrams of Triangles.

tween the points indicated, proceed as follows:

Divide II J of plan into any convenient number of equal parts, as shown by the small figures. Also divide N M into the same number of parts as was J II. Draw solid lines connecting similar points, as 22', 33' and 44'. In a similar manner connect by means of dotted lines the points in II J with those of the next highest number in M N, as 1 with 2', 2 with 3', 3 with 4', &c.

The next step to be taken is to construct a section of the article as it would appear when cut by the line of the roof. This section is to be used for obtaining the stretchout of the pattern along the edge meeting the roof. The atretchout of top of article, as shown by A B of elevation, can be obtained from the

ing lines in X' H' J'. Thus make line D' W' (5 5) equal to X' J', &c. A line traced through the points thus obtained, as shown by W' C', will give the shape of J' H' when cut by the roof angle D' C'. The divisions in W' C' correspond with similar divisions in J H, Fig. 1.

The next step will be to construct sections corresponding to the lines drawn in N M H J of plan, and thus obtain the width of the pattern between the points indicated. Extend A' B' of Fig. 2, as shown by A'S, and from point C' draw C' T parallel with A S. At any convenient place erect the perpendicular O P, cutting A' S and C' T as shown. From P on the base line set off the distance P R, equal to the space M II of plan, or, in other words, the distance between the stack and lower edge of the flange. From R erect the perpendicular R Q, and connect P and Q. If the triangle R Q P was placed with ita base on M H of plan, the hypotenuse P Q would give the distance from point H in plan to point M, as if measured on the finished article.

To construct the remaining triangles, draw lines from the points in D'C'

parallel with C' T, cutting O P. Connect the points in O P with Q, thus forming the sections corresponding with the solid lines in plan. For the second diagram of triangles, erect the perpendicular T S, and from T set off the distance T V, equal to the length of any of the dotted lines in plan. From V erect the perpendicular V U. Continue the lines from P to 4 until they intersect T S. From the points thus obtained in T 8 draw lines to U. The second set of triangles thus obtained, and shown by dotted lines, correspond to sections through the article on dotted lines in plan. The divisions now obtained are all that is necessary for describing the pattern. The stretchout of the upper edge of pattern, or that coming against the stack, can be obtained from M N of plan. The stretchout of the lower edge of

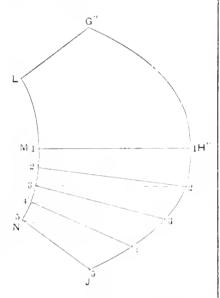

Fig. 3.-One-Half of Pattern Shape,

the pattern, or that which comes against the roof, is obtained from C W in Fig. 2, while the distances across the pattern, as indicated by the solid and dotted lines, are obtained from the first and second diagrams.

To develop the part of pattern shown by M" H" J N" in Fig. 3 proceed as follows: At any convenient place draw the line M" H". Establish the point H" and with the dividers set off the distance P Q of first diagram of triangles, or, what is the same, making it in length equal to C' B' of the section. From M' as center, and with radius M 2' of the inner circle of plan, which represents the top of article, describe a small src. From H" as center and with T U of the second diagram of triangles as radius, being equal to the distance indicated on plan from H to point 2', strike another small arc intersecting the one just struck, thus locating point 2' of the pattern. With point 2' of the pattern as center and Q 2 of the first diagram of triangles as radius strike a small are, which intersect with one struck from point H" of the pattern as center and the distance 1 2 in C' W' of Fig. 2 as radius, thus establishing point 2 in the

lower edge of the pattern. With point 2 of the pattern as center and 2 3 in M N of plan as radius strike a small are, which intersect with one struck from point 2 of pattern as center and U 2 of second diagram of triangles as radius, thus establishing point 3 of pattern. With point 3 of pattern is center and Q 3 of first diagram of triangles as radius strike a small are, which intersect with one struck from point 2 of pattern as center and distance 23 io C' W' of Fig. 2 as radius, thus establishing point 3 of pattern. Proceed in this manuer, using in the order described the stretchout of the top edge of pattern, as shown in M N of plan, the hypotenuses of triangles corresponding to the dotted lines in plan, the stretchout of the elliptical section, as shown by W D C', and the hypotenuses of the triangles shown in the first diagram. Lines traced through the points thus obtained, as shown by M H J N, will be the quarter pattern. The corresponding pattern, as shown by M' L" G" H", can be obtained in a similar manner or by duplication. Then N" M" L G'H" J" is the pattern for part of article shown on plan by N M LG H J. If the article was to be made in two pieces, using the pattern shown in Fig. 3, the joints would be at J N and L G of plan. As the net pattern only is shown, the necessary edges are to be allowed.

# Trades School at Elmira Reformatory.

The eighteenth year book of the New York State Reformatory, Elmira, N. Y., containing the annual report of the Board of Mauagers for the year ended September 30, 1893, which has just been issued, is a handsomely gotten up volume of nearly 200 pages, enriched by excellent i lustrations, diagrams and tables, giving complete information in regard to this reformative institution. It is remarkable in that its typography, illustration and binding are solely the product of prisoners' labor, and each is of the very best character.

Among much matter of great interest, perhaps the most interesting portion of the report is that relating to the trades school system in operation there, to which brief reference has previously been made in these columns, and which, according to the Board of Managers, is "well organized and excellently administered." The achool is under the direction of E. E. Clark as principal, to whom we are indebted for the copy of the report. It embraces 34 trades, and during the year 1804 pupils received instruction in the various classes. Of these, 452 were paroled, and 355, or 78 per cent., went directly into employment in the trade taught them there, instead of recruiting the ranks of the "lapsed masses" of unproductive or vicious humanity.

#### The Plumbing Class.

Among the most prominent of the trades taught are plumbing, steam fitting and tinsmithing, each of which has a large following among the inmates of the reformatory. Plumbing is taught in all its branches. The benches are fitted out with improved pipe holders—a local innovation—for holding pipes

and joints in all positions, thus doing away with bricks. The following account of the class is extracted from the Summery, the institutional organ: "Among the many trades taught at the reformatory, that of plumbing can be placed in the first rank, as much on account of the facilities it offers for providing remunerative employment to Inmates in free life, as by reason of the special opportunities the institution affords for intelligent and advanced practical efforts in this line. At the inception of the class, about four years ago, it numbered 30 pupils, the attendance increasing gradually with the capacities of the reformatory, until now 60 inmates are receiving regular instruction in it. The majority of men graduate from the plumbing department as advanced apprentices, commanding, at the time of their release on parole, wages not smaller than \$1.50 per day. The others-generally those who have had occasion to exercise their talents on the suffering steam pipes or other vital organs of the reformatory, or in the eatablishment of new fixtures for the use of its population-manage to secure better paying positions, as journeymen, at a salary of \$2.50 and \$3 per day. The regular course of instruction, which originally included 1008 hours of work, actually covered in 304 hours, divided according to 20 distinct lessons: these are in their order: calking and cutting cast iron pipe fittings, making seams of sheet lead, overcast joints, cup joints, making traps, wiping horizontal and upright round joints, and branch joints (four lessons), wiping on stop cocks, wiping flange joints on floor and safes, wiping waste in copper lined bathtubs, wiping flange on 2-inch pipe, witing ferrule from 1 inch to 2 inches, wiping joints in corners, under floors or between joiets at different angles, making bends with and without sand, wiping tanks or cisterns, making safes for fixtures, putting overflow in safe waste, setting water closet, wash basin, sink, urinals. The value of the instruction afforded in this class, apart from the institutional work performed by its members, may be surmised from the fact that 23 of its graduates secured employment as journeymen or assistant plumbers during the past year. "

#### Steam Fitting Class.

An adjunct of the plumbing class is one in steam fitting, which is under the direction of the plumbing instructor. Graduates from one frequently pass into the other in order to perfect themselves in both branches, the institution naturally sflording a large field for practical labor in either. Three hundred hours of instruction are supposed to complete the course, prior to graduation, after which pupils not paroled are either transferred to another class or assigned to repairs within the building. outline in the steam fitting class calls for 19 lessons: Learning names and use of tools, sizes of pipes, dlilerent fittings and styles of valves; cutting right and left nipples by hand; cutting nipples from 1 inch to 8 inches by machine; cutting crooked and running threads: cutting pipe to measurements; packing valves; running joints; making gaskets for flange unions, water unions, steam traps and pumps; binding offsets in pipe; making offsets in pipe with 45° ells; cutting openings in different s zed pipes and tapping for connections; making connections, using right and left couplings, ells and nipples; making connections with flange and water unions; running threads with lock nuts; connecting radiators with union valves

and unlon ells; connecting radiators with right and left nipples; making box coils; making wall coils with headers; making wall coils with return bends; fitting up and trimming a boiler; connecting radiators to boiler by the two pipe system; connecting radiators to boiler by the one-pipe system.

#### Tinsmithing Class.

In the tinsmithing class the pupil acquires a knowledge of tin and sheet iron work. He is at first instructed in the use of bench shears and hand shears; then come lessons in grooving, wiring, folding, burring and turning machines and soldering bottoms and seams of tinware. At this moment he is prepared to make such srticles as straight cups, flaring pans, coffee pots. Later on, after other miseellaneous work, the pupils are called upon to describe patterns for flaring articles, elbows of different shapes, T-joints at different angles, &c. They are then prepared for general job work and the manufacture of ware from diagram and Very little measurements received. machinery is used in the tinsmithing class; it is supposed to be more profitable to the followers of it to construct their own work as much as possible without mechanical aid.

#### General System of Instruction.

A similar system of instruction is used in the 30 odd other trades taught, which range from stone cutting to stenography and from carpentry to cooking. Every class is provided with a register made up of bound printed sheets, on which are recorded each pupil's work, the general form of record varying for each class. In the register is also kept the number of hours spent on the various labor divisions, dates of examinations and markings corresponding, &c. so that his standing and progress may be computed at any moment. As the pupils advance they are assigned to work of a more responsible nature and in most of the classes perform labor of actual value to the State. Every class has at least one foreman or chief instructor, a citizen employee. He in turn selects from among the graduates of his class a certain number of men who act as assistant instructors, to coach along the entire department. Examinaalong the entire department. tions are held at the expiration of the time mentioned for each special division of the work assigned to the pupils, and upon the successful issue of these examinations depends the division of work for the succeeding days. Classes are held every week day, in the morning and afternoon, and in two or three evenings of the week as well. Each pupil is taught drawing so far as it is requisite for the trade he is studying. In fine, the trade instruction offered is of the very best quality obtainable, and is calculated to impart a thorough knowledge both of the practical and theoetical aspects of the trades taught.

Weeding railway tracks by electricity has been tried on the Illinois Central Railroad after lime, steam, fire and gasoline burners had been tried with little success. The apparatus, devised by J. Wallace, Chief Engineer, and A. A. Sharp, Division Superintendent at Memphis, Tenn., consisted of an ordinary flat car, to which was attached a sort of circular brush suspended at right angles to the track and of authicient length to extend over the ends of the ties. It was studded thickly with fine copper wire, which came into contact with the weeds and grass on the track

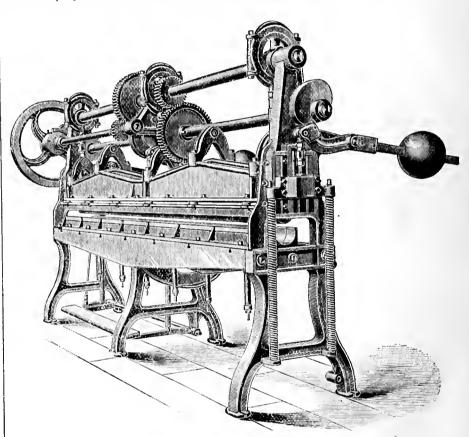

as the car passed over the road, the brush being so constructed that it could be raised or lowered at will. This brush was attached to an electric generator by fine wire, through which a strong current of electricity passed to the brush, and from it to the weeds through which it was driven. Its touch killed the weeds, root and branch. The machine, after thorough trial, is said to have been pronounced a success. Attached to the ear is a box car carrying a stationary engine and dynamo.

# The Niagara Gutter Former and Bender

The gutter former and beader just introduced by the Niagara Stamping & Tool Company of Buffalo, N. Y., is

die acts, and while it remains at the lowest point the outside slides come down again to complete the bead or beads

The time required to form and bead a 10-foot length of gutter with one or two beads is about two seconds. The formed gutter is loosened from the lower dle by spring attachments and it can be removed without difficulty from either end. The work produced is perfectly straight and the beads are round and uniform the entire length. There is no tongue or hook in the bead, which is unavoidable when using a grooved rod for the work. This is a convenient feature for the slip joints, and it results in a considerable saving of stock, since the hook on a 10-foot length of gutter requires 30 square inches of metal for double bead. A bead can be made with

THE NIAGARA GUTTER FORMER AND BEADER.

designed for both forming and beading the gutter at one operation. The machine is built with sufficient stiffness to prevent apringing. It has a central frame supporting the bed and giving additional bearings for the shafts. The motion is controlled by a positive clutch mechanism, and the dies required for the work are attached to three aides, the two outside ones being connected. The machine is back geared one to three. The shaft with fly wheel and clutch makes six revolutions, while the shaft with eccentries to operate the outside slides makes two, and the shaft for the inside slide, which is operated by cams and carries the forming die, completes but one revolution.

ing die, completes but one revolution.

The sheet, previously cut to the correct width, is put in its place lengthwise. A depression of the foot treadle engages the clutch and throws the machine in motion. First the two outside slides descend simultaneously to break the edge of the sheet, or both edges if an eave trough with double bead is being made, then the forming

this machine as small as ‡ inch dismeter and up to 1 inch diameter. Provision is made to take the spring out of the material sufficiently to produce a trough of the standard width. The machine is constructed for 6-inch gutter and the smaller sizes. The working parts are so arranged that the exchange from one size to another can be performed rapidly and without trouble. In addition to a half round eave trough the machine can be provided with dies for so-called architectural gutter of various designs, with bead along the edge. Material as heavy as No. 24 gauge can be worked, or on an extra heavy machine even as heavy as No. 20 gauge. The dies are arranged to accommodate a gutter with a slip joint at either end, right or left.

Competition among the gas companies in Brooklyn has resulted in a gradual fall of the price of gas from \$1.25 to 80 cents per 1000 cubic feet within the past six months.

# HEATING PLUMBING.

## **NEW WORK AND CONTRACTS.**

A. M. Fierson, Cromwell, Conn., who does a large florist business is building two new greenhouses, one will be heated by steam, the other by hot water, with Faultless Furman boilers, in order that a comparison of results can be made.

CHAS. LUKER will use a Heckler ateam boiler in heating the Kellogg School, at Canton, Ill., having secured the contract at \$1190.

FOSTER & GLIDDEN, 53 Dearborn street, Chicago, are to install a Farquhar hot water heating plant in the residence of Jamea W. Janney, 4729 Greenwood avenue.

THE CONTRACT for furnishing the steam heating apparatus for Christ Church, Hyde Park, Mass., has been awarded to E. C. Tourtelotte.

SECRETARY MCNABB of the Paterson, N. J., Master Plumbers' Association is doing a lot of heating work this fall and is installing one of the J. H. McClain Company Cambridge steam heaters in a residence on Ninety-third street, New York.

COOK & CHICK, 253-255 Kinzie atreet, Chicago, are to install ateam heating planta in the flat building of George W. Wright, 1885 Washington boulevard, and flat building of Herman Kranze, Oakdale and Evanston avenues.

WM. McCann is heating a greenhouse for Lovett & Co., Little Silver, N. J., using a Faultless Furman boiler.

McGuinness, Smith & Co. have the contract at \$23,970 for heating and ventilating the new Fifth Avenue School Building at Pittaburgh, Pa.

F. A. HULL & Co., Danbury, Conn., have the contract to do the plumbing and roofing for a \$10,000 addition to the plant of Gilbert & Bennett, at Georgetown.

GAY & CULLOTON, 40 North Clark street, Chiosgo, have contracts for the plumbing, gas fitting and sewerage in the store and flat building of M. A. Devine, Ravenswood; residence of Nicholas Cook, 1321 Oakdale avenue; ten flata of Samuel Gessler, 279-280 La Salle avenue, and 40 flats of F. C. Neagle & Bro., 186-188 Polk street.

A. B. Noyes & Co. have the contract for putting the steam heating apparatus in the new Citizens' Bank Building, and Farnham & Albee that for the plumbing. This is said to be the largest contract of the kind ever undertaken in St. Johnsbury, Vt.

WESCOTT & DAVIS, Portland, Maine, are putting the heating apparatus in Will Allen's new house on West street, using the Hub hot water heater, for which they are sole agents for Portland and vicinity. This firm have several other contracts in which they will use the Hub.

B. D. Duggan, 207-209 Lake atreet, Chicago, is to place Richmond hot water heaters in the residences of Voclab Kolock, 944 St. Louis avenue; Max Schweizer, Central Park avenue, and Dr. Arthur MacMeal, Berwyn, Ill.

GEORGE B. LEWIS is putting steam heating apparatus into the residence of Albert J. Bacon, at Hyannis, Mass.

FARNHAM & ALBEE, St. Johnsbury, Vt., have the contract for putting in

the steam heating in Sheriff Sulloway's house and H. A. Belknap's house, and heating and plumbing W. L. Russch's new house.

E. H. BARRY has been awarded the contract for the plumbing and piping for gas in the new Park Avenue School House, Providence, R. I.

THE BRIDGEPORT STEAM HEATING COMPANY, Bridgeport, Conn., have secured the contract for placing a Gurney heating apparatus in the residence of Robert A. Strickland, Stratford, Conn.

E. BAGGOT, 169-171 Adams street, Chicago, has contracts for plumbing, gas fitting and sewerage in the flat buildings of A. Mackay, 560 North State street; J. W. Janney, 4729 Greenwood avenue, and Charles Robinson, 4406 Oakenwald avenue.

Thomas W. Weathered's Sons, 244 Canal street, New York, are erecting a large conservatory for the Tampa Bay Hotel, Tampa Bay, Fla. They are completing and doing the heating work in a large greenhouse for John R. Hegeman, president Metropolitan Life Insurance Company, at Oriental Point, Conn. One of their No. 4 boilers is being used to heat the new greenhouse of the Convent of the Sacred Heart on Commonwealth avenue, New York.

THE FORKETT & BISHOP COMPANY, New Haven. Conn., have the contract for putting in a Bolton heater in C. E. Thompson's house, West Haven.

THE CONTRACT for heating, ventilating and plumbing the police station, at Rochester, N Y., has been awarded to Thomas W. Ford, whose bid was \$8450.

W. E. CORNELL, Lakeville, Conn., has the contract for plumbing, gas piping and tinning the house which John Sheppard, Jr., is building near Sage's Ravine.

Chas. N. Ruggles is building a new house at a cost of \$5000, at Bridgeport, Conn., for which the plumbing and heating contracts have not been let.

REV. FATHER HALM. paster of St. John's Catholic Church, Frederick, Md., is having a large heating apparatus placed in the church by the firm of Fuller & Warren Company of Troy, N. Y. The furnace weighs 6350 pounds.

THE BAKER & SMITH CCMPANY, 193-7 Van Buren street, Chicago, have contracts for steam heating in the residence of John A. Ayers, Jacksonville, Ill., and the Wilder Building, Louisville, Ky.

J. J. Wilson, heating engineer, of the Fuller & Warren Company, Troy, N. Y., has just closed the contract to heat 8t. John's Catholic Church, Frederick, Md. This church contains 284,000 cubic feet of space and two No. 350 F. & W. water combination, with 35-inch fire pots, will be used to do the heating. The system has been arranged by Mr. Wilson, and H. J. Wilson & Son will erect the work.

A RESIDENCE is being built at a cost of \$20,000, at Tarpville, Conn., for Mrs. J. C. Mitchelson that will be heated by furnace, piped for gas and have a modern system of plumbing.

Among the large orders taken this week by the American Radiator Company was that for the radiation to be placed in the Morgan Memorial Bullding, at Buffalo, N. Y.

Nasu & Hama, 2216 Wabash avenue, Chicago, are to overhaul the plumbing in the store and flat building of W. H. Wilson, Twenty-fourth street and Indiana avenue.

W. H. BUCKLEY, Burlington, Vt., has the contract for the plumbing and A. B. Franklin of Bosten has the contract for the heating at Fort Ethan Allen, Burlington, Vt. The Luildings are: One administration building, one double set of officers' quarters, one hospital steward's quarters and one powder magazine.

The Smith & Anthony Company, 217 Lake street, Chicago, have lately received orders for Hub heating furnaces from Ravenswood, Winnetka and Tyler, 111.

SEALED PROPOSALS will be received at the effice of the Supervising Architect, Washington, D. C., until October 21, for removing the old steam heating apparatus and furnishing a new low pressure return circulation ateam heating and ventilating apparatus for the United States Custom House and Post Office Building, New Haven, Conn. Drawings and specifications may be had from the Custodian of the Custom House and Post Office Building at New Haven or from the Supervising Architect, Washington.

THE S. WILKS MEG. COMPANY, 113-123 Clinten atreet, Chicago, report the following sales of Wilka hot water heaters: A large heater for new head-quarters at United States Military Academy, West Point, N. Y.; two large heaters for new residence of J. S. Jones, Granville, Ohio, and one heater for residence of Dr. Charles Zaremba, Riverside, Ill.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until October 30 for the laundry machinery for the United States Marine Hospital extension at San Francisco, Cal. Drawings and specifications may be had from the Custodian at the United States Marine Hospital, San Francisco, or from the Supervising Architect, Washington.

W. H. SIMPSON, Olean, N. Y., makes a specialty of steam and hot water heating as well as fixtures and plumbers goods generally, and his present contracts include the County Building, at Little Valley, the new Olean House and several other large structures.

The Davis Johnson Company, 45 Jackson street, Chicago, report the following sales of New Idea heating furnaces: T. H. Loybed, Faribault, Minn.; Pariot & Smith, Owatonna, Minn.; Hyde Handware Co., Northfield, Minn.; A. D. Palmer, St. Paul, Minn.; Ashworth & Seubert, Minneapolis, Minn.; H. Gaylor, Kanssa City, Kan.

J. M. Mason, Limerick, Maine, is to have his house heated by steam, the contract having been awarded to Geo. A. Carpenter.

THE CONTRACT for the steam heating and ventilating plant at the capitol addition at Bismarck, N. D, has been formally let by the capitol commissioners to S. I. Pope of Chicago for \$3335.

THE BOARD OF EDUCATION Of West Chester, Pa., are considering a system of heating and ventilation for the High School Building.

THE PLUMBING AND STEAM HEATING in the Beta Theta Pi Fraternity House, now under course of construction at State College, Pa., has just been awarded to H J. Schad & Bro. of Bellefonte, Pa.

# STEAM AND HOT WATER.

The F. & W. Co. Hot Water Heater.

We show in the accompanying illustrations a general view of the F. & W. hot water heater, manufactured by the Fuller & Warren Company, Troy, N. Y., while in Figs. 2 and 3 are shown broken views of the water sec The heater is made in the same general form as the boiler heretofore manufactured by the company, but in the new style they are made for a single large flow and return pipe, as shown in Fig. 1. From this large pipe the water can be distributed by means of manifolds to four or six pipes, and for very large buildings two heaters can be used as twins and eight or more pipes can be taken off. Figs. 2 and 3, which show a single arm and a double arm section, were designed to show the flow of water, a free circulation being one of the special claims made for this apparatus. The boiler is entirely of east iron, and special claims are made for the large amount of water heating surface. It is also said to be self eleaning. aections above the fire pot are connected with nipple joints, the hub being planed and fitted, making, it is aaid, leakage by expansion or con-traction impossible. The heaters are tested under hydraulic pressure of 80 pounds to the square inch before leaving the works. Another feature to which the manufacturers direct attention is the grate which the firm have used for a number of years past in their leading stoves, ranges and furnaces. The grate is mounted on anti-friction rollers, and by means of a lever shaker can be very easily operated. The shak. ing causes the clinkers to collect in the center, when by drawing out the slid-ing center they fall into the ash pit, which is made very capacious. The grate is suspended below the fire pot, affording ample space for the insertion of a poker or slicing bar through the "non-clinker" door. The grate is made very heavy, but in ease of any accident the ash pit front can be easily removed and the entire grate replaced without These heaters are made in trouble. three sizes, with fire pots measuring 20, 24 and 28 inches in diameter, adapted to supply from 450 to 900 square feet of direct radiation. These are the sin-The boilers of gle section boilers. double section are made with the same diameter of fire pot, and are adapted to supply from 600 to 1200 square feet of direct radiation.

# HEATING NOTES.

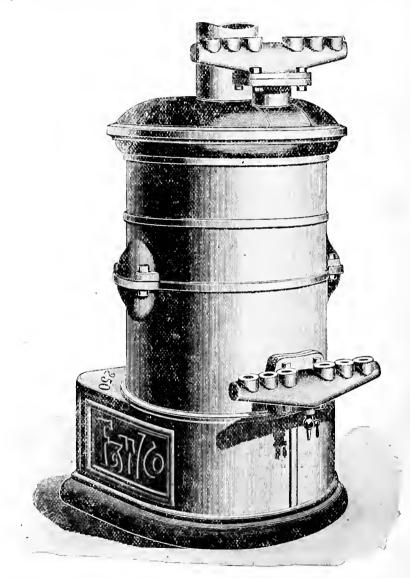

THE UNITED STATES HEATER COM-PANY, Detroit, Mich., send out a serviceable catalogue of the Capito', Heela and Mascot hot water and steam heaters of their manufacture. The pamphlet, of convenient size, is bound in paper, contains illustrations, general and broken, of the various heating apparatus, followed by several pages devoted to radiator valves and fittings, price-list of the same, tables of wrought iron pipe, price-list of radiators and directions for setting bollers.

J. H. Colman, Jr., has been in charge of the New York house of the J. H. McClain Company of Canton, Ohio, during the tour of Manager D R McCallum among the steam and hot water trade. The popularity of the Humber and Cambridge boiler, they claim, keeps the factory running overtime.

C. F. Hauss, one of the engineering corps of the Richmond Stove Company,

making a flexible covering with ample air spaces To insure durability a canvas or cardboard protection is provided.

The John Stimons Company, 110 Centre street, New York, have arranged for the sole agency of the American pipe hanger, and are showing a line of the Wolff gas radiators in addition to their line of steam fitters' and plumbers' supplies. They are furnishing Exeter

The F. & W. Co. Hot Water Heater. - Fig. 1. - General View of Heater.

has taken up headquarters at 75 Centre street, New York, and will look after the interests of their steam and hot water trade from that stand in future. J. W. Fryer, well known to the trade East and West, is now at Norwich, Conn., occupying Mr. Hauss's vacant chair.

THE NEW YORK ASHESTOS MFG. COMPANY, 11 Chambers street, New York, are putting on the market a new non-conducting material for covering boilers and steam pipes. It consists of several sheets of asbestos formed in "box plaits" and cemented together,

radiators and the valves and piping for some large heating contracts.

W. A RUSSELL, 89 Centre street, New York, has just returned from a satisfactory trip to Boston in the interest of the Niagara radiators and the Detroit quick opening ateam and hot water radiator valves, for which he is Eastern sales agent.

D. R McCallum, manager of the New York house of the J. H. McClain Company, Canton, Ohio, is enthusiastic over the reception of the Cambridge steam and Humber hot water boiler by the trade. He recently closed a contract for a carload of assorted boilers with a dealer of long experience. The Cambridge steam boilers, he is advised, have been selected for heating the schools at Santa Cruz, Cal., the committee having spent several months in investigation before making a selection.

which he can ship promptly a large order for either steam or hot water valves of angle or corner style, with coupling or male or female thread. He is also the New York representative of the Niagara Radiator Company, Buffalo, N. Y., and has recently filled

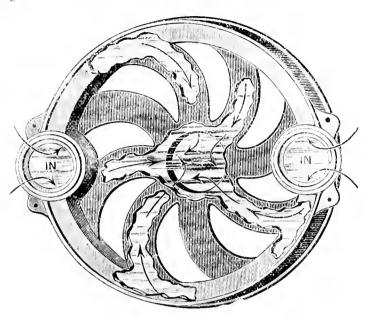

Fig. 2.—Broken View of Single Arm Section.

R. D. Jackson, Jr., manufacturers' agent and dealer in steam specialties, is located in convenient quarters right among the trade, at 89 Centre street, New York. He makes a specialty of the Electric boilers and the goods of the Van Auken Steam Specialty Company.

THE NEW YORK HOUSE, at 69 Centre street, of the Holland Radiator & Mfg. Company, Chicago, recently furnished 5800 feet of radiation to Mulhern &

orders with some of the largest fitters in his territory. A Niagara hot water radiator handsomely decorated is one of the ornaments of his office. Having served as a heating engineer with some of the largest boiler manufacturers, he is well qualified to give assistance to the buyers of his goods.

WE ARE INDEBTED to J. Hollis Wells, 32 Nassau street, New York, for a report in pamphlet form of a test on extended flue radiation vs. plain sur-

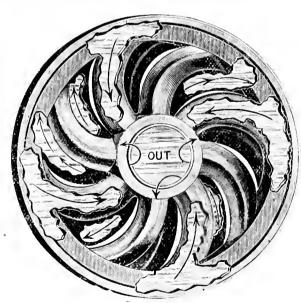

Fig. 3.-Broken View of Double Arm Section.

Piatti of Forty-second street, New York, for one of their heating contracts.

W. A. RUSSELL, 89 Centre street, New York, sales agent for the Detroit Quick Opening steam and hot water valves, made by the Detroit Lubricator Company, Detroit, is sending out a neat little catalogue of the goods. He has prepared a well arranged stock room and carries an assortment from

face radiation, made by Professors Denton and Jacobus at Stevens Institute of Technology, Hoboken, N. J.

In his message to the Mexican Congress on its reassembling on Sunday, President Diaz states that the Mexican Government has sold since April last nearly 1,000,000 acres of land to private individuals. During the last six months,

he says, 111 km. of new railroads have been built, making a total of 11, 100 km., and the construction of the important Interoceanie Railroad to Tehauntepec has been completed. The President looks for a greatly improved financial condition in Mexico this year.

August's fire loss of the United States and Canada, as computed by the Journal of Commerce, aggregates \$10,432,-800, which is a decrease of nearly \$3,000,000 from the figures of the corresponding month of 1893. So far the total fire loss for this year compares very favorably with that of the first eight months of last year, and exceeds by only a small margin that of the same period in 1892. The following comparative table of losses by months demonstrates the gratifying improvement that has taken place:

1892.	1893.	1894.
January \$12,564,9(0)	\$17,958,400	\$10,568,400
February., 11,914,000	9,919,900	11,297,600
March 10,648,000	16,662,350	9,147,100
April 11,559,800	14,669,900	11,540,000
May 9,485,000	10,427,100	10,777,800
June 9,265,550	16,344,950	8,232,300
July 11,530,000	12,118,700	16,307,000
August, 10,145,300	13,222,700	10,432,800
Totals \$87,112,550	\$111,324,000	\$87,453,000

There were 204 fires in August of a greater destructiveness than \$10,000 each, but none reached as great a loss as \$500,000. Of losses estimated at over \$100,000 nearly all were in the Western States, no very heavy Eastern losses being recorded.

The statistics of the New York Custom House, just issued, show that the amount of merchandise entered and not withdrawn from the bonded warehouses at this port, in the month of August, increased \$584,699 over the same period of 1893. The figures exhibit, however, a decrease of \$1,208,-472 over July of this year. As goods were received in unusual quantity in the warehouses during August, just before the new tariff law came into force, the decrease is attributable entirely to the extraordinary rush to withdraw merchandise during the last four days of the month, the new law having become operative on August 28. Had it not been for this circumstance August's figures would have shown a large increase over those of July. At the rate at which bonded goods have been with-drawn in the first half of this month it is estimated that the decrease in the sestimated that the decrease in the value of goods in the warehouses in September, as compared with August, will be quite \$7,000,000.

According to estimates given out by Mint Director Preston, at Washington, D. C., the total of gold coined in the United States during the fiscal year ended June 30 last was the greatest on record with the exception of 1881. Mr. Preston places the gold coinage of the year at \$99,474,912.50, made up of \$55,143,640 in double eagles, \$34,968,840 in eagles, \$9.287,180 in half eagles and \$75,252.50 in quarter eagles. Of this amount \$76,219,911.50 were coined in the Philadelphia mint, and \$21,637,000 in San Francisco. The mintage at New Orleans was comparatively insignificant. The increase in gold coinage has been due to the necessity of reducing the large supply of bullion in the treasury vaults into coin, to meet the drain on the Treasury caused by the panie.

The Lehigh Valley Railroad did the heaviest business in its history during the month of August.

# TIN PLATES.

The British Press on American Tin Plates.

The tone of the English papers in their recent remarks on the new American tariff is not calculated to inspire high hopes in the breasts of the Welsh tin plate manufacturers as to their prospects of regaining their pristine hold on the United States market. The London Ironmonger boldly tells the Welshmen that the American industry has come to stay and that it has been established on such a basis as will "cause the loss at no distant date of the American market to the manufacturers of plates in South Wales." Under the circumstances, the Ironmonger thinks it would be worse than foolish to flatter the Welsh tin plate makers with the idea that they can hope to retain their former monop oly of this great market. They can still send their product to the United States and will continue to do so for some time to come, but what was once their monopoly is, says the Ironmonger, hopelessly lost, unless the whole methods of the trade in Wales are thoroughly revolutionized and readjusted so as to meet modern conditions. Other papers advise reaching out in other directions, as Africa, Australia, &c., and there opening up markets for the goods heretofore sent to the United States. The London Economist advises the South Wales mak. ers to adopt the policy of "keeping prices moderate so as to check the new industry which has sprung up in Amer-But, at the same time, the journal seems to think that there is no valid reason why tin plates should not be made in America under the existing conditions so as to yield a reasonable, if not large profit to the American mak-Similar opinions have recently been expressed by such eminent trade authorities as the Western Mail of Cardiff, the Birmingham Post and the Liverpool Daily Post. Altogether, the Welsh tin plate manufacturers are finding many "candid frienda" in these days in the British press.

#### SCRAP.

THE TIN PLATE WORKERS of the Foxhole Tin Plate Company, Llansham-let, Wales, who have heen idle for two years, have accepted an offer of re-employment at a reduction of 20 per cent. from their former wages, and the works have been started up. The workmen in other parts of the district are said to be indignant and to have offered to contribute to the support of the men if they will cancel the agreement. Other idle tin platers are said to be weakening in their resistance to wage reductions and to be inclined to stretch the 36-box limit now that a revival in trade is ln prospect.

JUDGING from the stock of American tin plates accumulating on the floor of the warehouse of Gummey, Spering & Co., l'hiladelphia, that firm expect an increase rather than a decrease in their business in this line. Their works are in active operation, and they report quite an increase in the number of inquiries for their different brands of try and the quality will be fully main-

plates. They are meeting a good demand for Gummey's Anti-Pinhole bright tin plates, their introduction of same being much appreciated by tin smiths having a demand for tinware which they are required to guarantce against rust.

PRICES in the British tin plate market show, as yet, few signs of upward movement. Manufacturers on the other side appear to be apprehensive that any material advance just now would force business into the hands of their American competitors, and so are modestly maintaining their old level of prices. Meanwhile some of the American tin plate makers are bringing down their figures to meet the new tariff condi-

THE STARTING of the five new mills at the American Tin Plate Company's Works, Elwood, Ind., has been delayed by the unforeseen necessity of removing the two large driving wheels, which were found to be faulty, and the pro-curing of others in their place. The The difficulty in regard to the wage scale in the hot mills department of the works has not yet been adjusted, but the men have continued at work under the old scale up to the end of this month. On October 1 the cut of 25 to 30 per cent. in wages, demanded by the firm, is to go into effect.

PRESIDENT LEEDS of the American Tin Plate Company, Elwood, Ind., has returned home from a European trip.

Among the Philadelphia tin plate works which are actively occupied are those of the Philadelphia Tin Plate Company, Nathan Trotter & Co., proprietors. Only terne plates are at pres ent made by the concern, the product consisting of seven brands, including Trotter's New Method and Trotter's Roofing, both of which plates enjoy an enviable reputation.

THE MEURER BROS. COMPANY, Brooklyn, are adding two more tinning ma-chines to their tin plate plant, making a total of eight sets.

Gummey, Spering & Co., Philadelphia, are considering the advisability of adding a rolling mill to their Continental Tin Plate Works.

IRONDALE STEEL & IRON COMPANY, Middletown, Ind., have two out of six hot mills in operation, as well as two out of eight tinning stacks, and work is being pushed actively in the rest of the plant. The works will, it is expected, be in full operation within two months. The product at present commonths. sists, besides black plates for tinning, of one grade of charcoal and coke bright plates and one of roofing terne, all under the brand name of Crane. The firm's selling agents are B. P. Crane & Co., 1023 The Rookery, Chicago.

J. M. & L. A. OSBORN, Cleveland, Ohio, announce that their well-known brand of Eureka plate will still be on the market at the lower prices ruling under the new tariff on tin plates. They add that it will be made in this coun-

tained. They refer to the large num-ber of brands of terne plates which they earry as a great accommodation to their many patrons in Ohio and adjoining States.

It is stated that a number of Chicago capitalists are considering the advisability of locating a plant at Newark, Ohio, for the manufacture of tin plate.

THE CITIZENS of Anderson, Ind., claim that they will shortly have a larger tin plate plant than any other city in the country. The company who will build the works are stated to include a number of Indiana and Illinois capitalists, headed by Philip Matter of Marion and C. J. Dorsey of Anderson. The project contemplates a twelve mill plant, fully equipped for finishing bright and terne plates. Surveyors have been put to work on the site selected, in order to push the preliminaries as rapidly as possible.

IT IS STATED that arrangements have practically been completed for the establishment of a tin plate plant in Youngs-town, Ohio. A number of capitalists of that city are sald to be interested in the new venture.

THE NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., have not made any individual proposition to their workmen looking to a reduction in wages, but have met the officials of the Amalgamated Association in conference with other manufacturers.

THE EFFORT TO LOCATE a tin plate plant at Streator, Iil., has come to grief.
The promoters represented that they had \$150,000 to invest; that they desired to build works in a district having an abundance of coal; that they therefore preferred Streator to any point in natural gas territory, in which fuel might suddenly run short, and that all they wanted Streator to do was to raise \$11,000 toward the erection of buildings. The \$11,000 had been nearly subscribed by local business interests when the py local outliness interests when the promoters asked that it be raised to \$20,000, as that sum had been offered as a bonus by another city. Immediately upon the announcement of this demand the scheme was dramed by demand the scheme was dropped by

WE ARE ADVISED by Thomas Ward, general manager, that the Birmingham Rolling Mill Company, at Birmingnam, Ala., have under advisement the question of establishing a tin plate plant to be operated in connection with their rolling mill. If built it will be the first tin plate mill in the South.

On uext Monday, October 1, 1894, by statutory cuactment of the Fifty third Congress, the duty of  $2\frac{7}{16}$  cents a pound on tin plate will be reduced to 13 cents. The last official report on the in plate production of the United States carried the statistics down to June 30. After September 30 these valuable reports from Colonel Ayer, in charge of this branch of the work, will cease. The atatistics, however, will be brought down complete to that date.

ALL OF THE BLACK PLATE AND TIN MILLS of the Ætta-Standsri Iton & Steel Company. Bridgeport, Ohio, were closed down on Saturday, the 22d, pending settlement of the wage scale. This firm state that it is simply impossible for American manufacturers to pay the prices on the old scale since the reduced tariff has become effective. The mills of this concern will remain idle until adjustment of this matter of wages is accomplished to their satisfaction.

The Government crop report for the month of September shows a decline of 5.7 points in the condition of corn from the month of August, and no less than 31.6 from July. The Southern States are the only quarter in which improvement is noted. There a good corn crop is certain, but in nearly all the great corn States its condition is poor. In eight of the Western corn States, out of an aggregate crop acreage of 40,900,000, over 15,500.000 acres of corn have been cut up for fodder or abandoned. The condition of wheat, on the other hand, is quite favorable, showing 83.7, against 74.0 last year. There has been a marked improvement in this cereal since July. In parts of the wheat region the crop is fully up to expectations, and in other parts the yield has exceeded anticipation. Oats, rye and barley compare favorably with the averages of last year.

The New Southern Railway Company, formed by reorganization of the Richmond & West Point Terminal and the East Tennessee, Virginia & Georgia Railway Company, have acquired in absolute ownership 4,500 miles of road, and by the reorganization have reduced the bonded indebtedness from \$135,000,000 to \$90,000,000, just one-third, and the fixed charges from \$7,500,000 per annum to \$4,500,000, a saving of \$3,000,000 per annum. The bonded indebtedness of the road is now less than \$20,000 per mile. A dispatch—said to be officially inspired—from Chattanooga, Tenn., asserts that the reorganization was effected by Drexel, Morgan & Co. of New York in the interests of the Rothschilds of London and Paris and the Vanderbilts of New York, and that these two families, Drexel, Morgan & Co. and J. S. Morgan & Co. of London, each own one-quarter interest in the new company. The first annual meeting of the company will be held on October 2, at Richmond, Va., when bonds to the amount of \$120,000,000 on the entire property will, it is said, be authorized.

The detrimental effects of the recent depression on the jewelry manufacturing and kindred trades is clearly illustrated in the returns of the Government sales of gold bars for industrial uses during the past two years. These sales in New York City as given in the Journal of Commerce, by months, beginning with January, 1893, were as follows:

with January, 1899,	were as follows.
1893. January\$577,599.89	189;.
January \$577,599.89	January \$187,518,40
February 736,194.11	February 290,244.04
March 691,595,32	March 289,336,35
April 831,024.80	April 316,742.21
May 435,885 08	May 294,908.76
June 374,800 31	June 226,130.82
July 180,1(8.19	July 218,519.10
August 108,053.75	August 299,818.31
September. 220,677.10	
October . 267,899 64	
November, 352,729.75	
December. 160,248.91	

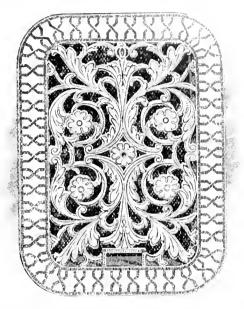

It is estimated that September's sales will aggregate about \$300,000.

A steady rise in the Treasury gold reserve is an encouraging sign of returning confidence.

The Florance Porcelain Register.

We show in the accompanying illustrations a front and back view of an entirely new style of register that is put on the market exclusively by Merchaut & Co., Inc., Philadelphia, Pa. The register face, Fig. 1, is made of glazid porcelain, and there are special features

directs attention is the means for securing the register within the flue. As shown in Fig. 2, there is a spring, s, bent upward from the face of the flange. As the register box is inserted in the flue or orifice in the wall, the spring s will become depressed in coming in contact with the walls of the flue, and tending to spring outward, will held the box firmly in position.

The Florance Porcelain Register. - Fig. 1. - View of Face.

in the mechanism, as shown in the back view, Fig. 2. The register was patented by Andrew J. Cohen of Philadelphia and, as shown in the illustration, is a most artistic production. It must be borne in mind, however, that the registers hereafter made will have a far greater exhaust area than has the one

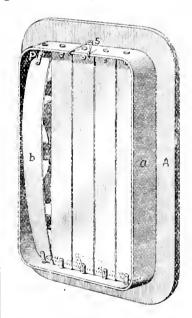

Fig. 2.-Rear View.

from which the engraving was made, which was the first ever produced. Referring to Fig. 2, which illustrates the mechanism of the register, the face A is formed in one piece with the rectangular flauges a, the upper and lower flanges being provided with holes to receive the pivots P on the slats b. These slats are made of spring steel, which gives them great strength and enables them to be readily put in position by bending, as shown in the illustration. Another feature to which the patentee

Furthermore, if necessary to remove the box, it can, by the exercise of a little force, be pulled cut. The particular feature of this register that will appeal to the trade is the capacity for ornsmentation it affords. The face, as mentioned above, is made of glazed porcelain, and in the particular register illustrated the black lines on the border are gilded, while the lines on the face are a delicate blue tint, giving, in conjunction with the gold, a most artistic effect. The question that will occur in connection with these registers is one respecting their strength. We understand that they have been most thoroughly tested, and while they are not intended for floor registers, where they would be subjected to heavy weights, they are of ample strength for all other purposes, being particularly adapted for ceiling and wall use. Furthermore, it is pointed out that they cannot be chipped or destroyed as easily as enameled registers, as the face is made of a solid material. The decoration being burned in, there is no possibility of discoloration by the heat of the flue. It will be readily understood that the porcelain can be decorated in any way to harmonize with the interior finish of a room.

The following receipt is given by an English journal for a composition which may be used as a damp proof coating for walls, or for repairing atone work, or for molding atatues or ornaments: 30 part of tin are dissolved in 40 parts of muriatic acid, and 30 parts of salammoniac are added. A powder composed of freestone, 50 parts; zinc oxide, 20 parts; pounded glass, 15 parts; powdered marble, 10 parts, and calcined magnesis, 5 parts, is prepared and made into a paste with the liquid above mentioned. Coloring matter may be added.

Another New Jersey trolley system is projected. It is to run from Camden to Trenton, taking in all the intervening towns.

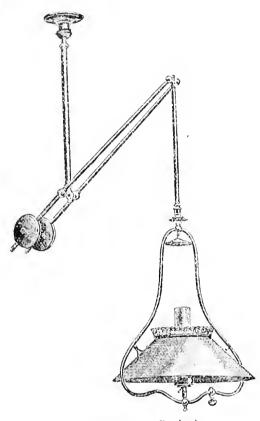

# PLUMBING and GAS FITTING.

The Surprise Gas Pendant.

The illustration shows an adjustable gas pendant that is being introduced by Best & Lloyd, Cambray Works, Handsworth, Birmingham, England,

# The Tobasco Automatic Siphon Tank.

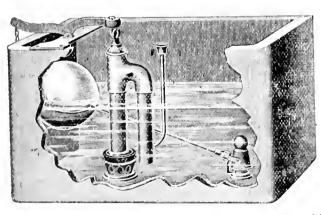

A broken view of the Tobasco automatic siphon tank for flushing closets is shown in Fig. 1 of the illustrations.

The Surprise Gas Pendant.

but, as is usual with English circulars, the one before us fails to give any explanation of the operation. It appears that the Snrprise pendant can be raised and lowered and also turned to the

It is a new device, put on the market by H. C. Montgomery, 90-92 Wood street, Cleveland, Ohio. The special feature of the tank is the supplemental air vent which communicates with the

The Tobasco Automatic Siphon Tank.—Fig. 1.-Sectional View of Tank.

gives the idea that a compensating weight preserves a balance and that the stiffness of the joint is depended upon to hold the light at the desired hight. It presents some features of convenience that may be suggestive to American manufacturers.

right or left, as desired. The picture | uptake of the siphon so as to effectually prevent, it is claimed, all noise and gurgling when the siphon breaks, while at the same time materially increasing the force of the discharge and thus enhancing its flushing capabilities. The conteal valve engaging with its flaring seat, it is pointed out, dispenses with

the employment of further guide. The tank is said to work noiselesaly under any pressure, and to siphon at any point while 1 inch of the siphon is submerged. An enlarged sectional view of the valve in this tank is shown in Fig. 2. This cut shows plainly the supplemental air vent, which, as pointed out above, is the special feature of the apparatus. The water is drawn up into the siphon tube by the siphonic action at the same moment that the atmospheric air is admitted by suction from above, the air

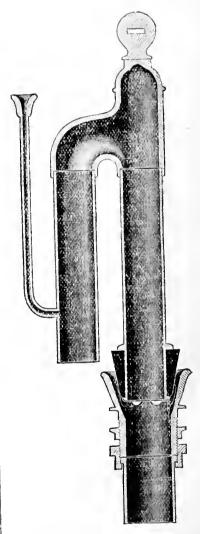

Fig. 2.—Sectional View through Valve.

coming down the smaller tube at the left. Both operations are simultaneous, thus giving the desired relief by sep-arating the air from the water.

It is REPORTED that Chief Clerk Schneider of the Health Department of Buffslo, N. Y., has applied to Judge King for warrants for the arrest of 75 plumbers. Dean Wilson, Inspector of Plumbing, is the complainant, and he charges them with violating the bealth charges them with violating the health ordinances by neglecting to properly ventilate sewer pipes, ainka and water closets. They have been warned, but, according to Mr. Wilson, did not take

### TRAPS AND VENTS.

The Board of Health of Leominster, Mass., took the initial step to make the plumbers conform to the new law by summoning them to appear at a special meeting last week Friday night and be examined. There was a general response, and the following were declared qualified to receive certificates: G. M. Kendall, O. H. Lyon, G. F. Kendall, G. A. Walls, L. M. Blocd, Win. Lynch, F. R. Smith, J. E. Fitzgerald, M. E. McGovern, J. B. Farnsworth, J. F. Lewis, C. W. Wolfe, R. A. Lyon, These men were engaged in business previous to July 10, 1893, and consequently were entitled to certificates upon answering a few questions satisfactorily. Plumbers who began business since then are required to be thoroughly examined, and for this purpose the following Board of Examiners has been created: Dr. C. E. Bigelow, H. N. Spring, William Booth.

T. B. Walmsley, instructor in lead burning at the New York Trade School last year, called on The Metal Worker this week and showed a new compound blow pipe for lead burning with illuminating gas, for which he is taking out a patent. It has been perfected from a pipe that he has carried in his plumbers' kit for years, with which he has done excellent work. He is with John McMenamy, another trade school instructor, at 1277 First avenue, New York.

The Shuster Foundry, Philadelphia, applied 70 of their reducing 's for use in the plumbing of the new apartment house at Broad street and Fairmont avenue, Philadelphia. As each fitting obviated the necessity for a reducer, and consequently as many joints, the advantages gained by their use is plain.

CHARLES SMITH, plumber, who dissolved partnership with George Fey, has taken his brother as a partner, and will open a shop at Arverne, N. Y.

W. P. TARRANT & Co., plumbers, have removed from 76 Putnam street to 12 Maple avenue, Saratoga Springs, N. V.

J. C. GILBERT, A. R. McCallum and Edward Keating have been appointed plumbers' examiners at Whitman, Mass.

YARRINGTON & McCABE, plumbers, Derby, Conn., have dissolved partnership. Mr. McCabe retires from the firm and Richard Yarrington will continue the business at the same location.

T. J. MORAN of Titusville, Pa., has purchased the plumbing establishment of M. Albrecht, at Olean, N. Y., and will conduct it in the future.

THE TITUS & BUCKLEY COMPANY have been organized at Portland, Maine, for the purpose of dealing in house furnishings and carrying on a plumbing and real estate business, with a capital stock of \$100,000. The officers are: President, Augustus C. Titus of Newport, R. I.; treasurer, Chas. H. Buckley of Lynn, Mass.

A NEW HEATING AND PLUMBING FIRM, at Springfield, Mass., will be Sprague & Moore, who expect to be ready for business in their new store about the first of next month. The firm consist of A. N. Sprague, formerly the foreman for H. O. Sprague & Son, and Mr. Moore, who was formerly a member of the Westfield Heating & Plumbing Company. In their new store they will carry a full line of stoves, hardware, paints, &c.

ATTENTION IS CALLED to the change in a well-known plumbing establish-

ment in Salem, Mass. F. J. Dearborn is the successor to E. P. Moulton and will continue the agency for the L. Bosquet hot water heater.

THE WESTERN SANITARY WARE POTTERY, Tiltonville, Ohio, how in the hands of a receiver, will not be sold, as reported, but will resume operations again shortly.

Thos. Kelly & Bro., 124 Franklin street, Chicago, report an increasing trade in their self-acting frost proof closets, siphon basins, and other plumbing specialties.

L SHICK is to open a plumbing store in Davis square, Somerville, Mass.

Ronalds & Co., 54 Cliff street, New York, make a specialty of kitchen boilers, both in galvanized iron and copper. In addition to copper boilers they make copper sinks, copper balls for valve cocks and plumbers' copper goods. Their sample room shows these goods in variety and a fine line fof sauitary earthenware in lavatories, sinks and water closets. They also display an as-

high grade water closets. A special notice requests that previous catalogues be destroyed and states that all their goods bear their name. Sixty plates are used to show the Utopia closet in the different styles it can be furnished, all of which are of non-absorbent, non-crszing vitreous carthenware. Then follow the Sea Shell, Pennant, Tobasco, and Saint Claire front outlet water closets, showing as many different styles of finish. The remaining pages show the Paragon closet seats and flush tanks and the Detroit Smitary water closet.

The Board of Health of Hingham, Mass., has licensed under the new law Rich & Marble as master plumbers, Edos Loring, employing plumber, and Charles B. Whiton, Fred. W. Noyes and E. Bradley Loring, journeymen plumbers.

The Imperial Hot Blast Blow Pipe.

The White Mfg. Company, 40 and 42 State street, Chicago, Ill., have just

The Imperial Hot Blast Blow Pipe,

sortment of French and Roman enameled baths and some handsome maible lavatories. In plumbing fixtures of high grade their stock contains a well selected line.

THE HAGERSTOWN PLUMBING COMPANY, Hagerstown, Md., are fitting up a new floor and other improvements.

C. H. MUCKENHIRN, Detroit, has been spending a few days among the trade in New York in the interest of the Venito pneumatic jet water closet made by him and for which Du Bois & Darrow are the New York agents.

W. P. Jones, Rutland, Vt., presided at the convention of the Vermont master plumbers, held at Burlington this week. The delegates from his city were G. H. Channell, F. II. Smith, Frank Tracy and C. E. Channell.

UNDER THE DATE of Scptember 1, 1894, the Park & McKay Company, Detroit, are sending out a 64-page catalogue printed on enameled paper and in a drab cover. The catalogue is devoted to the Utopia Siphon and other

put on the market a gasoline blow pipe, which is herewith illustrated. The manufacturers offer it as a complete tool for soldering, brazing, burning paint, melting metals, healing soldering coppers, thawing frezen pipes, making heavy soldered join's, &c. It will tun for four hours. The burner has a generator of double the usual strength, which can be regulated to furnish a flame of any size by a turn of the knob. The needle valve has a patent renewable seat which can be replaced when worn out at a cost of only 10 cents, making the torch equal to new. The reservoir is made of one piece of specially rolled brass of heavy gauge, rendering it leak proof, and yet the construction is such that the entire apparatus is light. The air valve is at the bottom of the pump, conveniently placed, dispensing with outside tubes and fixtures. The pump is very simple, supplying a strong blast and drain-ing every drop of gasoline. The reservoir is tested to 30 pounds pressure and warranted.

# STORE. THE RETAIL

# Successful Buying.

BY FRED MACEY.

It is an old saying that "troods well bought are half sold," and from the importance given by most business men to this department of their busimen to this department of their business, there seems to be considerable faith in the truth of it. A careful study of the science of buying must reveal the fact that while a buyer must to a very large extent be governed by conditions, there are still certain rules that seem to govern all transactions, and prominent among them may be named the following. them may be named the following, which will find a connection with almost every purchase in one form or another:

Study your wants, and buy only such

goods as will move.

Don't buy a new article unless there is a profit that will pay you to introduce it.

Keep close track of stock on hand. Know what sells and how much is

sold. Keep a record.

Do not allow smooth tongued travelers to sell you more than you want. When the goods come they are yours and you must pay the bill.

If you do not carry a certain article in stock and it is in your line, know

where to bny it.

Keep your catalogues and price-lists in good order. Have them complete and easy of access

Keep a Quotation Book and use it. Know, when you want anything, where you can buy it and at what

Study the cost of producing the

goods purchased.

Take good trade papers and read them. Keep posted on the changes in tariff, expiration of patents, fluctuations in values.

Solicit prices; you command a large field at small cost.

Use neat stationery. It makes a good impression.

Always find time to be courteons to the traveling salesman. It costs nothing and always pays.

Be clear and concise in the statement

of your wants.

Look upon all quotations as being subject to change, it not in base price, then in discounts, length of time, freights, &c.

Consider all quotations strictly confidential. Never give one man's price

to another.

Make price, quality and terms be the basis of a purchase. Friendship is good in its place but in business, justice only should rule.

Let dollars and cents be the first point considered in changing firms

point considered in changing firms.

Keep pos ed on new firms. Their prices are generally good. Use them, don't overlook quality, credit. &c.

If you want good prices and quick service, telegraph. It costs something to be sure, but generally pays when

done with discretion.

Calculate ahead. Ordering at poor prices, expensive telegrams and annoy-

ing delays will thus be avoided.

Work for quantity discounts. If you are not entitled to it unite with you are not entitled to it unite with another or find a jobber who is and is willing to divide up.

Work discounts, freights, packages, &c., for all they are worth. Don't forget that I per cent, of \$100,000 is \$1000.

If your purchases are large let the fact be known. Competition for your trade will be all the sharper.

Work for an inside track for articles

controlled by combinations, syndicates, &c. Use quantity, quality, treatment, time, style of packages, &c., for all they are worth.

Buy goods, prices guaranteed, then you are always on sure ground.

Contract when prices are low. To know when to contract understand the supply and demand, condition of patents, changes in tariff and other points peculiar to each article.

Adopt an order blank. Embrace in

Adopt an order blank. Embrace in the printing all the points desirable in regular orders: omissions will then be avoided.

Patronize home industries as much as possible. By so doing you con-tribute indirectly to your own business.

Be clear and concise in ordering.

Mistakes are less liable to occur. Keep a copy of all orders. Responsi-bility for errors can then be easily and surely located.

If you pay freight be sure to get all the benefit there is in water freights low classification, quantity, method of packing, &c.
Be sure that goods received are as

ordered in both quantity and quality.
Pay bills promptly. A firm can
afford to sell at a less margin to good

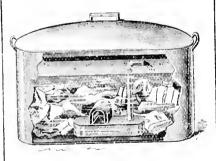

pay than to one who consumes part of his profits by collection expenses. Never forget that a small and well assorted stock is better than a large

stock. On the one hand the stock is clean and new, and money is turned oftener. On the other, stock deteriorates and its cost increases by interest and insurance on money invested. By following the above rules there

is no doubt that purchases can be made to good advantage.

## Bolgiano's Steam Clothes Washer.

The accompanying cut represents a ateam clothes washer, offered by the Bolgiano Mfg. Company, Baltimore,

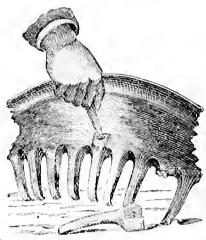

Bolgiano's Steam Clothes Washer.

Md. The washer is placed in the bottom of a wash boiler and weighted down with an iron or brick to keep it in place. Water is put into the boller until it comes within an inch of the top of the spout. The clothes are then put in snd allowed to boil for ten minutes after the water comes to a boil. At the expiration of the time the clothes, it is stated, will be all washed. The makers claim that the washer saves

all scrubbing, as it draws the dirt out of the clothes through a powerful suc-

# Adjustable Stove Tooth.

It very often happens that the fingered fire bowl of a stove has to be thrown away through the breaking or burning off of one or more of its teeth, whereas if new ones could be supplied it could be still further utilized and made almost as

Adjustable Stove Tooth.

good as new. It is to supply a want of this kind that Harkins & Willis of Ann Arbor, Mich., have just placed upon the market an adjustable stove tooth, which is made in four sizes and which; it is claimed, will fit any bowl. The engraving which we present herewith shows so clearly the appearance of the teeth and the manner in which they can be applied to the fire bowl that extended explanation would seem superfluous. The makers state that these teeth are meeting with great favor at the hands of the trade and the demand is greater than at first anticipated. The circulars which are issued relating to the goods carry full direc-tions for setting the teeth in connection with both light and heavy bowls.

LEVI HEV & Co. of 311-313 State atreet, Rochester, N. Y., refer to their Excelsior ateam cooker as a very satisfactory arrangement for use in connection with an oil, gas or gasoline stove. It can, however, be used on any cook stove with equally satisfactory results, and the statement is made that there is no possible danger of burning the food. The arrangement of parts is such that every variety of meats, vegetables, puddings, &c., can be economically cooked by steam at the same time, without mingling the flavors, and this by using only one griddle hole of the stove. The makers also state that food can be kept ready and warm for hours by means of one of these cookers without burning, drying or loss of flavor. The cooker is also convenient in preparing fruit for canning, or making any kind of fruit sauce. Still another advantage is that sauce. Still another advantage all variety of food can be prepared, and all variety of food can be prepared, and any one put in or taken out without disturbing the others.

### MEMORANDA.

CHAPMAN & HILLS have opened a hardware and stove store at Lorain, Ohio. The firm will also do heating and plumbing work.

J. MERTZ & Fons, agents for the Peninsular line of stoves in Sandusky, Ohio, are remodelling their store, putting on a new front and increasing the facilities for handling their large business.

Landers, Frank & Clark, New Britain, Conn., are manufacturing a line of square and clipped pointed putty knives, with smoothly turned round handles. The blades are fastened into the handles by a patented process, with the advantages of a handle that fits the hand, having no rivets to come out, no projecting tangs and no corners. The blades are furnished with beech, red and black handles.

THE LARGE and substantial volume issued by the Standard Stamping Company, St. Louis, Mo., will be of value and service to many. The catalogue measures 11 x 9 inches in s'ze, is bound in stamped cloth and contains over 400 pages. The variety of goods alluded to is most extensive, and covers sheet metal ware, tinners' supplies, house furnishing goods, &c., in great variety. At the beginning of the book are two views of the Standard Stamping Company's warehouse and works, following which is a list of the departments into which the volume is divided. The enumera-tion of these sections will indicate the contents of the book: Pieced Tinware, Japanned Tinware, Deep Stamped Ware, Shallow Stamped Ware, Spoons, Stamped Trimmings, Tinners' Miscellaneous Supplies, Tin Plate and Metals, Tinners' Tools and Machines, Galvanized and Black Sheet Iron Ware, Gss. Oil and Vapor Stoves and Trimmings, Stove Hollow Ware, Enameled Iron Ware, Wire Goods, Wooden and Willow Ware, Miscellaneous Goods. The book is pro-fusely illustrated and the printing is well done.

MIZENER & ORTH, Port Clinton, Ohio, were awarded first prize on stoves at the Ottawa County Fair. They handle the complete Peninsular line, the elegant appearance and merit of which elicited much praise.

# Trade Notes.

B. D. Duggan, 207-209 Lake street, Chicago, reports the following sales of the Richmond Warm Air Furnaces: Patrick Kelly, 819 St. Louis avenue, 2; M. R. Leyden, 1613 Monroe street, 1; Mrs. J. Fourtellote, 2197-2199 Adams street, 4; Mrs. M. Cair, 20 Rumsey street, 1; Mrs. M. Cresr, 15 North California avenue, 2; Hans Anderson, 2021 Lexington street, 3; Thos. Wrixon, Sheridan drive and Evanston avenue. 1; Mrs. M. Ayers, Adams street and West Forty-fifth street, 2; Charles Linden, Morton Park, 1; Joseph Thinnis, Lawndale, 1; Hopkus Bros., 1054 Millard avenue, 8.

AMONG recently incorporated companies in New Jersey is the Trenton Brass Company of Trenton, N. J. The new concern, with a capital of \$10,000, will manufacture Brsss Goods of all kinds. Chas. H. Baker, Cornelius Trafford and Claude E. Fell are directors.

THE AMERICAN CAN & STAMPING WORKS LIMITED, have been incorporated at New Orleans, La., with a

capital of \$50,000. The directors are Chas. B. Emmerich, George H. Dunbar, Jules Aldidge and W. T. Seaton of New Orleans.

THE NICKEL PLATE STOVE POLISH COMPANY, Chicago, Ill., make a number of Polishes to which they direct attention in their advertisement elsewhere. They include the Black Jack Paste Stove Polish, Black Eagle Stove Polish and Niekel Plate Stove Polish.

THE HANTUN BOILER for steam or hot water heating is the subject of an announcement elsewhere made by the Kewanee Boiler Company, Kewanee, Ill. The trade are invited to write for new catalogue and prices.

We are independent to the Stoves and Hardware Publishing Company, St. Louis, Mo., for a chromo lithograph of the new St. Louis Union Station, which is a large plate measuring 32 x 40 inches, printed in ten colors on fine plate paper.

JOSEPH HUSE & Son, 95-97 Blackstone street, Boston, Mass., make an annonneement respecting their bargain package containing 2 pounds of North Carolina Mica of assorted sizes, which they will forward to any part of the country for \$5.

Notice is issued to the trade under date of September 22, by the Specialty Wood Working Company, proprietors of the Packard Enameling Works, Warren, Ohio, that their articles of incorporation have been amended, changing the capital from \$10,000 to \$50,000, and the name to the Packard Enameling Company, the officers and directors remaining as heretofore. They have added new machinery to their plant, largely increasing the output, and announce that they are new in a better position to ship goods promptly than ever before. They also state that they have made a number of improvements in their enameling process.

G. A. Crosby & Co., 176 and 178 South Clinton street, Chicago, have issued the fourth edition of their catalogue of Presses, Dies and special ma-chinery for sheet metal workers. This edition is much more elaborate and comprehensive than its predecessors, thus exhibiting in a striking mancer the growth of this establishment, whose trade not only extends to all parts of the United States, but reaches to numerous foreign countries. The new catalogue covers 188 pages, and is handsomely printed and profusely illustrated. Several introductory pages are devoted to an enumeration of special points which are embodled in the machinery manufactured by this firm and general directions for its proper management. Power Presseaare then consid. ered. Illustrations are given of a great variety of styles for punching, making can caps, cleats, pail ears, &c.; forming covers for large tin packages; for heavy punching and stamping, as required by saw and implement makers; for cutting out large articles, such as pieced tinware, boiler covers and bottoms, stove boards, coal hod bodies, steel stove tops, &c.; for cu ting, punching and forming nuts, washers, &c.; Drop and Serew Presses, hand and foot Lever Presses, Trimming Machines and Crimpers are also shown in a profusion of styles. A special machine shown is the patent automatic double headed Crimper, which crimps at the same time both ends on the bodies of round cans at a very high rate of speed. Their line of can making machinery has been extended very considerably of late, a number of very ingenious machines having been devised which increase the daily product of a plant and therefore reduce the cost. Among these is an automatic Soldering Machine and an automatic Can Testing Machine. For those whose operations are not on a very large scale a full assortment of suitable machinery is shown, operated by power or hand. Tinners' Machinery is treated very comprehensively, as well as tinners' tools. The Clark kerosene oil system for heating fire pots and il atera is also illustrated and described.

The trade will be interested in the announcement made on another page in this issue by Stransky & Co., 27 Murray street, New York, in which they state that their offer to send one piece each of the different articles of Enameled Ware, &c., as samples at special prices was accepted by 33 dealers, 27 ordering goods from the samples and six sending in a second time. The renewal of the offer will be of interest to the trade.

THE ANNOUNCEMENT elsewhere of the Bellaire Stamping Company, Harvey, Ill., directs attention to the Columbian Enameled Steel Ware of their manufacture. The illustrations in the announcement show a variety of goods and also a general view of the factory at Harvey.

BUCK'S STOVE & RANGE COMPANY, St. Louis, Mo., in their double page advertisement in this issue show a few cuts of their Buck's Steel Ranges, which they refer to as being "up to dat;" in every particular. They advise us their sales of these Ranges have been very heavy, and that they are in receipt of many letters of commendation from the trade referring to this line of goods.

The double page advertisement of the Perfection Furnace Pipe Company, Toledo, Ohio, is of particular interest at this time of the year when so much is being done in hot air work by the tinners and furnacement throughout the country. A very large assortment of Furnace Fittings is illustrated in the announcement, and the lower prices that will prevail hereafter are alluded to.

WE ARE ADVISED that the American Tubing & Webbing Company, Providence. R. I., have served papers on manufacturers for infringing their patents on drop light and gas stove Flexible Tubing.

The Quaker City is not to have elevated railroads at present. After a long and persistent struggle the syndicate of New York and Philadelphia capitalists, who had actually begun preliminary operations under charters granted by the State of Pennsylvania, have given up the effort to give Philadelphia an L system on account of the numerous obstacles placed in their way. A section of the road, already built, has been taken down and shipped away as old iron, and the whole project is definitely abandoned.

A franchise has been granted by the Mexican Government to a new line of steamers which will compete with the Pacific Mail Company for the Mexican trade between the Gulf of Tehuantepec and San Francisco. Seven steamers will be run on the line, which, it is announced, will be in operation within a few months.

# STOVE TRADE NOTES.

## The New England Stove Trade.

The hot weather of the past mouth seems to have been an important factor in the stove trade of New England. The moderate stocks laid in by retailers early in the sesson have not been drawn upon to any appreciable extent, and it continues to be the disposition of the trade to keep up the hand to mouth buying policy which has been popular for some time past. This results in many small orders for quick delivery and creates a semblance of activity among the manufacturers. Most foundries in this section are running fairly full and are piling up a little stock, but in no case more than is likely to be needed even under present conditions. With the advent of colder weather a largely increased demand is expected, and there is hardly a reasonable doubt that this promise will be fulfilled. The repair trade is gradually becoming active, and jobbers of a variety of goods pertaining to the stove trade are doing a satisfactory amount of business in view of the conditions. Oil stoves continue to move freely; in fact, there is a constantly increasing demand for this line. There appears to be considerable business doing in furnaces and most of the manufacturers in this vicinity are rather crowded with orders.

## New Jewel Ranges.

Important additions have been made by the Detroit Stove Works to their line of ranges. Samples are now ready for inspection on the floor of their sample room in the Chicago warehouse, 2921 to 2933 La Salie street. Conspicuous among them stands the new Jewel steel range. This is a piece of work in which important improvements have been made both in design and construc-tion. A marked departure has been taken from the conventional style of ornamentation in steel ranges. The front, with its background of plain, smooth sheet steel or iron and flat nickel bands on the doors, has given way to a highly ornamented cast iron front richly carved, with doors bordered by nickeled carved work and the vertical corners also trimmed with carved columns. A highly polished nickeled steel band borders the top. The sup-ports of the high shelf are also faced with ornamental carving. The general effect is very pleasing. A weak point in many ranges is the oven bottom, which is liable to warp or buckle. In these ranges will be found a sectional oven bottom, made of sheet steel in four sections and warranted to stand the severest tests. The ranges are further provided with brick or iron linings, duplex or flat grate, poised oven door, high shelf or high closet

with rolling top, and a portable reservoir attachment that can be fitted to any range without the use of a water front. Two sizes are made—18 and 20 inch ovens.

The Prize Jewel is a new four-hole cast range adapted to the use of hard coal, soft coal, coke or wood. It is built on handsome lines and is richly orne-mented, the moldings being beautifully carved. The swell front is a fine piece of workmanship. Two styles of feed are provided, pouch and front feed. It is supplied with a draw hearth, brick or iron linings, duplex or draw center grate, two nickeled tea pot shelves, a fine nickeled guard on top of the high shelf or closet, and nickeled panels on oven doors showing the new trade-mark. The top end and outside oven ahelves are of an ornamental design, with the new trade mark inserted in the center of each. These ranges are made with 16, 18 and 20 inch ovens, and are furnished in all styles, with or without reservoir, high shelves or high closets.

The Faultless Jewel is the company's The Faultiess lewel is the company's new gas range, which has been received with marked favor owing to its rich finish as well as its good points as a cooking device. The front is exceptionally handsome, bearing a profusion of carved molded work on doors, end columns, skirting and legs, while the door borders and handles are nickel plated. It has four top cooking holes, one of which has an auxiliary simmering burner, and another has an auxiliary large burner, appropriately called a giant burner, for rapid heating. A water heating attachment, which is furnished if desired, has two cooking holes to utilize the waste heat. The oven is large, being 18 inch, while below it is a broiling compartment operated by the oven burners. The oven doors are poised. All valves are needle valves. A pilot light is used for igniting the oven burners.

# The Mt. Penn Stove Works

of Reading, Pa., have issued a 12-page supplement to their catalogue of 1893-4, covering their latest productions. Ranges shown are the Penn Item, a low priced six-hole range in four sizes, cut top, with or without reservoir and with either duplex or plain flat grate; the Penn City, a new and cheap solid end hearth six-hole range in four sizes, cut top, bailed ash pan, with or without reservoir and with either duplex or plain flat grate, handsome and attractive in appearance, and the Penn Chicf, a range similar in appearance and style to the Penn City, but having a narrower bottom. sheet iron goods are noticed the Penn Coin, a low priced straight draft surface burner, with large sliding feed door, deep ash pit, shaking center discharge grate and poke hole, fire brick lining extending above the door and surmounted by a handsome spun urn; the Penn Pride, a cheap surface burner, with half revertible flue, similar in appearance and design to the Penn Coin and having lower check

Penn Pearl, a surface burner with full revertible flue of the same design as the Penn Pride, but having aide foot rails. The Penn Chart and Penn Merit, handsome new parlor stoves, are shown and are made with straight draft and full revertible flue and in the latest style of ornamentation, topped with urns of artistic design. The supplement concludes with the Palace cellar furnace, described as a very cheap and effective furnace, and particularly commended on account of its low price. It has a large fire surface, improved center discharge grate, sheet steel gas proof drums and cast iron radiator immediately above the fire.

## A New Trade-Mark.

A new trade-mark has just been adopted by the Gem City Stove Mfg. Company, Front and York streets,

Trade-Mark of the Gem City Stove Mfg. Company.

Quincy, Ill. It comprises the words "Gem Stoves and Ranges" in combination with a design of suggestive character. The illustration which we present herewith shows clearly the features of the trade mark.

## The Raymond & Campbell Mfg. Company.

A stove catalogue which will take a high rank among the trade publications of the year is that just issued from the press by the Raymond & Campbell Mfg. Company of Middletown, Pa., and with New York office at 244 Water street. The size of the page is somewhat larger that the general run of atove trade catalogues, but is such as to afford the opogues, but is such as to shord the op-portunity for the use of cuts of liberal dimensions together with ample de-scriptive matter. The bedy of each page, upon which appears the printed matter, is of a light buff tint, forming a strong contrast with the black of the letterpress. The binding is in dark green paper covers with embossed side title in old gold. The frontispiece consists of a bird's eye view of the company's plant at Middletown. An inter-esting feature of the opening page is a classification of castings for repairs. dampers for the perfect control of the fire and nickeled trimmings; and the

as the Model Perfect, the Grand Perfect, the Capital, which has been redressed for this season; the Clifton, the New Pullman, which has also been redressed: the Anna and the Dollie, the latter being a new construction brought out to meet the demand for a range which the dealer can retail at a very low price. The cook stoves are represented by the Grand Susquehanna, a four hole construction embodying the latest improve-ments; the Grand Climax, the Grand Pride, the New Susquehanna, Ladies' Pride, the Keystone, the Expert, the Liberty and Perfect Miner. The heaters are next considered, being represented with the Art Perfect full revertible base burner and double heater occupying the place of honor. The company have spared no trouble or expense to make this stove complete in every respect, and it is offered the trade in two sizes. The Perfect Gem, a medium priced square stove offered in three sizes; the Royal Grand, a full revertible that heater of attractive design made in two sizes; the Art Jasper, made as a single and double heater; the Hustler, an attractive parlor stove made in three sizes direct draft and three sizes revertible flue: the New Royal, a round base burner; the Grand Active, a surface burner for hard or soft coal or wood; the New Active egg stove, the Autumn, a cylinder surface burner, and the Perfect Franklin, as well as an extensive line of cheaper constructions, make up the assortment. Attention is also given to the Conqueror furnace, made portable form and for brick setting. The catalogue concludes with a long list of hollow ware, mica, stove bolts, registers, &c., together with remarks relative to repairs, tables giving the average weight of castings for repairs, and an illustrated description of the Lindemuth Sun steam and hot water

### New Detroit Heaters.

The Detroit Stove Works have not been dismayed by the general depression in business, but have this year brought out a number of new patterns on which they have not only expended much money but much thought and a very great deal of taste. They have samples of these goods now on exhibition on their sample floor in their Chicago warehouse at 2921 to 2933 La Salle street. Prominent among them is the new oak stove the Detroit Jewel. This ia not an incased oak but a genuine oak with all the special features of the oak stove preserved, embellished by an ornamentation which was an inspiration of the designer. From the front it would appear to be a high art base burner, having the richly carved molded work forming the frame surrounding the door, running up to the top piece and down to the base. The body is made either of steel or cast iron. The steel body on the sides and in the rear tesembles the typical oak, but the cast body is most elaborately carved to correspond with the rich front. The grate is shaken through a small door in the top of the ash pit door. This small door also serves as a draft door in place of the usual sliding register. All doors have special cam shaped latches, which draw them perfectly tight, although the mounting is done so skillfully that this would seem almost unnecessary. These stoves have a swinging nickel top, with cooking hole beneath. Ventiducts run up each corner, taking air in at the bottom and discharging it heated at the top. The nickeled parts add greatly to the beauty of these stoves,

being done very artistically. The feed door has a superb nickeled exterior, which is prevented from tarnishing by an interior lining. Four sizes are made with steel bodies and four sizes with cast bodies. The company have also brought out another line of oak stoves named Oak Jewel. These are also handsome stoves, but are less elaborately decorated than the Detroit Jewel just described. They are well finished, with doors of the same type as the Detroit Jewel and in every respect well made and carefully mounted. are furnished in four sizes with cast bodies and five sizes with steel bodies. A new line of surface burners has been brought out named the Radiant Jewel. These are base heaters as well as surface burners. Four sizes are made-namely, 15, 17, 19 and 21 inch bodies. are made with cast fronts and Russia iren bedies. They have swinging tops, under which is a baking oven. The nickeling is elaborate, covering the base skirting, side rails, hood over ash pan door, number plate, trade-mark panel over feed door, and top band. They have a circular flue and ventiduct attachment, draw center grate and brick or iron linings. A east iron lining extends above the brick to protect the sheet iron body. These are remarkably well proportioned atoves and should take high rank among surface burners.

# Cleveland Co-operative Stove Company.

We are indebted to the Cleveland Co operative Stove Company, with main office and works at Cleveland, Ohio, and with branches in Springfield, Mo.; Chicago, Ill.; Minneapetis, Minn., and Chattanooga, Tenn., for a copy of the twenty-seventh annual catalogue and price-list of stoves, ranges and hollow ware, &c., which they manufacture. It is a very full catalogue, comprising something like 180 pages of letterpress, profusely illustrated, printed on a good quality of calendered paper and substantially bound in board covers, with side title in old gold. In offering this volume to the trade the company call attention to the fact that all of their first class cook atoves, ranges and heaters are now provided with portable bases instead of legs. The bases are entirely new in style and design and add very much to the appearance and saiability of the stoves to which they are applied. The company have also added many other desirable improvements as well as brought out new cook stores and heaters, making their line extensive and prices low. They also extensive and prices low. They also refer especially to their Black Hussar wrought steel range, which is entering its second year of popularity. Two changes have been made for this season, one being the substitution of three movable sections with two covers to each section in place of last year's loose centers, and the furnishing of eight or nine top, as desired. Her Majesty is a cast iron range of attractive construction, which the company are offering the trade in four sizes. The manufacturers refer to their line of ranges as comprising ten entirely distinet and separate patterns, with innumerable styles and sizes; also 22 distinct varieties of cook stoves for coal or wood, comprising an assortment of 150 sizes and styles. The ranges occupy something like 25 pages of the catalogue, and are offered under such names Torquoise, the New Paradise, the Radiant Linden, the Prize Linden, the Coronet, the Aunt Nancy, the Tele-

phone, the Artisan, which is a new fivehole range for coal or wood, and the Savon. The cook stoves till nearly 40 pages, and comprise, as already stated, very extensive assortment. Some of the more prominent constructions are the Black Hussar, the Loyal Linden, the New Iron Mountain, the Front Rank, the Iron Chief, the Early Bird, the Pearl, the Sure Thing, the Good Business, the Santon, Cock Robin, the New Black Hawk, the Buck Eye, the Home Treasure, the Cuckoo, the Bright Side, the Oakland, Prairie Flower, the New Duchess, Winona, Brechwood, Grand Rapid and Granger, many of the latter being wood cooks. The 60 pages latter being wood cooks. The 60 pages which follow are devoted to heating stoves, of which the leader is the Royal Linden, a square base burner, made in three sizes. The Skylark is a new revertible the base burner for hard coaloffered in four sizes. The At Home is in the nature of a Franklin, having blower jointed in the center and folded up from the top. When folded it fits reatly between the projecting nickel plated brackets in the upper front, with the mica or lower section only exposed, showing the full capacity of the fire pot. It is intended for hard coal, soft coal or coke. The Gilt Edge is a new square surface burner with tea kettle attachment, made in two sizes and intended for burning coal, coke or gas. A great variety of other heaters are shown, embracing surface burners, cottage parlor stoves, oak stoves, laundry, globe, cannon, Todd and box stoves. A list of hollow were and an alphabetical index completes the work.

#### ODD PLATES.

RATHBONE, SARD & Co., Albany, N. Y., are advised that one of their Brooklyn customers captured first premium on Acorn stoves at an exhibition recently held in his section. Last week Acorn stoves were exhibited at the fairs in Watertown and Schoharie, New York State.

FLOYD, WELLS & Co. of Royersford, Pa, have made a number of extensive improvements in their foundry during the past few weeks. Among these may be mentioned a large cupola and the erection of a coke house. The company expect to run full capacity the balance of the season, as they have a large number of orders on hand.

SECRETARY H. N. REYNOLDS of the Craig Reynolds Foundry Company, Dayton, Ohio, made a call on *The Metal Worker* while on a pleasure trip to New York, the Triumph line of hot air furnaces being forgotten for the time.

WALTER E. CLARK of the Phillips & Clark Stove Company, Geneva, N. Y., will probably represent his district in the Legislature of New York State next year, as it is one of the districts where the majority makes a nomination equivalent to an election, says Henry Glesson, the political sage of stove ornament fame from Beekman street, New York.

THE 1894-95 CATALOGUE OF GAS HEATING STOVES of W. M. Crane & Co., 838 Broadway, N. Y., contains 32 pages, in a red cover, with their Vulcan trade mark on the front and a cut of their factory on the back cover. An introduction calls attention to the prominence assumed by gas as a fuel. The first three pages are devoted to the new Vulcan gas grates and fire place heaten. The next nine pages show their perforated heating atoves and radiators, followed by cylinder heaters, the Perforaters.

tion stove and fire place heater, gas logs and andirous. The new Vulcan hot air furnace and hot water heater are then shown and their features and the convenience of gas for large heating fully described. These are followed by ceramic kilns, independent connections and a page is devoted to the Perfect controller for regulating the pressure of gas on the burners in a building to prevent waste.

THE PENNSYLVANIA GAS FURNACE COMPANY of 77 West Chippewa street, Buffaio, N. Y., are meeting with a good demand for their furnaces, and are kept very busy filling orders. They state that smong other places they have shipped them to Canada, where they are in successful operation with illuminating gas. The company had one of their furnaces on exhibition at the recent Toronto fair, where it excited a great deal of interest on the part of visitors. The display was made by A. II. Dixon of 43 Blower street, East.

The works of F. & L. Kahn & Brothers, Hamilton, Ohio, are running full in all departments with a complete force of hands. Legard Kahn is reported by a local paper as stating that business is fair and showing gradual improvement.

THE ECONOMY GAS STOVE COMPANY of Decatur, 111., is the name of a concern recently incorporated with a capital stock of \$5000. The incorporators include Gustavus Heidel, Henry Mathews, Albert Mathews and J. C. Hostetter.

THE LARGEST HEAT ever made by the Lexington Stove Foundry Company of Lexington, Ky., was on Fricay, September 14, when 10,300 pounds of pig iron were melted into atove plates. It is stated that the demand for the company's product is such that they will continue to melt not less than this amount each day. The goods are being shipped to various parts of the United States, and it is said that the local demand has become so atrong that the company are compelled to maintain a large retail store at 123 East Main atreet.

IN CONVERSATION with a representative of a Nashville paper, H. W. Buttorff of the Phillips & Buttorff Mfg. Company, that city, is reported to have expressed himself regarding the business outlook as follows: "Our business year commences in July, and a look into the business from July, 1893, to July, 1894, shows a vast increase during the latter months. During July, August and the 15 days of September past the business largely exceeds that of the similar period of 1893. There seems as increased demand with us from all parts of the country, even now, and we do not expect our largest trade until later in the fall. Many of the country merchants and other customers are delaying their orders, but promise to buy later in the season. This indicates, you can see, that they are buying with more care than in former years, and also that we may look for a largely increased trade for the balance of the year. We are making additions to our force in the foundry every day and are now working at a full capacity, which will have to be enlarged. In every department our business shows a material increase and of course other lines of business are experiencing a like benefit from an improved outlook of affairs during the last few weeks. If our business is a criterion, Nashville is cer-tainly tooking up and has the promise of presperous times.

THE MICHIGAN STOVE COMPANY announce that they have adopted a protective system of numbering for the henefit of those who handle their stoves and ranges. The point is made that consumers when shopping round from store to store compare cooking goods by the numbers on them, which designate the size of the cooking holes and the size of the oven. This, it is claimed, is unfair to those manufacturers who make their ovens of the full size thus indicated. Some manufacturers, for instance, mark their oven size as measured with the swell of the oven door, or if a cooking stove with the swell of both doors, or even by the measurement Thus there of the body of the stove. may be the difference of a full size between one 8-18 stove and another stove marked 8-18. The Michigan Stove Company have decided to change this system so that consumers cannot thus carry the numbers from one store to another and make comparisons on that basis. They retain the cooking hole number, but the other number is arranged on an original basis. Taking a 14-inch oven as the smallest oven they are likely to make, they number it 1: a 15 inch oven is numbered 2, and so on. Thus an 8-14 stove, old style, becomes 8-1 in the new style. They have also instituted another change. Hereafter, instead of placing the year on their stoves they will use a letter, so that consumers will not be under the impression that they are buying an old pattern stove, and dcalers will not have a stock of goods to be sold at a dis count merely because of the date on them

RATHBONE, SARD & Co 's Chicago house reports a steady increase in the volume of business from Northwestern patrons. The company are doing an exceptionally good trade in the Acorn Radiator, which is the pioneer of the air tight or incased stoves, and as such has proved a success in districts de-pending upon soft coal. They claim that the introduction of the air tight stove marks as distinct an epoch in stove history as the invention of the base burner. They are also doing well with their new steel range. The foundries at Aurora are running full. These works did remarkably well the past summer, continuing in steady operation when other stove foundries were closed. In the company's sample room in Chicago is shown a specimen of the new mammoth sign now being furnished to their best agents. It is a huge acorn made of sheet steel, painted olive green and lettered in pure gold leaf "Acorn Stoves and Ranges." It is claimed that this is the largest piece of work ever stamped from sheet metal. Two sheets are used, one for each side, which are bolted together after being stamped. A sheet containing 12 square feet was required for each side. It is a very fine piece of work, the shape of the emblem being well adapted to a sign of this character and made of this material. Its size will make it conspicuous for a long distance when hung in front of a store, while its striking appearance cannot fail to attract attention.

THE ENCELSIOR MFO. COMPANY, St. Louis, Mo, advise us that their September business will compare very favorably with the corresponding month for the past several years. A feature of their business is the very heavy demand for their Charter Oak stoves and ranges, which seem to grow more popular, as is evidenced by the steadily increasing demand for them from year to year. In the way of heating stoves they also report a

good trade and state the demand for their "hot blast" stove has greatly exceeded their expectations.

ECONOMY GAS STOVE COMPANY have been incorporated at Decatur. Ill., with a capital stock of \$5000. The incorporators are Gustavus Heidel, Henry L. Matthews, Albert Matthews and J. C. Hostetter.

WM. STRAUBE, who has been representing the Quick Meal Stove Company, St. Louis, in Illinois for some years past, has resigned and embarked in other business. This territory will hereafter be taken care of by H. P. Gingerich, who has for some time been Mr. Straube's assistant, and is therefore familiar with the wants of the trade in that section.

QUICK MEAL STOVE COMPANY. St. Louis. Mo, have about completed the improvements made in their Quick Meal gasoline stove, and wilt in about three weeks time have photographs of the stove in its improved form for the inspection of the trade. Their traveling men will start out about October 20.

L. CANFIELD, manager of the New York office, at 284 Pearl street, of the Danville Stove & Mig. Company, Danville, Pa., has added some new attractions to his line of square parlor heaters. The Beaver still occupies the position of honor. The Princess Beaver is a new square ventilator and double heater with nickeled skirt, foot rests. name plate and dome, and a handsome top ornament of copper and Venetian iron. It is a full revertible flue self-feeder, with dust flue and either the Ransom patent grate or a slide center grate. It has all the latest conveniences and is made in three sizes, Nos. 13, 14 and 15. The Ideal Beaver is a handsome but less coatly square heater with nickeled skirt, foot rails and dome, with ash pan, dust fine, magazine, large fire pot and center slide grate. It is made in several sizes and should prove an every day seller.

THE GLAZIER STOVE COMPANY Of Chelses, Mich, are distributing an exceedingly neat and well printed catalogue of the Brightest and Best oil and gas stoves, which they manufacture in great variety. The volume measures 45 x 7 inches, and is bound in attractive paper covers, with embossed side title in silver and bronze. The introductory pages are given to announcements to the trade, telegraphic code, reference to some of the leading features of the Brightest and Best heaters and an illustrated description of the brass tank, burner and wick tube. The oil heaters occupy a number of pages, following which attention is directed to combination heaters and cook stoves. in turn, are followed by constructions intended especially for cooking, lamp stoves, extension tops, ovens, Brightest and Best gas stoves, burners, wicks, &c. The engravings are well executed, the printing is on a good quality of calendered paper, the corners of the pages are rounded and the general make up of the catalogue is such as will find for it a place in the dealer's collection of stove trade literature.

THE THOMAS, ROBERTS, STEVENSON COMPANY of Philadelphia made a very interesting display of their gauze door range at the Food Exhibition recently held in Chester, Pa. Visitors were enthusiastic over the performance of the range and watched with no little curiosity and wonder the cooking operations of Miss Cross, who presided. We understand from the company that a simi-

lar display will be made in Wilmington, Del., the coming week.

THE MANHATTAN BRASS COMPANY, with cffice at 338 East Twenty-eighth street. New York, and with Western sales department at 506 Masonic Temple Building, Chicago, have brought out a 12-page pamphlet relating to Star heater oil stoves, which they manufacture in several styles and sizes. The goods are illustrated and briefly described, prices being given in each case. The pamphlet also shows the Star combination neater and cook atove, for which strong claims are made.

HENRY N. CLARK, 103-105 Blackstone street. Boston, favora us with a
copy of a stove board price list for 1894,
which he is distributing to the trade.
The little pamphlet is oblong in shape
and carries illustrations and prices of a
varied assortment of stove boards. We
a'so have from Mr. Clark circulars relating to the Blazer stove polish;
Blackene, a benzine paste stove polish;
the Erie extra finished hollow ware and
stove furniture; the Alaska pokers,
lifters, shovels and fire sets, together
with an illustrated catalogue of central
draft circular burner oil heaters made
in four distinct styles and sizes.

The S. M. Howes Company of 40-46 Union street, Boston, Mass., are the authors of an interesting publication of 28 pages, entitled, "Artistic Furnishing for Fire Places in Brass, Wrought Iron and Cast Iron." The designs which are presented of pertable basket grates are of a high order of merit, and are made in sufficient variety to meet the requirements of the trade. These basket grates are mounted on easters, with dump center grates. A varied assortment of brass andirons is also shown, as well as iron andirons in imitation of wrought iron, brass fire sets, genuine wrough iron fire sets, brass lenders, imported folding sereens, spark guards, ash dumps, fire place dampers, ash pit doors and broiler doors.

A. WEISKITTEL & Son. Baltimore, Md., are distributing fancy stickers carrying their trade-mark, name and address, all printed in red upon a light yellow ground.

T. D. Marson is the agent at Holley, N. Y., for the Splendid and Stewart goods, manufactured by the Fuller & Warren Company, Troy, N. Y. Mr. Matson is an enterprising dealer and believes in the use of printers' ink in directing the attention of the public to what he has for sale. He carries a good assortment of heaters, cock stoves and ranges, and also includes in his assortment the Art Laurel and Challenge oil heaters.

"THE ROCHESTER DIRECTORY OF RANGES made by the Fuller & Warren Company of Troy, N. Y.," is the title of a 20-page pamphlet which reaches us, bearing the imprint of Levi Hey & Co., 311-313 State atreet, Rochester, N. Y. Attention is first given to the grates and fire box employed in connection with the ranges made by the Fuller & Warren Company, following which are testimonials, together with names and addresses of those people in Rochester who have used the company's goods,

THE ART STOVE COMPANY, Detroit, Mich., made an interesting display of Laurel stoves and ranges at the Michigan State Fair recently held in Detroit. A careful list was kept of persons visiting the exhibit, and it was found that the average number of dealers inspecting the display each day was 18, with a

total of 180. So far as the company are concerned the fair is said to have been a decided success. They state that the judges awarded them first premium blue ribbon, also a special premium for high grade workmapship and the complete exhibit.

THE DETROIT STOVE WORKS, 12troit, Mich., send us a sample package of advertising matter which they are distributing to their friends in the trade. It is made up of illuminated cards, on one side of which is matter relating to Jewel stoves: a memorandum book, which the dealer will find useful, and a slip carrying an extract from the New York Tribune. entitled "Wasteful Economy in the Kitchen." The idea of the writer is that the wheels of a household will move much more smoothly if less money is spent on furnishing the drawing room, and more in supplying the kitchen with labor saving appliences. One of the essentials is a range or stove, and the one recommended in the article is the Jewel. The package of matter also includes a sample sheet of the letter heads which the company sell to dealers. The same quality of paper is said to be used for their own note heads, bill heads and statements, and the stationery is put up in blocks of 100 sheets each. ous kinds of stationery with dimensions in inches are enumerated and prices given for 500 and 1000 lots.

THE MARCH - BROWNBACK STOVE COMPANY, Pottstown, Pa., are introducing some new goods, among them being the Puritan, a sheet iron direct draft double heater, with a handsomely ornamented open screen around the fire pot, square base and nickeled side rails, and the Polarius globe stove, with square base, plain cylinder, corrugated inside sliding door, nickeled side rails and Eelipse or draw center grate. They are also introducing an improvement to their Crown hot air furnacea, in the way of a new cast iron self cleaning drum, the joints of which are said to be absolutely water tight, and consequently gas tight, and consequently gas tight, and consecular adapted to the use of soft coal. The surface of the drum is pinned, thus increasing the radiating aurface. Its self cleaning and gas proof qualities, the makers claim, give it an advantage over all other drums in use for soft coal. The same drum can be utilized in the Crown combination hot air and hot water heaters, as it contains recesses suitable for east water heaters of varying heat generating surfaces. The Crown furnace is made with sand joints, is strongly built, with a fire pot ribbed on the inside and allowing of a supply of air on the outer circumference of the fire to completely consume all the gases liberated in soft

THE MICHIGAN STOVE COMPANY have brought out an entirely new line of stoves and ranges, at prices to suit the times, which will be made under the name Michigan. In a handsomely printed circular, just received, this is alluded to as "the sensation of the sea-The circular illustrates and describes the Michigan cooking stoves, named: Grand Michigar, for coal or wood: Home Michigan, for wood only, and Loyal Michigan, also for wood The ornamentation is rococo, being its first application to stoves, and the illustrations show it to be very effective and pleasing. The atoves are otherwise well finished in every respect and are made in ten sizes with square top and four to six sizes with reservoir. The company are also offering to the

trade toy stoves which are miniatures of the Columbian Garland steel range. They are complete in detail and cooking utensils are furnished with each.

THE BANSION STOVE COMPANY, Beckman and Water streets, New York, have list fielded pointing red and built a No. 52 no Bay State furnace for brick setting, which attracts the attention of all pessers by.

THE R II. Date: Company, New York, are showing the Champion Roaster, an oven which can be used with gas, oil or gasoline stoves, on the top of ranges, and can be used with convenience by campers. It is so constructed that there is constantly a circulation of air within it, and is said to do excellent work with meats, poultry and game, as well as pastry, and is an article that can be used with advantage all the year round.

IN AN ITEM referring to the excellent trade enjoyed by the Dippo Mfg. Company. Chagrin Falls, Ohio, published in *The Metal Worker* of September 22, we inadvertently referred to a Cincinnati effice. The salesrooms of the firm are, however, located in Cleveland, as yet they having no Cincinnati effice.

A beautifully executed crayon portrait of the founder of the New York Trade School has been recently placed in the office of that institution. The late Colonel Auchmuty was always averse to having his likeness taken and no recent portrait of him was in existence at the time of his death. The present drawing is therefore copied from the only likeness available—a photograph taken several years ago—and presents him as younger in appearance than he was when known to the majority of our readers, who saw him only in his trade school days. Nevertheless, the likeness is said to be excellent of the man as he was in his early prime. The portrait was presented to the trade school by Colonel Auchmuty's widow. Mrs. Auchmuty keeps up a lively interest in the affairs of the institution which absorbed so large a share of her husband's interest and affection.

The trade school of the Pratt Institute, Brooklyn, commenced its winter session on Monday, September 24. All the classes were well filled. We are informed that, considering the recent hard times, the applications for instruction in the varicus trades, particularly in the departments of plumbing and carpentry, were well up to the average, and the outlook is decidedly encouraging.

News comes from England that two of the most influential and wealthy of the British trade unions—those of the boiler makers and shipbuilders—have issued a joint manifesto denouncing the socialistic platform adopted by a majority of the delegates at the late Trades Union Congress, at Norwich. This movement, it is said, has the support of a number of other unions, which desire to confine the operations of labor organizations to trade matters alone as apart from politics.

The South Metropolitan Gas Company of London have over 20,000 customers on the coin in the slot system of gas payment. They burn an average of 210,000,000 cubic feet of gas a year, and on 1,000,000 cubic feet the company derive a profit of about \$250.

# TRADE REPORT.

# The Iron Market.

There have been very few developments during the past week to clearly indicate the further course of the mar-The outlook is still hopeless as to the chances, in the near future, for a volume of business which will stop losses and give manufacturers a reasonable profit for their work. The whole American Iron trade seems possessed of a mad desire for tonnage. There seems to have been a general acceptance of principles which are not necessarily the wisest in all cases because they are avowed as the guiding ideas in a few conspicuously successful instances.

There has been quite a general advance in rates of freight, to go into effect on October 1, and this had led to some rushing of deliveries. As yet the efforts to make the huyer pay the advance have not been highly successful, and the next few weeks may show that the fierce competition will simply force distant works to lower their mill prices.

The rush into the Tin Plate industry is attracting attention. Hardly a week passes by but what new projects are announced, and what is far more tan-gible, there is recorded the placing of contracts for Tin Plate machinery.

It may be of interest to note that Tin Plate Bars sell much closer to the ordinary Billet in England than they do in this country. We have reports of actual recent sales at £2. 15. delivered in Wales, equivalent to say \$18.25. In the Pittsburgh district they are reported to have sold at \$23 @ \$23.50, or say \$6.50 @ \$7 above the common 4 inch Billet. In England the difference is less than \$1.

Pig Iron.—There is a fair amount of business in the New York market, but low prices continue to be made by Southern furnace. The effect of the advance in freight rates has not vet been shown. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12 for No. 1; \$11 @ \$11.25 for No. 2; \$10.65 @ \$10.75 for No. 3; \$10.90 @ \$11 for No. 2 Soft, and \$11.15 @ \$11.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.40.

Philadelphia advices indicate that there is no unusual pressure of Iron on that msrket, although consumers recognize the fact that there are full supplies at figures recently ruling; some indeed are of opinion that they are likely to do better later on. Some very respectable sized lots of Standard Mill Irons have been taken at about \$10.50, delivered, and of No. 2 X at \$11.50 @ \$11.75, and at points such as York. Harrisburg, &c., \$10 and \$11 @ \$11.25, respectively, for similar qualities, the difference being that these points can be reached by some furnaces at about 50¢ lower rates of freight. It is believed that there cannot be any material reduction from the figures now quoted for first-class Irons, but the impression is very general that the chances for a 25¢ movement are more in that direction than toward improvement. General quotations for

Philadelphia and nearby points are about as follows:

Standard No. 1 Foundry X	\$12.50 @	\$12.75
Standard No. 2 Foundry X		
No. 2 Piain	- 10.75 @	
No. 1 Soft	11.50 @	
No. 2 Soft	10.75 🙉	11.00

Local Coke Iron has again been quite active in the Chicago market, and indi cations are much atronger of a stiffening in prices. Makers are getting such an accumulation of orders that they are more independent. They are also atrength-ened in this feeling by the fact that a considerable advance can be made without surrendering any part of their mar-ket to outside Irons. Among the orders placed during the week were several 1000-ton lots. Southern Soft Irons are in moderate demand, but no large sales have been made in this locality. Furnace companies with but locality. one or two exceptions, and those small concerns, are well sold up on this grade and hold prices very firmly. Quotations are given as follows for cash.

Lake Superior Charcoal	\$14 50 @	\$15.00
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10.00 @	10,25
Local Coke Foundry, No. 3	9.50 @	10,00

Southern. No. 2, Soft	10.50 @	10.75
Alabama Car Wheel	17.50 @	18,00
Jackson County Silvery	15.50 @	16.00
Other Ohio Silvery	14.25 @	14.50

While the output of BessemerIron in the Pittsburgh district is much heavier now than ever before, it is still true that there is a large consumption going on, and stocks are remarkably light. There is a probability that two or three of the Valley furnaces will soon change off from Bessemer to Mill Iron. Quotations are as followa:

No. 1 Foundry.......\$11.75 @ \$12.60, cash No. 2 Foundry.......... 10.75 @ 11.00 "

There has been less active demand for Southern Coke Iron during the week in the Cincinnati district, for the Iron Pipe works are out of the market, but the Southern furnaces, having sold liberally for forward delivery, are not urging stock on the market, and are indifferent about selling unless they obtain very full prices. The attempt of foundries there to buy No. 3 Foundry at less than \$7, f.o.b. Birmingham, has been unsuccessful, although some sales have been made at \$6.85. There have been considerable sales of No. 2 Foundry in the aggregate, but generally in small lots from 500 tons down to single carloads in this district. There is also a fair demand from the East for prompt shipment, in anticipation of an advance in rates of freight of about  $50\,\mathrm{e}$ ?? ton for rail and water, so that all the Iron the furnaces can furnish in the early future can be sold at pretty full prices. Quotations are as follows:

Southern Coke, No. 1		
Southern Coke, No. 2		
Southern Coke, No. 3	. P.10 🚳	
Ohio Soft Stone Coal, No. 1		15.50

Lake Superior Car Wheet and	1	

The situation of Pig Iron in the St. Louis market remains practically urchanged so far as volume of business is concerned. Prices cannot be called weak, and yet an inquiry for a few hundred tons brings out some remarkably low figures, showlog a lack of confidence on the part of the makers for any early improvement in prices. Pipe manufacturers appear to be the heaviest consumers of Iron just now, although the local architectural works, stove foundries, etc., are all working full, and are taking their shipments very freely. We quote as follows for cash, f.o.b. cars St. Louis:

# Metal Market.

Pig Tin.—There has been a sharp reaction in prices, and the market is at present in somewhat uncertain shape. The appearances are that the unusually heavy supplies are too much for the speculative "bull" syndicate to handle and that considerable realizing has taken place. Officially no sales of large lots have been reported at less than 16.10¢ for September, 15.80¢ for October and 15 70¢ for later months. It is understood, however, that some sales were made privately at as low a price as 16¢ net cash for September delivery and that ordinary jobbing quantities went at prices remarkably close to the officisl quotations. Over 1600 tons have arrived here since the 1st inst. and it is estimated in some quarters that the arrivals for the entire month will be close to 2000 tons. Granting the most liberal estimates of consumption the actual receipts add about 500 tons to the stock in dealers' hands. At the close prices were a fraction higher, spot delivery being quoted 16 20¢ net cash, and later deliveries correspondingly up. Purchases by consumers have been very moderate. Prices for small lots were unchanged at about 174¢ b lb for Straits Pig.

Copper.—Prices have been raised a fraction higher. Aside from this little has transpired. There are few and only small buyers, since deliveries on old contracts supply consumers' wants in a Jobbers' prices for great measure. small parcels of Lake Ingot are at about the level of the past few weeksnamely, 1014 1 lb.

Sheet Cupper.-There has been a decided improvement both in the volume and character of inquiries during the past week. Large consumers are agala coming into the market for stock, and some good sized orders have been placed for Cornice Copper, as well as other Sheet Copper products. Prices for Manufactured Copper are nominally without change, but the recent advance in rates for lugot has instilled a firmer tone into the market for these materials. While the volume of sctual volume of business now passing is not very Malleable...... 15.25 @ 15.75 | large, compared with the season's average in past years, manufacturers and dealers look for a satisfactory growth in the demand and a good fall and winter trade. Sheet Copper in small lots is quoted at a 15¢ P lb net basis.

Pig Lead.-Prices have been raised a trifle, in the face of more or less adverse market conditions. Several hundred tons of common Western went early in the week at about 3.17½¢, and it seems difficult to buy large lots now at less than 3.20¢. The most plausible reason given for this change is the statement that business at late prices has been unprofitable, and that producers are inclined to hold back. There is a general uncertainty about the market which may develop into something definite before long. Meanwhile the consumptive demand is quite moderate, and prices for small lots from stock average about 3\\$\psi\$ @ 3\\$\epsi\$ \\$\\ \text{1b}\$.

Lead Pipe and Sheet .- The general demand does not expand to any notable Consumers are buying, as a rule, to supply their current needs and little more. Prices in this district are apparently well maintained in accordance with the llst.

Solder.-Prices have been again marked down. Half and half, guaranteed, is quoted by jobbing houses at  $11\frac{1}{2}\phi$  and No. 1 at  $9\frac{1}{2}\phi$  @  $10\phi$ . The demand is very fair.

Spelter. - No further change has taken place during the past week. Or-dera have been few in this market and chiefly for moderate quantities of the metal, but between purchases elsewhere and the condition of the Ore market prices remain very firm. For moderate retail quantities of ordinary Western 41¢ B it is the ruling rate. Fancy brands command the usual premium.

Sheet Zine.—Consumers' demands in this market are hardly up to the average. Prices have remained on the bssis quoted for the past few weeks—namely, 5¢ B lb for 600-lb casks, and 51¢ for smaller lots.

Antimony .- Prices have remained almost stationary at 104¢ for Cookson's, and 91¢ for Hallett's, in small parcels. Little business has been done outside of the ordinary jobbing distribution.

Nickel. Sellers' figures are about 38¢ @ 40¢ for ordinary quantities, but on attractive orders some concession would probably be made.

Tin Plates.—The spot demand for all kinds of Plates during the week has naturally been moderate and confined to the supply of absolute needs-generally in the line of Roching Plates, in view of the change in tariff and the accompanying reduction of prices which is looked for after next Monday. Inquiries for future deliveries have, however, been brisker, but dealers as a rule have not cared to contract for next month's business to any large extent until they can see the drift of the October market more clearly. Some fair forward business in light weight Cokes has been transacted, but other lines of Plates have been quiet. What the actual reduction in prices will be nest week it is difficult to say. Therefore it has been difficult to say. thought inexpedient to change the quotations on imported Plates un il some really reliable rates can be given. It will probably be safe, however, to calculate a reduction of from 75% to \$1 a box on IC 14 x 20 Tin and Terne Plates, and \$1.50 to \$2 a box on IC 20 x 28, as compared with the enrrent quotations. A good increase of business is looked for when the new duty goes into effect. Free stocks of foreign Plates in hand are reduced to a com-Omaha, Neb.....

paratively small volume, but importing honses hold a good assortment in bot d, and large shipments are said to be on their way. Stocks at Swansea are their way. unusually heavy. A very fair demand for domestic Reofing Plates is noted, and stocks of the material are said not to be excessive. A number of the larger American Tin Plate works are shut down pending the settlement of the wage scale, while several of the smaller "dipping" establishments have suspended operations indefinitely, thus reducing the output materially during the present month.

A London cable dispatch to The Iron Age dated September 26, reports as follows on the British Tin Plate market: Tin Plate has been in limited demand and the market is a shade easier. nary Bessemer Cokes have been offered at 10/ and other descriptions at corresponding prices. The demand at present is chicily for export account. Stocks at shipping ports have increased to 338,000 boxes. Swanses quotations are as follows:

	10.	20	
Bessemer Cokes, IC	10	0.00	
Sigmens Cokes, IC	10	1) ((1)	
T D Stool Cakes IC.	10	(1)	
Down Corner 20 v 28	CR 19	1175	10.3/
Churcoals IC	11	11 166	12/6

Sheet Iron .- Manufacturers' agents report mills as continuing busy on orders, several of them being perforee behind hand in deliveries. The outlook behind hand in deliveries. is considered quite favorable for a good fall business. Jobbers, however, for reasons previously stated, speak of a limited retail demand for Black Iron. Galvanized Sheeta are in very active demand, with a firmer tone to prices. We quote 75 % @ 75 and 5 % off. No. 27 Common Iron Sheets in small lots are quoted at  $2.65\phi$ .

# Chicago Report.

#### CONDITION OF THE

# Hardware Trade.

HILE there has been no material W change in the business situation during the past week or two, there is a perceptible though not in all lines a very marked improvement in the volume of business and in the tone of increased hopefulness and confi-dence which characterize the trade. Manufacturers and jobbing houses generally report the demand, while not up to that of 1892, as being considerably larger than last year, and it is reony larger than last year, and it is regarded as an encouraging sign that Tools, Builders Hardware and articles connected with the machinery and supply trades are moving more freely than for a long time. Travelers who are out are sending in frequent orders, which indicate, in the di-versity of goods and moderate quantities purchased, the comparatively depleted stocks of both retailers and jobbers and the closeness and care with which both classes of trade are purchasing. Our advices from retail merchants show that they are doing a better business than for some time. and are generally anticipating a fair though not heavy trade in the near future. Prices are without important change and fail to show any general improvement. In the present condition of the iron market and of general business this is not surprising. There is an evident disposition on the Inere is an evident disposition on the part of prominent jobbing houses to ent prices pretty freely, and a good many comparatively low prices are made by them. Financial conditions are satisfactory and little complaint is made in regard to collections.

are satisfactory and fittle complaint is made in regard to collections.

Advices from Chicago,—The Northwest has had the first genuine cold snap of the season the past week. It suggested the approach of winter in such a way that jobbers expect a decided increase in the demand. winter in such a way that jobbers expect a decided increase in the demand for seasonable goods. They have already begun to experience a little of the movement, which is now sure to develop. The volume of general business above a greated increase above a greated increase. ness shows no special increase over previous weeks. The trade of the first half of the month, however, has shown such an increase over August that jobbers think they are doing well now jobbers think they are doing well now if they can keep up to the pace thus set. Staple goods are moving in somewhat better quantities, but the carload trade in Wire Nails has fallen off and Barb Wire is not doing quite as well as had been anticipated. Johbers are considering what changes they will make in prices of Tin Plate, to take effect after October 1. The changes to be made will probably not be very radical. Heavy Hardware is holding its own well. The trade in this line has somewhat exceeded the expectation of jobbers and they are rather surprised to find it running along so far into the fall.

# Notes on Prices.

Wire Nails .- The Wire Nail market is in about the condition referred to in our last report. The demand is satisfactory, and the volume of business comes up to reasonable expectations. There is more or less irregularity in regard to price, and the tone of the market is not strong. The market price for earload lots at mill is 95 cents to \$1, the former figure being usually obtainable on fair lots, but beyond it manufacturers are unwilling to go. The New York price is \$1.25 to \$1.30 from store.

Advices from Chicago.—The largest manufacturers are maintaining prices firmly in the endeavor to hold the market up and not to permit general demoralization. Cuts have been made by only one or two concerns and it is expite ed that this week will witness some developments which will tend to restore a better feeling. Orders in this immediate locality have been light, but trade outside has been fair. Jobbers quote small lots from stock at \$1.15 and report a good demand from their customers, but few applications for carloads.

Cut Nails.—There continues to be a fair and pretty steady demand for Cut Nails, for the most part in lots of moderate size. Comparatively few very large orders have been placed. Active competition continues between some of the Western mills and those in the East for the business of the territory naturally belonging to the latter, and some low prices, when freights are taken into account, have been made for goods delivered on the seahoard. Small lots from store are held at \$1.05 to \$1.10.

Advices from Chicago.—This branch of business runs along from week to week with no special feature worthy of note. Orders are small but fairly numerous, and local manufacturers are satisfied with the volume of business coming in. Jobbers quote small lots from stock at \$1.10 to \$1.15.

Barb Wire:—The Barb Wire market is rather sluggish and the fall demand has not set in with much vigor. Prices are fairly well maintained, but of late there has been some evidence of a disposition to shade quotations when necessary. Four-Point Galvanized is held at about the following prices: Pittaburgh, \$2 to \$2.05; Cleveland, \$2.05 to \$2.10; Cincinnati, Allentown, Chicago and New York, \$2.15 to \$2.25.

Advices from Chicago.—Barb Wire manufacturers report that the regular fall trade has not yet started up. They expect it to come in October with a rush. Prices latterly have weakened a trille, and jobbers are quoting small lots at \$1.90 for Painted and \$2.30 for Galvanized, with the usual allowance for carload lots.

Market Wire.—The Wire market as a whole is in an unsatisfactory condition, and comparatively low prices are prevailing. There is also a good deal of diversity in the quotations made by leading manufacturers, which justify close attention on the part of buyers to the prices at which they place orders. The condition of the market is such that very diverse prices are quoted by prominent manufacturers to those who desire comparatively small quantities, while to close buyers exceedingly low net prices are named.

The Columbia Lifter.—This article is offered by A. C. Williams, Ravenna, Ohio, and is designed for use as a stove lid lifter and for removing from ovens pans of puddings, roasts, &c. A description of the device appeared in our issue, 15th linst. The Lifter is sold to the trade at \$12 per gross net for the nickeled and \$9 per gross net for the japanned.

Refrigerator Door Fastener and Lock.—An illustrated description of this device was given in our last issue. The Fastener is manufactured by P. J. Conroy & Co., Paschall P. O., Philadelphia, Pa. It is sold to the trade

from the following list, subject to a discount of 40 per cent.

	Highly	Nickel plated
Ornamental	polishe l	brass.
brass.	brass.	Perdoz.

Tire Bolts.—An advance has been made in the prices of Tire Bolts, the new discounts being as follows:

Glass. -The principal feature of the Window Glass market during the past week is the further decline in quotations from factories. This decline does not appear to be restricted to any particular locality, as it is reported that quotations have been made in New York, Pitts-burgh and Chicago of 85 and 20 per cent. discount for single and 90 per cent. discount for double strength Glass. These quotations are for large quantities of Glass, and do not apply to prices made by jabbers to retailers. There made by jobbers to retailers. appears to be a disposition on the part of jobbers to realize what profit they can on the business they are doing, rather than to decrease prices in proportion to the lower quotations of manufacturers. It is understood that jobbers as a rule anticipate lower prices when all of the factories are in operation, and are not anticipating their wants to any great extent. Demand has therefore dropped off, as there is no apparent reason to anticipate a scarcity of Giass. It is reported that 556 pots, or their equivalent, are now in operation, representing about one-third of the capacity of the country. The demand for Plate Glass continues fair with no change in prices.

Old Metals.—The market for Old Metals is quiet, except for a few grades of Scrap Iron which are in fair demand. Prices show no radical change, the following quotations representing the rates now paid by dealers in New York:

#### American Tin Plate List.

The list of American tin plate makers and their brands, printed in The Metal Worker of July 7, having received from the trade in general many expressions of approval in respect of its usefulness, we print in this issue a complete American tin plate list, corrected to the end of last month, and propose in future publishing a table of a similar character in the first issue of each quarter. The list now presented includes all the domestic tin plate works that are actually in existence, and that are, or have been lately, in active operation. In addition to these there are, at the present time, at least half a score of works in course of erection or being planned. In regard to the particulars given as to the number of tinning sets "in operation," it should be mentioned that the returns from the works represented the situation as it was last week. Since that time many of the larger works have closed down temporarily, pending a settlement of the wage scale, and are not, therefore, for the moment exactly in the position noted in our list. A satisfactory feature of the present exhibit will be found in the fact that over twenty of the American tin plate makers are either making their own black sheets or are now preparing to do so, while others have the matter in contemplation.

#### Heating Passenger Steamers.

The heating of the large passenger steamers plying on the ocean and on our open waterways in the winter season seems to be a separate branch of business from house heating. The heating systems in the vessels built by the Government are designed by the Government engineers and erected by the workmen of the pipe fitting corps. In some of the large public shipyards the same course is pursued, while others sub-let this portion of the work to

what might be termed marine steam heating firms. Experience seems to be the best guide in apportioning the heating surface, for in several steamers of a similar character built by the same firm much difference exists in the amount of surface used in the first and last boat. In the last boat the surface exposed in the steam main running through the staterooms in some cases was found to be ample, in others a large amount of surface was required, owing to the exposure. Another feature of such work is the pitch given the piping, which owing to the motion of the boat when running is much greater than that used in buildings. It is also necessary to get the water of condensation entirely out of the pipes when the boat is not running to prevent freezing. The peculiar requirements of this work have led to its being made a specialty by a few concerns near the larger shipping ports.

# The Supply of Black Plates for Tinning.

The apprehension of a short supply of black plates west of the Alleghauy Monntains, owing to the peculiar provisions of the new tariff act, was not well founded. If such a shortage does occur, it will be at some time in the future when the capacity of the dipping plants becomes considerably larger than it is at present. Offerings of black plates have increased instead of falling off. This is not due to the closing of tin plate factories pending the readjustment of wages, since contracts are sought for deliveries extending over long periods. Foreign manufacturers of black plates are soliciting business as well as the domestic makers, so that a supply from abroad is assured if it be found that American makers cannot meet the demand or ask higher prices than consumers can afford to pay. The fact appears to be established that the Welsh manufacturers are willing to sell their product in such form as may be desired by the peculiar conditions of the American trade. If they cannot sell their product as finished tin plate they will accept the situation and sell black plates. They do not propose to lose the opportunity to sell something, if they can only get the opportunity.

## The Domestic Output

The willingness of the foreign manufacturers to take business of this character is shown by the alacrity with which they have offered consumers the full benefit of the reduction in duty. Instead of even slightly advancing their prices, under the impression that the American dippers needed to supply themselves from abroad and could stand a little squeeze, they have now gone somewhat further in the other

direction and named lower rates. This has at least been done for delivery at Western points, easily reached by local manufacturers whose output has attained such proportions that they are obliged to solicit trade. In this respect a remarkable change has but shortly taken place, the output of domestic black plates having expanded so considerably that Western dippers are almost, if not entirely, receiving their supply from the home mills. This is the case notwithstanding the great increase in the output of the tinning plants. So confident now are the Western dippers that their interests will not suffer by reason of a shortage in the supply of black plates that they are adding to their tinning facilities. Meanhile, the negotiations for a readjustment of wages in the American black plate mills are being watched with keen interest by all parties, as the sales now being made are evidently based on the lower costs which will prevail when the readjustment is effected.

# Improving Manufacturing Plants.

The latent spirit of enterprise appears to be developing in a very encouraging manner in certain lines of business. New works are being undertaken, and extensions and improvements are being made in old ones. It is noticeable, however, that this spirit of enterprise is confined to lines in which either an undoubted opportunity exists for an expansion of trade or owners of plants already built are confident that they can hold their own against any competition. Even among such concerns the impulse to progress was almost if not entirely checked by the financial troubles of the past year, but now that they have been safely passed the work of advancement can again be taken up. A great deal of capital is sure to be invested at no distant day in making improvements in workshops of all kinds in the introduction of labor saving appliances. Builders of machinery and devices of this character are receiving inquiries in constantly increasing volume from manufacturers who say that they must find a way to cheapen costs in order to retain their hold on the trade. A little further culargement in the general demand, which will show that the future really has better things in store, will cause orders for such appliances to be placed which will considerably stimulate the engineering establishments.

The export trade of the port of Savannah, Ga., for the year I893-94 shows an increase in value of \$5,230,000 over that of the previous year. The greatest increase was in cotton and phosphate

# THE LETTER $\mathbb{B}(\mathbb{I})X_{\mathbb{I}}$

#### A Tin Roof Problem.

From B. J., Indiana.-I have a large church roof to repair, the roof having been put on some two or three years ago, but the tinner who did the work got his standing seams too low, so that they leak at every rain. Can you inform me how to stop this leak with little expense! I did think of getting some roofing cement and mixing it with japan dryer thin enough to make it stick and But the filling the seams with it. trouble is, if it dries hard will it not crack and fall out, and thus let the roof lcak again?

Answer. - As our correspondent intimates, we fear that the roofing cement that he proposes to use would, when dry, crack, and thus fail to fulfill the purpose for which it was applied. We would suggest that if the seams are given two or three coats of hot tar they will be made tight. The tar is heated in an iron boiler over a wood fire and applied with brushes to the seams. The second and third coats should not be applied until the first one is completely dry. Should the black streaks of tar be objectionable the seams can be painted any color desired.

### A Hard Worked Pump.

From G. W. G., Pawling, N. Y .- I was recently called in to repair a wind mill pump and found it set as shown by the sketch I would like to ask the readers of The Metal Worker if anything was gained by setting the pump down in the well 30 feet and having the suction pipe enter the well about 4 feet below the top of the well and then run down to the pump. The pump does not work well and I would like to know what to do to get more water.

Note. - If the pump was set at the top of the well it would be above the limit that water is raised by atmospheric pressure, as the water line is shown to be 40 feet below the top of the well. A pump works on the principle of exhausting both air and water from its chamber and the atmospheric pressure on the surface of the water forces the water up into the pump to a hight of 34 feet or less. Our correspondent has evidently made an error in some of the dimensions given, for if the suction pipe entered the pump well 4 feet below the top water would have to be lifted 36 feet before it flowed down to the pump, which would not be possible. The fact that the pump does work shows that the lift is considerably less than 36 feet. The sharp turn in the suction pipe and the friction due to its length are a tax on the pump. Because of the sharp turn and the great length of the discharge pipe, 2500 feet, considerable power would be required

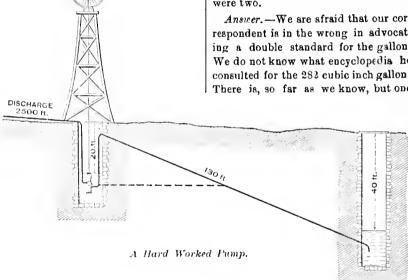

to overcome the friction and drive the water through it, sa the sketch suggests that this pipe has a slight ascent which must be overcome. The pump would be materially relieved if the suction pipe was run as shown by the dotted line, as it is probable that the pump has been set so deep, as shown, to prevent its becoming frozen. This change in the auction pipe would reduce the possibility of an accumulation of air, which can now collect at the top of the turn in the pipe and which would make an irregular discharge and a jerky action that would be very hard

ive results. If the galvanizing on pipe is not destroyed by overheating and the iron is perfectly protected by the costing, galvanized pipe will render good service.

#### Size of a Gallon.

From J. T. W., Omaha, Neb.—Please inform me through The Metal Worker if there is more than one standard gal-I see in referring to the encyclopedia that it gives ale measure 282 cubic inches and wine measure 231 cubic inches. Is milk measured by ale or winc messure, if there are two? The inspector of weights and measures was in my place the other day and I asked him what standard milk was measured by. He claimed that there was but one standard measure, and I held that there were two.

Answer. - We are afraid that our correspondent is in the wrong in advocating a double standard for the gallon. We do not know what encyclopedia he consulted for the 282 cubic inch gallon. There is, so far as we know, but one

on the pump. The discharge pipe should be several sizes larger than required by the pump and the sharp turn should be removed by the use of 45° ells. These changes will enable the pump to render better service, but if any greatly increased supply is required a more powerful pump set lower, larger pipes and a direct suction pipe without turns will be necessary.

## Copper Smoke Pipe.

From F. H. P., New Bedford, Mass Will The Metal Worker please state what is the best metal for a smoke pipe for a hot air furnace? Would copper be better than galvanized iron?

Note.-This is a question on which different opinions may be held. If the first cost is not considered copper has the advantage, though pipe that has not been galvanized can be cited that has lasted 20 years. Where pipe lasts but a short time the cause may often be traced to a sluggish draft in the chimney, and the condensation would also attack copper pipe, but not with such destruct-

standard gallon in the United States, which is the one holding 231 cubic inches. The English gallon contains 277.274 cubic inches. The gallon has been subject to many changes since it was first standardized, way back in the thirteenth century, but at present we know of no other than the 231 cubic inch gallon for this country.

### Water Lime,

From J B. D.—Plesse inform me through The Metal Worker if there is more than one kind of water lime?

Note. - By water lime we presume our correspondent refers to what are known as hydraulic limes, which slake more slowly than air lime and when in paste harden very slowly under water or in wet localities. The hydraulic limes are made from stone containing from 18 to 30 per cent. sllicate of alumina, of earbonate of magnesia or of a mixture of both. It will be seen from this that there may be many varietles of hydraulic limes.

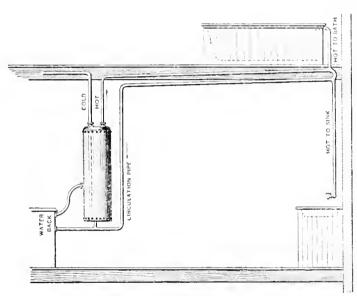

### Water Back Overtaxed.

From J. G., Red Bank, N. J .- I have a job piped with iron pipe, as shown in the sketch, in which it is impossible to get the water hotter than lukewarm. A & inch supply connects at the top of the boiler and a tube of copper runs within 6 inches of the bottom of the boiler. A 4 inch hot water pipe runs from the top of the boiler to a sink and bathroom and then is reduced to a §. inch pipe, which returns to the boiler and connects with the pipe which car-ries the cold water from the boiler to the water back. The cold water pipe to the water back runs 18 inches from the center of the boiler to an cll which turns along the range to the water back 18 inches further, when another ell is used in making the connection. The return is made by an ell at the water back, then 2 feet of pipe and a 45° ell, from which a pipe runs to the bent coupling at the side of the boiler. Both of these pipes are & inch. All of the pipes have a heavy fall and the bathroom is on the second floor, all the

it fails to heat the water. Some drawback in the way of friction and slow circulation would result from the ella in the piping to the boiler. It is probable that the result desired by our correspondent can be best obtained by doing away with the water back, using a solid fire pot in the range and running a coil of 1 inch pipe around the top of the fire pot. It should be run so that it will not obstruct the draft, yet will be subjected to the hot gases passing over it as well as being heated direct by the fire. There is nothing in the piping of the job to be criticised except that larger than a 1 inch return pipe is seldom used on so small a job, and often a a inch pipe is considered

#### Repairing Granite Ware.

From L. M., State College, Pa -Please inform me as to whether you

Water Back Overtaxed.

other fixtures being on the first. The range used is a No. 8 hot air range with an oval cast iron fire pot, which is cut out on one side for the water back. If the water cannot be made hotter the job will not be satisfactory.

Note. - Evidently a great deal of work is required of the fire, which must cook on top of the range, bake in the oven, heat the kitchen and heat a current of cold air to be used in warming another room as well'as heating the water in the boiler and the constantly cooling circulating system by means of the water back. The water back in such a range is usually exposed to the air current on one side, which has a cooling effect, and the fire chambers are not ordinarily increased to meet the extra requirements. The cast iron fire pot with the air currents outside of it absorb heat and chill the outer portion of the fire very rapidly and do not leave it in a state to have a powerful effect on the water back. It is probable that the water back is placed on the side away from which the gases are drawn, and they have very little effect upon it, and, as a consequence, know of anything for repairing granite ware. We have a great deal of this work to do, and I would like to know of some better plan than simply soldering. I would also like to know if there is any way to clean spots from Russia iron.

Answer.—In The Metal Worker of August 25, 1894, was a letter from Collins & Richards, Cincinnati, Ohio, in which they refer to an enamel cement which they make for the purpose of repairing such ware. We do not know of any way to clean Russia iron. The spots mean that the planished surface is corroded, and while it can be made smooth by rubbing it would be difficult, if not impossible, to get back the original dark polish of the metal.

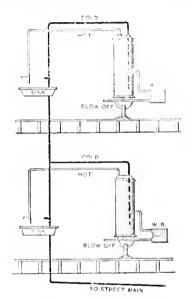

## Sims' Patent Gutter.

From SIMS MFG. COMPANY, Newark Ohio.—We notice a letter in The Metal Worker of September 29 asking for the address of the manufacturers of Sims' patent gutter. We wish to say that we own the patent and manufacture the gutter.

# Hot Water Backs Into Supply.

From W. J., Brooklyn, N. Y .- I send herewith a rough sketch of a plumbing job I am puzzled over. The boilers in two flats, one over the other, are supplied with water from the same main, which also supplies the brauches which run to the sinks. When there is a good run to the sinks. When there is a good fire in the range in the upper that and none in the lower range hot water runs from the cold water faucet on the lower floor when it opened. I have looked the job all over for the cause of the annovance without success. A new tube that runs to a point 6 inches from the bottom of the boiler was put in about three months ago. The boiler is coupled at the top correctly, there are no trups in the piping and there is an ample water supply. I will be glad to hear of a remedy soon, as it is unpleasant to wait five or six minutes for cold water to come. The boilers do not get extra hot or the water in them.

Note.—It is not an uncommon thing for hot water to back into a supply main for a considerable distance, even to the hydrant in the yard. It is possible that a separate branch from the

Hot Water Bucks Into Supply.

main in the cellar to the boiler would overcome the trouble if the heating power is not strong enough to send hot water beyond the branch. Another plan would be to put a piece of casting or fire brick between the water back and the fire, to reduce the heating power. Some risk would attend the use of a check valve if a hole was not drilled in the check, or a notch filed in it, to provide for the expansion of the water when heated. The check valve would prevent a considerable amount of heat passing, as the notch or hole need not be larger than is inch in size. The necessity of the notch or hole will be understood when it is stated that water expands about 1 gallon in 23 when heated, or about 2 gallons in a 40gallon boiler. If the check valve was tight and the boiler was full of cold water, and a fire lighted, there would be sufficient expansion when the water was heated to split the pipe, boiler or water back, whichever was weakest-and probably it would be the water

#### Boss Squaring Shear.

The accompanying illustration shows the boss squaring shear, made by the Niagara Stamping & Tool Company of Buffalo, N. Y., which was especially constructed for the manufacture of nestable stove pipe. It is distinguished from ordinary squaring shears through the combined grooving and hold down

possesses all the merits of the machines of this kind manufactured by the above firm

#### Rock Wool Sectional Covering.

The covering of heating pipes, whether for steam, hot water or hot air, has been demonstrated to effect a very substantial saving in fuel. The

Boss Squaring Shear.

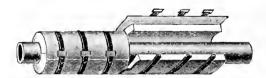

attachment in front of the cross head carrying the upper knife. The ma-chine can be used like an ordinary squaring shear, with or without hold down, or for cutting and grooving at the same time, or for grooving only. The hold down forms a clamp which holds the sheet firmly down upon the bed and thereby prevents "draw cuts." This hold down can be thrown in or cut of operation by simply depressing the treadle and then throwing the hand lever shown in the middle of cross head to the left, which will lock the hold down in position out of action. When it is desired to use the shear for cutting and grooving, or for grooving alone without cutting, a blade shown is fastened upon the shear bed in front of and the proper distance from the lower knife, and securely fastened by means of thumb screws underneath the table. An adjusting screw to the left of the clamp is then turned to adjust the hold down to the turned to adjust the hold down to the width of the groove desired, and tuc thumb acrews in front of the hold down are fastened. Next the hand levers on both sides of the hold down are raised and the whole is ready for operation, the preliminaries not requiring more than one or two minutes' time. The back gauge is adjusted for the The back gauge is adjusted in proper width of the pieces to be cut and grooved, and the sheets held against the front gauge. When a piece is cut off the same is at once grooved, so that after the pipe is formed and the 'hook' folded in a Wright's folder, the sheets can be locked together and act down with a mallet. The shear, it is said,

picture here presented shows the rock wool sectional covering made by the New York Fireproof Covering Company, 126 Liberty street, New York. It consists of a non-conducting mineral formed into blocks of more or less flexibility, mounted on canvas and secured to the pipe by thin sheet metal straps. It is made for all sizes of iron pipe from ½ to 12 inch and for hot air fur nace pipe. It is also made for covering steam boilers, hot water heaters and hot air furnaces to prevent loss of heat. It is claimed that by its use the

Burning Gas.

BY A NOVICE.

It is deemed by some who undertake the manufacture of gas burners for fuel purposes to be advantageous to heat the gas and air in an atmospherie burner before it reaches the point of ignition. The object is to avoid a reduction in the power of the flame by the introduction of a cold mixture, but there are other important points to be considered. One man claims that he would prefer that the burner should never rise in temperature above that at the time when it is lighted and has arranged as far as possible to accomplish this result. The explanation given is on this lasis: All burners are arranged to consume one part gas and several parts air. The orifice through which the gas is fed is regulated at 1 part gas to, say, 6 of air at the point of mixing. The gas being under pressure the quantity will be maintained and will drive in with it, at first lighting, the quantity of air arranged for, when there will be 1 part gas, 6 parts oxygen and 24 parts ni-trogen. If the mixture is heated all of the constituents will expand and as the gas is under pressure its quantity will be maintained, when its expansion will quantity of air from entering. A double reduction in the air supply will result from the expansion of the air, so that it is quite possible that the 6 parts oxygen, mentioned for illustration, may be reduced as low as 4 parts, or lower, when the flame changes in character and efficiency. Where the burner is used efficiency. by an experienced man and has an air regulating device, the regulator may be opened and the quantity of air properly adjusted. Should such a burner light back and it become uccessary to shut it off and relight it while it is hot, it would be necessary to reduce the air supply very low and let the gas on full before attempting to relight. Most of the burners in use do not have an air regulator and the change in the character of the flame is due to the cause just described. To prevent a radical change in the flame after the burner has become bot, the gas orfice is made to insure a proper flame when the burner is heated. This gives a very small quantity of gas in proportion to the air when the burner is cold and consequently the lighting back occurs. The remedy then applied by many, instead of being to let the gas flow a bit before trying to

Rock Wool Sectional Covering.

saving in fuel is sufficient to pay for its cost in a short time. In hot air furnace work less difficulty is said to be experienced in heating rooms on the windy side of a house or with long pipes running through a cold ceilar. In steam there is much less conder sation in the delivery, and in hot water the water reaches the radiaters at a higher temperature. The company are issuing circulars giving prices and deceriptions and an account of a test made, where pipes covered with their material condensed but one third of the steam condensed in a bare pipe of the same size.

light, is to enlarge the gas orifice, often in this way spoiling the burner.

Imports have increased to such an extent at Philadelphia that the wharves were choked up with goods last week, and the Collector of the Port was compelled to request a considerable increase to his force of customs officers.

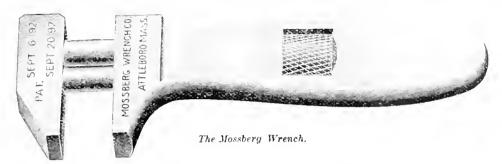

A St. Louis dispatch asserts that an English syndicate is negotiating for the purchase of all the street ear manufacturing plants in that city with a view to their consolidation.

# THE RETAIL STORE.

#### The Mossberg Wrench.

Mossberg Wrench Company, Attleboro, Mass., are offering a wrench with rapid adjustment, as here shown. The handle of the wrench is drop forged, with drawn steel rods for the shank. and one end of the swing strop is passed through the opening between the revolving slider and the cross bar. The strop is held in a horizontal position and by moving the machine forward and back over the strop the friction causes the blade to be reversed

ing the last two weeks of September the firm sold 11 stoves, half of which were with complete housekeeping outfits. The firm have a novel advertiscment in the shape of a bicycle, which is on exhibition at the post office in Spencer. It was built by Henry Fisher

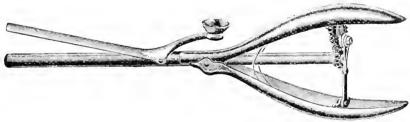

This method of construction, the manufacturers remark, insures a wrench that for strength, symmetry, durability and lightness meets all requirements. The wrench is alike on both sides, measures 4½ inches in length, opens 1½ inches and weighs 6 ounces.

# The Service Stropping Machine.

The accompanying cut represents a stropping machine for rszors, put on the market by E. Lothar Schmitz, 92 Reade street, New York. The metallic parts of the machine are nickel plated, with black enameled handle and a substantial cross bar. A nickeled metallic attachment, with brass set screws A and B is used to keep the handle and blade of the rszor in a straight line. In adjusting the attachment to the back of the shank and handle the hook of the screw A is passed through the handle and turned, then fastened in

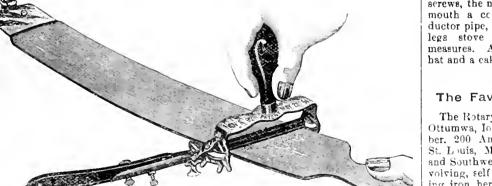

each time, automatically turning it on its back with the cutting edge pressed against the strop. It is remarked that the strokes may be short or long, quick or slow, just as desired, and that in every case the machine will work to

and Duane King expressly for use as an advertisement. The wheels are two huge grindstones, the sprocket wheels are well curb wheels and the chair is such as is used in wells. The frame is made up of a shovel, axe helve, one

The Favorite Curling Iron.

perfection, giving the blade a fine keen edge, such as never can be produced in the ordinary way of stropping. The point is made that the strop will not be spoiled, as it is quite impossible to cut double harpoon fork, two single harpoon forks, two fork handles, two neck yokes, grindstone hanger, &c. The handle bars are lead pipe and the seat is a scoop shovel. The rider lights his way by means of a lantern with a reflector. The body of the rider is a coil of rope and a butter bowl. The neck is a tin pail, the head three pie tins, the eyes are can serews, the nose a coffee pot spout, the mouth a cooky cutter, the arms cenductor pipe, the hands are weeders, the legs stove pipe and the feet gallon measures. A kettle cover is used for a hat and a cake tin for a collar.

The Service Stropping Machine.

B

place by screwing the knurled nut. After this the screw B is turned until the handle and blade arc tightened in a straight line. The screw B, when once properly adjusted to a rezor, needs no further resetting. The rezor blade is then slid in the frame holder

into the leather. The stropping ma chine is sold together with the strop.

Fisher & Sons are enterprising dealers at Spencer, N. Y., and make a specialty of the products of the Corning Stove Company, Corning, N. Y. Dur-

### The Favorite Curling Iron.

The Rotary Curling Iron Company, Ottumwa, Iowa; Heimbuecher & Webber. 200 American Central Building, St. Louia, Mo., agen's for the South and Southwest, are offering the self revolving, self adjusting reversible curling iron here shown. The curler revolves in either direction at will, adjusting its own gearing by having the clamp button turned once arcund in the direction desired. The point is made by the manufacturers that the curler does its work so easily and quickly that but one heating is necessary for curling the hair, thus saving much time and annoyance incident to the old methods; and that the curler is superior to any ever placed on the

# The Wernicke System of Hardware Shelving.

Illustrations are presented herewith of an ingenious and convenient style of hardware shelving and drawers manufactured by the Wernicke Company of Muncapoli, Minn. The inventor of this system of shelving recog-

will be seen on examining the end on the left. These horizontal sections are called crates by the manufacturers. The construction of a crate is shown in Fig. 2. The cross pieces separating the compartments are held in position by a board extending down the center of the top and two boards along the ends of the bottom. All crates being made in the same way, it will be seen

Fig. 1.-The Wernicke Hardware Shelving and Drawers.

nized the fact that hardware merchants require shelf and drawer fittings more than almost any other class of merchants owing to the character of the goods they handle. Yet it is difficult always to suit the requirements of stock or space. Shelving built rigidly in its place according to arbitrary measurements, no matter how carefully con-

that when one is placed over another the two bottom boards of the top sec tion together with the single board of the under section will make a complete bottom for a shelf or a drawer compartment, and they are so carefully fitted that they interlock and cannot easily be upset. Fig. 3 shows a crate with the compartments supplied with drawers.

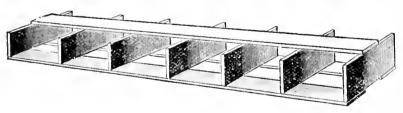

Fig. 2.—Crate.

sidered, often proves not completely adapted to the stock. Small beginners also find their enlarging trade requiring more shelf room from time to time. It is desirable to have additions harmonize with the original plan. Again, when a merchant finds it necessry to remove to another location, which will happen sometimes, the cost

Open shelving or drawers can be used as desired. The crates are interchangeable as well as the drawers, so that they do not have to be marked when taken down for removal.

The company manufacture a standard size of either oak or ash in antique finish to fill orders for immediate shipment. They take orders, however,

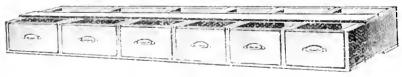

Fig. 3.—Crate Supplied With Drawers.

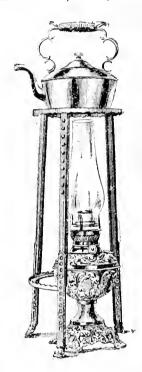

of the change is greatly reduced if the shelving can be easily taken down and refered. The shelving effered by the Wernicke Company meets these requirements. Fig. 1 shows a drawer case of their design, consisting of two vertical sections. The line of division is seen down the center. This case is built in separate horizontal sections, as

for any dimension desired and with finish and trimmings to suit individual tastes. The claim is made that first cost is less than common board shelves with plain plue boxes. No esrpenter being required to move or change the shelving a considerable item of expense is thus avoided subsequently. Although the company have not been

long in the field they have furnished quite a number of hardware stores in the Northwest with their system of shelving.

## Adjustable Lamp Frame.

W. G. Creamer & Co., 96 John street, New York, are offering an adjustable lamp frame, to allow of lamps being utilized as atoves, as shown in the accompanying cut. The frames are made of iron, painted solid colors, in red, olive and dead black, and each frame is accompanied by bolts and screw driver for putting them together. The length of the legs is adjusted at the bottom when setting up the frame, so that the top of the chimney will be about \( \frac{3}{4} \) inch below the top of the frame. The device is designed for use with any ordinary kerosene lamp, to utilize the heat for cooking purposes without interfering with the light. The frame is made in three sizes, Nos. 8, 12 and 16,

Lamp Frame Work.

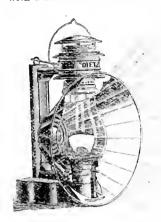

adjustable in hight from 8½ to 26 inches, with tops from 5½ to 8 inches in diameter. The No. 8 is designed especially for use in the sick room or nursery and the larger sizes for light cooking. Sad irons can be heated, it is stated, and baking of tea biscuits can be accomplished perfectly by placing a small tin oven on the top of the frame. The frames come knockdown, packed in pasteboard boxes 1 inch thick.

#### Aluminum Ware.

Silver & Co., 304-314 Hewes street, Brooklyn, N. Y., have begun the manufacture of a line of aluminum cooking and household utensils. They have ready for shipment four series of lipped rigid handle saucepans of 1, 2, 3 and 4 quarts capacity, ranging in price from \$5.50 to \$10.80 per dozen, net; two sizes of Berlin saucepans, with covers and handles; two sizes of tea kettles, holding 4½ and 6½ quarts, made entirely of aluminum, with cold handles also, an 8 inch spider of cast aluminum and cast cold handle, together with lemon reamers, &c. They will extend the line as fast as possible.

## Revolving Search Light.

The picture herewith shows the Revolving Search Light, a new lamp recently put on the market by the R. E. Dietz Company, 60 Laight street, New York. It consists of an oil tank, burner, glass globe, an upright tubular section and a revolving reflector. It is provided with a bail so that it may be carried as

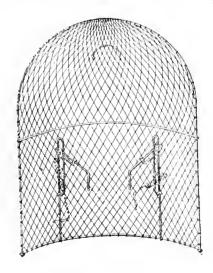

Revolving Search Light.

a lantern and arranged to be hung up in warehouses, &c., or for lighting the lawns of suburban residences. The reflector is so arranged that it may throw the full light in any direction as it moves in a circle around the globe. It is made in two sizes, Nos. 30 and 60, the smaller size being arranged for a bullseye to be attached to the burner plate. A simple device is provided for raising the globe for lighting and cleaning. It is claimed that these lamps will not blow out in a wind and that they give a powerful and brilliant light.

## Extension Fire Guard Arm.

The Cincinnati M'g. Company, Cincinnati, Ohio, are offering extension arms in connection with fire guards, as

Extension Fire Guard Arm.

shown herewith. The arms are made to raise or lower to fit the grate bars, also to be extended or thrown back to fit any grate. The point is made that thia is a desirable addition to fire guards, as grate baskets vary much in size and style. When extension arms are specified in ordering guards the company furnish them without additional coat.

### New Era Axle Sash Pulley.

The cut here shown represents an axle sash pulley put on the maket by the Empire Forge Company, Lansing-burgh, X. Y. The manufacturers remark that the axle pulley runs perfectly true, being held in position by steel stirrups, and that it has double bearings and a solid case. They state that

Paus, Fry Paus, Dripping Paus, Drinking Cups, Water Dippers, Pie Plates and Perfection Cake Paus. These are made with satin finish and present a most handsome appearance. The firm have issued a catalogue entitled "Pure Aluminum Ware," which is worthy of the fine line of goods of which it treats, It is printed in blue ink on fine paper, with illustrations in aluminum bronze, is bound in heavy paper the color of

New Era Axle Sash Pulley

the pulley has been tested to an equiva lent of 30 years' use without showing any wear. The pulleys are made in 1<sup>2</sup>/<sub>4</sub> and 2 inch sizes, with both plain and ground wheels.

# Empire Stencil Dauber.

Empire Forge Company, Lunsingburg, New York, are introducing a novelty in stereil daubers, as shown

Empire Stencil Dauber.

herewith. The brushes have solid metal handles and ferrules with black bristles. The handles are tinned, and the brushes are packed in paper boxes.

# MEMORANDA.

ARTICLES OF INCORPORATION have been filed at Omaha, Neo., by the Hibrecker Stove Company, with a capital stock of \$40,000. The concern have been organized to deal in stoves, hardware and Louse furnishing goods, succeeding John Hibrecker, Jr., whole sale dealer in stoves.

SIDNEY SHEPARD & Co., Buffalo, N. Y., and C. Siduey Shepard & Co., 23 and 25 Randolph street, Chicago, are now off-ring to the trade a line of domestic utensils of their own manufacture made of pure aluminum, The line made thus far comprises Dish Pans, Milk Pans, Sauce Pans, Preserving Kettles, Pudding Pans, Cake Pans, Muffin Pans, Corn Cake Pans, Wash Bowls, Square Bread

which suggests aluminum, and is mailed in envelopes of the same paper.

McKenny & Waterbury, 164 Congress and 108 Frankin streets, Boston, Mass., are offering the trade "a new household comfort" in the shape of the Ansonia combination lamp and stove, which can be used for either lighting or heating purposes. With the exception of the radiator or cylinder, which is made of Russia it in, all the parts are nickel plated. The flame and heat are regulated by a patent wick moving device, the same sals used on the Ausonia Mammath lamps. The oil fountain has a capacity for 4 quarts and will furnish fuel for ten hours when the device is used for heating purposes and 12 hours when used for lighting. The diameter of the Ausonia lamp is 8 mehes and the hight 27½ inches.

# The Perfection Vegetable Slicer.

The Leavitt Machine Company, Orange, Mass., are offering the trade a vegetable slicer, as here shown. It

The Perfection Vegetable Slicer.

consists of a board, in which an oblong opening is made diagonally near the cutter and concaved on one side. The knife is placed on the flut side over the opening in such a position as to make a shear cut both ways. The cutter is made of ateel, with beveled edges, and is attached to the board by means of two screws. The device is designed for alicing potatices, apples, cucumbers, and all kinds of fruit and vegetables.

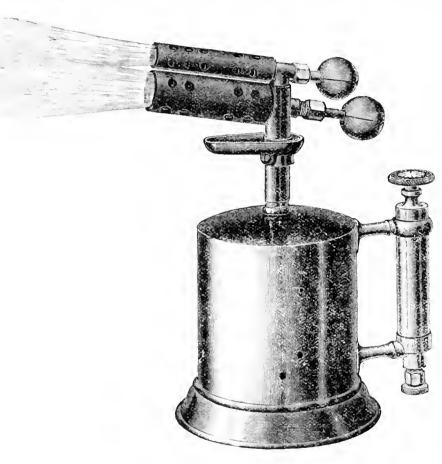

### The Duplex Hot Blast Blow Pipe.

The accompanying illustration shows the Duplex hot blast blow pipe for gasoline, just brought out by the White Mfg. Company, 40 and 42 State street, Chicago. It is fitted with two burners, one being of the standard size and the other of small size. When heavy work is to be done both burners are used. On light work the small sized burner can be used alone. This tool is intended for soldering, brazing, burning paint, thawing frozen pipes, making heavy soldered joints, &c. The generator is of double the usual strength, but can be regulated to furnish a flame of any size desired. The needle valve is fitted with a patent renewable seat, which can be replaced when worn out at a cost of only 10 cents, making the torch equal to new. The reservoir is made of one

vention of smoke, of fuels, natural and artificial, and of electrical apparatus Applications for space should be made to H. Engel, at the exhibition offices, Northeastern Bank Chambers, Sunderland

#### Thin Films of Gold.

The Journal of the Franklin Institute states that one of the interesting ex hibits made at the recent conversazione of the Royal Society, held June 13, 1894, was that of J. W. Swan, who presented a number of specimens of leaves of gold of extreme thinness, which had been prepared by the process of electro deposition. From a brief notice of the exhibit, published in London Nature, it appears that it represented an attempt by Mr. Swan to produce gold leaf by electro chemical instead of mechanical means. "The leaves

The Duplex Hot Blast Blow Pipe.

piece of specially rolled brass of heavy gauge, rendering it leak proof. The air valve is at the bottom of the pump, dispensing with outside tubes. pump is simple, but provides a very strong blast while it drains every drop of gasoline. The reservoir is tested to 30 pounds pressure.

The directors of a large Brooklyn jute bagging factory are out with a letter to their employees announcing that they will be obliged to close their mill on account of the removal of the duty from bagging, and the consequent inability of the industry to meet the competition of foreign cheap labor.

An engineering and industrial exhibition is to be opened in Sunderland, England, in November next, and is to be continued for about two months. Space is to be set apart for the exhibition of gas appliances of all kinds, of grates and stoves designed for the pre-

were prepared by depositing a thia film of gold on a highly polished and extremely thin electro-copper deposit. The copper was then dissolved by perchloride of iron, leaving the gold in a very attenuated condition. The leaves were approximately 10000000 inch thick, and some of them mounted on glass showed the transparency of gold very perfectly when a lighted lamp was looked at through them."

It will doubtless prove somewhat of a surprise to Mr. Swan to learn that ideatically the same method of procedure for the production of films of metal of extreme tenuity was described and illustrated by A. E. Outerbridge, Jr., in a lecture delivered before the Franklin Institute in 1877, an abstract of which was published in the Journal. At the stated meeting of the Institute held May 16, 1877, the then resident secretary, the late J. B. Knight, made reference in his monthly report to the thin gold fi ms produced by Mr. Outerbridge in the following terms:

Transparent Gold .- In the course of a lecture on gold, delivered before the Franklin Institute on February 27 last, A. E. Outerbridge, Jr., of the Assay Department of the mint in this city, gave an account of some experiments he had made with the view of ascertaining how thin a film of gold was necessary to produce a fine gold color. The plan adopted was as follows: From a sheet of copper rolled down to a thickness of  $\frac{5}{1600}$  inch, he cut a strip  $2\frac{1}{2}$  x 4 inches. This strip, containing 20 square inches of surface, after being carefully cleaned and burnished, was weighed on a deli-cate assay balance. Sufficient gold to produce a fine gold color was then deposited on it by means of the battery; the strip was then dried without rub-bing and re weighed and found to have gained 10 grain, thus showing that 1 grain of gold can, by this method, be made to cover 200 square inches, as compared to 75 square inches by beating. By calculation, based on the weight of a cubic inch of pure gold, the thickness of the deposited film was ascertained to be  $\frac{1}{080400}$  inch, as ngainst  $\frac{1}{367650}$  for the beaten film. An examination under the microscope showed the film to be continuous and not deposited in spots, the whole surface presenting the appear-

ance of pure gold.

Not being satisfied, however, with this proof, and desiring to examine the film by transmitted light, Mr. Outerbridge has since tried several methods for separating the film from the copper, and the following one has proved en-tirely successful. The gold plating was removed from one side of the copper strip, and by immersing small pieces in weak nitric acid for several days, the copper was entirely dissolved, leaving the films of gold, intact, floating on the surface of the liquid. These were collected on strips of glass, to which they adhered on drying, and the image of one of them is here projected on the screen, by means of the gas microscope. You will observe that it is entirely continuous, of the characteristic bright green color, and very transparent, as is shown by placing this slide of distoms behind the film. By changing the position of the instrument, and throwing the image of the film on the screen by means of reflected light, as is here done, you will see its true gold color.

Mr. Outer oridge has continued his experiments, and, by the sume processes, has succeeded in producing continued films of the producing continued films. tinuous films, which he determined to be only the 2708000 inch in thickness, or 10,584 times thinner than an ordinary sheet of printed paper, or 60 times less than a single undulation of green light. The weight of gold covering 20 square inches is, in this case,  $\frac{13}{10}$  grain; 1 grain being sufficient to cover nearly 4 square feet of copper. As you see, the film is perfectly transparent and continuous, even in thickness, and presents all the characteristics of the one shown before. That a portion of the image appears darker is due to superposed films, the intensity of the green color being proportioned to the thickness through which the light passes.

Ex-General Master Workman Powderly of the Kuights of Labor has been admitted to the bar in Pennsylvania, and will, it is said, practice law in New York City.

The German Government proposes to grant a concession for laying a new cable between Germany and the United States, the cable to be laid by 1897.

# PLUMBING and GAS FITTING.

#### Chief Wade on Sewer Gas

The following is an extract from a The following is an extract from a paper on 'Sawer Gas, and How to Detect It," prepared by Caief Rufus R. Wade of Massachusetts, and read by Colonel Henry Splaine, one of the Bay State delegates to the Factory Inspectors' Convention at Philadelphia. It became by caving that there is no longer began by saying that there is no longer any excuse for ignorance on this subject, which is one of importance to every householder. By a strange anomaly, men who work about sewers are free from malaria, and yet whole families are subject to epidemies which come from this deadly gas. It is the germs secreted therein that make it deadly. Those who are already deb'litated, as well as children and operatives in our large factories, are most vulnerable to its influence because they are restricted to the house.

If the amount of sewer gas is excessive in an apartment it will be readily detected, but it is at the same time possible for enough to flow in to be highly injurious. All connections with the injurious. sewer should be perfectly gas tight, with no openings in the connections to allow the gas to enter the apartment. There are two ways of detecting the presence of gas—the amoke test, and the oil of peppermint test, but there are instances in which these tests may act satisfactorily at one time, and yet at another not show the danger of sever gas. This is due to a defect in the drainage system, which should have regular attention by the householder after it is put in, as traps that are perfectly air tight when introduced may become loosened by use.

The defective drainage of a single tenement may set in operation causes A garbage beyond human control. heap in a backyard contains germs of an epidemic that may depopulate a town. Now, the most serious mistake which is so commonly made in this matter is to attach supreme importance to causes of public sickness that are displayed and palpable, and entirely over-look those that are hidden. A pile of filth in a public thoroughfare arrests attention, and is promptly removed. Yet it may be far less perilous to public health than the leakage of sewer gas, which, if inodorous, as it often is, does its deadly work in secret.

Observance of Plumbing Law.

The following from a Boston paper will show that there is nothing object tionable to the plumbers in that city in submitting to an examination:

"That the plumbing business is fast becoming popular, doubtless owing to tits fabled profitableness, is shown by the number of applicants for licenses. According to law, all persons wishing to engage in this business must be ex amined by a Board of Commissioners, who shall pass upon their efficiency. uno anali pass upon their emerchey.

Last year there were, on an average, six applicants a week, while now the average is 40."

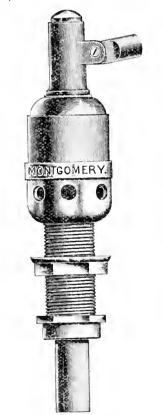

The diaposition to work according to law, shown by the increased applications, is creditable to the Boston plumb-

ers. Business men seldom depart from well established customs quickly, and the provisions of the law must have been very satisfactory to all concerned to bring such a number to promptly seek licenses.

In some places much opposition has been made to the advance in the methods of doing plumbing work, as required for good sanitary conditions. The opposition has not always come from those whose bills for plumbing work have shown an increase, but frequently from plumbers who have not frequently from plumbers who have not been progressive and kept informed on modern plumbing methods and systems. such men having been in business for years object to being examined as to their competency, but if they have no fear of passing the examination, as seems to be the case in Boston, there is no reason why they should object to what is required in the general interest of all good citizens. In several cities there are trials pending of plumbers who have ignored the law and who would have been far less inconvenienced had they done their plain duty, and which they will be compelled to do in

### The Montgomery High Pressure Ball Cock.

H. C. Montgomery, 90-92 Wood street, Cleveland, Ohio, manufactures

Montgomery High Pressure Ball Cock.— Fig. 1 .- General View of Valve.

an improved high pressure ball cock, a general view of which is shown in Fig. 1 and a sectional view in Fig. 2 of the accompanying illustrations. The par-

ticular claim made for it is absolute noiselessness in operation. When the water enters the inlet passage it flows up into the air passage and there forms

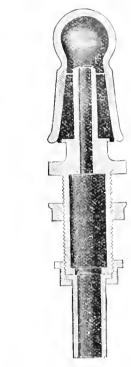

Fig. 2.—Sectional View of Valve.

a cushion for the closing of the valve. When the valve is opened the cushion is relieved and the water discharges itself in umbrella shape down its cone shaped bearings, cleaning and washing off the parts in its downward course, thus, it is pointed out, making it impossible for any substance to lodge on the valve seats.

## Vermont Master Plumbers.

The Vermont Master Plumbers' Association which was organized in Rutland, April 11 last, held its semi-annual meeting at the Van Ness House, Burlington, September 24 About 25 were present, a number of Burlington plumbers joining the association. The objeets of the association are stated to be the enactment of a smitary law by the Legislature to create more efficiency in boards of health, to improve the class of work done by plumbers and for social intercourse. Remarks were made by John Mitchell, president, and W. Emmet Crosby, executive clerk of the National Association of Master Plumbers.

The following officers were elected:
President, G. H. Holden of B trlington;
secretary, J. P. Bagley of White River
Junction; treasurer, A. B. Kingsland of Burlington. The president appointed E. A. Valiquette of Rutland, E. F. Wardwell of Woodstock and W. P. Jones of Rutland the Executive Committee. Plumbers were present from Montpelier, Woodstock, Rutland, White River Junction, West Randolph and other places in the State, and considering the distance to be traveled, the convention was well attended. The membership has doubled since the last meeting and the outlook is good for an equal increase at the next convention. The next convention will be held in some city where there is no association, with the intention of forming one.

#### Plumbers' Banquet at Salem, Mass.

Gathered about the tables at the Essex Ilbuse Thursday evening of last week were 35 representatives of one of the most important trades in Salem, Mass., the plumbers'. They were the members of the Master Plumbers' Association, which embraces the leading plumbers of Salem, Peabody, Beverly and Danvers, together with invited guests.

Among the latter were John Chambers, the local Inspector of Plumbing; Clerk Raymond L. Newcomb of the Board of Health; O. S. Kendall, presi-dent of the Worcester Association; Henry A. Despar of Worcester, who framed the State plumbing law; J. W. Green and J. W. Jordan of Worcester.

Others about the tables were as follows: Robert Robertson, F. A. Wendell, lows: Robert Robertson, P. A. Wenden, E. G. Kelly, Joseph A. Andrews, James W. Trow, George Norton, R. A. Ravel, T. J. McDonald, D. T. Veaton, J. F. Cabeen, F. H. Caskin, A. M. Stevens, Edward Tyler, Daniel Ingersoll, P. H. Sweeney, Wm. Webber, Carter Herrick, Chas A. Pnippen, Joseph Robertson, C. F. Driacoll, Chas. Pickett, H. W. Chas A Pnippen, Joseph Robertson, C. F. Driscoll, Chas Pickett, H. W. Cawley, Wm Hart, James A. Corman. This association was formed last

March and monthly meetings have been held at the master builders' head quarters every month. The efficers are as follows: Robert Robertson of Beverly, president; Frank A. Wendell, first vice president; E. G. Kelley of Peabody, second vice president; Jos. A. Andrews, treasurer; James Trow, secretary.

The first business of the evening was the discussion of an excellent spread, served in Landlord Davis' best style. The menus were gotten up in a reminiacent and humorous sort of a way, plumbers' titles, such as "baked pig" and "soldering solution," being applied to many of the courses, the whole being headed, "The plumbers' long bill" bill.

A series of remarks then followed, interspersed with songs by Robert and Joseph Robertson, James Trow, James A. Corman and Joseph A. Andrews, President Robertson introducing the speakers and vocalists. One of the first to be called upon for remarks was Plumbing Inspector John Chambers, who stated he would earnestly co-oper-ate with the plumbers to elevate the sanitary condition of the city, and who advocated a house to house inspection. He was followed by Vice President F. Wendell, the originator of the local plumbing ordinance, who spoke as fol-

Mr. Chairman and Gentlemen: I am pleased to meet you all on this occasion, the first social meeting of our association, and to find that the plumbing profession has taken the lead in our city toward throwing aside petty jealousies and bringing us together in a friendly onamer to talk over the latest ideas in sanitary plumbing. As I understand it, one of the objects of this meeting is to talk over the plumbing ordinance, and see if anything can be done to lessen the work and still make it as well. Now, I only voice the sentiments of all the members of our association in saying that all are in favor of doing so if it can be done without making imperfect work. The first question is, "Why are we obliged to have a plumbing ordinance?" and the answer is

that io the past few years contract work has made bidders overanxious to get the contracts, and the result has been inferior workmanship to such an extent that a law was passed by the State requiring every city to adopt an ordinance. To day no person can apply that to the harmonic property of the state of the particular to the state of the s was passed by the State requiring every city to adopt an ordinance. To day no person can undertake to do plumbing without being examined practically. One year ago work could be thrown together, if one wished to, with mortar, cement or putty, but to day it must stand a test in the presence of an inspector. It costs more to do the work at the present time, but is it not much better to pay more for a job and know that when completed it is safe and sound? I do not believe that all cases of sickness, such as malarial fevers, are caused by defective plumbing, but a large percentage of sickness can be traced directly to that source. A good illustration which bears out this assertion may be seen by the chart which langs in the Board of Health office showing the city of Salem. Clustered here and there in the different wards are pins representing cases of typhoid and diphtheria, and in nine cases out of ten they are situated near the outlet of one of the sewers or where no trapping has been done. Now, I believe we have a good ordinance but situated near the outlet of one of the sewers or where no trapping has been done. Now, I believe we have a good ordinance, but which could be modified in some respects and so amended that the inspector should have the authority (in the case of old work) to allow certain work to be done when it will be cheaper and better for the

said trap to be approved by the Inspector of Buildings.

Others were called upon for remarks, and a general discussion was continued until a late hour, many interesting points being brought up and explained by those best posted, for the benefit of the others.

#### Water Closet Pull.

The accompanying cuts show a new water closet pull which James Temple, 1016 Columbia avenue, Philadelphia, is putting on the market. The pull is introduced as an improvement on the chain pull in common use, being more durable and less liable to get out of order through misuse or otherwise. may be set in brick or stone, or in tile or plaster partitions. When required for new work the case or body A, Fig. 1, can be put in the wall at the time the roughing in work is done. When the pull is used in a plaster partition the chain should be passed through the opening B; but when used in a brick, stone or tile partition it is better to run

Fig. 1.-Broken View of Temple's Patent Waler Closel Pull.

Fig. 2.—The Pull in Service.

owner. For an example, that when a sink and set wash trays are to be placed together it should be left optional with the owner

owner. For an example, that when a sink and set wash trays are to be placed together it should be left optional with the owner whether he use one trap or two. It looks to me unnecessary to use more than one, while others may think differently.

I was called upon to put in a set of wash trays which were to be placed next to a sink which had a 2-inch iron waste pipe, but I was not allowed to enter it without carrying a pipe through the roof, according to the ordinance. I had to extend it some 25 feet to enter the main soil pipe, but I believe it would have made a better job to have entered the 2-inch waste near by. Such things ought to be left optional with the Plumbing Inspector, to my way of thinking. I also believe that if a person wishes to put on a trap under his sink it should be allowed, even if not ventilated, as it would help make the work more thorough, said trap to be approved by inspector. The Plumbing Association has come to stay, and will be a help to Salem in a sanitary way in years to come. Before closing, I would say that all members cannot but highly appreciate our Inspector of Plumbing, who, through his impartiality and thorough knowledge of the business, has won the esteem of all, I will close my remarks, and thanking you for calling, on me, would suggest the following amendment to the plumbing ordinance:

"That when set trays and slak are to be placed together, owner may use only one trap when waste pipes are independently connected Into trap and trap ventilated,

the chain through the opening C, so as to avoid the necessity for cutting into the wall the full depth of the pull casing all the way up. A slotted upper plate receives the tank lever when set at a proper angle, and in adjusting same it is necessary that the slot should be in line with the slot in plate E. When the lever cannot be set at an angle a small angle iron bar may be attached so as to make connections and fi. into the slot in the plate. The openings B and C are suited to ½-inch irou pipe, the pipe being used to incess the chain and being carried up as far as the bottom of the upper plate. In setting the pull easing in rough work the plate E should be removed. When the job is finished the bar D may be adjusted and the plate screwed on In setting the pull allowance should be made for the In setting the tile or wainscoting sufficient to allow of the setting of the back of plate E flush with the finish. The pull is made of iron neatly finished with nickeled plates and knob.

BUFFALO, N. Y., has just contracted for a large addition to the city sewerage aystem.

### TRAPS AND VENTS.

At the shiftend of Wm. Cramp & Sons, Philadelphis, a force of about 400 men are employed in the plumbing and pipe fitting department doing the work on the ships in course of construction. A very complete system of plumbing and heating will be installed in the new passenger steamers now building at their yard. The sanitary provisions not being governed by any city ordinances in such vessels, the whole plant is arranged by their engineering corps before their skilled plumbers and sleam fitters start in the work of erection.

The City of East Liverpool, Ohio, us a natural gas for fuel almost exclusively in residences and in the kilos for firing ware. The gas companies have issued orders that after November 1 all residences must use and burn gas for heating through meters. This is making considerable work for plumbers and gas fitters, and also for laborers in digging trenches.

IN ADDITION to having done the p'umbing and steam heating in the four palatial steamers of the Fall R ver l. ne, Il. C. & F B. Calkins, 177 Christopher street, New York, did the work in the United States naval vessels "Boston," "Chicago," "Atlanta" and "Marblehead."

Indianapolis Plumbing Company is the name of a new corporation at Indianapolis, Ind., with a cari al stock of \$1500. Directors: W. F. Koppper, Susie Dewald and M. Dewald, Jr.

A MOVEMENT is being made to form a master plumbers' association in Cumden, N. J. Geo. Leathwhite, Geo. Hammond, Wm. Calhoun, Wm. Longheed and Plumbing Inspector Francis are doing the preliminary work among the 34 plumbers in the city. Camden is the only city in the State where the plumbers are examined, and the plumbing laws of the city are said to be the best in the State.

GEORGE W. KROWL, agent, plumber and ste-m fitter, has removed his place of business to the store at 325 Carroll street, E mirs, N. Y.

A COMPLAINT is made at Newton, Mass, by the plumbers that the office of Plumbing Inspector has not been regularly filled.

THE tinning and plumbing establishment of Spicer Brothers, Bridgeport, Conn., has dissolved. The business in the future will be conducted by the senior partner, Joseph N. Spicer.

- T. J. Moran, son of William Moran, the well-known plumber of Titusville, Pa., has purchased the plumbing establishment of M. Albrecht in Olean, N. Y. Tommy starts in husiness under very favorable auspices. He is a good plumber, having had seven years' experience with his father, hesides holding a certificate from the New York Trade School for competency in the art of plumbing.
- J. W. FAUST has gone into the plumbing and gas fitting business, at Crawfordsville, Ind. D. Pickett is his foreman.

THE DAY MFO. COMPANY of Detroit, Mich., will remove their bathtub factory to Milford, the village having voted a bonus of \$5000.

"The Evolutionary Developments of Domestic Pumbing During the Past 30 Years" was the title of a paper read before the American Public Health As-

sociation during its session at Montreal last week by J. W. Hughes of Montreal, who concluded by pointing out the necessity of good plumbing, and showed that the cheap st work man was not always the best.

WILLIAM POMEROY, 926 Madison street, Brooklyn, N. Y., has applied for a patent and is about to put on the market a new pipe coupling. It is designed for making a joint in lead pipe without the use of solder.

Thomas Brabson has moved to more convenient quarters at Bridge and Plymouth streets, Brooklyn, N. Y., where, in addition to his brass finishing shop, he has a brass foundry. Mr. Brabson is making a number of plumbers' specialties in valves, cocks and governors.

WALTER HANNUM and Henry Trim mel have charge of installing the plumbing system in the new school at Monticello, for which their employers, Carson & Co. of Danville, Ill, have the contract.

J. A. Berg, a plumber of Chicago, has opened a shop at 217 Madison street, O.tawa, Ill.

WM. A. FAUST, who has spent several years past in Milwaukee, Wis., where he was in the employ of one of the principal plumbers of that city, has startel in business for himself at 3 Cron street, Pittston, Ps.

J. H. MACHETH of Mankato and A. P. Schul z of St. James, Minn., have united their capital and skill and will run a plumbing shop at St. James.

THE VINCENNES SEWER PIPE WORKS, at VINCENLES, Ind., were burned on the 29th ult.. entailing a loss of about \$40,000, half covered by insurance. The plant was an important one, employing 140 men.

John F. Hughes has gone into the plumbing and steam fitting business, at 712 Main street, Little Rock, Ark.

LINDLEY & MEREDITH, the new plumbing firm, at Bennington, Vt., have received the most of their stock and tools, and are rushed with business

Again has the speedy Cunarder "Lucania" broken the Atlantic record. On her westbound trip, last week, she accomplished the trip from Queenstewn to Sandy Hook in 5 days 7 hours and 48 minutes, heating the recordher own-by 50 minutes. The "Lu cania" now holds all transatlantic records; namely, for the fastest trip east and west, the greatest single day's run, the greatest average daily runs and the greatest hourly average. The approach of the stormy term will probably put a stop to any further record breaking achievements for this season. Meanwhile the present year has seen the time of passage reduced by about five and one-half hours.

Last week's West Indian cyclone is reported to have done considerable damage to the cotton and rice crops in the middle and coast regions of the South. The Florida orange crop is also stated to have suffered severely from the storm. Happily, unlike the cyclone of a year ago, but little loss of life is recorded.

In order to prevent a recurrence of the floods which devastated British Columbia last summer the Canadian Government have begun a survey of the banks of the Fraser River with the view of devising a system of dykes.

### FLASHINGS.

WE ARE IN RECEIPT of a very nest card of invitation from Gara, McG'nley & Co., to inspect their burding at 28 South Seventeenth street, Philadelphia, on O tober 16 1894 Another form of the same invitation comes in all the mandatory semblance of a subjecta, which recites how the recitiont is commenical, under the power of this subpara, which is issued by the Supreme Court of Rooting, to lay saide all other business and ergagements and be present October 16 st 23 Sauch Seventeenth street, the new quarters of the wellknown firm of roof repairers Gara, McGinley & Co., and the further text of the sub; ceas relates to the necessity of leaving orders for overhauling roofs, gutters, spouts, &c., under penalty of suffering damage from fall and winter atorms.

THE NEW YORK METAL LATH WORKS. 110-114 Navy street, Brooklyn, N. Y., are now constructing partitions made of angle, channel and T-iron, to which is attached their York metal lath. work is plastered on both sldes of the partition, making practically a solid slab of iron and plaster. The company have recently set up at their works several different kinds of partitions, some on wood and some on iron, to which they have invited the attention of architects, builders and others interested. The company also construct what they call "solid partitions," specially adapted for air and light shafts, dumb waiter and elevator shafts in flats and other buildings where floor space is valuable and economy and fire protection necessary.

ARTICLES OF INCORPORATION have been filed for the establishment of the Crittenden Roof & Mfg. Company of Minneapolis, Minn. They propose to manufacture sheet metal work and all kinds of roofing, and have an authorized capital stock of \$10,000. The incorporators are Mason H Crittenden, Frank V. Emery and C. S. Talbot.

The Manhattan Cornice & Rodfino Works, Flist avenue and Sixtyfirst street, New York, have recently secured the contracts for the sheet metal work in connection with the new buildings at 71 Fourth avenue and at 256 West Twenty-third street. The company have completed the contracts for roofing, cornice and skylight work on flats in Ninety-second street near Third avenue; also on two flats in Ninety-eighth street near Columbus avenue, belonging to David Richey, and on the factory and dwelling on East Seventy-first street built by Murphy Brothers.

A LARGE ADVERTISING SHEET is published by the St. Paul Ro ting, Cornice & Ornament Company, St. Paul, Minn., which will be of interest to the trade, as it shows many patterns of cornices and window caps. The assortment includes main cornices and lined cornices, and incidental reference is made to finials, skylights, steel ceilings and other goods of this kind. In addition to the engravings dimensions and prices are given.

The grand jury of the Criminal Court of the District of Columbia have returned indictments against the president and secretary of the Sugar Trust as a consequence of the refusal of those officials to answer questions put to them by the Senate Investigating Committee in June last.

# TIN PLATES.

Philadelphia Tin Plate Trade.

The tin plate trade is in a very confused condition owing to the changes in duty. It is, however, the intention of those who have embarked in the manufacture of tin plates in Philadelphia and vicinity to hold on to the trade which they have built up. Quality has been a special feature with several of the leading manufacturers in this market, and they are now respirg the benefit of their foresight in a continuous demand specifying certain brands which, after severe trial, have proved equal, if not superior, to imported brands.

The demand for the American continuous rooting tin is, we are advised, Increasing rapidly and the proprietors of the patents are putting in new machinery, which, in the course of two or three weeks, will double the present output and enable them to make wid has of 14 inch to 20 inch and 28 inch.

### Weish and American Wages.

In an interview published in the St. Louis Globe Democrat, Thomas Neid ringhaus of the St. Louis Stamping Company makes a detailed statement in regard to the causes which have compelled the company to announce a reduction in the wages of their tin mill employees, under the operation of the new tariff law. As the situation of the St. Louis Stamping Company is similar to that of the other tin plate manufacturing concerns now shut down pending the adjustment of the wage question, the figures given by Mr. Neidringhaus will be read with interest. He remarks as follows: "Under the McKinley bill the duty on tin plate was 2.2 cents per pound, affording us a protection estimated at 75 per cent. Since the Wilson bill became a law the duty is placed at 1.2 cents per pound, affording protection of only 35 per cent. In order to meet the disadvantages our business will suffer on this account we were compelled to make a reduction in the wages of the rellers, catchers, doublers and heaters, who number about 200 men. There are 600 men employed in the works, but of this number only the 200 mentioned will be affected by the new wage schedule. Under the new \* égime—that is, the Wilson bill—the foilowing wages will be paid: Rollers and catchers, \$3.71 per ton, netting \$8.35 per day of eight hours; dcublers, \$2.02 per ton, netting \$4 50 per day of eight hours, and heaters, \$1 86 per ton, netting \$4.15 per day of eight hours.

Statistics show that in England rollers and catchers receive \$3.76 per day, doublers \$2.23 and heaters \$2.10. Under the M. Kinley bill we paid our men 150 per cent. more than the work men in the Welsh tin plate works received, and even now, notwithstanding the passage of the Wilson bill, which affects cur business so seriously, they are receiving 100 per cent. above the wages of the Welsh laborer. The reduction mentioned applies to the making of black plate only. Just what action will be taken by our men it is not for me to say. We explained every de-

tall and showed just why it was that we were forced to eller them less wages."

### Tin Plate Wages.

No agreement having been reached between the tin plate and black sheet mills and their employees over the question of a reduction averaging 25 per cent. in wages, to go into effect on October 1, a general shut down has ce-curred. Advices received at the headquarters of the Tin Plate Manufacturers' Association of the United States, in Pittsburgh, are to the effect that the shut down is general, only two or three plants being in operation, and these are expected to close as soon as present contracts have been filled. Among the last concerns to close down was the United S ates Iron & Tin Plate Mfg. Company, Demmler, Pa., who closed their plant for an indefinite period on Saturday of last week. At present the outlook for a settlement of the wage difficulty is unfavorable, the manufacturers claim ing that it is impossible for them to continue paying wages on the old basis and compete with foreign product under the new tariff. A meeting of the above organization was held in Pittsburgh last week, but only routine business was transacted. The present wage dispute was not under consideration, as the manufacturers have not receded from the original position taken by them when the change in the tariff was made.

### SCRAP.

THE FIRM of James B. Scott & Co., tin plate manufacturers, of Pittsburgh, Pa., who made an assignment in February last, having been reorgan zed, were succeeded on September 27 by a new corporation under the name of Follansbee Brothers Company.

Some very heated correspondence has been appearing of late in the English press on the subject of the prospects for Welsh tin plates in the United States market. Although some of the disputants exhibit, or assume, an extraordinary ignorance of the conditions of the American tin plate manufacturing in-dustry, the balance of opinion seems to lean to the conclusion that home competition in America is an entity which has to be reckoned with, and that the tin plate plants established in the United States are genuine concerns, the product of which is already seriously threstening to oust the Welsh article from the market. A correspondent of the Cardiff Western Mail, who states that he is part proprletor of a We'sh tin plate works, writes to say that he can no longer blind himself to the fact that the American trade is slipping away. He mentions in confirmation of his statement that one of the largest importers of tin plate in the United States had said to him lately: "We feel the effects of the American competition in every town of importance in the United States." Bitterly does he add: "I suppose that when the trade has left us, and gone to America, we shall then

begin to reduce the cost of production, and that the workmen's union will, by that time, have seen the propriety of doing something to keep the trade—when it is lost!"

PHILLIPS TIN PLATE COMPANY, Philadelphis, advise us that they are running five tinning sets on full time.

THE TIN PLATE PLANT of Wallece, Banfield & Co., Limited., Irondale, Ohio, was shut down on October 1, and will remain closed until the adjustment of the wage scale.

THE TIN MILLS of the Falcon Tin Plate & Sheet Company, Niles, Ohio, are shut down pending the settlement of the wage scale.

THE BLACK PLATE MILL and tinning department of the St. Louis Stamping Company, St. Louis, Mo., are closed down until the wage question is settled.

THE DEATH is announced in England of David Davies, proprietor of the Beaufort Tin Plate Works, Morriston, near Swansea, and one of the best known tin plate manufacturers of Wales. Mr. Davies was a notable instance of success attendant on industry. The London Engineer thus sketches his life: "He began life as a farm laborer, and next filled a humble position at the Penydarran Works as a roll cutter. One of the specialties of Penydarran was the nail rod, but at one of the Staffordshire iron works a burnished one was turned out which was of a superior kind, and David Davies, on his own inspiration, traveled thither and worked in a humble capacity at the works until he learned the process, and, returning, he introduced this and made a fortune. He lived to acquire the ownership of the Penydarran estate, sold this, acquired the College Works, Llandeff, which he aga'n sold, and finally bought the Beru-fort Works, near Swansea, and was more successful than the generality in avoiding labor difficulties."

HENDERSON TIN PLATE COMPANY, Norristown, Pa., inform us that the tinning machine in operation at their works is of the Thomas & White pattern and not a Morewood michine, as stated in a "Scrap" note in our issue of Seplember 22.

MERCHANT & Co, Inc., issue, under date of Oct. 1, from their Chicago office, a list of quotations on tip, terne plates, metals, &c. These include the American roofing plate, Tandem continuous roofing tin, besides a full assortment of foreign plates. A'so sheet metals and their Spanish tile and Star ventilator.

HENRY W. SCATTERGOOD, proprietor of the Black Diamond Tin Plate Works, Phlladelphia, sends out blotters calling attention to the "best mottled roofing plate in the market," which is the way he describes the Black Diamond. The blotters are backed with enameled paper, making them very serviceable for desk use.

THE tin plate works of Marshall Bros. & Co., 1156 Beach street, Phlladelphia, are running with four sets on double turn. OCTORER 6, 1891.

<sup>\*</sup> Preparing to make back plates.

A CABLE DISPATCH from Swansca, Wales, states that a novement is on foot there with the olject of erippling the tin plate industry in the United It being contended that the Americans cannot produce certain plates without Welsh labor, the representatives of labor in Wales, it is said, are inviting the return to that country of all tin plate workmen in America who have been discharged from their positions, or whose wages bave been reduced as a consequence of the adop tion of the new tariff. As a consider able propertion of the tin plates still in Wales are said to be without em ployment and rumors are rife of a con templated reduction of wages for this class of labor in that country also, it is difficult to understand what solid inducements to return can be held out to Welsh tin p'ate workmen bere, even if they are suffering from a present or prospective reduction in wages. The contention that certain plates cannot be made in the United States without Welsh help is one that would not be easy to substantiate. We have reason to believe that American workmen are even now turning out all classes of tin and terne plates known to the trade, and turning them out of a quality that compares to advantage with any impor ed material. There are large tin plate works in the United States where the labor is entirely American.

THE ROLLING MILL AND TIN PLATE-DEPARTMENTS of the St. Louis Stamping Company, St. Louis, Mo., have temporarily closed down. The employees were informed on Monday that a reduction in wages would have to be arranged in order to meet the new tariff conditions before the works can be again put in operation. The company's stamping works and the other departments of the large establishment continue in operation. Advantage will be taken of the shut down of the rolling mill and tin plate departments to make repairs and alterations and erect new machinery.

Among the tin plate works which have been closed down this week in consequence of the wage scale controversy is that of the Bultimore Iron, Steel & Tin Plate Company, Locust Point, Baltimore, Md., the men having refused to accept a 20 per cent. reduction.

THE BLACK PLATE MILLS of the Lalance & Groej an Mfg. Company, Harrisburg, P., are almost the only mills now turning out this product, nearly all similar works having been shut down pending the settlement of the wage scale. They are reported to be running full and as crowded with orders.

The Chicago Stamping Company of Chicago are putting in a Morewood pot, which was needed to bring the capacity of their tin plate plant up to the requirements of their factory.

It is REPORTED that an eight-mill tin plate plate has been located at Converse, Ind., through the efforts of the Converse Land Company.

A COMPANY has been organized at Atlants, Itd., with a capital stock of \$150,000, to put in operation at once the tin plate plant of the Indiana Tin Plate Mir. Company, now in the hands of receivers.

The New Castle Steel & Tin Plate Company, New Castle, Pa., have closed down their plant pending a set-

tlement of the wage question with their During the month of Auemp'oyees. During the month of August and that part of September in which the plant was in operation, the output of black plates of the very highest grade was the largest during any similar period since the concern started operations. David Elias, formerly su erintendent of the Cwmfelin Tin Plate Works, Swanses, South Wales, has been superintendent of the above plant since August 1. Had a reduction in the tariff not interfered with the operations of the New Castle Steel & Tin Plate Company it was the intention of the firm to considerably enlarge their plant, but just at present they have decided to do nothing in the way of enlargement until the outcome of the wage question is definitely known.

CUSTOMS REVENUES this week have been considerably sugmented by withdrawals of tin plates from bond, the new tariff of 1.2 cents a pound having become operative last Monday. Importers have been na urally allowing their stocks to accumulate in bond until they could withdraw them under the lowered duty, and the volume of goods thus held was abnormally heavy in this city, Philadelphia and Baltimore at the beginning of the month. It is estimated that between 200,000 and 250,000 baxes have been released in New York during the week, besides 80,000 to 90,000 each in Philadelphia and Baltimore. New York importing house alone is said to have paid \$40 000 in duties on Monday In addition to these amounts nearly all the importers have been carrying large quantities of tin plates in storage on the other side, where warehouse rates are considerably cheaper. Some of these stecks are already on their way over, so that the market will be well supplied for the next few weeks. No more opportune time could have been chosen for a pause in the operations of the domestic works. By the time the present wage difficulties have blown over the market should again be in shape for receiving the home

H. W. MERCHANT of Merchant & Co., Incorporated, Philadelphia, left last week for England by the "Paris" on business connected with the firm. Mr. Merchant will be absent about aix weeks.

MERCUANT & Co, INCORPORATED, Philadelphia, have this week made a reduction in the prices of their guaranteed American Tin and Terne Plates. The firm's Tin Plate works are reported in full operation, with a gratifying volume of orders for their well-known brands. Messrs. Merchant are receiving a very large pa'ronage for their Tandem Continuous Roofing Tin, the demand for which is so large that they are unable to turn out the material fast enough.

W. W. SANDERSON of Morris, N. Y., is agent in that place for the goods of the Fuller & Warren Company, and during the progress of the Morris Fair he extended invitations to visitors to call at his store and examine the lines of stoves and ranges which he had on exhibition. Mr. Sanderson is a believer in the efficacy of printers' ink, and in the local papers carries an advertisement in which the merits of the Splendid and Stewart goods are noted. In one announcement be states that ten first premiums have been secured thus far in New York State.

# Trade Notes.

THE COMMISSIONERS OF CANADIAN CEUNTY, Oxlahoma Ferritory, recently rurchase i steel cells for the jail at El Reno, the county seat. The cells are 7 feet fquare, 7 feet high, with exterior corridor in front 6 feet wide. The work was furnished by E. T. Barnum of Detroit, Mich., the well-known manufacturer of Wire and Iron Work.

CHARLES II. Low, president and manager of the Corrugated Elbow Company, Cincinnati and Chicago, with offices at Cincinnati, reports trade very satisfactory in volume. They are running their Chicago factory day and night and the Cincinnati factory on full time.

THE MARSHALLTOWN IRON & STEEL COMPANY, capital stock \$100,000, have been chartered to operate the sheet mill at Marshalltown, Del. The plant was first built in 1836, but it was not until 1830 that a ateam mill was erected. This has been enlarged twice since, in 1884 and 1889. Its annual capacity is rated at 3000 gross tons.

A NUMBER OF IMPORTANT IMPROVE. MENTS in the plant of the Cicveland Steel Company, successors to the Britton Iron & Steel Company, Cleveland, Ohio, have been made during the past few months. In the light plate mill, which is now in operation on single turn, the two heating furnaces are fired with oil on a new principle, which thus far has given entire satisfaction. temperature of escaping stack gases has been registered at 520°, a result that is regarded as quite astisfactory. On leaving the furnace the alab is carried to the rolla by an automatic chain table, the operation of which is comparatively noiseless and inexpensive. All the manipulations of the plate at the rolls are directed by a single operator from the top of the housing. The roughing mills are 26 inches in diameter. The middle roll is stationary, and the apecial device originated by Manager John A Potter makes it pos-aible for the manipulator to screw down the top roll to the middle one and at the same time bring up the bottom roll. The rolls of the second stand, through which the finishing passes are made, are 32 inches in dismeter, excepting the middle roll, which is smaller. From the finishing rolls the plate is taken to a table and marked, then sent through the trimming and squaring shears. A buckling machine atraightens out any buckles in the fiaished product and leaves a very smooth plate of excellent finlsh. The work of erecting two new sheet mills is la progress, and it is expected that these will be in operation in the next two or three weeks. The light plate mill is now turning out 22 tons in eight hours, the product ranging from 11 inch to No. 18 gauge. The galvanizing department, located on the opposite side of the railroad from the plate and sheet mills, is not in operation at present, but negotiations are in progress for the construction of a way under the tracks, and a conveyor will probably be put in for the transfer of the sheets that are to be galvanized.

THE OCTOBER CALENDAR CARD issued by the Joseph Dixon Crucible Company, Jersey City, N. J., shows a quali inside of a stack of Lead Pencils, with an appropriate quotation from Longfellow accompanying it. An excellent feature of these calendar cards is the back of blotting paper.

# STEAM AND HOT WATER.

### Compound Radiator Valve.

A new radiator valve for use in steam heating is being placed on the market by the inventor, James II IIntehinson, 529 West street. New York, with Cor-nell, Hiscock & Underhill, 13 Gold street, as selling agents. It is claimed that but one valve is necessary for each radiator where it is used, also that no air valves are required, and that each section of the radiator is quckly and thoroughly heated. Fig. 1 shows the valve complete, which is of the angle pattern and seated on a Jenkins disk. From the cut it will be seen that there are two openings in the bottom of the valve, one for the steam and the other for the return condensation, although the return opening, it is claimed, is unnecessary, as the valve is said to enable a single pipe system to work perfectly by means of the internal construction. The passage leading from the valve is divided horizontally into two parts, steam entering the radiator through the upper and the condensation returning through the lower part, a check valve

livered directly and independently into each section. Fig. 3 shows the valve with the distributing pipe connected with a radiator on a system where a drip pipe is used. The delivery of the

Utica, N. V. where their new sectional boiler for steam and hot water has been under an experimental test that has proven very satisfactory. The new boiler is built after a construction pat-

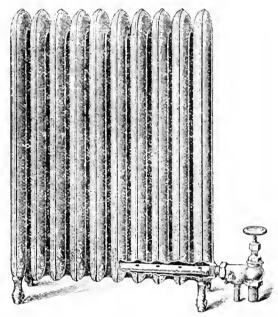

Fig. 3 -Showing Valve, Radiator and Distributing Pipe.

steam to each section heats the radiator quickly, and, it is claimed, disposes of the air so that air valves are not necessary. The condensation in the radiator falls on the outside of the distributing

Compound Radiator Valve,-Fig. 1.-General View.

preventing steam from entering into the latter. The large plug on the side of the valve enables the check valve to be removed, ground to its seat, or a new one inserted when necessary. This check valve prevents a reverse circula-

Fig. 2 -Distributing Pipe.

tion, and secures a positive circulation in one direction. Fig. 2 shows a distributing pipe which is attached to the valve and extends into the radiator with openings in it so that stesm is depipe, and leaves the radiator through the opening on the under side of the pipe. The valves were used during last winter, it is said, with excellent results. It will be seen that no special piping is required for the valves, which can be used with any radiator.

### HEATING NOTES.

Paul Steam System Company, organized at Portland, Maine, for the purpose of making and dealing in steam heating appliances, have fited certificate. Capital stock, \$1,000,000 of which \$50,000 is paid in. President, Edgar W. Anthony of Brookline, Mass.; treas urer, F. H. Monks of Brookline, Mass.

W. M. MACKAY, 211 Water street, New York, has returned from a visit to the main office of Hart & Crouse, at

ented by Mr. Mackay, and he is well pleased with so substantial a vindication of his ideas on the subject of boiler designing.

C. W. Hewson succeeds the firm of C. G. & W. G. Hewson, at 179 Christopher street, New York, in the house heating and steam fitting business.

Fuller & Warren Company, Troy, N. Y., issue a supplementary hot water catalogue that will be of interest to the heating trade. It shows the F. & W. Co. hot water heaters in their different styles, single and connected in the twin system. Views of the boiler sections and also of the grates are presented, and likewise full particulars and tables of the sizes and prices are given.

ALEXANDER DON, manager of the steam and hot water department of Du Bois & Darrow, 61 Gold atreet, New York, has just returned from a trip through South Jersey and Eastern Pennsylvania and All Right and Volunteer boilers mark his stops along the road.

THE SULLIVAN PLUMBING & HEATING COMPANY, Bay City, Mich., are rushed with business and keep a force of over a dozen practical mechanics working all the time. They have just received a carload of radiators.

THE BOARD OF MANAGERS of the American Society of Heating and Ventilating Engineers are holding weekly sessions on Monday afternoins at the Broadway Central Hotel, making preparations for the first annual meeting in January. They are also looking after the incorporation of the acciety, the printing of its by-laws, preparation of

certificates and printed matter, and will have several locations as permaneut headquarters to recommend.

THE HOHMANN & MAURER MEG. COMPANY, Phymouth and Jay streets, Brooklyn, N. Y., make a specialty of gauges and thermometers for steam and hot water work and also for use in laboratory practice, japanning ovens, &c.

E. C. Moses of the J. F. Pease Furnace Company, Syracuse, N. Y., called at the New York effice, at B ckman and Pearl streets, this week on his return from Philadelphia, which he visited in the interest of the Economy line of heating apparatus.

N. L. Frost of Smith & Winehester, Bos on, Mass., entertained W. A. Russell, 89 Centre street, New York, who brought to their notice the merits of the Detroit quick opening steam and hot water valves and the Niagara steam and hot water radiators for use in connection with their Winehester boiler.

THE EXETER MACHINE WORKS, 32 Olive street, Boston, Mass., are sending out circulars to the trade directing attention to the Exeter superheated ladiator bronze powder and bronze liquid, especially adapted for decorating radiators, steam pipes, &c. The bronze is made in various colors, including gold, silver, copper, green, fire, orange and lemon.

# HEATING PLUMBING.

### NEW WORK AND CONTRACTS.

J. J SULLIVAN has been a varded the contract for the gas fitting in the Gay apartment house on Chapel street, New Haven, Conn.

DISLEY & WEYAND have the contract for the plumbing in St. Anne's new school and rectory, at Waterbury, Conn.

THE NEW COLLEGE of the Missionarics of L<sub>1</sub> Salette, in Parkville, Conu, which is 48 x 113 feet, has the foundations up. It is to be heated by steam.

The Town of Westminster, Mass., has voted an appropriation of \$1300 to put new heaters in the High School Building.

The Plumbing Firm of B. R. Dibble & Co., Winsted, Conn., have been awarded the contract for plumbing the new factory under erection by the Metalliform Company.

THE CONTRACT FOR HEATING the new brick addition to the Road Cart Works, at Flint, Mich., and adjoining buildings was awarded to Geo. W. Hubbard on a bid of about \$2000. Some 15,000 feet of piping will be used in the work.

Thomas Dunlea of Binghamton, N. Y., is placing a heater in the First National Bank Building, at Susquehanna, Pa.

GRAY & TEMPLE have been awarded the contract for constituting steam heating apparatus in Firemen's Hall, at Linsingburg, N. Y.

THE SCHOOL COMMITTEE of Jersey City, N. J., are to advertise for bids for heating School No. 13.

FRANK BARCLAY of Beatrice, Neb., has the contract for heating the Whitin Library.

W. H. Bodine & Co, Bellows Falls, Vt., are about to start on the tin roofing of the new Arms Block. They have also contracted to do the plumbing work. The heating contract, however, has not yet been given out.

THE PARKE, LACY COMPANY have finished their contract for heating and ventilating the Garfield School, at Oakland, Cal., and have turned the job over to the Board of Public Works.

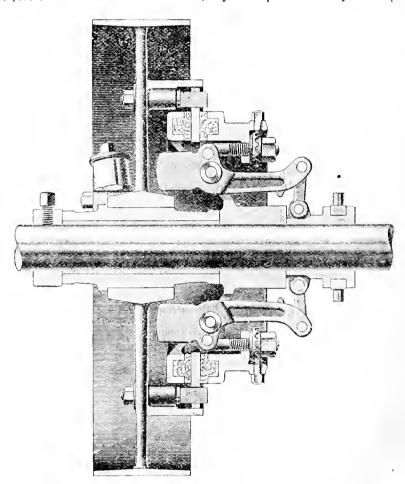

HENRY WILLARD, Milford, Mass., is doing the plumbing for the Molded Counter Company, at their Jefferson street factory. All the floors are to be piped for steam, about 2000 feet in all. Mr. Willard has also four different contracts to put in Page heaters.

The Ithaca Plumbing & Heatino Company, Ithaca, N. Y., have just finished the s'eam heating plant and the modern system of plumbing for the new Delta Kappa Epsilon Fraternity Lodge at Cornell University at a cost of \$1700.

Watson and have the contracts to heat J. W. Salzmann's new residence with hot air; also the new residences of Johnston Bros, and James G. Van Keuren.

### The Bliss Friction Clutch Pulley.

The E. W. B iss Company of Brooklyn, N. Y., have just placed on the market the friction clutch pulley of which we present a sectional view. Flexibly connected to the pulley is a friction disk against which the clutch members grip. By this construction if the pulley wears ont of true on the shaft no difference results in the operation of the clutch, no undue strains are brought on any of the parts and no adjustments are

THE BLISS FRICTION CLUTCH PULLEY.

EDWARD E. PARKER, Woburn, Mass., has lately secured the following contracts for heating private residences by steam or hot water: Thomas B. Road, Burlington, Mass.; Mrs. J. P. Converse, Charles H. Dudley, Charles W. Ames, David Cunes and Theodore J. Callahan, Woburn. A Gurney heater is to be used in the last house and Richmond heaters in the others.

THE CANFIELD STOVE COMPANY, Kingston, N. Y., report plenty of business in their heating, plumbing and tin departments. They have completed the steam heating system in the large new factory of the Hulson R ver Furniture Company, on Thomas street, also the hot water heating system in the residence of Dr. T. O. Kestor, Accord, N. Y. They are now busy installing hot water heating systems in the residences of D. S. Manchester and E. Mayers. They have recently completed the hot air heating systems in the residences of M. Schoonmaker and Robert

necessary to compensate for wear. There are only two clutch members, one keyed rigidly to the shaft to which the levers are attached, and the other movable. The levers are so balanced that at any speed at which the clutch is run the centrifugal force has no tendency to throw the clutch in or out of operation.

The clutching members are circular and concentric with the shaft, the only projecting parts being the levers. Four elbow levers are arranged at equal distances about the shaft. To the outer end of each lever is attached a link connected to a sleeve formed with a groove in which is the operating yoke. The movement of this sleeve serves to bring the friction disk in contact with the disk on the pulley. All necessary adjustment is provided by the screws shown. The horse-power which the various sizes of these clutches will transmit is obtained from tests by a dynamometer constructed for the purpose. The clutches are made for pulleys from 14 to 96 inches in diameter.

# STOVE TRADE NOTES.

### Gas as a Fuel.

In their fall catalogue of gas heating stoves W. M. Crane & Co., 838 Broadway, New York, make the following comment on the rapidity with which gas is growing in use as a fuel:

It has been already demonstrated that houses may be beated as well as lighted and dinners cooked by gas, and that it is possible to do without the grosser forms of fuel altogether. To heat a room, warm a both, or cook a chop it is surely easier and cleaner to turn on the gas when it is wanted, and turn it off when it is not. Nothing is more safe, economical and clean than gas in the way of fuel. What is called gas in coal is the only quality that is of practical value, either for fuel or illuminating; then why handle tons of coal, clean up ashes and dusty rooms. Acc., when all that is obtained from coal can be had on tap by connecting with the gas main? With the many improvements in the application of gas to a variety of uses, heading of all kinds and hiusehold work, it is only a question of time when gas will entirely supplant coal.

It is well to observe here that it has

It is well to observe here that it has been satisfactorily proven that gas even at \$1 25 per 1000 feet compares fa-v-rably with coal in cost for cooking compared on the dollars and cents basis. For hest ag rooms for a few hours it is probable that a favorable comparison in cost would result, but when the heat is required continuously throughout a win-ter gas would cost considerably more than coal. As an offset to this increased cast is the infinitely greater conven-ience, freedom from dirt and absence of labor, which, where the expense can be afforded, leaves gas the victor on the field. Gas is being sold in a number of cities at less than \$1 per 1000 feet, and in some as low as 75 cents, which will have two effects, one to incresse its u e as a fuel, the other to create a de mand for a reduction in price elsewhere that its convenience may be more widely enjoyed.

### Oak Garland Stoves.

The Michigan Stove Company have issued a handsome special catalogue of their Oak Garland line of stoves. catalogue comprises 12 pages and is gotten up in the most approved style of engraving and art printing by the Mat-thews Northrup Company of Buffalo, N. Y. Attention is called to the fact that the Michigan Stove Company present the largest line of Oak stoves in the market, consisting of the Oakdale Garland, the Syphon Oak Garland, the 1894 Oak Garland, the Horizontal Oak Garland and the Oak Pannant. There are suitable for any kind of fuel, hard or soft coal or wood. The Oakdale Garland is a lavishly ornamented all cast stove, both direct draft and revertible flue, made in two sizes. The Syphon Oak Garland is a richly decorated stove of original construction, giving a full base heating siphon flue to a boiler iron Oak stove, and is made in three sizes. The 1894 Oak Garland is claimed to be the tightest fitted stove ever made. All de tails are arranged to this end. The usual draft slide damper in the base has been replaced by a graduated opening in the upper part of the ash door, also used for shaking the grate, but when

clesced is drawn absolutely tight by a patent self locking latch, thus excluding the entrance of air even fr in this source. The stove is trimmed with an artistic urn and an elaborate foot rail and is made in four sizes, one size being smaller than is usually offered. The Ilbriz intal Oak Garland is a novelty in wood burning stoves, being ar anged for heating air by circulation as well as for furnishing heat by direct radiation. It is handsomely decorated and is made in two sizes with direct draft, and two sizes with revertible flue. The Oak Pennant is a moderate priced yet nicely finished stove, adapted to any kind of fuel and made in seven sizes, the smaller sizes being expected to displace cannon and extrage stoves.

### ODD PLATES.

M. M. Gowdy, Springfield, Mass., is offering the trade a sheet iron air tight heater, which is made under Cole's patent. It is referred to as being strong, durable, economical and comfortable, and specially adapted for use in parlors, bedrooms, offices, stores, school houses, It is made of American Russia iron and sheet steel, and lined with heavy sheet steel. It is claimed that the heater will hold fire for 48 hours with wood, and that the draft furnishes absolute control of the fire. The heater is made in several siz a with a capacity The heater for taking wood ranging in length from 22 to 28 ioches. A circular which Mr. Gowdy has issued illustrates and deacribes the bester, gives full directions for setting it up, and presents a number of testimonials from those who have used the atove. Mr. Gowdy reports an increasing demand for the heater, and states that its merits are being appreciated more and more as the trade becomes acquainted with it. The manufacturer expects to shortly increase his force to double the present capacity in order to meet the demands of the trade.

THE FOUNDRY of the Gladiator S ove Works, at Russell, Ky, was des'royed by fire on Tuesday, September 25, involving, it is stated, a loss of over \$40,000. The foundry had been running but a few days when the fire occurred.

A CIRCULAR just Issued by Ferris & Son of 813 North Twenty first street, St. Louis, Mo., describts the Queen heating stove, which is said to be so constructed that a large saving infuel results from its use. Wood is the fuel employed and it can be burned in the shape of large knots, chunks or chips, as the case may be. The Queen is referred to by the makers as capable of keeping a slow burning fire 48 hours, and that it will heat a room 20 feet square in a very few minutes in the coldest weather.

THE NORTHWESTERN STOVE REPAIR COMPANY of 509 North Fourth street, St. Louis, Mo., have devised an order blank which they are distributing to dealers for the purpose of facilitating the ordering of repairs for stoves and ranges. The blank carries at the top the name and address of the company, with a place to be filled in by the dealer,

designating whether the repairs shall be shipped by freight or express. The central portion of the ide k is divided into eight columns, covering the number of pieces, the name of the stove, its number, the kind of friel used, names of the parts wanted, the maker's name, the lates' date of patent, and whether front or pouch feed. At the bottom of the blank are lines for remarks, date, and the full name and address of the dealer ordering.

THE C. H. BENNETT FURNAGE COMPANY OF 289 291 Main street, Cincinnati. Obio, favor us with a copy of a 22 page entalogue, which they have issued for distribution among the trade. It relates among other things to "the true principles of warming and venti-lating as applied to schools, churches and other public buildings." Attention is given to the Bennett furnaces, which are illustrated and described at length. la numerous instances sectional views of buildings are presented with various part colored in such a way as to clearly show the construction, together with the course of air currents. The publication is arranged in a manner calculated to interest the trade, while the descrip lve particul ira are very full.

LEVI HEY & Co of Rocke 'c', NY, exhibited in Sove Hill at the fair recently held in that place a number of stores and ranges made by the Fuller & Warren Company, Troy, N.Y. The assortment included the Splendid Stewart, PP. Stewart and the Diamond Stewart stores and heaters. The exhibit was in charge of W. II. Dutcher, manager of the firm, who was ably assisted by J. A. Palmer, representing the Fuller & Warren Company. The exhibit also included the Perfection radiator made by Messra, Hey & Co, and which is meeting with a large sale throughout the country.

A COUNTRYMAN was so impressed with a gas store on exhibition in a city store, says the Philadelphis Ledger, that he invested in one, slihough there was no gas in the small village in which he lived. He did not know why the thing would not work until he had made a second trip to the city with his complaint.

RATHBONE, SARD & Co. of Albany, N. Y., have on exhibition at their New York sales om, 251 Water street, a full line of Acorn stoves and heaters, which are of special interest to the trade. The goods are made and finished in a first-class manner and thoroughly in keeping with the reputation which Acorn stoves have established. With regard to shipments the company say that goods are delivered in New York the day following the receipt of orders and in the case of telegraphic orders in less than 24 hours. The manufacturers are in receipt of advices from a cuatomer in Bradley, S. C., to the effect that during 30 years of married life he has used nothing but Acorn stoves and will never change his opinion that "they are the best on earth."

According to the Youngstown Telegram the stockholders of the Girard Stove Company, Girard, Ohio, held an

important meeting on the evening of September 25 at the Board of Commerce rooms. It was decided to increase the number of directors from seven to nine, and L. S. Crum and A. Obendorfer were elected to the board. It is stated that the directors have decided to keep their works in Girard unless the Board of Commerce offera greater inducements for them to locate in Youngstown.

AT THE FAIR recently held at Brandon, VI., an interesting exhibit of Stewart stoves was made by Stafford & Phelps, who occupied the space at the left of the main entrance. This concern are agents for the goods made by the Fuller & Warren Company of Troy, N. Y., and the display which they made was the center of interest on the part of visitors.

A REPRESENTATIVE of one of the Albany papers recently called upon leading members of the stove trade in that section, with a view of ascertaining their opinions of the business outlook for the coming year. Grange Sard of Rathbone, Sard & Co. is said to consider the present condition of business an abnormal one, but does not think it can be remedied by legislation. He is quoted as follows: "Things will right themselves unless some unlooked for calamity occurs, as for instance, the failure of the corn crop in the West. We are not giving our full force of workmen employment, nor are there any hopes that we will be able to do so fer some time."

EUGENE MUNSELL & Co., 218 Water street, New York, are meeting with a good demand for their specialties, and we understand that their shipments during the past few weeks have been heavier than for any corresponding period during the past year and a half.

The Mars square parlor heater is a construction of medium price that is being shown by George Starrett, 227 Water street, New York. The stove has nickel skirt, foot rails and dome, and has a large illumination. It has all the modern conveniences for cleanliness and saving of labor. Although the a seller.

ADVICES FROM ALBANY are to the effect that the plant of the Albany Stove Company, which has been idle for a long time past, will soon resume operations under a new management. The entire plant has been renovated and improved and sidings from the railroad tracks have just been laid to the door of the building, thus giving good shipping facilities.

Cole & Cole of Omaha, Neb., are vigorously pushing the sale and manufacture of their new air tight heater, which was illustrated in these columns not long ago. Less than six weeks since they began the manufacture of this heater, turning out at the start a few degen stoves per day, which was the full espacity of their works. They have now devised the machinery necessary to turn out over a thousand a month, and they are giving employment to a force of 25 men. Orders for the stove are said to be coming in from every section of the country and also from Mexico.

THE KEISEY FURNACE COMPANY, Syracuse. N. Y., report a very gratifying condition of bus ness at the present time. They state that the actual sales of Kelsey furnaces for the month of September of the present year exceeded by 50 per cent, the sales of the heaters

for the corresponding month of any previous year.

THE PERRY STOVE COMPANY of Albany, N. Y., are running their force of 300 men full time and are enjoying a very good business. Nathan B. Perry considers the business prospects very good.

A. Weiskittel & Son, Baltimore, Md., favor us with a four-page folder, printed in colors, illustrating and describing the Fire King gas grates, radiators and heaters. These goods are made in various sizes, adapted to meet different requirements, and are offered the trade in very attractive style. The gas grates are referred to by the makers as being first class in every particular and fitted with an improved burner, which gives great heat, and combination cocks, so that the burners can be regulated to use any kind of gas. The radiators are made with and without casing, the latter, it is claimed, adding much to the finish of the goods, making them resemble steam or hot water radiators, which are used in fine apartments.

THE WALKER & PRATT MFG Com-PANY of 31-35 Union street, Boston, Mass., send us a copy of a well printed and attractive catalogue relating to their new range known as Walker's Culinet. The stove is unique both in appearance and general construction, the arrangement of parts being such that the fire box is at the front of the stove, the oven is elevated and every. thing easily accessible. There are five boiler holes, with the fire directly under the two front covers. The fire box is oval and is fitted with either a plain grate of improved form or the company's patent triple shaking grate. The shape of the oven is such that at any time it may be divided by a partition plate to form two ovens, the oven rack being exchanged for a pair of racks of half the size. The oven is heated on all sides and occupies about the same position as a pipe shelf or an elevated oven in an ordinary construction. peculiar feature of the stove is the hot water boiler, which is placed in the vacant space behind the fire box, about where the oven would ordinarily be found, and is exposed to the direct sc-tion of the fire, thus doing away with the use of the common form of water front and connections. The boiler is of cast iron made in one piece, the largest size having a capacity of 40 gallons. The boiler rests upon the main bottom of the stove, the opening through which it extends into the fire box being made tight by a putty joint. The service pipes may be connected at either end of the boiler, as desired.

D. G. LITTLEFIELD of the Littleficld Stove Works, Albany, N. Y., is reported in an interview with the representative of a local paper to have expressed the opinion that the prospects for business are very fair, but he is not thoroughly convinced that the favorable outlook will continue for any great length of time. The company are running their force full time whereas last year the men were only engaged every other day.

GEORGE STARRETT, 227 Water street, New York, finds an increasing trade in Craig's steel, for which he is the manu facturer's agent. In order to show its merit Mr. S'arrett's sales men carry a half pint cup made of this material, the bottom of which is double seamed and the top rim wired. A handle of the same material is edged and swedged as

well as riveted to the cup. Another evidence of its toughness is shown in its adoption for the top of the Star oil heater, which is stamped up in very ornamental form and perforated without a break. The top of these stoves was previously made of spun brass. Stove dealers are using this material freely for bodies in cylinder stoves and for piping where a nest finish is required.

"HOME COMFORT COOK BOOK" is the title of a 168 page volume which reaches us from the Wrought Iron Range Company of St. Louis, Mo. Among the opening pages we find a bird's eye view of the company's works at Toronto, Oatario, an interior view of their salesroom in the hotel kitchen outfitting department in St. Louis; a photo-reproduction of their exhibit at the World's Columbian Exposition and also of the display made this year at the California Mid-Winter Fair. There is also brief mention of the fact that the Wrought Iron Range Company furnished the New Planters' Hotel in St. Louis with its kitchen outfit and also supplied kitchen outfits for the Union Station Ca'é Company at the new Union Station in the city named. As indicated by the title of the volume, the greater portion of its pages are devoted to recipes for the housewife. There are also long lists of names and addresses of people in St. Louis using the Home Comfort range, together with illustrated letter press relating to Home Comfort goods, hollow ware, culinary appliances, hot air furnaces, &c. An alphabetically arranged index together with directions for operating Home Comfort ranges are other features of the work.

H. WATERMAN, local manager of the Cleveland Foundry Company, and with offices at No. 107 Beekman street, New York, has just returned from a tour among the trade in Philadelphia and Baltimore.

THE CHICAGO & ERIE STOVE COM-PANY of Erie, Pa., have issued a circular calling special attention to the novel character of the new ges burner used in connection with their gas heaters. It is called the Multi radiating burner, and is claimed to give an extra heat to the gas before it reaches the fire, thus "improving combustion and economizing in fuel." The company have also issued a new circular of the Sapphire gas stove, which is supplied to the trade finished in extra nickel or brass, according to preference. The success of this stove has been such that the company have added a new top, two side pieces and a fender.

WE ARE ADVISED that Sam S. Utter of 113 Beekman street, New York, made shipments during a recent week of eight carloads of Parlor, Game and Bantam oil stoves, with Denver, Col., and San Francisco as the destinations. We are also informed that Mr. Utter's local trade has increased in comparison with sales made during the corresponding periods of last year.

BROOMELL, SCHMIDT & Co., York, Pa., are furnishing the trade with a little pamphlet entitled "House Heating from the Kitchen Fire," and consisting of testimonial letters from a few of those who have used the Heatencook range for cooking and as a house heating apparatus. The manufacturers state that they are daily in receipt of many inquiries concerning this stove and are making very satisfactory sales. Accompanying the pamphlet is a clipping from the York Dispatch of September 22 and entitled "The Result of a Hint."

THE FULLER & WARREN COMPANY of Troy, N. Y., are the assignees of a patent recently granted to G. G. Wolfe for a grate and fire chamber for stoves and ranges. The invention relates especially to the manner of constructing and arranging an oval grate to adapt it to be horizontally rotated on its center, for use in combination with an oval fire chamber. The object of the construction is to prevent the piling up of coal at the ends of the fire chamber, where the best combustion of fuel is not possible, and to effect a vigorous and effective combustion at all points. The grate proper is made with air passages, and is constructed with a downwardly projecting foot at the front. The grate rests on rollers in the frame and has downcast serrated ends and a downcast serrated rim surrounding the central opening. The frame is attached to the inner walls of the stove by proper connections, and is constructed with a cross web or brace, slide ways and rollers turning in slots, with the faces of the rollers prejecting above the face of the frame. the frame. The draw center part of the grate is formed with projections on ita side edges and an outward projection on its urder side edges opposite. The projection is arranged to rest loosely in the slide ways of the frame and the outturned projections to pass in under the lower edge of the slide ways at each side, for the purpose of keeping the parts in place as the draw center is moved out or pushed in. At the front of the draw center part of the grate is a U shaped opening, which widens out as it extends toward the front. At its inner end, near the center of the grate, it is constructed with a shelf made with an opening for the entrance of a pivot pin on the lower side of the shaking bar, the latter being made with a longitudinal slot to receive the downwardly projected foot of the grate proper. When it is desired to dump the fire the shaking bar is drawn out, and with it the draw center portion of the grate, which leaves au opening through which the contents of the fire chamber may be passed to the ash pan.

The Excelsion Mfg. Company of St. Lou's, Mo., are furnishing dealers with a sheet carrying proof impressions of a number of advertisements of the Charter Oak stoves, suitable for use in a variety of ways. The advertisements are made up in pleasing style, each occupying a space equivalent to from 2 to 3 inches of an ordinary newspaper column.

The New Home Furnace Company, recently organized at Norwalk, Conn., will have their goods made by the Economy Foundry & Machine Company, Syracuse, N. Y., under patents granted to Gen. George D. Surford of Albany. The concern was organized by Mr. Sanford, with whom are associated Brown & Co. of Syracuse, N. Y, and George H. Raymond of Norwalk, Conn. Mr. Raymond will have general control of the business, with headquarters at Norwalk.

The works of the Joseph Bell Stove Company, at Muncie, Ind., are said to be running with an increased force and that the company are behindhand with their orders. The prospects are reported to be favorable and the indleations are that the works will be kept running full capacity for some time to come.

THE A. C. BARLER MFG. COMPANY, 111 and 113 Lake atreet, Chicago, have a very fine exhibit of their oil heaters at the St. Louis Exposition. It attracts

much attention and is highly praised by a constant stream of visitors.

THE DETROIT STOVE WORKS have received the following interesting communication from one of their customers, McNary & McNary, Martinaville, Ill., under date of September 25: "We sold to Levy Wells of this place a No. 225 Royal Jewel wood base heater in the fall of 1892. He ran that stove all winter, heating three rooms and a hall, on less than 2½ cords of 4-foot wood cut from one hickory tree. Who can beat this record?"

J. H. Cont & Son, Adams and Water streets, Brocklyn, N. Y., are issuing to the trade a 24-page catalogue of gas heating goods. The first pages are occupied by the Cort re flector stoves. The next three pages show the Cort perforated gas stove, which is entirely new this year. The body is ornamented with colored glass jewels, and an internal cylinder takes the heat to the top of the stove, from whence it is passed down outside of the cylinder and escapes through the perforations. The rext pages are devoted to the E'ectric heater, which is made both as a reflector and with an asbestos flame plate. These are followed by two styles of portable gas grates, after which comes a fire place grate, designed to be used in connection with a mantel. Another of their new things is shown in the Cort gas radiator, which is made in three sizes, each of the heating tubes being arranged with an inner heating tube which carries the hot air from the flame to the top of the radiator, where it returns on the outside of the tube and escapes at the bottom to the floor. Then follow their line of Perfect oil heaters. the No. 20 being a new stove this year, with a 15 inch circular wick and presenting a very attractive appearance. The No. 6, also new, has a 10-lneh circular wick, and is designed for use in bathrooms and other small apartments. The last page is devoted to gas and oil stove sundries.

THE MICHIGAN OIL STOVE COMPANY have been formed at Benton Harbor, Mich., to manufacture a stove of original design. They have placed an order with the Benton Harbor Iron Works for 500 kerosene oil burners.

THE HOFFMAN-RUSSELL COMPANY, 82 Lake street, Chicago, report that the demand for Triumph heating furnaces is so great that they have difficulty in filling orders.

THE KELSEY FURNACE COMPANY of Syracuse, N. Y, show, by means of a four-page folder which they have just issued, the Kelsey Generator, which is a hot water boiler converted into a warm air furnace. The device consists of a series of corrugated V shaped tubes, through which fresh air circulates in-stead of water. The cold air is taken from the outside by means of a duet to the generator, and passed through the upright corrugated cast iron tubes instead of through radiating atecks, as in the direct system of steam and bot water heating. By this means the com-pany claim that they secure "all the advantages of the later method without incurring the risks, and pure, fresh, warm air is assured, as the circulation through the corrugated tubes is rapid and continuous." The folder shows the heater with the outside easing broken away so as to indicate the arrangement of parts.

GROSSIUS SONS of Cincinnati, Ohio, are running their works full capacity.

They state that their furnace trade is especially large at this season of the year.

THE NEW YORK OFFICE of the Cleveland Foundry Company, at 107 Beekman street, are sending to the trade a circular letter in reference to the Puritan oil and gas heater, with which is inclosed one of their 1894 catalogues.

A fire which broke out in a pile of old flasks in the yard of Cribber, Sexton & Co.'s stove works, on E-lestreet, Chicago, on the evening of the 24 inst., was greatly magnified in the daily press. The loss was slight and the foundry was not damaged in the least.

The Smith & Anthony Company of Boston, Mass., are shipping a carload of Regal Hub ranges to Bernard Me-Canghey & Co. of Pawtucket, R. L., this being the second carload of the Regal Hubs that have been shipped to this firm during the year. Mesers. Me-Caughey & Co. find the wire gauze oven door a splendid selling point. The large and cleanly hearth and ash pan of the Regal are also points which the Pawtucket people seem to appreciate, and serve to make the Regal Hub the leading range in that market.

THE WHITE MFG. COMPANY, 40 and 42 State street, Chicago, offer to the trade their improved Perfection oil heater, which made its first appearance last season and met with gratifying success. It is a small stove, weighing but 15 pounds, yet it has satisfactorily demonstrated its efficiency in heating rooms without aid from any other source. Being so light in weight it is particularly recommended by the manufacturers for use in rooms in which only a temporary heat is required—pamely, bathrooms, chambers, &c. It has a cast iron base to support the fount, above which is a perforated Russis iron drum, finished with a nest removable canopy, covering a perforated top, which can be used for heating water.

THE ENTERPISE STOVE COMPANY of Vincennes, Ind., Edvise us that their anticipations regarding the sale of their Radiator heater have been more than fulfil'ed. The goods are sold far ahead and the company are running their foundry seven days a week without working Sundays. This is done by overtime on week days. The company's coal and wood ranges are also in good demand, and, from the letters received by the makers, evidently give entire satisfaction.

THE EDWARDS PARLOR LAMP STOVE COMPANY have removed their main office from the Masonic Temple to 123 Dearborn street, Chicago. They are now at work on a new stove which will be ready for the market in a very short time. The company issue a bright little Illustrated pamphlet regarding their lamp atove, entitled "All About A. M Kitchen is president of the corporation, Charles Hudson is secretary and treasurer, and O. H. Wallop of London, England, is vice president. Mr. Wallop has organized a company in London, with a capital of £50 000. to manufacture these lamos, having purchased the patents and the right to aell in all European countries and Australia, besidea being entitled to sell all improvements hereafter made. foreign company is named the American Lamp Stove Company, with offices and showrooms at 6t and 65 Holborn Viaduct, Londoo, E. C. They issue a 16page illustrated catalogue, showing the several styles in which the stove is made and the uses to which it can be

# TRADE REPORT.

### The Iron Market.

American Pig.—Buying in the New York market contiques on a limited scale. The attitude of the makers of standard brands of Northern trons is watched with some interest. The question is whether they will continue indefinitely the policy of holding prices consider ably above those at which Varginia and Alabama Irons are selling. A good many good customers have been learning how to get along with a smaller percentage in their mixtures and others have been forced by competition to do away with it entirely. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12 for No. 1; \$11 @ \$11.25 for No. 2; \$10.65 @ \$10.75 for No. 3; \$10.90 @ \$11 for No. 2 Soft, and \$11.15 @ \$11.25 for No. 4 (Foundry Forge) is \$10 @ \$10.40.

Our Philadelphia advices indicate that sales in that market have been on a larger scale than seemed likely two or three weeks ago. So much was taken in August that a falling off was expected for September, but it maintained the record. Whatever the cause, the fact is beyond dispute that prices made no improvement, and with a full supply of material in consumers' yards it is hardly to be supposed that the demand will be as heavy in October as it was during August and September. Furnaces are well sold up, however, so that the chances are thought to be fair for a steady market at unchanged prices. General quotations for Pailadelphia and nearby points are about as follows:

 Standard No. 1 Foundry X
 \$12.50 @ \$12.75

 Standard No. 2 Foundry X
 11.50 % 11.75

 No. 2 Plain
 10.75 % 11.80

 No. 1 Soft
 11.50 % 11.75

 No. 2 Soft
 10.75 @ 11.00

The sales of the week in the Chiesg? Pig Iron market included several round lots of Coke I on, and inquiries are still coming forward. The situation looks as encouraging as ever for future business from the standpoint of local makers. Somewhat higher prices are being asked, and instances are noted in which the advance is sustained. Conditions are such that at almost any time a marked upward movement is to be expected in this class of Iron. Some fair inquiries are in 'he market for Southern Soft Irons, but prices are held at comparat vely high rates owing to the better demand for Southern Irons from other localities. Lake Superior Charcoal is still very quiet. This is due to the fact that Malleable Iron makers are taking increased quantities of Coke Bessemer for their purposes, which displaces very much Charcoal Iron. Quo tations are given as follows for cash.

and Bridge and Indian		
Lake Superior Charcoai	\$14 50 %	\$15,00
Local Coke Foundry, No. 1	10.25 @	10.50
Local Coke Foundry, No. 2	10,00 @	10,25
Local Coke Foundry, No. 8	9 50 %	10:0
Local Scotch	10.25 6	1110
Ohio Strong Softeners No. 1	13.00 @	13,50
Southern Silvery, No. 1	@	
Southern Slivery, No. 2	Q	
Southern Coke, No. 2	10.75 @	11.25
Southern Coke, No. 3	10.50 @	10.75
Southern, No. 1. Soft	10,75 🐼	-11.25
Southern. No. 2, Soft	10,50 @	-10.75
Alabama Car Wheel	17.50 60	15,00
Jackson County Silvery	15 50 @	16,00
Other Ohio Silvery	14 25 @	14.50

The situation in the Pittsburgh district is practically the same as noted last week. The demand for Foundry Iron is of a hand-to-mouth character, but prices show no charge one way or the other. We quote as follows:

No. 1 Foundry.........\$11.75 @ \$12.00 Cash. No. 2 Foundry........... 10.75 @ 11.00

Cincinna'i advices are as follows in regard to that market: The general tone of the market has been and still is easy for Southern Pig Iron, but not to the extent of warranting any lower quotations, for while the demand is mainly of a jobbing char acter, it has enlarged sufficiently to be encouraging, and the aggregate sales foot up about 20,000 tons for the week, although none of them were large, and seldom reached 1500 tons in any one lot. There have been liberal sales for Eistern shipments, for the proposed advance in freight rates on October 1 stimulated buying, but that has now been postponed until the end of the year. The indications are that the consumption of foundry grades of Southern Coke Iron is keeping fully abreast of the production, and if this is so there will doubtless continue to be a confident undertone to the market. Quotations are as follows:

In the St. Louis market prices appear likely to be ent to a considerable extent by the larger furnaces which have hitherto refused to meet the lower prices. No. 2 Foundry is the grade which seems to be about the weakest, \$10 being the quotation for that grade. Quotations are given as follows for eash, f.o.b. cars S. Louis:

 Southern Coke, No. 1 Foundry
 \$10.75 \$11.00

 Southern Coke, No. 2 Foundry
 10.00 \$10.25

 Southern Coke, No. 3 Foundry
 9.50 \$9.75

 Southern Car Wheel
 16.59 \$17.00

### Metal Market.

Pig Tin.—Prices for wholesale lots have declined considerably in the face of fairly liberal purchases by jobbers and consumers, and considerable covering of speculative "short" accounts. Spot stock has been accepted at nearly 10 metric with the liberal price obtained a week ago, but the latest sales showed some reaction from the lowest prices. The decline was due chiefly to the weight of unusually heavy supply of Tin in sight. Official records place the visible supply for Europe and America on the 1st inst. at about 23,300 tons. They also make it appear that deliveries were remarkably large. This would warrant the inference that the invisible supply, otherwise stocks

in jobbers' and consumers' hands, has increased considerably. Prices for small lots from store are unchanged on a basis of 174¢ \$\vec{v}\$ lb for Straits Pig.

Copper.—I pwarl of 500,000 lb Lake Superior Ingot have been sold at or about 9\(\frac{3}{2}\psi\), for delivery during the balance of the year. A good business in E ectrolytic at about 9\(\frac{1}{2}\psi\) has also bren effected and liberal quantities of ordinary casting stock were placed at 9\(\frac{1}{2}\psi\) To some extent the business was speculative, but it is claimed that consumers were the chief buyers and that the proposed agreement of producers as to output has had nothing to do with the movement. Jobbers report a fair business in Lake Ingot, the price for small retail lots remaining at or near 10\(\frac{1}{2}\psi\)

Sheet Copper. — Compared to the business of the last few months there has been quite a good buying provement in Sheet Copper for cornice and other work, and inquiries show a very gratifying expansion in volume. The aggregate of business, however, falls somewhat short of expectations and is still below the season's average. Prices are firm and the inclination of the market seems to be in the direction of higher rates, with an increasing trade.

Pig Lead.—The market has been somewhat softer and is rather weak in appearance at the present time. A considerable amount of foreign Lead has arrived for delivery on contracts made some time ago with the largest consumers, Exports have at the same time made a good showing. It is clear, however, that a surplus over home wants remains sufficient to keep the market in a rather weak condition. Jobbers are asking 3\(\frac{3}{4}\phi\) @ 3\(\frac{3}{4}\phi\) a 1b for American Pig and experiencing oaly a moderate demand.

Spelter.—The demand is tame and the market generally has a soft appearance. Prices for small lots of Western are maintained at about  $44 \, \phi \, \widehat{\phi}$  lb, fancy brands securing the customary premium.

Aluminum.—The Pittsburgh Reduction Company announce the following priets on Aluminum Ingots in ton lots: No. 1 Aluminum, 98 % pure, in rolling ingots, 58¢; No. 1, 98 % pure, In ingots for remelting, 53¢, and No. 2, over 94 % pure, cast in ingots for remelting, 50¢ % lb. For small lots, the prices are respectively 63¢, 60¢ and 55¢.

Tin Plate — There has been rather more buying and also some improvement in the demand for both prompt and future deliveries, which served to stiften prices to the extent of about 5¢ \$\varphi\$ box for 14 x 20 Plates from the lowest point recently touched. The market, however, has been rather disappointing and has not shown the spirit that was looked for. Orders still partake largely of the hand-to-mouth nature which has characterized them for so long. The wants of the larger consumers appear to have been provided for in advance by contracts made some time ago, while the expectation of a further reduction in prices is probably preventing producers

from doing much in the way of future business. Canners' requirements are practically all satisfied, so that the demand from that quarter is very meager. Free atocks in importers' and jobbers' hands are now pretty full owing to the large withdrawals from bond under the new duty, which have been made dur-ing the week. Supplies are large at English shipping ports and imports are likely to be heavy during the coming weeks. This knowledge helps to keep down prices. For small lots from stock, quotations on imported Pates have been reduced from 75¢ to \$1 ? box on 14 x 2), and \$1 50 to \$2 7 box on 20 x 28 Plates. Domestic Rooting Plates of the higher grades continue in very fair demand, and the home manufacturers are reducing their prices to meet the cuts made in those for the foreign material. The closing down of the greater part of the American works pending the rearrangement of the wage seale will reduce the output of American Platea considerably.

A London cable dispatch of October 3 to The Iron Age reports on the British Tin Plate market as follows: Tin Plate has been dull, in the face of fair inquiry, buyers' and sellers' views on prices being considerably apart. Shipments have been heavier, however, and stocks at primal points are reduced considerably. It is not believed that prices will improve until those shipments have been disposed of to a considerable extent. Swansea quotations are as follows:

are as tottows.

Bessemer Cokes, 1C 10 3 @	
Siemens Cokes, IC 10, 4 %	
J. B Steel Cokes, 1C 10,6 @	
Dean Ternes, 20 x 28 22 @	237
Charcoals, IC	12, 6

Sheet Iron.—The mills producing Black and Galvanized Sheets are crowded with orders, and manufacturers' agenta are asking, in some cases, a slight advance in prices where prompt shipment is required. Prices for Black Iron are rather firmer, No. 27 Common in small lots heing quoted at 2.65%. Jobbeta report quite a brisk demand for Galvanized Sheeta, small lots of which are quoted at 75 and 5% off, although it is still possible to obtain 75 and 10% off on favorable orders. London cable advices state that large orders have been placed in the English market for Black Plate at £7, 15/ for Siemens, chiefly for delivery in the Southern States.

# Chicago Report.

Scrap.—Old Material is gradually growing in importance as a factor in the market, but values so far have not moved up more than a trifle on some special grades. Dealers quote the following list of buying prices, Chicago delivery:

Per	net ton.	Let 10
No. 1 Wrought Scrap	<b>\$7.00</b>	
Machinery Cast	6.00	
Matleable Cast	5.00

### CONDITION OF THE

# Hardware Trade.

THE RETAIL TRADE in many sections are apparently experiencing an improvement in their local bustness, which, while not bringing up the volume of trade to a normal average. is regarded as giving indications of a more satisfactory condition of things before long. Their orders are more frequent and better assorted that heretofore and remittances are usually sent with a good degree of promptness. There is a good deal of unevenness in the reports of manufacturers in regard to the improvement which is apparent in the business situation, some of them reporting trade much better than it has been and considerably in excess of last year, while the experience of others does not justify so favorable a report. The condition of business through the country at large as seen by representative jobbers is given in the following reports from our special correspondents in the principal markets. do not as yet show any general improvement, and on many lines of goods are low and somewhat irregular.

Advices from Chicago.-The general Hardware trade is in fair shape in comparison with lusiness dur-ing the first half of the year, but the demand is somewhat spasmodic. days of heavy business being followed by other days of comparative dullness. Some houses seem to be more favored than others. One instance is noted in which a jobbing house has been obliged to add an additional been obliged to add an additional floor for shipping purposes, and during the week was obliged to work this de-partment at nights to keep up to the igrush of orders. House Furnishing Goods and Tinware are in much better demand, but orders are still coming in mainly for broken lots. The Rocky Mountain States are buying more freely now than at any previous time this year. Some fine orders have come in from that section during the past fortnight. This indicates a much more confident tone among the merchants of the Silver States, and it is pleasant to note the improvement in that section. The Tin Plate situation is unsettled. Jobbers differ materially in quotations and it may be a week or two hefore they get together and the market becomes more strictly defined.

### Notes on Prices.

Wire Nails .- The Wire Nail market is characterized by a perceptibly better to ie than a week or ten days ago, and, as a result, prices are a little firmer. The market is represented by the quotation of \$1, at mill, for carload lots, a figure which is well maintained by the manufacturers. The improved condi-tion is regarded as resulting principally from action recently consummated, by which the manufacturers hope to do away with, or at least diminish, a disturbing influence in the market, the of feet of which has been felt for some time, as Nails have been off red at what appeared to be irregular and exceptionally low figures by parties operating in the interest of one of the mills. It is rumored, however, that the product of this mill hereafter, for a time at least, will be under the control of other manufacturers. The market is undoubtedly in better condition than it has been, and the manufacturers are holding prices steadily. The New York price continues \$1 20 on dock and \$1 25 to \$1 30 from store.

Advices from Chicago.— Manufacturers are now asking better prices, having evidently made some new arrangement during the past week which gives them a firmer basis of operation. Quotations on factory lots are about \$1.10, Chicago, and if this rate is maintained or advanced jubbers say that they will very shortly be obliged to advance their quotation of \$1.15 on small lots from atock.

Cut Nails.—The Cit Nail market is not especially active, but there is a fair volume of business, probably as large as should be expected in the general conditions of trade. Prices are unchanged, and are represented by the quotation of 90 cents for carload lots on dock, New York, with the usual average, while small lots from store are held at \$1.05 to \$1.10.

Advices from Chicago.— Manufacturers report a much larger volume of bisiness coming in from all parts of the Northwest. Orders are not much larger than they have been, but there are more of them. Jobbers quote small lots from stock at \$1.10 to \$1.15.

Barb Wire.—There is not much activity in the Barb Wire market and prices are unchanged, the tone of the market not being perhaps quite so strong as it has been. Four-Point Galvanized is quoted as follows: Pittaburgh, \$2 to \$2.05; Cleveland, \$2 05 to \$2.10; Cincinnati, Allentown, Chicago and New York, \$2 15 to \$2.20.

Advices from Chicago. — Scattering orders are beginning to come in for spring delivery. These are welcomed as an indication of much larger business of the same character to be placed this month. Manufacturers have latterly been large purchasers of Wire Roda and are evidently looking forward to as large a business this fall and winter as ever. A little irregularity is noted among jobbers, but leading houses continue to quote \$2.30 for small lots of Galvanized from stock, with the usual altowance for carload lots. When shipments can be made direct from factory to buyer lower rates are quoted by jobbers.

One-Minute Dish Washer. — This Dish Washer is put on the market by the Bolgiano M(g. Company, Baltimore, Md., by whom it is sold to the trade at \$60 per dezen, subject to a discount of 50 per cent.

Steam Clothes Washer.—Bolglano Mfg. Company, Baltimore, Md., are Justing this article on the market, a description of It having appeared in our issu: September 29. The Clothes Washer is sold to the trade at \$6 per dezen, subject to a discount of 50 per cent.

Screws.-During the past week there has been a flurry in the Screw market owing to a projected advance, which though made known to many in the trade failed to materialize. In view of the unsatisfactory condition of the market and the low prices which have prevailed conferences were held by the manufacturers with a view to advancing the price and making the base discount 83½ per cent. instead of 85 per cent. as at present. It was thought that the way was clear for such advance and some of the manufacturers made announcement to that effect, but it was found that one of the manufacturers whom it was hoped would unite in the action did not deem it advisable to do so. As it was the un-derstanding that the advance was on the condition that all the makers should unite, the project therefore fell to the ground, and those manufacturers who had made announcements of the change countermanded their advices to that effeet. As a result the market has returned to its former condition without any change in prices.

Glass.—The American Window Glass market is in much the same condition as reported last week. The demand is fair for immediate consumption, but jobbers are buying sparingly. There is also a noticeable absence of any speculative tendencies, as there is a feeling among the trade of uncertainty regarding future prices. It is reported that further declines in prices have taken place for double strength Glass. New York importers of French Window and Picture Glass have adopted a new pricelist, which went into effect October 1, and which we print herewith. There is a allght change in the arrangement of brackets and a reduction in list prices, which, the importers explain, was made to correspond to the change in tariff. The list is subject to a discount of from 60 and 10 and 5 to 70 per cent. in any quantity. This revised list has not been adopted by importers outside of New York:

The condition of the export petroleum trade appears to be very active, judging by the following item extracted trom a Philadelphia journal of last week: "A river of petroleum is now rushing from the oil country through the pipe lines to Philadelphia to load the largest fleet of bulk oil vessels that has ever been at that port at any one time. At least 15 000 000 gallons of crude and refined petroleum will be required to fill the orders now on hand for this particular class of vessels. There are twelve bulk ateamships and two barks loading petroleum in Phila-

delphia on foreign account. The average cargo of a modern bulk cartier is 1,500,000 gallons. There are also large sailing vessels carrying oil which are principally owned in France. The shipments from the Phi adelphia ports during the past week aggregated 5,075,008 gallons. The total shipments since January 1 have been 223,861,151 gallons.

It is believed that this year's shipments will be the largest ever known in the history of this port."

### Theater Ventilation.

Notwithstanding the present demand for improved ventilation in our halls of assembly and amusements, there still exists a lack of appreciation of the diffienlties attending the proper installation of a system for this purpose. As a rule, the cubic space per occupant is less in a theater or hall than in any other ordinary apartment, while its complete inclosure, the usual absence of windows, the arrangement of balconies and galleries are all against the adoption of the same methods that may be employed in the school house. In the latter, with its exposed walt and window surface, the air becomes cooled in transit and may therefore be widely admitted above wood base in the warm inner wall and thence allowed to pass to the cold outer wall. where it becomes slightly cooled and falling returns to the inner wall and escapes by a vent register at the floor. In the theater, however, the air is almost certain to be warmed in transit. The animal heat of the occupants. supplemented by the thorough heat insulation of the walls, is usually sufficient to raise to a considerable degree the temperature of the air within the room unless it be frequently renewed by the admission of cold, fresh air. If this air be admitted through the side walls, thorough distribution is almost an impossibility, and there is therefore presented for the purpose of air admission only the floor and the ceiling. The former is the better and simpler as regards mere coincidence of natural currents due to the animal heating of the entering air and of the general direction of the air movement from the floor upward.

Methods of Supply.

Ventilation to be satisfactory must be imperceptible in its manner of accomplishment, but evident in its results. The difficulty of introducing through the floor of a theater a sufficient volume of air to meet all the requirements of successful ventilation. and yet without producing objectionable drafts, can best be shown by conconsidering an auditorium seating 2000 persons. At 30 cubic feet per minute per person there will be required a total volume of no less than 60,000 cubic feet of air per minute. It is extremely difficult to admit this volume through the floor without some currents passing directly from the entrance openings toward the persons of the occupants. At all events it is unwise to figure on a velocity through inlet openings exceeding 100 feet per minute. Obviously, to secure this velocity with the above named volume there will be required an aggregate area of opening equal to 600 square feer. This can only be secured by almost a complete honeycombing of the floor. The most common method consists in perforating the risers of the amphitheater steps upon which the chairs of a theater are usually placed, or even making the entire face of such risers of wire netting or register facing. the air being admitted to them from a plenum chamber beneath the auditoriumfloor. Admission through specially constructed chair legs, through nosings along the steps or through numerous specially constructed downward deflecting outlet pieces, have all been tried and with varying success. The imperceptibility of the current of air admitted depends not only upon its velocity but also to a large degree upon its temperature. The necessity of supplying the air at a temperature slightly less than that desired within the theater, in order to allow for its heating by the persons of the occupants, is largely the cause of failure in some otherwise perfectly planned systems of floor supply. A radical departure from this method consists in admitting all the air through a perforated ceiling and removing at the floor through openings similar in arrangement to those provided for floor admission. With ceiling supply the direction of movement of the air volume is directly opposed to that naturally taken by it, due to its being warmed in transit, and consequently mechanical means are required to compel it to pass downward. In fact, to insure its removal through the desired channels an exhaust as well as a supply fan is necessary.

The Welsh Tin Plate Situation.

The tone of the Eoglish trade press indicates that the prospect of external competition is drawing the whole of the Welsh tin plate manufacturers and workmen into "closer and better working terms." The tidings of large new tin plate plants building or projected on this side of the Atlantic, and of extensive preparations now being made for enlarging the American tin plate production, are undeabtedly causing a good deal of apprehension in the minds of the Welshmen, who expected a totally different result to follow on the passage of the new tariff law. Instead of imposing a check on the rival industry in America, they note that the Wilson law is apparently stimulating it. The London Engineer thinks that the position of the Welsh tin plate makers under the circumstances is not encouraging. Other papers foresee a probable necessity for cutting wages in order to meet the competition of the American works, and in this case advise the tin plate workers to be reasonable and cheerfully consent to bear their share of the burden. For the moment, however, the Welsh workers are having a little "boom" after their long spell of inaction, and the exports of tin plates from the shipping ports are in excess of deliveries from the works, a condition that has not prevailed for many months past. Several works have started up again in the last three or four weeks, and it is even reported that a new steel works is about to be built at Llanelly, the center of the trade, to supply bars to the tin plate makers.

A compilation of the daily reports of fire losses in the United States and Canada, received by the Journal of Commerce during the month of September, shows a total of \$10,149,000, a little less than the figures for September, 1893. The losses for the first nine months of this year are calculated to have been \$97,602,000, against \$121,832,700 in the same period last year. A considerable proportion of last months losses were due to the destructive forest fires in Minnesota and Wisconsin. Otherwise the exhibit would have maintained the ratio of decrease which has marked all the months of the current year as compared with last year.

The Cincinnati Commercial Gazette of September 30, in reviewing the local labor situation at the close of the month, remarks as follows: "A careful résumé of the condition of the labor situation locally admits of the belief that at no time during the past year have the conditions been more favorable and the indications for a general improvement in the immediate future better than at the present time. The ranks of the unemployed are gradually but surely being reduced, and a most thorough investi-gation fails to reveal the fact that thereis, at present, any severe suffering from lack of work, though there are still many persons throughout the city who are still out of work. Reports from a number of mills and factories of different kinds indicate that the working forces in many will soon be increased. and there is a general feeling of hopefulness.

# THE TIN SHOP.

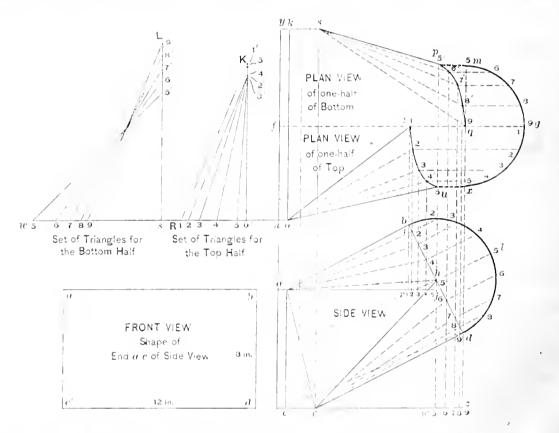

Pattern for Article Rectangular at One End and Round at the Other.

From Subscriber, Philadelphia.—Please publish in The Metal Worker a method for obtaining the patterns for a tapering article rectangular at one end and round at the other. The two ends are to be at an angle to each other when the article is placed in position.

Answer.—In Fig. 1 let a' b' c' d' represent the front view of rectangular opening and a b d e c the side of article

lines in the direction of tu and pm. On ca extended, as ok, set off the distance a'b' of front view, and add the part indicated by ny. Bisect ok in f, and erect the perpendicular fg. With point g as center, and hb of side view as radius, strike the semicircle mgx, divide it into eight equal parts, and from the points thus obtained drop perpendiculars through mx, cutting lines of similar number drawn through bd. From the points of intersection in tu draw lines to o, and draw tu. In

the triangles required for the top part, as shown in RO'K, Flg. 1, proceed as follows: Draw the right angle RO'K, and from O' on O'R set off the length of lines in bhjv of side view, as indicated by the small figures. From O' on O'K, set off the length of lines in bhjv of plan of top, also as indicated by the small figures. Connect the points in O'R with those of similar number in O'K, as shown. To obtain the triangles required for the bottom part, proceed in a similar manner. Draw the right

Pattern for an Article Rectangular at One End and Round at the Other.—Fig. 1.—Plan, Front and Side Views for which Patterns are Wanted.

for which patterns are required. The half profile of round top is represented by b l d. To obtain the necessary messuring lines for describing the patterns, a half plan of top and bottom and two sets of triangles are required, to secure which proceed as follows: Extend a' b' and c' d', as shown by a i and c z; also divide hld into any convenient number of equal parts, in the present instance eight. From the points thus obtained drop lines cutting b d perpendicular to same. From the points in b d draw lines to points a and e. With the Tsquare placed at right angles to c z, and brought successively against the points in b d, drop lines cutting c z and a j, as shown. For convenience extend these

a similar manner draw lines from the points of intersection in p q to s, and draw p q.

We have thus secured in f t u n the plan view of one-half of top, and in y p q f the plan view of one half of bottom. Then the lines in o t u of plan give the altitudes and lines in b h j v of side view give the bases of triangles for obtaining the pattern of top part. Also, the lines in s p q of plan give the altitudes and the lines in h d z w of side view give the bases of triangles for obtaining the pattern of bottom part. The hypotenuses of these triangles will give the distances between points shown in plan by o t u and s p q as if measured on the finished article. To obtain

angle W S' L. From S on S' W set off the length of lines in h d z w of side view, as indicated by the small figures. From S' on S' L set off the length of lines in s p q of plan of top, also as indicated by the small figures. Connect the points in S' W with those of similar number in S' L, as shown.

For the pattern shown in Fig. 2 proceed as follows: Draw the line O O', in length equal to a'b' of front view, or ok of plan. Bisect O O' in C, and erect the perpendicular C D, in length equal to ab of side view, and draw O D, D O'. These lines are equal in length to R K of first diagram of triangles. With O of pattern as center, and 2 2 in R O K as radius, describe a

small arc, 2', which intersect with one struck from point D of pattern as center, and b 2 in b l of profile as radius, thus establishing point 2' of pattern. Proceed in this manner, using the length of lines in R O' K for distances from O' of pattern, and the stretchout between points in b l of profile of side view for the distance between points in D G of pattern; then draw D G', G' O'. With point G' of pattern as center, and 5 5' in W S' L of triangles as radius, strike a small arc, E', which intersect with one struck from point O' of pattern as center and a e of side view as radius, thus establishing point E' of pattern. Draw G' E', E' O'. With point E' of pattern as center, and 6 6' of triangle in W S' L as radius, strike a small arc, 6', which intersect with one struck from point G' of pattern as center and 16 of profile as radius, thus establishing point 6' of pattern. Proceed in this

The Baron De Hirsch Trade School.

The committee of the Baron De Hirsch Trade School, established at 225 East Ninth street, New York, to which we have referred on previous occasions, have caused a reorganization of that institution. They have introduced fresh blood into the management and a new system of instruction, with the view of improving the efficiency of the school. The school course, which was formerly an indefinite oncits duration depending for each individual student on the amount of progress made by him-has now been limited to a regular course lasting six months. The evening classes have been abandoned and all the energies of the school have been confined to 'the day classes. The class rooms have also been rearranged and enlarged. The machine shop, the carpentry and wood turning shop and the plumbing shop, which were formerly much cramped for room, each now occupies a whole floor of the building, giving them much better accommodations and more light and air. The

The classes are held on five days of the week. Saturday being the Hebrew sabbath, no work is done on that day. The hours of session are from 8 a.m. to 6 p.m. Trade instruction is given until 4 p.m., and during the last two hours the scholars of each class are taught English—of which language they are ou joining the school entirely ignorant — and michanical drawing. Once a week the instructors give a lecture to their pupils bearing on the trade they are learning.

The plumbing class room, which occupies the whole of the third floor of the building, is well furnished with the necessary appliances. Each pupil has his own kit of tools and a drawer in which to keep them, a gas soldering furnace, pipe holder, &c. Accommodation is provided for 25 boys. The class is under the direction of George F. Helbig, a practical plumber of Hebrew birth, who has had considerable experience in the trade in this city. The superintendent of the school is George Ernest Yalden, a mechnical engineer, who is assisted by Louis

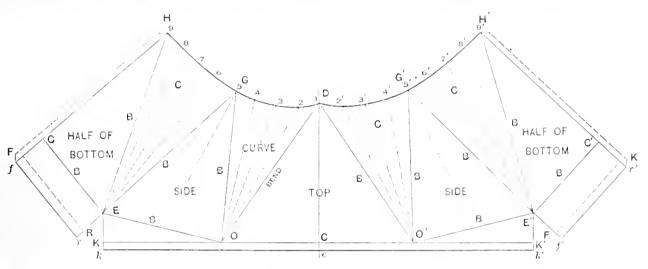

Fig. 2.—Development of the Complete Pattern for an Envelope of a Pipe as Shown by the Front and Side Views of Fig. 1.

manner, using the length of lines in W S' L as distance from E' of pattern, and the stretchout between points in l d of profile of side view for the distance between points in G' H' of pattern, and draw G' H', H' E'. With point H of pattern as center, and ed of side view as radius, strike a small arc, C', which intersect with one struck from point E' of pattern as center and n f of plan, or CO of pattern, as radius, thus establishing point C' of pattern; then draw H' C', C' E'. From E' and C' erect the perpendiculars E' F', C' R', in length equal to ce of side view, and draw F' R'. From F' and R' set off the distance no of plan and draw f' r'. With O' of pattern as center, and a c of side view as radius, strike a small arc, which intersect with one struck from E' of pattern as center and e c of side view as radius, thus establishing point K' of pattern, and draw O' K' E'. From K' of pattern set off the distance  $\mathbf{F}'$  f', and draw k' c' parallel with K' C'. Then D G' H' r' f' k' c' represents the half pattern of article. The other half can be obtained in the same manner or by duplication, as may be found convenient.

class in painting has been provided for in an adjacent building. The committee have also expended considerable money in new machinery and appliances, so that the scholars have every facility for learning their respective trades under the most favorable conditions.

The school is a free one founded by Baron De Hirsch for the young Russian and Polish Jews who come to the United States without a trade on which to rely, and it has already proved of great assistance to this class of people. Just at present, owing to the lessened emigration of the past 12 months, the classes are not as well filled as they might be, but it is expected that additional scholars will present themselves after the current term.

The course, under the new régime, began September 1, and will last until the end of February, when another six months' course will be commenced. At the end of the course the scholars will be examined by committees from the different trade organizations, as is the case in the New York Trades School. They will be granted certificates of proficiency accordingly. The system of instruction followed is molded on the pattern of that established in the New York Trades School. When the scholars are graduated, they are presented with a kit of tools, and every effort is made by the school authorities to place them in situations where they can immediately begin to earn their living.

Wasself, a graduate of the Hebrew Technical Institute.

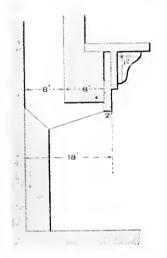

Preparation of Chromium. - From some new researches of Henri Moissan upon chromium, it results that through the use of the intense heat produced by the electric arc it is possible to prepare fused chromium in very large quantities. The product may be refined either by fused lime or by the double oxide of calcium and chromlum. The metal obtained under such circumstances is less fusible than platinum. It may be filed, it takes a beautiful polish, and is not attacked by atmospheric It is attacked but slightly by agents. scids and resists aqua regia and alkalies in fusion. This preparation of chromium will permit of efficaciously studying the alloys of the metal. United either with aluminum or copper, it gives, in fact, some very interesting results. Pure copper, alloyed with 0.5 of chromlum, has its toughness nearly doubled, and the alloy, which is capable of taking a beautiful polish, alters less than copper does in contact with moist air.

The County Commissioners at Omaha, Neb., have agreed in a proposition to vote bonds to the smount of \$1,000,000 to aid in the construction of the projected Platte River Canal.

# THE LETTER BOX.

### A Smoky Fire Place.

From Edwin A. Jackson & Brother, New York City.—May we not offer some further suggestions on fire place construction? In The Metal Worker May 12 "J. A. S.," of Fairfield, lows, says that half the fire places of his town smoke. Fully one-half of the fire places in the whole country smoke badly. Now, as to the trouble with the one he illustrates and describes, we would say that in the first place the fire place does not have a separate flue. Very

A Smoky Fire Place.—Sectional View at Throat of Fire Place.

aeldom will a fire burn well where the flue does not run aeparate to the roof.

2. The flue, even though it were separate, is too small. It should be 8 x 8 inches at least.

3. The fire place is too far out, giving the flue too much slant, and therefore too much friction.

4. The throat is a long and tapering one, and is not shaped as it should be. This point was commented upon in answer to "F. A. F.," in The Metal Worker of April 7.

5. The grate does not fit the fire place. It is a mistake to have space between the brick work and the grate, as this causes eddies which check the draft and make the grate to smoke.

6. There is too much brick work over the front of the grate. You have here about 9 inches, and amoke atriking this curls out into the room. To remedy, or rather help, the matter, it is first necessary to build up the fire place to just fit the grate and cut the brick arch on a slant. It will, however, never work well with the fluc construction. Another mistake is the damper over the grate. It is better to have the grate open wide here, at least when a fire is first started.

The question of overhanging brick work is not well understood, and a writer is wrong here who says make your flue 8 x 8 inches or 8 x 12 inches and have a 4 inch wall on the front, incressing this to 8 inches around the fire place. What is the result? The depth of flue 8 inches plus the 8 inches of b.ick work plus about 2 inches for tilling gives 18 inches, as shown in the accom-

panying sketch. A grate seldom runs over 15 inches deep, and often not over 12. That requires 3 to 6 inch filling on the back of the grate, and over the grate we have 10 inches dead space and 2 to 5 inches of flue. Even where an 18-inch fire place is used we have 10 inches dead apace and 8-inch flue. Smoke striking this surface curls out into the room usually quite as much as into the flue. It is better to have only 4 inches of brick and 2 inches of tile, or a total depth of 14 inches, of which the greater part is open space—the fluc. Where 8 inches of brick is used be sure it is cut on a slant, running down to 4 inches or less.

### Carpenters' Gauge.

From I. D. A., Punxsatawney, Pa.— Every tinner has seen a carpenter hold his finger under his rule at 2 or 6 inches, as the case required, and lay it on a board with his pencil against the end and run a mark down the board to make a line to saw to when he wanted a strip. They have also seen him stop suddenly and pick a splinter out of his finger, and both have felt that there was an annoying risk attending the use of such a gauge. Here is a gauge that can be carried in the pocket, is safe, more true than the finger, and is something with which acraps of heavy the can be worked to a profitable advantage. To make it, take a piece of tin Action of Copper on Tin.

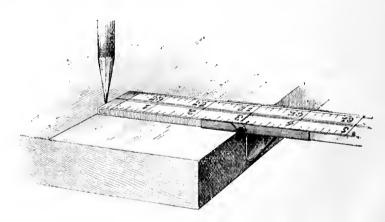

From "BILLY THE KID," Hebron, Neb.—Does the copper bottom on a wash boiler or coffee boiler make the tin body rust, or wear, out faster than if a tin bottom were used; if so, what is the cause?

Note.—There may be some difference in opinion as to whether the body wears out faster with a copper bottom than with a tin bottom. It is true, however, that electrical action will take place between the two metals under certain conditions, and if the tin coating on the iron is partially destroyed the iron will be esten away very quickly. It is not uncommon to find fine holes all around the bottom of a wash boiler with a copper bottom and the same is true of coffee boilers.

### Sims' Patent Gutter.

From J. D. A., Remington, Ind.—In answer to "W. J." of Ridgedale, Tenn., I would say that he can purchase Sims' patent gutter from Rhodes, Dickelman & Co., Forest, Ohio.

The Twin City fron Works of Minneapolis, Minn., have recently begun the manufacture of a fire proof door for use in warehouses and other buildings, for the Fire Proof Door Company of that city, who own the patents. It was

Carpenters' Gauge.

2 inches long and 1\s\s\ inches wide. Turn up an edge at a right angle on each side and \s\s\ inch high. In one edge cut a triangular notch, as at A, \s\ inch from the end. On the under side, just even with the upright line of the notch A, tolder firmly a stop 1 inch wide, letting it run down atraight \s\s\ inch; then turn the end back for a brace and solder fast. In use, a rule is placed between the edgea, with the desired measure even with the notch and held in place with the thumb, while the fingers of the left hand grasp the gauge and the rule firmly. The right hand holds a pencil at the end of the rule and a true mark can be made on rough timber with safety, as can readily be seen from the cut. The cost is so little that they can be sold for a dime with a good profit.

necessary to build hydraulic machinery for the purpose, but the company proved equal to the emergency and erected a press of large size, capable of exerting a pressure of 4000 pounds to the square inch, and weighing 26 tons. The door is composed of two sheets of ateel or copper, as may be desired, which are pressed into panel form to conform with any design specified. These sheets are fitted over a wood frame and the inside filled with mineral wool, making them perfectly fire proof. The frame is grooved and the steel pressed into the groove, and it is then fitted with a steel band which extends all around the door, making it perfectly atrong and rigid. These doors can be finished up in nickel, copper, brass or bronze. The casings are made with the same protection.

# PLUMBING and GAS FITTING.

### Plumbers and the Health Association.

In a paper read by President John Mitchell of the National Association of Master Plumbers, before the Twentysecond Annual Convention of the American Public Health Association, at Montreal, Canada, on September 25-28 of

the present year, he said :

Having been delegated to represent the National Association of Master Plumbers at your convention, I deem it essential to summarily outline its history, the demand for the reform it has materially assisted in inaugurating, a reiteration of its objects as relating to public health, and the results achieved. In our success we are indebted to many of your members, some of whom are

doubtless present.

Through the associated efforts of progressive men of the craft our associprogressive men of the craft our association was organized twelve years ago.

Annual conventions, composed of delegates from filial local associations, have been held regularly, at which papers have been presented and discussions entered into which have proven very helpful to the trade, and, resulting in better work, have been beneficial to the

public and a monument to our efforts.

Our constitution reads: "This association is organized for sanitary, commercial and social purposes and has for its special object the advancement of the trade in all the latest discoveries of science appertaining to sanitary laws. Having made this public declaration it behooved us to acquaint ourselves with the principles of sanitation and the best methods of construction to attain the goal. This meant a higher education

of the craft.

### Present vs. the Past.

The task of arousing the dormant energies and encouraging the pro-ficiency of all members of the craft, both in and out of the association, was a herculean undertaking; but a com-parison of the present beautiful sanitary bath room with the not very ancient outhouse, wash bowl and pitcher, demonstrates our phenomenal success.
The plumbing of a house is now one of the most important branches of the building trade. The transition from the insalutary pan closet and other crude fixtures, the chaotic arrangement of pipes, to the handsome lavatory, closet and bath, and the systematic arrangement of pipes, traps and vents, has made it feasible and absolutely safe to place any fixture in a sleeping apart-ment without danger of the exhalation of mephitic fumes.

It is utterly useless for me to attempt to discuss with you learned gentlemen the septic influence of sulphurated hy-drogen, sulphide of ammonium and organic matter, commonly known as aewer gas, as a ready conveyer of the materies morbi, or cite cases of the ravages of medieval pestilences and mortality statistics to convince you of what, to me, is obviously apparent, that a akillfully executed and scientifically planned drainage system, to carry off sewage and prevent the pollution of the

atmosphere by noxious effluvium, is a paramount requisite to health. As physicians your efforts are mainly directed to the cure of disease, while ours is that of prevention. Your knowledge is obtained from books couched in technicology, scientific diagnosis and hospital practice. Our knowledge is obtained through an apprenticeship, averaging live years, first carrying the kit, furnace and coil of lead pipe all at once, and later, if we are worthy our vection, a systematic study of mathematics, mechanical drawing, chemistry and hydraulics. A plumber should not only be able to wipe in a trap, but, if it siphons, explain why; for we are practical plumbers and sanitarians only so far as our knowledge of the above extends.

### Do Good Work,

There are some owners and contractors who desire and are only willing to pay for a chesp class of work, making it almost impossible for the conscientious plumber to live and execute sanitary work, which is the pride of all. That there are a few mercenary tenement owners and plumbers who heaitancy in subjecting have no others, perhaps ignorantly, to typhus, diphtheria, cholers, pulmonary phthisis by the construction of defective house drains, which afford a congenial nidus for the germs of these maladies, is to be regretted. Without legislation to put a sudden quietus upon the open disregard of hygienic laws complete safety cannot be obtained. With the continued co operation of your members, national sanitary legislation is assured, but the delay and the resultant effects imperil more lives than the ab-sence or disregard of the laws regulating the handling of poisoned drugs by the incompetent druggist or his ignorant The trite maxim that "an ounce of prevention is worth a pound of cure, is universally recognized but too often overlooked by the householder, who, after the triumphant entry of the insidious foe, the direct cause being his ignorant or criminal neglect, has lost the life of a loved one, finds, too late, that he has maliciously directed his shafts of alleged wit to the honest "plumber's bill."

### Object Lessons.

Notwithstanding the frightful object lessons inculcated by vicious ventilation and pestiferous sewer gas, people are slow in demanding a cessation. They look to Boards of Health and the honest work of the plumber for protection against the Protean enemies of health; for our errors of commission or omission we are morally amenable.

As early as 1886 the master plumbers of Maryland drafted and secured the passage of a law providing for a State Board of Commissioners of Practical Plumbing, consisting of three practical plumbers, a member of the State Board of Health, also a member of the Board of Health, also a member of the Board of Health of the City of Baltimore, appointed biennnially by the Governor, to examine all engaged in the business of plumbing and issue certificates of competency. Any one found conduct-

ing said business without a certificate was subject to a fine of \$50 for each The law had been in vogue but a short time before an incompetent and unlicensed plumber appealed to the courts, claiming that under the cou-stitution he had been deprived of his means of livelihood. The High Appellate Court of Maryland declared that if any calling was of such a character as to require a special course of training or experience to pursue it with safety to the public, it was eminently proper for the Legislature to restrict it.

### Legistative Enactments.

The Legislature of New York enacted a law in 1892 to provide for an examination to determine the fitness of all plumbers in the business. Massachusetts passed a similar statute in 1893.
The Honorable Board of Commissionera of the District of Columbia has passed regulations governing plumbing.

It is complimentary to sanitary science that nearly every city in the United States has ordinances regulating the proper running of supply and ventllation pipes, the separate trapping of each fixture, the abolition of the cesspool, &c. The paramount right of such ordinances rests upon the well recognized maxim, "Salus populi est suprema lex" (the health of the people is the

first law).

It is not necessary to delay action to ascertain whether the plumbing in a building is in proper condition until crape is hung on the door. Annual or semi-annual inspection of old and new buildings should be made compulsory. An advance along this line has been consummated in Chicago, where a semi-annual inspection of all buildings is made under the supervision of the De-

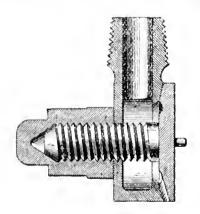

partment of Health and Drainage.

The sanitarians of Ohlo, Rhode
Island, New Hampshire and Texas, as
well as other States, are working for the passage of sanitary laws. The National Association of Master Plumbers extends thanks to many of your members for past assistance in this com-mendable work, and now urges that your association, interested in this momentous question, stamp its approval on the work and, if consistent, pass a resolution urging your members to exert themselves to the end that pure air and pure water may abound in every

A NEW MANUFACTURING COMPANY IS to be organized at Springfield, Mass., to be called the Hercules Float Works, which will be composed of Henry S. Anderson, manager of the United Elec-tric Light Company; Frank Engelhard, superintendent of the plating depart-ment of the Springfield Brass Company, and others. The work done will be ex-perimental at first, but floats of all kinds will be made, such as are used in steam traps. The floats will be of copper and they are to be manufactured by new electro process which has never been tried before. The rooms of the firm will be located at 54 Taylor atreet, where the machinery is now being set up as fast as possible.

### A Clean Out Urinal Spray.

To obviate the frequent stoppage in the flow of water from the pipes supplying alab urinal stalls, owing to the collection of dirt or sediment around the small holes bored in the pipes, Savill, Walls & Co., 1229 and 1231 Budden street, Philadelphia, Pa., have introduced the clean out urinal spray here shown. It is simple in design and said to be exceedingly effective in use. Fig. 1 shows a sectional view of the device, which is made of brass. It consists of three pieces-viz., a hollow or chambered center piece, or body, with a nipple at its upper end for connection to a tee in the supply pipe, and having a concaved face on one side, with grooves on the lower edges radially disposed, and two guide pins extending from the outer edges of the face; a cap or circular plate at the end of a screwed stem or spindle, the inner face of the cap being convexed and grooved to register with the body face, and having two holes for the guide pins in the body face, and a nut or bonnet squared for use with a wrench. When connected to the under side of a supply plpe with the nut or bonnet outward the water flows directly to the channels formed by the grooves, and is discharged through same in the shape of jets at an angle sufficient to cause a thorough wash of the face of the slab. When one or more of the apertures become choked with sediment it is simply necessary to loosen the nut or bonnet, when the pressure of water acting against the face cap will force the cap away from the body so as to separate the grooves forming the jet sperture and quickly remove the dirt. The nut is then tightened and

Clean Out Urinal Spray.—Fig. 1.—Sectional View.

the perfect flow of water continues. As has been seen, the spray is essily kept in an efficient condition, with the result that the whole surface of the urinal slab is at all times in a clean and wholesome condition.

Fig. 2 shows a urinal fitted with the spray and also with an or dinary pipe. The spray is the invention of Joseph H. Savill, who has made application for patent protection, and it will, no doubt, to a large extent supersede the perforated pipe so commonly used, and which is so troublesome to keep clean.

Joun McCart died last week at his home, 703 Dolphin street, Baltimore, Md., after an illness of six weeks with Bright's disease. Mr. McCart was born in Ireland in 1828. His parents brought him to this country when he was two years old. He was educated in Baltimore, where the family settled. In 1854

he began the plumbing business at the corner of St. Paul and Centre streets, where he continued it until his last illness. His plumbing work is seen in the Maryland penitentiary, city jail and other large buildings.

# An Eel in the Corporation Tap.

Some idea of the pleasure attached to the plumbing business can be gained from a description of what was recently necesthe tap was removed; and as there was a heavy pressure, considerable water escaped before the plug could be inserted in the hole. The tap, it was found, when loosened, had been forced out by the water and thrown up the trench, and to it was attached an eel 1 inch in diameter and 15 inches long. The eel, it appears, had been forced into the cock some 3 inches, and the head and body reduced to a diameter of  $\frac{1}{2}$  linch for this length, while the other portion was considerably swelled, although it had evidently not been confined in its nar-

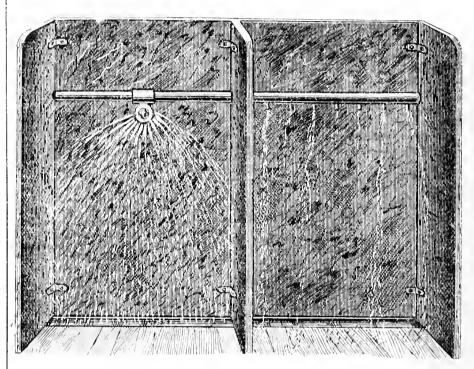

Fig. 2.-View of Urinal Fitted with the Spray and with Ordinary Pipe.

sary to open up the water supply in the house of one of the customers of Boyd & Schnaier, 277 Columbus avenue, New York. On being notified of the stop-page of the water supply the building On being notified of the stopwas visited, and on tracing along the water supply pipe and closing the stop cock on the service, it was found that the trouble was on the street side of the cock. By driving a nail in the pipe, on the street side of the stop, there was no flow of water, and to com plete the investigation it was necessary to dig a trench in the street for the purpose of examining the pipe. It being evident that the trouble was between the nall hole previously made and the street main proper, the pipe was cut away from the corporation tap and an attempt made to remove the obstruction by the sid of a piece of wire.

The wire, however, would penetrate the obstruction, though the water was held in check. The presence of blood held in check. The presence of blood on the wire after removal led to the supposition that the trouble was caused by a small fish or eel imprisoned in the pipe. On closely examining the tap it was found that the hole in the street main was somewhat enlarged by corrosion, and that the tap was also somewhat esten away. Preparations were then made to remove the tap. A piece of tough wood was shaved to the same size and diameter as the tap, and a soldering copper and furnace put in readiness to increase the size of the tap by tinning after it was removed so that when reinserted in the hole a close connection would be made. After these preparations were completed and the plumber clothed in an oil cloth suit, row quarters for any length of time. By the use of force the eel was detached and the cock filed bright and tinned, and, as anticipated, it was found to be somewhat reduced in size at the point where it entered the main.

After shutting off the cock the task of getting the tap into the main was begun. The plumber stood to one side of the opening, so that when the plug was loosened there would be no danger of its being thrown violently against his body by the torce of the water. To find the hole and insert the tap with a spray of water covering a considerable space was no easy task, and when found some strength was required to hold the tap until it could be driven in with a hammer. This being effected and the service pipe repaired, the necessary joints were wiped and the job was complete. The eel has been preserved in alcohol in a glass jar, and is kept on exhibition in the show window of the plumbers.

### TRAPS AND VENTS.

THE BOARD OF HEALTH OF TROY, N. Y., have passed a resolution permitting the use of any good anti-siphon trap. Michael J. Whelan has been appointed assistant plumbing inspector.

W. F. DONNELLY has opened a plumbing shop in Plummer's Block, corner of Ash and Auburn streets, Auburndale, Mass.

THE FIRM of Wyman & Tallman, plumbers and house furnishers, on Main street, Nyack, N. Y., were dissolved last week by mutual consent. George

W. Tallman retired on account of ill health. George Wyman will continue the business.

WILLIAM O'LEARY has moved his plumbing establishment from 83 M:. Auburn street to 26 Boylston street, Cambridge, Mass.

AN AGREEMENT has been made at Boaton, Mass, that eight hours shall constitute a day for a plumber and the pay shall be \$3.75.

JAMES BARRETT has severed his connection as toreman of W. H. Hell's plumbing department and has opened a tinsmith and plumbing establishment on his own account in Haverhill, Mass.

GEO. E. WARING, New York, engineer in charge of the reconstruction of the drainage in the Capitol Building, at Washington, D. C., recorts the work completed at a cost of \$25,932. It included practically the construction of an entirely new system of waste pipes and fixtures throughout the building.

THE ELLIS & COOGAN COMPANY, plumbers, of Milwaukee, have fited articles of incorporation in the office of the Secretary of State. The capital stock is \$20,000 and the incorporators are Joseph Etlis, Richard Coogan and F. B. Grasp.

James Monyon, the plumber and tinsmith, has opened a repair shop at 54 Cavanaugh's lane, Woonsocket, R I.

IT HAS BEEN DECIDED by the city suthorities of Chicago that a plumber with more than one place of business needs only one license.

WALLACE BROS, plumbers, doing business at Evanston, Ill., made an assignment in the County Court on the 31 inst. in favor of William A Ratcliffe. Assets, \$3300; liabilities, \$5197.

As the season approaches when the gas is lighted earlier in the day the Union National Gas Saving Company, 744 Broadway, New York, find an increased demand for their National automatic gas saving governors. They issue a pamphlet describing the operation and use of these goods, besides presenting testimonishs from a large number of stores, factories and residences in which their governors have made perceptible reductions in the gas bills, while at the same time aiding in the maintenance of a steady and brilliant light.

ON FRIDAY MOHT of last week the plumbers of Monmouth County, N. J., assembled at the call of President Mc-Leod at one of the famous hostelries of Long Branch, N. J. An elaborate menu was served in courses, which was attended with interest by the guests, while harmony and good fellowship prevailed. After the banquet speeches were made by State Vice President John Highman of Patentan in which he are Hickman of Paterson, in which he re-joiced at the burisl of all enmity between plumbers and such evidences of good feeling. Secretary J. T. McNab good feeling. Secretary J. T. McNab of the Master Plumbers' Association of Paterson followed in the style peculiarly his own and equally entertaining. Ex-Secretary Don of the Master Piumbers' Association of Newark also entertained the guests. Those who know of his energetic work for the benefit of the association were surprised at his oratorical abilities. J. M. Heatherton, Jr., responded to the toast of "The Press" with the same success with which the press captivates all who are within its reach. After these sages had addressed the guests the wits assumed control and laughter prevailed.

The nusiness heretofore conducted in plumbers' and gas and steam fitters' supplies by James B. Clow & Son of Chicago is to be transferred to a corporation named James B. Clow & Sons, with an authorized capital stock of \$250,000. The license of incorporation was taken out on the 4th inst, by James B. Clow, Will E. Clow and James M. Johnson.

THE C. W. WILLIAMS COMPANY, Concord, N. H., plumbers steam and gas fitters, with a capital of \$4100, have been incorporated under the general laws.

THE MASTER PLUMBERS' ASSOCIATION of Fall River, Mass., held a regular meeting last week and installed the recently elected officers of the organization. It was voted to give \$100 to the Associated Charities of this city. After the meeting there was a social session, during which an excellent collation was served.

Among the items of work of the plumoing inspectors given in the report of Inspector D. J. McKeough, Utica, N. Y., are the following showing something of the calls that have to be attended to: Permits issued for sewer connections, 214; connections made. 205; inspections made on sewers, 307; permits for water and gas, 38; specifications for plumbing work filed, 19; inspections on rough plumbing work, 93 (and work found defective on 11); number of reinspections and found remedied, 11; final inspections, 72 (found defective, 1); total number of inspections, 495; water closets put in, 89; baths, 16; wash basins, 19; sinks, 58.

On Monday night the classes of the New York Trades School will open for the season of 1894-5. The evening plumbing class is not as large this year as it was last, when it was necessary to induce a number of applicants to take instruction in some other trade. There are already 40 applications for the day plumbing class, which commences a month earlier this year, on December 3. Other classes that our readers will be interested in are the Steam and Hot Water Heating, and the Tinsmith, Roofing and Cornice work, both of which begin on January 2, 1895.

THE BROWNHILL COMPANY of 838 Broadway, New York, have recently fitted three of the fire department atations in New York City with their Perfect gas controllers and have also made a large shipment of these goods to South America.

James V. McGarver & Son, 1414 Race atreet, Philadelphia, Pa., have recently completed a very satisfactory water heating plant in the toilet and bath rooms of the Academy of Notre Dame, Philadelphia, using a No. 3 Douglass instantaneous water heater. This apparatus heats the water for two lavatories and two bathtubs. These fixtures are located in three different rooms where it was not convenient to get hot water from any other source.

ROACH & DELEHANTY, 906 Columbus avenue, New York, are installing urinals and a 22 foot aiphon range water closet in the achool at 179 East 124th street, and are also doing the plumbing in the large boarding stable at 101 Amaterdam avenue.

A PLUMBER'S LICENSE has been granted to Reilly & Mabee at Amsterdam, N. Y.

BOYD & SCHNAIER, 347 Columbus avenue, New York, are very busy doing plumbing repair as well as new work.

They are running 24 plumbers and a number of helpers and laborers at the present time.

THE EILIS & COOGAN COMPANY of Milwaukee have been incorporated, with a capital stock of \$20,000, to een luct a plumbing business. The incorporators are J seph Elus, R chard Coogan and F. B. Grasp.

Louis A. AND HARDLE C CORNELIUS doing bisiness as Cornelius Bros., at 120 West Like stree. Chicago, have made an assignment in favor of Charles II Ames as assignee. Assets and liabilities were estimated at \$18,000 each. The firm have been engaged in the manufacture of plumbers' specialties.

Carrying Electricity on the Person.

A correspondent, R. W. Hill of Manchester, England, sends to Industries and Iron an amusing letter respecting an el etrical means he has devisad as a defense against thefts from the person. After relating by what means he was bereaved of a valuable personal ornament Mr. Hill recoun's the measures he has sagaciously devised to meet any fu'ure contingencies of a like nature. "I rigged up," said he, "A small contact for my scarf pin, bought a tiny electric bell, made a double pocket accumulator and am now ready for any emergency. I may say I now carry about with me a whole electric museum. The source of electric energy is stored up in said secumulators, and I have made a contact for my watch. Thus if any attempt is made to extract it quietly the tell tale indicates the fact at once. The third item of my equipment is a tiny incandescent lamp concealed in a well finished artificial water proof flower pinned to my coat. The lamp is useful during a performance at a theater, when the light in the house is usually lowered, and when I may desire to look at the programme, &c. Another piece of apparatus, invaluable to an inveterate an inveterate amoker, as I am, consists of a very fine platinum coil placed in a cavity made of asbestos. By inclining the little glass tube the mercury in the same closes the circuit of my pocket battery, and I can thus light my cigar, &c., regardless of the westner. The entire museum weighs about 22 ounces, and the only bother is the recharging of the battery. The latest addition to my store is a hollow cane fitted with a tiny lamp provided with a small silvered reflector concealed in the knob. The hollow cane is sealed at the bottom by a rubber stopper, and the exclting fluid is a mixture of chromic and hydrochloric acids. The cell consists of an amalgamated zinc rod and a strip of platinum foil. This type of battery was used for Tissandier's 'Navi-gable' balloon. By inclining the cane the lamp is, of course, fed by an e'ectric current and gives a good light. Any intelligent person can rig up my portative museum in a few hours.

The vagaries of the contract system are well illustrated, says the London Plumber and Decorator, by tenders just received by the managers of the Central London School District for the painting of the Hanwell Paupers' School and the erection of two new gate posts. Of the 12 sent in, the highest tender for painting, the architect's estimate for which was \$3 360, was \$9,250, and the lowest, \$3,696; while for the erection of the posts the highest price quoted was \$223 and the lowest \$21.75.

# PLATES.

### A Unique Gateway.

We print herewith an illustration of a very unique piece of art in the way of oansmental tin work. The illustration represents an arch which was erected by the U. S. Iron & Tin Plate Mig. Company of Demmler Station, Pa., on the occasion of the centennial celebration of the city of Mckeesport, Pa. This arch was designed by C. M. Bart berger, architect, Pittsburgh, and erected by the McKeesport Hardware Company's corniee department, of which Mr. Steffy is superintendent. The extreme width of the arch is 28 feet; it is 32 feet high, and the gateway 14 feet wide. The eagle in the center between the battlements was made by Henry Adler of Pittsburgh, of the first tin plate that was made at the U.S. Iron & Tin Plate Works after the pas sage of the McKinley bill. This engle is a beautiful work of art. In 1892 it is a beautiful work of art. formed the center piece of the balcony above the speakers' platform at the National Republican Convention in Minneapolis, and in 1893 it adorned the exhibit of the Associated Tin Plate Manufacturers at the Columbian Exposition in Chicago, where it was adposition in Chicago, where it was admired by a large number of experts. The two side posts of the arch, each seven feet square, were adorned with fine portraits of Governors Pattison and McKinley, the honored guests upon this oceasion.

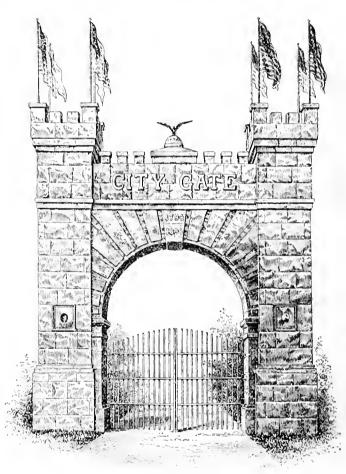

Occasion.

The occasion which induced the U. S. Iron & Tin Plate Mfg. Company to have this arch erected was a very significant one. In the first place the company felt the desire to show to their fellow citizens of the city of McKeespert that they possessed a patriotic interest in the affairs of the city, it having been frequently asserted that although the tin plate company was in the city of McKeesport the latter did not get due credit for having within its borders the pioneer tin plate works in the United States.

This arch was erected at the city line below the works, showing clearly that the boundaries of the city of McKees. port included the tin plate works and was called the "city gate." A very interesting ceremony took place at this point on September 13. The Gov-ernors of the State of Pennsylvania and the State of Ohio, together with other distinguished guests who had consented to participate in the celebra-tion on that day, and who had come from Pittsburgh to Demmler Station by special train, were, in accordance with the programme planned by the Centennial Committee, received at the city gate. On the arrival of the train at Demmler a mounted bugler, clad in continental uniform, announced by bugle sound the arrival of the guests. The gates, which were made of tin tubes, were closed, and the bugler, ad vancing, announced to the gate keeper, who was a'so dressed in ancient costume, that the guests had arrived. The Mayor of the city, Hon. Jas Z. Andre, who, with a deputation of McKeesport citizens, stood inside the gate, then ordered the gates to be opened, and while the band was playing "Hail to the

Chief." the Governors and their suites marched through and were received by the Mayor with an address of welcome, in which he pointed out the industries of McKeesport and especially greeted the Governor of Penusylvania as the chief executive of the State, and delivered to him, through the hands of his daughter, a badge in the shape of an ornamental key made from planished iron such as is manufactured by the W. Dewees Wood Company, stating that the planished iron key would fit the tin plate gate. He further pointed out that ernor McKinley with a very neat souvenir badge made of tin plate, the Mayor stating that as these gates had been opened that morning for the Governor of Ohio to pass through, so had he (McKinley) opened the gates for the tin plate industry to enter and become established in the United States.

After the Mayor's address of welcome the Governors and the other honored guests, among the number being Gen.
D. H. Hastings, Hon H. M. Jackson,
State Treasurer of Pennsylvania; Hon.
W. A. Sipe, Hon. W. A. Stone, Hon.

A Unique Gateway.

while at this end of the city was the gate on the line of the pioneer tin plate works of the United States, the opposite boundary of the city was formed by the large works of the W. Dewees Wood Company, the well-known makers of planished or Russian sheet iron, and that between these two works were the National Tube Works, the largest wrough troop pipe works in the United States together with rolling mills blast States, together with rolling mills, blast furnaces and Bessemer steel plants be-Sterling Steel Works, at which the fa-mous Wheeler-Sterling armor-piercing projectiles were manufactured.

The Mayor then requested the Governor to assume control of the city and also to give the freedom of the same to his brother Governor of Ohio. The Mayor's daughter then presented Gov-

C. L. Mageé, Adjt. Gen. W. L. Greenland, Judge J. F. W. White, Hon. John F. Dravo and a large number of John F. Dravo and a large number of McKeesport's and Pittsburgh's prominent citizens, under the gu'dance of the directors and officers of the company, inspected the U. S. Iron & Tin Plate Works, which were in full operation, and witnessed the process of operation, and witnessed the process of tin plate making from the raw steel bil-let to the finished plate. While the party inspected the tin plate depart-ment proper, Governor McKinley, upon the suggestion of foreman Purcell, dipped a plate with his own hands. It came out bright and handsome and was presented to Mrs. McKinley as a soupresented to Mrs. McKinley as a souvenir of the occasion.

After an hour profitably spent in this manner, the party proceeded to the private hotel of the U.S. Iron & Tin Plate Mfg. Company and partook of a luncheon, which was served by the ladies of the members of the company and at which the president of the com pany bade the guests the special welcome of the U.S. Iron & Tin Plate Mfg. Company, and thanked them for accepting the hospitality of plain American citizens.

After luncheon the party left Demmler Station by 'he special train, which stood in waiting, in the best of humor to participate in the further festivities of McKeesport's centennial celebration.

### SCRAP.

A DISPATCH to the Cincinnati Com-mercial Gazette from Elwood, Ind., states that the report that all the tin plate manufacturing plants in the United States closed down last week indefinitely, or until the wage question is settled, was false as far as the works of the American Tin Plate Company of Elwood are concerned. Three mills have been closed down for repsirs, throwing only 45 men out of employment temporarily and leaving two mills in active operation in the hot mills department, while all the rest of the plant 'is running right along at its usual capacity. The repairs to the three mills were to be completed by the end of this week, when they would probably be started. The additional five new mills have been completed and put in operation. understand that the employees have been informed that there will be no reduction in wages.

A LONDON CABLE DISPATCH cites the Exchange Telegraph Company of that city as authority for the statement that the Welsh manufacturers are so anxious for the return of the British tin plate workers now in the United States that they have offered them free transportation home, in addition to guaranteeing them employment, if they will return.

THE TIN PLATE MANUFACTURING COMPANY who located recently at Anderson, Ind., were incorporated last week under the name of the National Tin Plate Company.

THROUGH the month of September of this year the New Castle Steel & Tin Plate Company, New Castle, Pa., employed over 460 workmen and paid out \$20,000 in wages.

THE STOCKHOLDERS of the American Tin Plate Company, Elwood, Ind., at a recent meeting, elected the following officers and directors: President, W. B. Leeds; vice-president, John F. Hazen; treasurer, D. G. Reid; secretary, L. H. Landon; directors, W. B. Leeds, Mrs. W. B. Leeds, D. G. Reid, J. M. Oversheimer and John F. H zen.

N. & G. TAYLOR COMPANY, tin plate manufacturers, Philadelphia, advise us that they are running 18 stacks, and that the demand for their plates was so great during the latter part of last month that they were compelled to work up to 10 o'clock at night. The firm say they not only propose to keep up the quality of their standard brands, but to improve them in every manner possible; and that they have now under way a plan for increasing the wearing qualities of the Taylor Old Style brand, which already carries a very heavy coat-

A REPRESENTATIVE of the United Press in London has been interviewing the representatives of firms in various branches of trade doing an export business with the United States, in regard to the effects, present and

prospective, of the Wilson Gorman tariff on British industries. Ameng others, F. Bond of Vivian Younger & Bond, metal merchants, had this say about the tin plate trade: "Heretofore the effect of the tariff has been almost nil in our business. There must have been a quantity of tin plate in bond in the United States. I believe there will be a tendency in the States to increase gradually the home production. The new duty will not encourage the tin plate firms in South Wales greatly. It does not leave a sufficient margin to encourage and develop rapidly the American tin plate trade, but the growth of tin plate manufacture in the United States is bound to be exceed ingly gradual in any event, for tin plating is the bardest process in any branch of the metal trade." This difficult proc-ess, however, has, we understand, already been mastered by American workmen in American tin plate works.

THE COMPETITION in Spain between Welsh and native made tin plates is referred to as becoming severe. The new three-mill works near Bilbao are in operation and are turning out a considerable quantity of plates. They are said to be well arranged and fitted with the latest appliances.

THE BLAINA IRON & TIN PLATE COMPANY, LIMITED, of Monmouthshire, England, have announced to their workmen that the works will commence operations on October 15 on the same terms as neighboring works. This means a conceasion by the workmen of 15 sheets of tin plate per box, an arrangement made by the men in the different Phillips works, at Abertillery, Nantyglo, Pontymister, &c. This is a method by which the 36-box rule is nominally adhered to, but virtually evaded.

THE ATLANTA STEEL & TIN PLATE COMPANY, Atlanta, Ind., are making rapid progress in the erection of their works. The contract for mills is in the hands of the Lewis Foundry & Machine Company, Pittsburgh. The foundations for the rolls and engine are partially completed. The engine is a Woodruff & Beach automatic cut off 36 inch disperter out. tomatic cut off, 36 inch diameter cylinder and 72 inch stroke, to be gesred direct to the mills. The buildings are The buildings are to be all iron and brick. The company have 2000 acres of gas territory in the Elwood district and are in the market for 4 miles of pipe for their gas line.

THE DUQUESNE TIN PLATE COMPANY of Pittsburgh, manufacturers of tin and terne plate, whose works are located at Soho, are considering the advisability of removing their plant to New Kensington, Pa., some 20 miles from Pitts burgh on the line of the Allegheny Valley Railway. In case the removal is de-cited upon it is the intention to erect a black plate mill for rolling down sheets from bars. As yet no decision has been arrived at in the matter, and it will probably remain undecided until the present wage troubles surrounding the tin plate industry have been removed.

THE BRITISH BOARD OF TRADE returns for September show exports of tin and terne plates during the month to have been 27,000 tons, against 25 000 tons shipped in the previous month. of this amount, 17,000 tons was sent to the United States, as compared with 13,000 tons in August. The movement of plates in this direction to enter under the new tarlff began to increase toward the end of the last month. It is likely that October's shipments will, however, | ing sailing ships afloat to day.

largely exceed those of September, as considerable quantities of plates which were held by importers in warch uses on the other side are said to have been withdrawn and shipped hither in the past week or two.

THE ENTIRE PLANT of the Ellwood Tin Plate Conpany, E twood City, Pa., is closed down pending adjustment of the wage scale.

J. H Rogers, the well-known tin plate manufacturer, of E. Morewood & Co., L'anelly, Wales, is now in this country in connection with his interests in the plant at Gas City, Ind.

ONE OF THE MOST distinguished gatherings of military and naval officers ever witnessed in the city of Philadelphis took place on the evening of Tuesday, October 9, when Clarke Merchant, head of the well-known tin plate and metal house of Merchant & Co., Incorporated, tendered a reception at his residence, 1615 Walnut street, to the Commander-in Chief of the Military Order of the Loyal Legion, assembled in the Quaker City for its tenth annual meeting. The handsome residence of Mr. Merchant was beatifully decorated for the occasion with palms and flowers, while a string orchestra discoursed delightful music. After the reception in the main parlor a collation was served to the guests, the list of whom included many famous names. Mr. Merchant is a graduate of the Annapolis Naval Academy and served as a lleutenant commander in the navy.

THE CRESCENT SHEET & TIN PLATE COMPANY, Cleveland, Ohio, were in-corporated October 5, with a capital of \$200,000, to manufacture, sell and deal in sheet iron and tin plate, with the following directors: H. P. McIntosh, Francis Widlar, N. C. Brewer, E. W. Moore, A. B. Foster, James Paton and J. A. Matthews. At a meeting of the directors the following officers were elected: President, M. P. McIntosh; vice-president, A. B. Foster; secretary and treasurer, J. A. Matthews, and superintendent, James Paton. The company will begin operations with a fourmill plant, increasing their facilities in accordance with the demands of business. Two hundred and fifty men will be employed, and there will be a daily output of 35 tons of the manufactured product. The company have not yet decided upon a location, the prices asked for land not having been entirely satisfactory, but it is definitely settled that the mills will be erected either In Cleveland or in Loralu.

The medical officer of health of Bethnal Green, one of the poorer quarters of London, says of the 102 bakehouses in the district that in 40 per cent, the bread is made in cellars. "In the whole of the parish," he reports, "I only found seven of these places in what I should call a clean and satisfactory condition; the others are either dirty and untidy or some fault was found, such as bad ventilation, defective sink traps, closet flushing apparatus out of order, or bad surface drainage of vard, &c.'

It is an interesting fact, says the American Shiphuilder, that the relative dimensions o Nosh's Ark—viz., depth one tenth of length and beam one-sixth of length, glving depth 60 per cent. of beam, are precisely those of many of the finest, fastest and heaviest cargo carry-

# THE RETAIL STORE.

### New Ideal Oil Heaters.

The A. C. Barler Mfg. Company, 111 and 113 Lake street, Chicago, have brought out two new oil heaters which are herewith illustrated. Fig. 1 shows the larger of the two, which is named the No. 6 Ideal, and Fig. 2 represents the smaller, named the No. 5 Radiant. The No. 6 Ideal is constructed on an entirely new principle of air circulation. The Russia iron heating drum has an interior lining which extends down to and incloses the burner. A circular row of smal holes around and close to the burner admits air to be heated. The air thus passes into the heated stace between the outer jacket and inner lining in numerous small currents and becomes instantly very highly heated and is discharged at the top without coming in con act with the flame. It pours out at the top with even greater fierceness than the discharge from a hot air furnace through The stove also emits addi a register. tional heat by radiation from the direct action of the flame. The drum tips over for lighting or filling, and when tipped is firmly held in a slanting position by an ingenious locking joint. The burner is a 9 inch circular, central

New Ideal Oil Heaters -Fig. 1.—The No. 6 Ideal Heater.

draft, with an extra feeder wick. The oil fount is removable from the base, made of brass which is nickel plated, and every one is tested by steam. The stove is finished with a removable swing top, having a grate under it for heating water or cooking. Half balls are east on the feet, enabling it to be readily moved on the floor, although the stove is so light that it can easily be carried from one room to another. It is beautifully ennamented with nickel work. The heat supplied by one of these

stoves is remarkable when its size is considered. It stands but 33 inches high.

The company are just completing an indicator to be applied to the fount, which will show unerringly the quantity of oil in it, or whether it is empty.

Fig. 2.—The No. 5 Radiant Heater.

This indicator will be placed on all Ideal heaters in the future. It is separate from the filling aperture.

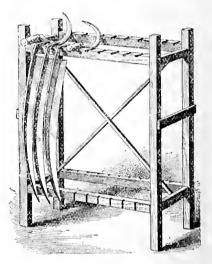

The No. 5 Radiant heater is smaller than the Ideal, being only 30 inches high, is made with an ornamental flat top for heating water or cooking, but in its interior construction is the same as the No. 6 Ideal. It is intended to meet the requirements of those who desire a less expensive and yet an efficient oil heater. The finish is of the same high character. These atoves are warranted by the makers not to emit either amoke or smell.

### Self Pouring Oil Can.

Asbury Paine Mfg. Company, Tren ton, N. J., are putting on the market the Self Pouring oil can, by which the filling and emptying of lamps and oil stoves is readily accomplished. The self pouring action is due to air pressure exercised on the oil by the special form of lid which is employed. inverted cup lid slides within the neck of the can. The knob attached to this lld has a small hole through it to act as an air inlet or outlet. As the apout goes to the bottom of the can every drop of a l, it is stated. Is poured from the can. The spout forming a siphon, the oil can also, it is claimed, be withdrawn from the lamp or oil stove when de The opening in the can is 27 inches in diameter, so that through it, it is pointed out, the can may be cleaned in side and filled without a funnel, while the size of the opening also permits the oil in the can to be seen. The cleanliness connected with the use of these cans is especially emphasized by the manufacturers. They are made of brass and tin, polished, in two sizes, No. 1 holding 2 quarts, and No. 2 holding 4 quarts.

### Scythe Rack.

The accompanying cut represents a rack for holding the stock of Scythes, a description of which appeared in Ironmongery of London. The upright posts are 2 inches square, and the side rails upon which the Scythes hang are 1 x 134 inches in size. The rack is 42 inches long and 48 inches high. The slots cut in the top rails are just wide enough to accommodate the heels of the Scythes, while the cuts in the lower rails are made with a hand saw, sufficiently deep to allow the ends of the Scythes to rest in their proper

Seythe Rack.

places. The rack described is designed to hold 18 Scythes on each side—though a rack can obviously be made to hold a greater or less quantity.

### Cast Steel Garden Weeder.

Sheble & Klemm, Frankford, Philadelphia, are putting on the market the garden weeder here shown. It is made of cast steel, which, It is claimed,

Cast Steel Garden Weeder.

renders the tool much superior to the ordinary iron article. It is described as being well finished, sharp and not likely to clog. It is supplied with either short or long handle.

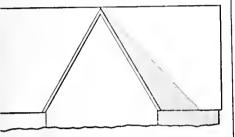

MEYER BROTHERS, 4146 Cottage Grove avenue, have the contract for warm air heating in the six flat buildings of E Pardridge, Rhodes and Indiana avenues.

# STEAM AND HOT WATER.

Heat Lost by Roofs.

BY LEICESTER ALLEN.

It is very desirable that some reliable data should be collected on this subject. Box, in his treatise, speaks of it in cases where there is no interposed ceiling as being a large amount, almost impossible to calculate. I might cite numerous instances where the roofs of buildings are probably as important factors in the loss of heat as the glass.

Heat Lost by Roofs.—Fig. 1.—Elevation of Roof.

I know of a church roofed with slate, the roof being of the king post variety and having a high pitch. It has no ceiling under the roof trusses. This church, though consuming large quantities of coal in cold weather, has never been comfortably warmed when the outside temperature was low. Sometimes all the gas burners have been lighted to sid the four large furnaces, and yet, the latter being driven to the utmost, the church cannot be warmed sufficiently for comfort. There are few buildings of its size these furnaces could not overheat in any weather to which this edifice is exposed. The interior looks nicely with its richly decorated roof

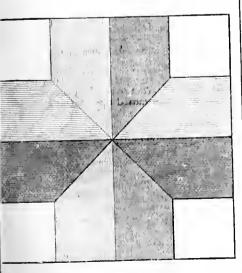

Fig. 2.—Pian of Roof.

trusses exposed, and from this point of view the roof is satisfactory; but as a place for people to congregate in comfort in winter weather the structure is a decided failure.

I contracted for and superintended the erection of a steam heating plant in

a suburban house several years ago. It was a frame house filled in with The house was two stories brick. high, nearly square in plan and had an unceiled attic covered with a high shingle roof with four gables, about as shown in Figs. 1 and 2, which are, respectively, a plan and elevation. The apparatus was finished and tested at a time when doors and windows were all in, and the house had been lathed and plastered throughout. Only the hard finished coat, the trim and interior were lacking to complete the building. The foreman on the job reported to me that there was a deficiency in the heating power of the plant. I went out to see for myself what was lacking, and as I approached the house I noticed that, while the roofs of neighthe snow on its roof was much melted away. As I entered the building, the foreman called my attention to thermometers placed in different parts of the house. The average indication was a little less than 60°. Telling him to follow me, I ascended to the second story and found the door at the head of the atairway leading to the attic had not yet The heating of this been mounted. attic, used for storage only, had not been comprised in my contract.

I had the door mounted, and closed it. Thereafter the apparatus filled its guarantee in every particular. In one hour after this door was closed a temperature of 70 was maintained everywhere in rooms containing radiators, with the automatic damper of the boiler closed down, and the boiler steaming freely with a moderate fire. By driving the apparatus the temperature could very easily he made excessive. Here was a practical illustration of the effect of roofs in transmitting heat from interiors of buildings.

I once placed a steam heating apparatus in a New England church having a high pitched slate roof with a ceiling of corrugated sheet iron under it, nailed on wooden supports. I allowed for this roof a transmitting power equal to the exterior surface of the two side walls of the church and added 25 per cent. I calculated the radiating surface necessary to supply the heat this roof would transmit on the basis named, while for walls, glass I used customary and ventilation methods. I found very little excess of capacity in the apparatus to meet the demands for severe cold westher.
The roof in question was a veritable cosl eater. The sheet iron ceiling transmitted heat to the space between it and the roof almost as readily as though a large opening had been cut through it. Several times I went up into this space with a thermometer and found it the warmest part of the building. This roof had about the form indicated in the diagram, Fig. 3, which may be regarded as a cross section. Doubtless the readers of The Metal Worker can contribute many instructive experiences on this subject which would prove of interest and value to the trade

In a building having a roof exposed interiorly, I once knew of an addition of about 30 per cent of radiating surface

over that first put in before anything like satisfactory results were obtained. The amount first put in was more than enough for a building of equal size, having same walls and glass, but roofed and ceiled in the best manuer with lath and plaster. I infer, therefore, that in this case the exposed roof increased the first cost of the plant something more than 30 per cent.; and as fuel consumption increases nearly in the ratio of increase of radiating surface needed in a

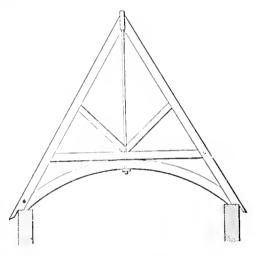

Fig. 3.-Section through Church Roof.

building, in this case about 30 per cent. of the fuel burned was demanded by the unceiled roof.

### HEATING NOTES.

M. Mahony of Troy, N. Y., is distributing a very neat card calendar for the month of October, copies of which are before us. In one instance the design consists of a landscape in which the typical milkmaid is seen returning to the house, while above the picture is a fac-simile of Mr. Mahony's trademark, together with his name and address. Another design has the trademark as its central feature, while above is an inscription intimating that thousands of homes are made comfortable by the use of the Mahony boilers.

HEAT CONSTRUCTION COMPANY are a corporation at Chicago, Ill., with capital stock \$250,000. The incorporators are George M. Stevens, Clayton E. Crafts and William E. Crafts.

AT A RECENT MEETING of the directors of the Sperl Heater Company, Carbondale, Pa., the machine tool equipment for the shop was ordered. With the exception of the boiler, which is to be furnished by B. W. Payne & Sons of Elmira, N. Y., the equipment will be furnished by the Niles Tool Works of Hamilton, Ohio, whose representative, L. B. Eaton, an old Carbondale boy, secured the order for that concern.

THE HOLLAND RADIATOR WORKS, at Elwood, Ind., are busily engaged and a steady increase in the pay roll is reported. Orders are being received in

gratifying numbers, and the outlook for the workmen is encouraging for steady employment at fair wages.

RICHARD D. JACKSON, Jr., 89 Centre street, is the New York agent for the Ideal boilers made by the Ideal Boiler Company, Chicago.

- J. H. Colman has just returned to the New York office of the J. H. Mc-Clain Company, Canton, Ohio, having made a profitable trip through New England in the interest of the Cantou, Humber and Cambridge steam, hot water and hot air apparatus.
- L B. Collins of the Holland Radi ator Company, Chicago, has been making a visit to their different foundries, and is now at the New York office prepared to fill all orders promptly.

THE D. F. MORGAN COMPANY of Akron, Ohio, with Western branch at 23 and 25 West Lake street, Chicago, now have their new steam boiler ready for the market. They claim that it is "the most economical boiler in the world."

# HEATING DO PLUMBING.

### NEW WORK AND CONTRACTS.

CARNEY BROTHERS, Utica, N. Y., have secured the contract for the plumbing in the St. Luke's new Parish Building, and also in the parsonage now being erected by the congregation of the Zion Lutheran Church.

EXETER radiators are being used by W. D. Parlin, Natick, Mass., in heating the Wellesley College, at Wellesley, Mass., and by H. W. Hubbard, Keene, N. H., in heating the new school at Troy, N. Y.

E. B. NEALLEY, Bangor, Maine, is building a large business block that will have a steam heating plant.

MICHAEL KILROW, Norwich, Conn., the plumber, has a large contract on hand putting in about 3 tons of lead pipe at Thos. DeWolf's place in Prestoo, to carry water from a reservoir to the house and barn. Mr. Kilrow is also putting in new plumbing at Mrs. Kent's house.

Monaher & Breed, Norwich Conn., have charge of the plumbing in the new Central Building, and will put in 10 water closets, besides washbowls and other fixtures. They also have the contract for the steam heating, and will use two Allright hoilers. Monaher & Breed have another important contract in the plumbing of the Allen flats on School street.

GEO. F. BARD, Norwich, Conn., is at work on a large contract at the Pequot Mills in Montville, putting in a system of hydrants for fire service. A large steam pump will be connected with a 10,000-gallon tank for this purpose. Mr. Bard also has the plumbing of M. M. Whittemore's house on East Broad street, and the refitting of the Wauregan House with new plumbing fixtures.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until October 25, for all the labor and materials required to fix in place complete the low pressure, return circulation, steam heating and ventilating apparatus for the United States Custom House and Post Office Building, at Sheboygan, Wis. Drawings and apecifications may be had

from the office of the Custom House, at Sheboygan, Wis., or from the Supervising Architect, at Washington.

A NEW HEATING SYSTEM is to be placed in St. Mark's Church, Adams, Mass.

A. L. Brown of Norfolk, Conn., has closed a contract to put in a large "ram." to pump the water from Haystick Mt. to the house of Levi Phelps, in the northern part of the town. This is one of the largest jubs of the kind which has been undertaken in that locality, and involves the laying of more than 3000 feet of pipe.

THE SCHOOL COMMITTEE of Belmont, N H. will expend \$1500 for a heating plant for their new school building.

IT IS PROPOSED to heat by steam the building of the Berwick Odd Fellows, at Somersworth, N. II.

THE CONTRACT for heating and ventilating the new crimary school building, at Northboro, Mass, has been awarded to the Hub Plumbing, Heating & Stove Company, Clinton.

W. H Morrison, Torrington, Conn., is putting Gorton boilers in both the McNiel block and Hotchkisa blocks He says the Government use this boiler for their buildings, there being 35 of them at Fort Sheridan.

LEVI CASE & Co., Glena Falls, N. Y., have been awarded the contract for putting in a steam heating plant in St. Mary's Church. They will use a Florida double boiler, for which they are agents. Several radiators will be put in, and coils will be located under one half of the pews. The firm have placed one of these boilers in the residence of A. W. Sherman, and have been given the contract to put heating systems in the Catholic Convent at Keeseville and the Commercial Hotel in Whitehall. They are also doing the plumbing in S. D. Kendrick's house.

HARING & Co. of Sufferns have just completed the plumbing work and the heating apparatue in the new Methodist parsonage, at Sloatsburg, N. Y.

THE SUPERVISORS' COMMITTEE ON PUBLIC BUILDINGS, at Mayville, N. Y., is about to solve the problem of heating the county offices at this place in cold weather, by removing the 25 horse-power boiler from the insane asylum at Dewittville to the building of the County Clerk. It is proposed to not only heat the clerk's and treasurer's offices, but to conduct the steam underground across the park to the court house and heat that building. Since the insane were removed from the county farm the asylum has been tenantless, consequently the boiler is of no use there.

WALTER P. DUNN has the contract for heating the new school house on Ridge street, Newark, N. J.

THE II. MOOERS COMPANY of Milwaukee have secured the contract for heating the two new brick blocks of lasac Stephenson in Marinette, Wis., also his other two blocks adjoining.

J. P. Adamson, St. Paul, Minn., bid \$3200 and secured the contract for putting a hot water heating p'ant in the court house and jail at Haatings, Neb.

THE THATCHER FURNACE COMPANY are installing two of their large size No. 12 Champion steam boilers with twin connection in St. Ann's Church and Academy at Nyack, N. Y. The boilers are placed under the church, which is piped on a circuit system and heated

by direct radiation. A 4-inch steam main is run in a trench 120 feet to the acbool and chapel building, which is heated on a similar plan.

JAMES BIRKETT, Brooklyn, N. Y., is installing in the achool at Amityville, L. l., a combination heating plant, using an Economy combination ateam and hot air apparatus.

FRANKLIN & BURNHAM, Beekman and Pearl streets, New York, have closed a contract with William Hart to heat his factory with an Economy ateam heater.

Among the contracts taken by the Baker & Smith Company, 193-197 Van Buren street, Chicago, can be mentioned the steam heating in the Masonic Temple, Lead, S. Dak., and the Catholic Church, Campus, Ill.

THE L. H. PRENTICE COMPANY, 203-205 Van Buren atreet, Chicago, have the contract for steam heating in the Chicago Historical Society Building, Dearborn avenue and Ontario atreet.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, are to install a steem heating plant in the Post Office Building, 1058 Millard avenue.

THE FULLER & WARREN COMPANY, 147-149 Lake street, Chicago, report the following contracts for warm air heating: John E. Cowles, Woodlawn avenue, four houses; S. M. Gosselin, Hermitage avenue, three furnaces; R. H. Klekant, 7532 Wright atreet, two furnaces; S. C. Swern, West Adams street, two furnaces; W. W. Augur, 404 Ontario street, one furnace; R. W. Hyman, 168 Ontario street, one furnace; also a complete system of warming, ventilating and sanitary closets for the public school at Bayfield, Wis.

THE KELLY & JONES COMPANY, 48 to 52 North Clinton atreet, Chicago, have been awarded the contract for ateam heating the Josephine Madden apartment building, Calumet avenue and Thirtieth atreet.

A. Mandler, 164 Webster avenue, Chicago, has the contract for the plumbing, gas fitting and sewerage in the flat building of M. Fisher, 321 Chicago avenue.

THE ROBINSON HEATING & VENTI-LATING COMPANY, Limited, of Altoona, Pa., have been awarded the contract for placing the heating apparatus in the new Methodist paraonage in Hollidayaburg.

TOBER, CARRY & Co. of Augusta, Maine, have been awarded the contract for putting in the new heating apparatus for Johnson Bros., shoe factory.

THE CONTRACT for heating the Mercer County, N. J., Almahouse has been awarded to the Headley Leavitt Company of Trenton, N. J.

THE CONTRACT for furnishing the steam heating and ventilating apparatus for the public building at Martinsburg, W. Va., has been awarded to Conrad Cline of Martinsburg.

THE STEAM HEATING PLANT installed by Rufe Bros. in the new post office at Doylestown, Pa.. was tested for the first time last week with highly pleasing results to all concerned.

M. E. CAMPBELL has been awarded the contract to place a steam heating plant in St. Paul's Lutheran Church, at Orwigaburg, Pa.

G. GARDNER is putting ateam heating apparatus into the Hotel Gardner, at Adams, N. Y.

# ROOFING AND CORNICE.

### Laying Gravel Roofs.

From J. A., Chicago — Will The Metal Worker kindly publish directions for laying a gravel or tar rcof, and the amount of material required. Also how to repair an old roof of the same composition. I am located 18 miles from the business center, and there are a number of gravel roofs to be laid in this neighborhood. When there is any of this kind of work to be done here it is customary to employ regular roofers. With a little information on the subject I think I could do all such work.

Answer. - For a gravel rcof, the boards should have a slant of at least 1 inch to the foot, and the roof boards should be of a good quality of matched flooring. Commence at the eaves to lay the felt, by cutting off one-third of a strip, first laying the one third, then the two-thirds piece, then a full width sheet, the three edges being even at the eaves. The finish at the top of the roof is made in a similar manner. The roof is then to be laid as in shingling, laying each sheet one-third exposed, thus making three thicknesses of felt. While the felt is not to be attached to the boards except by nailing, the edges can be secured by cementing with roofing composition. The felt is held to the roof boards by roofing tins, which are punched or pressed pieces of tin with a hole in the center, through which a barbed wire nail is driven. The tine are put on in rows at right angles to the eaves, about 8 inches apart, and 4 feet between rows. Care should be taken to lay the felt without wrinkles, and when nailing, begin in the center of roof and nail toward the edge.

For a finish at caves or other edges of the roof use lath, which can be secured with barbed wire nails. For a finish about fire walls, chimneys or skylights, the felt should extend up the sides about 1 inch, with lath or triangular strips of wood firmly nailed over the edges. When finishing about chimneys and skylights it is well to use an extra thickness of felt. The roofing composition is to be applied hot, and for the purpose of heating same it is usual to employ an iron kettle of suitable size. Commence at the top of the roof to apply the composition, which can be done by means of a mop. As one man applies the composition, another pushes the gravel into it, this being done while the composition is hot. For the ordinary gravel roof coal tar is used, which is thickened with rosin, this being done while the tar is heated. Clean, dry gravel should be used, such as is free from sand and loam. For one square of a three-ply roof there is required about

50 pounds of felt, 100 pounds of composition and ½ cubic yard of gravel. For a four ply roof, 60 pounds of felt and the same quantity of composition and gravel.

To repair leaks in an old roof, sweep off all gravel and dirt about the leak and remove the old composition. Apply three thicknesses of felt with compositlon between. Then nail the felt about the edges, using roofing tins and barbed wire rooting nails; then cover with composition and gravel. To recoat an old roof, the loose gravel and dirt should be removed, using shovels and heavy brooms. Repair any leaks that may be found, when the composition and gravel is to be applied as above directed. While gravel roofers may use a compound of coal tar and rosin, dealers in roofing materials have a roofing pitch distilled from coal tar that is recommended as superior to coal tar and rosin. There are also various kinds of prepared roofing that can be applied without gravel. The felt is of sufficient strength and thickness so that only one thickness is required. The edges are joined by means of cement and nails, the whole being covered with composition, sand and some fire proof compound.

### FLASHINGS.

The American Roofing Company of St. Louis, Mo., have lately closed contracts for five cars of galvanized iron, 23 gauge, for a large steel foundry now being built at Granite City, Ind. and for three cars, 20 gauge, painted iron, for the same place. The company have recently put on the market what is known as the American metallic lathing, for which they report a very satisfactory trade. They are preparing samples, circulars, &c., illustrating this lathing, which will shortly be sent to the trade.

E. A. Muzzy of Meriden, Conn., has just put a gravel roof on the new S. & S. meat house on Union street, for C. D. Kinney, the contractor. He has also finished the work of recoating all the roofs of the Warner Foundry at Cedar Hill and has several out of town contracts.

THOS. F. ABERN & Co., New Haven, Conn., have the contract for the steel ceilings in the new Hublinger Building on Chapel street.

The Willis Mfg. Company, 128-130 North Academy street, Galesburg, Ill, have just issued from the press a new catalogue of stamped ornaments. The volume is oblong in shape, consists of 56 pages, and is bound in board covers with gilt side title. The goods shown in the catalogue are produced in zinc, copper, brass or bronze, and, as a majority of the goods are kept in stock at all times, the makers are in a position to

promptly supply the trade. They refer to their facilities for modelling and special work, and state that the prices quoted are for goods in sheet zine, unless otherwise noted, and are subject to a discount to the trade, which will be quoted on application. The assortment shown includes sheet metal statuary, enrichments, spandrela and gable ornaments, panels, rosettes, shells, scrolls, leaves, capitals, garlands, finials and stamped shingles for hips. Attention is also given to rock face painted steel, self capping roll roofing, galvanized iron gutters, ceiling centers, interior cornices, &c. The catalogue circludes with an alphabetical and a numerical index.

James A. Miller & Bro., 129 and 131 South Clinton street, Chicago, are to furnish the skylights for the Monon shops, at La Fayette. Ind; also the sheet metal and slate roofing on the buildings at Fort Harrison, Helena, Mont.

The following simple process for brorzing copper is credited by the Scientific American to M. Mondit of Caen, France. The formula is said to be capable of giving every tone from bronze to antique green, according to the length of time that the copper is allowed to remain in contact with the liquid. After the piece has been scoured it is covered with the following mixture by means of a brush:

 Castor oil
 20

 Alcohoi
 80

 Soft soap
 40

 Weter
 40

The mixture is left on till the required shade is obtained, then dried with hot sawdust and coated with a very dllute varnish.

Chicago has a woman garbage inspector, Mrs. Paul, who is said to be a pronounced success in her recently acquired official capacity. She really inspects, "exploring streets and alleys, and does not hesitate to watch the "dumps" receiving their refuse loads. As she is not paid by the city, but by the women of the Municipal Order League, at whose instance the city anthorities have clothed her with power to act, Mrs Paul is entirely independent of politics and is therefore able to carry out her duties unhampered.

The rolling mills of the McCullough Iron Company, North East, Md., were damaged by fire on the 9th inst., caused by an explosion of lamps in the engine room. Two of their three sheet mills escaped injury and are working without interruption. The roof over the third mill was burned and the bar mill was destroyed. The forge and other buildings were not harmed. The loss is amply covered by insurance, and the company will repair the damages at once. There will be no interruption to business. Their other sheet mills, at Wilmington, Del., and Rowlandaville, Md., are running on full time.

# STOVE TRADE NOTES.

### The Ohio Stove Trade.

There is a slow, but steady and decided, improvement in the condition of the stove and range industry throughout Ohio, Indiana, Kentucky and West Virginia. Reports received from the trade in the section referred to, without an exception, are encouraging. The returns from manufacturers in Ohio are especially gratifying, reflecting a confident feeling respecting the future as well as an increased volume of business for the present. The prominent features noted two weeks ago have been accentuated and further confirmation of the state of business as then set forth has been received. A majority of the foundries testify to an increase in the volume of business during August and September over corresponding months of last year of 20 to 25 per cent. It may be well to state, however, that in some sections of Indiana, while there is an improvement in progress it is less decided than in Ohio and Kentucky, the drawback to trade being due seemingly to financial affairs, collections being difficult to make, and customers who a few years ago discounted bills are now disposed to ask extension in time of payment and other indulgences.

While dealers are still very conservative and are inclined to let manufacturers carry stock, the character and urgency of the orders placed indicate a healthful and steadily growing demand from the consumptive trade. While the individual orders are small the aggregate is considerable, and with few exceptions the demand is for immediate or early shipment. A point worthy of special note is that the sales of manufacturers, especially during September, were not only larger than during the corresponding time last year, but indicated a marked improvement over trade in 1892, when the largest business of record was experienced by many foun-

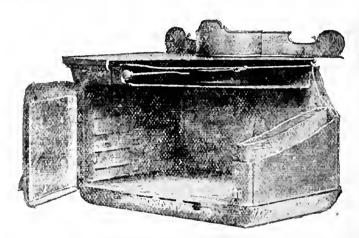

The most recent development is that mall orders from salesmen on the road are rapidly increasing, and if the outlook does not change most foundries will be kept running full until Christmas. Since July 1 each week has witnessed the return to work of an increased number of molders, so that now many, if not all, shops in this section are employing a full quots of men and at full time, too. This transfer from the idle to the ranks of the bread winners is a factor of great importance and significance; in fact, it must be regarded as the most encouraging feature in the business situation.

Money is plenty, and as the banks are less rigid in scrutinizing business paper there seems to be more solicitude to loan rather than to borrow. During the past week, however, lines of discount at the banks have increased materially and more currency has been sent to the country to assist in the movement of tobacco, cotton and other crops. This freer distribution of funds is reflected in the more confident tone prevsiling in commercial circles.

### Walker's Culinet Range.

The Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Msss., have added to their assortment and recently placed on the market a range possessing many features of interest to the trade. It is known as Walker's Culinet and is heated air from the rlsing pipe to the lower edge of the doors. The oven is elevated, occupying about the same position as a pipe shelf, and is supported by a column or rising pipe which is made double, there being one pipe within the other. The space between the inner and outer pipes forms a flue which passes the air for ventilating the oven and heating the oven doors. This oven construction is one of the special features of the Culinet and the manufacturers atste that the three necessary principles of oven ventilation are followed. The top of the oven forms a convenient warming shelf. The low closet is placed in the space behind the fire box and below the range top, with a door on each side. It is of good size with a shelf at middle hight. The upper closet is above the oven and has a lift front of pianished iron.

In the styles of the stove which are provided with hot water boiler, the

Walker's Culinet Range.—Sectional View of Oven with Parts Broken Away, Showing Flue Construction.

provided with oval fire box, fitted with a plain grate of improved form or with the company's patent triple shaking grate, as may be ordered. There are five boiler holes, the fire being directly under the two front covers. The arrangement, however, is such that the products of combustion pass under all the covers before hesting the oven, which is oblong in general shape and has a capacity for easily receiving at once several pans or dishes. The oven is heated on six sides, thus giving a uniform temperature in every part. The vertical smoke flues in the ends of the oven are thin cast iron tubes, while the top oven flue is of rectangular form, these flues being entirely within the oven. The smoke flue is in such a position as to cover the entire back of the oven. The illustration which we pre sent herewith represents a sectional view of the oven used in the Culinet range and will enable the reader to form a good ides of its construction and the arrangement of the flues. oven doors are also provided with flues, through which is passed a current of air highly heated by circulation between the inner and outer parts of the double rising pipe. An interior flue leads the

latter occupies the place of the low closet, resting behind the fire, to which it is directly exposed. The boiler is made in one piece of cast iron, and the largest size has a capacity of 40 gallons. The Culinet is referred to by the manufacturers as being very compact and of convenient hight, the top cooking surface being 30 inches above the floor, while the bottom of the oven is elbow high. With regard to the ornamentation, the Culinet has no nickel plated trimmings or polished edges. handles and rail are of bronze metal, giving very pleasing effects in contrast with the cast iron of the stove. A bronze rail extends across the front and is inte ded as a guard for clothing. It is set away from the top about 11 inches, and is arranged to form the handle of the broiler door, dropping out of the way when the door is opened. The brorze parts of the door hinges are also ingeniously arranged to form an element of the ornamentation.

THE HOME STOVE COMPANY of Indianapolis, Ind., report a good demand for stoves, and though running their foundry full force every day are still getting behind with orders.

Stove Freight Rates in the South.

The Chattanooga Stove Company of Chattanooga, Tenn., have good reason to rejoice over a recent change in freight rates. The Chattanooga Times

About a year ago this company, which was then in a most prosperous condition, was auddenly paralyzed by an advance in rates on stoves to Ohio points, in which territory the company did their largest business. At the time the advance came the concern were run ning with a full force of hands, and often with extras, to keep up with orders, while the increasing business made the managers vaguely think of enlarg-

ing the plant.

But without any warning whatever the Southern Railway & Steamship Association sent the rates up to such a notch that the industry was practically killed. At least it was killed so far that the works shut down, throwing many men out of employment. The warehouse was stocked with stoves just then and the managers were in a peck of trouble by the advance. If you had approached George W. Farrington, secretary and treasurer of the company, on the subject of freight discrimination against Chattanooga just then, he could have given you some pointers and enough of them to make you believe that Chattanooga didn't have a single friend among the railways.

He would have told you, for instance, that it was cheaper for them to ship atoves via Memphia to Ohio points than direct up the Cincinnati Southern from Chattanooga, because Memphis had such a cheap rate out of there to Ohio that her rate plus the rate from here to Mem phia wouldn t near equal the single rate from here to Cincinnati.

Of course, Mr. Farrington began to try to get the rate restored, so that the Chattanooga Stove Company might have a living chance for some business. But either because it didn't want to, or was such an elephantine body that it couldn't move with greater rapidity, the promise of relief made by the Southern Railway & Steamship Association hung fire and never ripened into fulfillment.

With all his effort he might have been working yet and the Southern Railway & Steamship Association might have been throttling this industry still, but for the withdrawal of the Queen & Crescent from the association. cut it loose, that made it independent, and then Mr. Alexander's way was clear.

Yesterday he received authority to make a rate on atoves from Chattanooga to Cincinnati of 19 cents per hundred, in effect at once. What this means is essily seen when it is stated that the old rate was 47 cents. By reason of the reduction the Chattanooga Stove Company will ship five carloads of stoves to Ohio points to day, the works will be run on full time and the force increased.

### ODD PLATES.

A MALICIOUS RUMOR has been circulated, which has found its way into the daily papers, that the Round Oak Stove Works, at Dowagiac, Mich., had closed down indefinitely. Fred. E. Lee, general manager of the estate of P. D. Beckwith, says that the works were shut down one week to enable the workmen to attend a local fair, but that they were not shut down indefinitely. He further says that the establishment

has run full all the year and at the same | wages paid before the panie.

THE ECLIPSE STOVE COMPANY OF Mansfield, Onio, write us as follows: The fall season for 1894 has opened up with us very satisfactorily, as we think most anybody would acknowledge when they come to consider that the amount of business done in August and September exceeds that done in the same months last year by 20 to 25 per eent.

THE FAVORITE STOVE & RANGE COM-PANY of Psqua, Onio, have increased their capacity every year during the past six years in order to keep up with the growing demands of their trade, and they now refer to their plant as one of the most complete of its kind in existence. They have 16 departments in the manufacture of their goods, each being in charge of an efficient foreman. The company have added many new patterns to their already extensive assortment and are bringing out additional goods as the demands of their enstoniers seem to warrant.

ALL the stove works in the twin towns of Royersford and Spring City, Pa., are reported as being in active operation, with favorable prospects for business.

THE LEXINGTON FOUNDRY COMPANY of Lexington, Ky, state that they are behind with orders on cook stoves and a few lines of heaters. They are running their shop full every day.

ONE OF THE ATTRACTIONS at the Gas Appliance Exchange, at 37 West Fourteenth street, New York, are the Jewel gas radiators made by George M. Clark & Co., Chicago. On entering the door three of these radiators attract the attention. The central radiator is finished with a white enameled cast iron base. The heating decorated with gold. tubes are of enameled sheet iron of a dark blue color. The top of the radi ator is also enameled. The radiator at the left has a nickel base, enameled tubes and a nickel top. The radiator at the right has a plain cast iron base, enameled tubes and plain cast iron top. These goods are fitted with the Clark burner, and are provided with an inner heating tube around which the products of combustion rise to the top of the radiator and then pass down through it to nearly the bottom of the radiator, where they find an outlet.

THE DETROIT PAPERS speak in very complimentary terms of the exhibit of atoves, ranges and oil heaters made at the recent State Fair by the Art Stove Company of Detroit, Mich. The ac-counts also state that the company are about to open a downtown salesroom at 202 Woodward avenue. They are fitting up the atore in a very attractive way and will carry a complete assortment of their apccialties. A novel feature of the showroom will be stoves in actual operation. The new salesroom will be in charge of John O. Campbell.

THE OHIO STOVE COMPANY of Ports mouth, Ohio, send gratitying information to the effect that their August and September sales show a marked increase over the same months of last year, the September sales being larger than those of 1892.

F. M. BORDEN & BROTHER, 120 North Second atreet, Philadelphia, are sending an announcement to the trade of an arrangement made with the March Brownback Stove Company and the Grander Stove Company, which enables them to acli their repairs at regular foundry prices. On the reverse

side of the announcement is a "A Word to the Y's," followed by a list of the foundries for which they furnish repairs at bottom prices.

E. K. CONANT, 9 West Fourteenth street, New York, is showing two new sizes of the Dangler return the radiator. This year these radiators are provided with burners that are easily removed and are so arranged that the heat passes up the flue on one side of the heater and returns down the flue on the oppoaite side from whence It is discharged into the room. Below the radiator is an evaporating water pan over which the heated air passes in escaping, carrying with it an agreeable moisture. Provision is made for refilling the water pan and a device provided that aids in lighting the burner.

THE FOSTER STOVE COMPANY of Ironton, Onio, report that for the past month they have had all they can attend

NEWSPAPER REPORTS which reach us from the South are to the effect that the Memphi Stove Company of Atlanta, Ga., who were partially burned out a few weeka ago, are about to retire from business. R A. Williama, the proprietor, is offering for sale his stock of cook stoves, ranges and heaters, granite ware and house furnishlng goods, and it is probable that the assortment will be closed out in a very short time.

THE CHICAGO & ERIE STOVE COM-PANY, Erie, Pa., are beautifying their extensive building at the corner of Twelfth and Sassafras streets with a new coat of paint.

C. EMERICH of Columbus. Ohio, writes: "Trade since the middle of September has far exceeded our expectations. Our new goods are com-manding a large trade, and a though we are running our foundry on full time we are behind our orders on some of them."

THE MANHATTAN GAS HEATING COM-PANY, 903 Seventh avenue, New York, are sending out their fall and winter catalogue of Manhattan gas heaters, showing a variety of styles and sizes. All goods are fitted with their patented chamber burner and adapted for either natural or artificial gas. They are designed for fire places and are furnished with cast iron frames in nickel, bronze or japan, and with rails, fenders and baskets. Several styles are shown in brass frames and with sides and fronts of polished and hammered brass. They are fitted with a detachable burner and mixer, and a slip connection, so that the grate is easily connected and need not be set in place till all the work in a new building is completed. It is claimed that they have capacity for heating a large room, and can be arranged to ventilate as well as heat. They have been used in some of the finest apartment houses and residences with satisfaction both as to heat and consumption

J. B OLDERSHAW of Baltimore, Md., was in the city the past week visiting his friends in the trade. During his stay he called at the office of The Metal Worker, and, in conversation relative to trade matters, he reported the demand for his specialties very gratilying.

THE PORTSMOUTH STOVE & RANGE COMPANY of Portsmouth, Ohio, among other good things say: "The demand for steel goods is constantly increasing, although that may be accounted for in part by the fact that the merits of the Model are being appreciated more and more every day."

THE UNION STOVE WORKS OF 70 Beekman and 66-68 Gold streets, New York, are offering their New Invader parlor stove in four sizes, and their Belmar for 1894 in three sizes, with diameters of the tire pots ranging in the several sizes of the Belmar from 9 inches up to 12 inches. The New Invader has been improved for this season and has round fire pot, shaking and draw cen ter grate, nickel trimmings, and handsome bronze urn. The Belmar embodies the latest improvements and is of rich ornamentation. The company state that they now make two sizes of the Red Cloud furnace or double heater, and have added a large size to their line of Commander furnaces. For their Flirt B cylinder stove they make nickel base and legs, nickel foot rails and nickel top band for all s'zes.

THE SMITH & ANTHONY COMPANY of 217 Lake street, Chicago, Ill., are to place a Hub warm air furnace in the building occupied by the Atlas Tack Corporation of 193 Lake street, that city.

Bridgeford & Co. of Louisville, Ky., write us to the following effect: "There has been a gradual improvement in business with us since September 1. The prospects are that there will be fairly good business in the South, though we do not expect any boom."

Grange Sard of Rathbone, Sard & Co. is spending a couple of weeks in Chicago, where he has a host of friends.

THE STAR COUPLER COMPANY, St. Louis, advise us that the demand for their Star couplers for connecting water back to boiler have increased to such an extent that they have been compelled to make additions to their factory, and also to introduce additional machinery. They have also adopted a new price-list, which makes the net prices for their couplers considerably lower than heretofore.

R. M. ELLIOTT of Hamilton, Ohio, received first prize at the Butler County Fair for his disp'ay of Peninsular stoves and ranges. Special mention was also made by the Committee of Award of the "constructive merit and elegance of desigo" of the New Air Tight Peninsular. We are also advised that Furlong & Emerson, agents of the Peninsular Stove Company at Franklin, Ohio, received first premium on the Peninsular line of goods exhibited at the Warren County Fair recently held at the place named.

THE GEM CITY STOVE COMPANY of Dayton, Onio, are very busy, and expect this year to do the largest business they have ever done.

"THE SPIRIT OF '76" is the title of a monthly publication devoted to the principles, incidents and men of 1776 and Colonial times. In the October issue is an interesting article entitled "Cooking in '76," the methods in vogue at that time being contrasted with the conveniences at the command of the housewife of the present day. illustrations represent a kitchen interior at Washington's headquarters, Newburg, N Y., the building being known in ante Revolutionary days as the Hasbrouck House. The brick oven in the kitchen was used for baking purposes by the family of General Washington during his stay, from April 4, 1782, until August 18, 1783. The method of using the old brick oven, which is described in a very interesting manner, is

in sharp contrast with cooking operations conducted by means of a new Columb'an Garland steel range there referred to as being made by the Michigan Stove Company of Detroit.

The Toledo Stove Company of Toledo O iio have a fine line of new cooks and ranges for both wood and coal, which are giving satisfaction to the trade. The makers are having a specially good demand for their Greenwood Oaks, which are made in five sizes. The company are steadily increasing their working force, and are now erecting a four-story and basement warehouse and mounting room.

THE WHITE MEG COMPANY, 40 and 42 State street, Chicago, have brought out the Imperial oil heater, designed to sell at a very low price, while at the same time meeting the demand for a good portable heating apparatus. It consists of a central draft lamp of 400 candle power, which is mounted on an ornamental cast iron stand. The stand is square shaped with four feet, so that it is not easily upset. Below the burner of the lamp a holder is attached which supports a sheet iron drum that extends The drum is above the lamp chimney. perforated on the sides to permit heated air to be discharged into the room, and is also perforated on the top for the same purpose or to enable it to be used for cooking purposes. An ornamental top is also provided, to give an appropriate finish to the heater when not in use for cooking. The Imperial is made in two styles of finish. One style is with black base, brass lamp and black top, while the other is with full nickeled base, lamp and top. The weight is only 15 pounds, so that it can easily be carried from one room to another. One filling runs it an entire day. The drum is attached in such a manner that it can easily be removed and the lamp can then he used for illuminating purposes.

THE ENTERPRISE STOVE COMPANY of Vincennes, Ind., state that September was the best month they ever had by 30 per cent.

INADVERTENTLY an error was made in our last issue in connection with the notice of the Elwards Parlor Lamp Slove Company, 123 Dearborn street, Chicago. The president of the corporation, A. M. Kitchen, should have been credited with the organization of the London Company, who will manufacture and sell these stoves in Europe and Australia.

A. E. Bourn of Plover, Wis., is the inventor and manufacturer of a stove to be used in cars in which potatoes are shipped. It is stated that the demand in the Northwest for stoves for this special purpose causes a trade of fair proportions.

THE Journal of Topeka, Kansas, states that the Wellington Foundry & Stove Works are to be removed to Wichita.

THE EXCELSION MFG COMPANY, St. Louis, refer to their Junior Hot Blast as meeting with much favor at the hands of the trade. They advise us that their sales of Charter Oak stoves and ranges are considerably in excess of last year and will compare favorably with the season of 1892, which was an unusually heavy one for these goods.

THE WALKER & PRATT MFG. Com-PANY, 31-35 Union street, Boston, Mass., favor us wish copies of several leaflets relating to the Culinet range, which they have just placed upon the market. We also have a little pamphlet entitled "Kitchen Help," the text being in-

tended to throw "new light on an old subject." The pamphlet tella how old atoves have been dressed in new garb with nickel trimmings and legs to make them longer, look bigger and sell better, the atoves themselves, however, remaining practically unchanged. In contrast with this are the merits of the Culinet, which are fully set forth. Reference is made to the hight of the top cooking surface, the elevated oven, the fire directly in front, as are also the broiler door, the clinker and the ash pan doors. The oven is double and heated on all sides, and only one damper is provided, which is pulled out to kindic the fire or bake, and pushed in to check the fire.

E. O. & W. STAFFORD, 7 West Fourteenth street, New York, New York agents of the Milwaukee Gas Company, Milwaukee, Wis., are showing photographs of a new gas radiator, a new size of the Perfection gas range, and a new gas grate. They are also showing a new bathtub made by the Moseley Folding Bath Tub Company, Chicago, designed to be heated with oil, and for which they have established an agency in Costa Rica. They are also showing a full line of goods made by the Gilfillan Scale & Hardware Company, Chicago, consisting of postal, confectioners' and other scales. They also show a very convenient nail puller made by the same concern.

MATTHEW O'NEILL of Binghamton, N. Y., agent for the Acorn stoves and ranges, secured first premium at the fair recently held in that place.

THE SCHANTON STOVE WORKS of Scratton, Pa., are putting a complete hydrant system into their establishment to be ready for fire emergencies. Automatic sprinklers are run entirely through the mounting and pattern shops.

THE NOVELTY GAS & OIL STOVE COMPANY, 25 East Fourteenth atreet, New York, are showing several new things in small gas heaters for apartments and bathrooms. They are very at ractive in appearance, with nickel plated bases and planished sheet iron bodies.

THE QUICK MEAL STOVE COMPANY, St. Louis, Mo., will be represented on the road during the coming season by Wm. S. Ley, who will visit the trade in Indiana, Michigan, Ohio and Kentucky; Wm. A. Lockwood in Kanssa, Nebraska and Oklahoma; Louis A. Buck in the Dakotas, Mionesota and Wisconsin; C. C. Hoppe in Missouri, Arkansas and Texas; H. P. Gingrich in Illinois; A. X. Smith in Iowa; John A. Preston in Florida, and Ralph S. Buck in Northern California.

THE FACTORY of W. M. Crane & Co., at 414 West Fourteenth atreet, New York, is the scene of no little activity at this season of the year. The factory occupies a space 50 x 200 feet, divided into an office and receiving atoreroom, nickel plating plant, polishing department, sheet iron shop and construction shop, with a large space devoted to the atorage of completed gas apparatus for heating and cooking and for mechanical purposes. All the d fferent departments are equipped with the latest labor saving machinery and the foreman is held responsible to turn out a high grade of work. Gas cooking apparatus, for the time being, is giving way to gas grates, Leader gas heating atoves, the Vulcan hot air furnace and Vulcan hot water heaters for large residences. Their department for making steel ranges and broilers for hotel and restaurant kitchens ia busy at all seasons of the year.

# TRADE REPORT.

# The Iron Market.

Reports are somewhat conflicting, although the weight of evidence is against an encouraging view of the situation. One aggressive district or individual concern may relapse into temporary repose as a contestant for work, but others rush into the fray with renewed desperation. Their attitude for the time being tinges the reports of localities or individual authorities. Although some of the greatest concerns in the country are reported to be very busy, proofs that they want more keep cropping up.

In Foundry Irons there is a weakening tendency. After a number of false starts, another attempt to advance rates of freight from Southern furnaces is talked of. This cry of "wolf" is

growing monotonous.

Charcoal Pig has sold under \$13 in

Detroit lately.

The feature of the week in the Metal trade has been the slump in Tin. The Tin Plate mills are still closed. Public sympathy is not altogether with the manufacturers.

Pig Iron.—Aside from a slight weakening tendency on the part of Southern Nos. 1 and 2 there have been no developments during the past week in the New York market. We quote standard brands \$12 50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tidewater. Bouthern Iron. same delivery, \$11.50 @ \$12 for No. 1; \$11 @ \$11.25 for No. 2; \$10.65 @ \$10.75 for No. 3; \$10 90 @ \$11 for No. 2 Soft, and \$11.15 @ \$11.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.40.

Philadelphia advices indicate that the demand for Pig Iron in that market is fair, but decidedly less active than it has been for some time past. Consumers appear to have covered their requirements for the next 30 or 60 days, so that new business is rather slow, and usually at pretty close to inside quotations. Furnaces are well sold up, however, and, while orders can be placed on terms somewhat in buyers' favor, there is no great pressure to sell, as such a course would weaken prices without leading to any important increase in the volume of business. General quotations for Philadelphia and nearby points are about as follows, and  $20\phi$  @  $30\phi$  less at such points as York, Harrisburg, &c.:

 Standard No. 1 Foundry X
 \$12.50 @ \$12.75

 Standard No. 2 Foundry X
 11.50 @ 11.75

 No. 2 Plain
 10.75 @ 11.00

 No. 1 Soft
 11.50 @ 11.75

 No. 2 Soft
 10.75 @ 11.00

The market for local Irons in Chicago is reported as holding up remarkably well. Among the sales of the past week was one of 2000 tons, which shows that all the large buyers have not covered their requirements into the future. The prospect for the foundry trade appears to be growing brighter. More foundries are being employed and they are increasing their consumption of Iron. Inquiries are consequently growing for Pig Iron rather than diminishing. Some cutting is reported in Southern brands, but the leading companies insist that they are holding

firmly to quoted prices. Lake Superior Charcoal has at length given way under pressure of some of the leading sellers and quotations are now openly made of \$13 by makers themselves. A 500 ton lot is reported to have been sold at Detroit under even this price. Quotations are given as follows for eash.

Lake Superior Charcoal. Local Coke Foundry, No. 1 Local Coke Foundry, No. 2 Local Coke Foundry, No. 3 Local Scotch Ohlo Strong Softeners No. 1 Southern Silvery, No. 1 Southern Silvery, No. 2 Southern Coke, No. 2 Southern Coke, No. 3	10.25 @ 10.00 @ 9.50 @ 10.25 @ 13.00 @ @ 10.75 @ 10.50 @	11.00 10.25 10.00 11.00 13.50  11.25 10.75

In the Pittsburgh district, in spite of the large output of Pig Iron, stocks are low, showing that consumption is keeping well up with production, for the time being, at least. This is used as an argument by those who insist that the downward tendency in prices will soon be checked, and a recovery take place. However, the future of the market is very uncertain and depends altogether on the demand for finished material. The situation in Foundry Iron is the same as has been noted from week to week for some time past. We quote as foliows:

In the Cineinnati market, while the volume of current business in Southern Pig Iron is undoubtedly smaller than it was a month or two ago, there appears to be more Southern Iron selling than is currently produced and the shipments from the furnaces are trenching upon surplus stocks. The market may be said to be steady with sales of single carloads up to 1000 tons, and in the aggregate a fairly satisfactory volume of business. There have been considerable sales of Charcoal Iron and generally at lower prices. As a rule Southern Coke Iron is well sustained in price, but the general tone is not very confident and if stocks were urged upon the market they could not long be sustained. Quotations are as follows:

Southern Coke, No. 1	<b>8</b> 10.7F
Bouthern Coke, No. 2 9.75 @	10.00
Bouthern Coke, No. 3 9.10 @	9,25
Ohio Soft Stone Coal, No. 1 14.50 @	15.0.
Ohio Soft Stone Coal, No. 2 14.00 @	14-5C
Lake Superior Coke, No. 1 12.00 @	12 50
Lake Superior Coke, No. 2 110 @	11.50
Hanging Rock Charcoal, No. 1., 16.00 @	16 5
Hanging Rock Charcoal, No. 2., 15.50 @	16.00
Tennessee Charcoal, No. 1 13.00 @	18.50
Tennessee Charcoal, No. 2 12.00 @	12.50

No improvement is reported in the St. Louis Pig Iron market so far as prices are concerned, although the demand for Iron is decidedly better. Sales during the past week will foot up about 5000 tons, divided among the car works, stove foundries and architectural works. The demand runs largely to No. 2 Foundry and No. 1 Soft, with occasional sales of Gray Forge. The redeeming feature of the market is the general acceptance of Iron by consumers, who continue to take it as fast as shipped, which indicates that they are melting considerably more Iron than they were 30 days since. The general opinion is that a good volume of business will be in order without any improvement in prices during the balance of the year. We quote as follows for eash, f.o.b. cars St. Louis:

### Metal Market.

Pig Tin.—Prices fell sharply early in the week, the decline on wholesale lots of spot stock being 0.20¢ @ 0.25¢, on October delivery about the same and on later deliveries 0.25¢ @ 0.30¢. Speculative dealings on the decline were quite heavy. The market strengthened later in the week, futures going at 0.10¢ above lowest figures. Purchases by outside dealers and consumers have been on a liberal scale, making in all a large volume of business. The large selling was chiefly by operators in touch with the conflicting interests in Europe, and suggests that the foreign syndicate is more inclined to reduce than increase their holdings. There is superficial evidence of manipulation, such as is sometimes resorted to for the purpose of enabling large holders to realize some profit. Prices of small lots of Straits Pig are unchanged at about 174¢ \(\vec{\pi}\) lb.

Copper.—Dealings have been much smaller the past week than they were during the preceding one. The demand has been lighter also, and the market has a very tame appearance. Sellers offer reservedly, however, and claim that the statistical position is still in their favor. If sales have been as large as reported during the past two or three months it is safe to presume that home consumers and exporters are supplied for the balance of the year. The price of Lake Ingot in small parcels from store shows no change. Manufactured Copper is in very fair demand and prices are quite firm

Pig Lead.—Only a moderate business has been effected during the week under review, and buyers generally appear indifferent about anticipating future wants to any great extent. Prices for small lots from store are rather easier, American Pig being quoted by jobbers at  $3\xi \phi \otimes 3\xi \phi \otimes 1b$ . Lead Pipe and Sheet is in very moderate demand, prices in this section being firm as per list.

Spelter.—Dealings here have been moderate, but the market has a firmer tone, due to purchases in the West for other account than Eastern consumers. Prices for small lots of Western remain on a basis of  $4\frac{1}{4}\phi$   $\frac{2}{10}$  lb.

Antimony.—The market has remained steady, though quiet. Small parcels of Hallett's are quoted at 9½¢, and of Cookson's at 10½¢ plb.

Tin Plate.—The market Is in a somewhat uncertain condition pending the arrival of Plates by steamers overdue and those that have recently sailed from British shipping ports. Available

stock for current delivery is thus kept moderate and orders for some sizes and grades are very difficult to fill at the moment. Spot stock is in very fair demand, but there is only a larguid in-terest in future deliveries. The first frost has put a period to the operations of the canners, and the can makers have not yet shown any inclination toward providing themselves with fresh stock. Future business, in a word, is stagnant. The demand from the smaller consumers, however, has kept jobbers and re tailers quite busy. Both Bright and Roofing Plates in moderate lots are in request for immediate delivery. recent rains have searched out the leaks in roofs, while the adage respecting "an ill wind" has proved true to the advantage of the roofers and tinners during the recent heavy gales. class of consumers are very busy just now, and the aggregate of their requirements maintains a good movement in the sale of Roofing Plates, which has served to keep prices quite steady. Prices are, however, still somewhat irregular, and it is not likely that they placed on a settled basis for some little time to come.

A special London cable dispatch of October 10 to The Iron Age reports on the British Tin Plate market as follows:

The demand for Tin Plate has been restricted chiefly to small lines and special sizes. Rather more doing in Oil sizes, where sellers are willing to cut prices a trifle. Stocks at shipping ports now about 220,000 boxes and rapidly declining. Swanses quotations are as follows:

Bessemer Cokes, 1C	
Charcoals, tC	12/6

Black Plates and Wasters continue in very good demand.

Sheet Iron.—Reports from the mills mention generally full order books, with a difficulty in filling orders for prompt or near future delivery. Most manufacturers are entirely sold up for October delivery, and ask an advance on current prices where immediate ship ment is needed. Galvanized Sheets are in very active demand. Jobbers' quotatations are from 75 and 5% to 75 and 10% off.

# Chicago Report.

Scrap.—A large amount of Old Material has changed hands here during the past week, but most of it has gone direct from owners to consumers, and not through dealers' hands. Dealers quote the following list of buying prices, Chicago delivery:

• • • • • • • • • • • • • • • • • • • •	Per net ton.	Per Th

### CONDITION OF THE

# Hardware Trade.

THERE is a good deal of unevenness in the market, not only in the matter of prices, of which the trade are well aware, but also in the volume of current business. This feature of the situation is illustrated in the fact that some houses report September trade as nearly, if not quite, up to that of 1892, while the large majority of concerns are justified only in referring to business as somewhat in excess of 1893. In certain bues of goods, Builders' Hardware, for example, there is a less active demand than for others, while seasonable goods and some kinds of staple Hardware are moving more freely. Business is also much better in some sections of the country than in others, and at the present time there is no doubt that trade in the South, especially the Southwest, is in a gratifying condition. Reports from New York State trade are not very satisfactory and in New England there is also complaint of sluggish business, and collections in many places are difficult. On the whole the volume of trade is moderate and a little spasmodic and irregular. A large amount of goods in the aggregate are changing hands, and the retail merchants are sorting up their stocks with a little more liberality than for some time. They are still buying cautiously and the stocks in dealers' hands continue low.

Advices from Chicago.—The demand for Shelf Hardware is running about the same as it has been, but here and there a note of complaint is heard. Most jobbers, however, say that they expect somewhat of a falling off at this time of the year, being between seasons. The philosophical are extracting comfort from the situation by believing that it means heavier business after a while. They think that if merchants should stock up now they would carry the goods on their shelves until spring and be unable to pay for them, and therefore it would be considerably better for the jobbing trade to pass through a comparatively quiet time from now until the spring trade begins and then have it come along with its old time vigor. The impression seems to prevail quite generally that spring business will be as heavy if not heavier than usual. The only matter of consequence transpiring during the week was the settling of Tin Plate prices. Jobbers have now pretty

well agreed upon a price of \$5.75 as a basis for Calland and Melyn grades, \$5.50 for Allaway, \$5 for Bright Coke Plates, \$10 for Terne Plates, Mansel grade, and \$10.50 for Worcester brands. The demand for staple goods is fair, except for Barb Wire, in which trade is quite light.

### Notes on Prices.

Wire Nails. - The Wire Nail market is in a peculiar and not very confident position. The price of \$1 for carload lots at mill is quite regularly maintained, though in some cases where Nails are delivered the manufacturers realize something less than this figure. The volume of business is not especially large, as buyers are waiting to see what the developments of the market may be and whether the manufacturers succeed in eliminating the disturbing influences which to a greater or less extent have been felt for the past month or two. It would seem that as yet their efforts in this direction have not been entirely successful. The mills are nearly all of them fully occupied on orders and report that the amount of current business is fair. The New York price continues \$1 25 to \$1.30 from store.

Advices from Chicago.—Inquiries are light. The developments of the past two or three weeks have evidently scared buyers and they are now waiting to see whether the market has settled, being unable to determine just what course to pursue. Jobbers report a good demand for small lots from stock, but have reduced their quotations and now name \$1.10 to \$1.15 for such lots.

Cut Nails.—The movement of Cut Nails, while not especially heavy, is fair, and manufacturers in view of the general business condition are not disposed to complain. Prices are well maintained. The competition of Western mills is active, but the Eastern manufacturers are holding their territory pretty well. Small lots from store are held at \$1.05 to \$1.10 with the usual average.

Advices from Chicago.—This trade is moving in about the same condition as reported last week. The demand on manufacturers is quite good, but runs only to small lots. Jobbers have slightly reduced their prices out of stock and now quote small lots at \$1.05.

Barb Wire.—The Barb Wire market is sluggish and the demand light and spasmodic. Four-Point Galvanized is quoted as follows, delivered at the points named in carload lots: Pittsburgh, \$2 to \$2.05; Cleveland, \$2 05 to \$2.10; Cincinnati, Allentown, Chiago or New York, \$2 15 to \$2.20.

Advices from Chicago. — Manufacturers report that a few orders are being entered for spring delivery, but this business is by no means up to expectations. The carload trade for early delivery is quite light. Jobbers are selling small lots of Galvanized from stock at \$2.25, but report that very little is moving at present.

American Bolt Company.—The following quotations, which we have received from the American Bolt Company, Lowell, Mass., will be of interest as indicating the ruling prices on the goods made:

New Era Axle Sash Pulley.—This Pulley was described in our last issue as put on the market by the Empire Forge Company, Lansingburg, N. Y It is sold to the trade from the following list, which is subject to a discount of 65 per cent.:

Plain Face, Plain Wheels,

Face Plate, Sq. End.

Plain Face, Ground Wheels.

Plain Face, Plain Wheels.

Face Plate, Rd. End. No. 0411, 134-inch wheels,  $\frac{4}{4}$  x 1 inch .50 No. 0412, 2-inch  $\frac{4}{4}$  x 1 inch .55

Plain Face, Ground Wheels.

Face Plate, Rd, End.

No. 0411,  $1_{34}^{\circ}$ -inch wheels,  $4 \times 1$  inch .53 No. 0412, 2-inch  $4_{12} \times 1$  inch .58

Cordage —The Cordage market is on the whole in not so satisfactory a condition as for the past month or two, the demand being light and prices showing symptoms of weakness. At though no reductions have been made on Manila and New Zealand, Sisal has been reduced 4 cent per pound.

Glass -The past week has witnessed no change in the condition of the American Window Glass market, either in demand or prices. Trade continues about the same, with no indication of the increase in business naturally ex pected at this seas in of the year. There is a lack of uniformity in the prices made by jobbers in different parts of the country, but Pittsburgh factory the country, but Pittsburgh factory prices remain 88 per cent. discount for single and 90 per cent. discount for double, in lots of from 3000 to 5000 boxes, with 24 per cent. additional discount for cash in either strength. As reported last week New York importers adopted a revised list on foreign Glass, from which a discount of from 60 and 10 and 5 to 70 per cent. is allowed. A discount of 70 per cent, from the new list is about equivalent to 80 and 10 and 10 and 5 per cent. discount from the former list; which latter price, it is understood, Boston importers are selling at, from the old list. The Plate Glass trade continues encouraging, and factories it is recentled. tories, it is reported, are well sold up, although the tendency is to vard lower prices. The average prices in New York and New England are stated to be 70 and 10 per cent. discount on sizes 5 feet and over, and 75 and 10

per cent, discount on sizes under 5 feet, from the Distern list. From Western manufacturers' list reported discounts are 70 and 10 and 5 per cent, discount on sizes over 10 feet, and 70 and 10 per cent, discount on 10 feet and less.

Old Metals —Prices show no radical change, the following quetations representing about the rates now paid by dealers in New York:

### Trade Notes.

THE ENTERPRISE FOUNDRY COMPANY of Rochester, N Y, send us a neat folder calling attention to the Columbia Radiator, which they manufacture for use in houses or offices. The merits of the Radiator are clearly set forth and a price-list given showing the sizes and finish in which it can be supplied to the trade.

THE FIRM of Merry & Clark, importers of and dealers in Tin Plate and Metals, 535 West Fifteenth street, New York, have dissolved. Geo. E. Merry will continue the business at the same address, under the firm name of Merry & Co.

An increasing demand for the American Ash Cars and Oily Waste Cans is keeping the galvanized sheet iron department of the American Samping Company, 104 John street, New York, running full. The Ash Cans are made in different sizes with heavy wrought iron bottom and with the sides stiffened. The Oily Waste Cans have a self closing lid and are mounted on feet to increase their safety.

PAGE.

I THE NUTMEG ARTESIAN WELL COMPANY is the name of a new concern in Waterbury, Conn., with an effice at 120 Bank street. As their name implies, the firm were organized for the purpose of digging artesian wells and the partners are W. P. and H. S. Jarrett. At present the company are drilling wells for the Methodist parsonage, Postmaster C. B. Atwood and Chas. Lockwood in Watertown, one for Seeley & Upham in Waterbury and several others.

In another part of this issue will be found the announcement of a special sale of Granite Ware by E Bissell, Son & Co., auctioneers. The sale will take place at 12 Murray street and 15 Park place, New York, on Friday, October 19, at 10 o'clock in the morning. goods consist of several thousand cases of Granite Iron Ware, and the sale is made by order of the St. L uis Stamp ing Company. The auctioneers will also sell, by order of the manufacturers, also sell, by order of the manufacturers, 300 Victor and 100 Columbia Parlor Gas Heaters, all with Russia iron bodies and highly polished nickel plated bases and tops. There will also be sold a large line of planished Tea and Coffee Pots with copper bottoms. The entire catalogue together with duplicates will be sold without reservation in quantities to suit the jobbing trade, department stores and the retail trade. The catalogue for the sale will be ready on Saturday, October 13.

S. Bernstein is traveling on the Pacific Coast in the interest of the Instantaneous Water Heating Company and the Brownhill Company of Chicago. These companies make the Douglas Instantaneous Water Heater, which is growing in popularity with both the people and the plumber, and the Perfect Gas Controller, which is not less popular as a light improver and a gas bill reducer.

The Fenracute Machine Company, Bridgeton, N. J., manufacturers of Presses and Dics, are quite busy in their shops, running with a good force and on full time. They are building several large Presses, among others being a very heavy double crank Cutting Press for the General Electric Company of Schenectady, also another heavy double column Press for a firm in Clevelsnd for embossing ceiling plates, &c. They are also building several special machines for the Standard Oil Company, which are to be shipped to Mexico. Orders for Cutting and Punching Presses are coming in frequently, and prospects for a good fall trade are better than for some time past.

THE CHAPMAN VALVE COMPANY of Indian Orchard, Mass., are building an addition to their foundry, making the latter 185 x 120 feet in size. It is stated that about \$25,000 will be apent on the building and new machinery.

WE HAVE RECEIVED a catalogue and price-list of the Buffalo Meter Company of Buffalo, N. Y., makers of Water Meters. This Meter is of the disk type. It is stated to be especially sensitive at small flows.

MERCHANT & Co., 202 Lake street, Chicago, state that their Tandem Continuous Roofing Tin, which is put up in rolls of 100 square feet, is in such demand that they have been unable to lay in a stock of it. Shipments are made on back orders as rapidly as the Tin is received from the factory. A second machine has now been erected in the factory at Philadelphia, and the trade will soon be supplied more promptly, unless operations are inter-

fered with by the labor troubles in the black plate mills furnishing the sheets for coating. This Tin is put up in three widths—namely, 14, 20 and 28 inches.

Rochester Lamp Company, 42
Park place and 37 Barclay street, New York, are just issuing their third export catalogue of Rochester Lamps in a great variety of styles and designs. This pamphlet has 40 pages, 15½ x 12¼ inches in size, profusely illustrated, and is bound in an illuminated stiff paper cover. It is printed in both the English and Spanish language on each page. One of the features of the catalogue is the line of New Rochester Lamps, said to be new in every particular, especially the wick movement, cone, chimney lift, overflow in dicator and improved burner, which gives a double tlame and increased combustion. A full assortment is shown, including varieties of Hand, Parlor, Table, Store, Banquet, Piano, Student, Hall and Library Lamps, together with Chandeliers, Bracket Lamps, Lanterns, Street Lamps, Oil Stoves and Heaters, Bicycle Lamps, Lamp Shades and Forms, with a number of kindred specialties. There are also Onyx Cabinets and Tables, both with and without Lamps.

### ODD PLATES.

(Continued from page 60.)

The Smith & Anthony Company seem to possess the happy faculty of getting their Hub ranges to the front whenever there are any cooking schools or food exhibitions under way. Their new Royal Hub range is now being used exclusively at the World's Food Exhibition at the Mechanics' Building in Boston. The leading cooking experts like Mrs. Dearborn, Mrs. Lincoln, Mrs. Barrows and others, are here giving almost daily demonstration lectures with the Royal Hub range as an auxiliary. The manufacturers feel very much complimented by the repeated selection of their Hub ranges for these great public tests.

THE ECONOMIC SMOKE PREVENTING FURNACE COMPANY is the name of a new corporation at Chicago, with a capital stock of \$200,000. The incorporators are William H. Braine, John W. Chaffee, Proctor K. Malin.

THE J. D. SMITH FOUNDRY SUPPLY COMPANY of Cincinnati, Ohio, have issued from the press a supplementary catalogue, known as No. 22, and relating to tumbling barrels and exhaust fans. The goods are fully described and carefully illustrated, the various patterns being presented in such a way as to clearly show the essential features. There is also presented an interior view of a building, showing a good arrangement for placing a number of tumbling barrels and the manner suggested by the company for making the exhaust connections. Attention is also invited to sand blast apparatus for cleaning small castings, forgings, &c., as well as removing the scale from steel and iron plates. Accompanying the supplementary catalogue are loose sheets illustrating some of the minor specialties of the company.

THE DAYTON MFG. COMPANY of Dayton, Ohio, have recently purchased from the Covington (Ky.) Brass Mfg. Company all the material, tools, machinery, patterns, &c., used in the manufacture of the Insurance gasoline stove, and have also contracted with A. J. English & Co. of Cincinnati to secure the exclusive right to manufact-

ure this stove under all patents owned and controlled by them. This wil form an important addition to the company's plant, and there is in course of construction a three-story brick building, 63 x 120 feet, in which the new industry will be carried on.

A PRESS DISPATCH from Cleveland, Ohio, states that the establishment of the Cleveland Foundry Company of that city, makers of gas and oil stoves, was burned out on October 10. The lose is placed at \$110,000, about 80 per cent. of which is said to be covered by insurance.

### Naming Tin Plates.

At a time in the history of the American tin plate manufacturing industry when new brands of tin and terne plates are increasing and multiplying on all sides, it may be well to call attention to a matter, which, though apparently trivial in itself, is nevertheless of sufficient importance to merit a word of warning and advice. We refer to the vicious practice which has been adopted to a certain extent among the Welsh tin plate workers, of branding plates by symbols or geometrical figures in place of names. It is a most inconvenient way of designating tin plates. Such marks are difficult of description in conversation or correspondence and also to display in print. Plain names of an appropriate natureand the plainer and more easily decipherable they are the better-are abundant enough to provide a varied nomenclature for all the tin plates that are ever likely to be made in America, without resorting to fancy devices. We trust the American manufacturers may continue to stick exclusively in naming the products of their works to plain, easily pronounceable words. Life is too short and time is too valuable for the ordinary business or trades man to waste either in the wholly unnecessary endeavor to describe a special brand of tin plate by the fancy mark on it, whereas he can do so in one word in cases where the brand is sensibly and properly named.

### Rules for Hot Air Heating.

A seasonable article that will be read with more than ordinary interest by the furnace heating trade appears elsewhere in this issue, under the title, "Determining Size of Pipes and Registers to Heat Given Amount of Space." The author, Geo. D. Hoffman, has had much experience in the work of furnace heating, and treats the matter in a clear, concise and intelligent way,

that will appeal to the practical men | of the trade. It is a frequent source of complaint that, while with steam and hot water heating the surfaces and mains can be figured out by well-tried rules, in hot air heating the proportioning of pipes and registers is largely a matter of individual judgment, and. as a matter of fact, a great deal of work is laid out according to the guesses of the contractor. While it is true that if based on a long experience these guesses may be approximately correct, is is nevertheless highly desirable that definite rules be established for determining the diameters of heater pipes and the size of registers. Rules of this sort are given by Mr. Hoffman, and we hope that our wideawake and progressive readers will compare them with the rules they employ and let us know how they agree, for a discussion of this kind will be of great interest and benefit. It is time for the furnace trade generally to follow more exact rules in their work and not depend upon the empirical methods that have been in vogue.

### Unsanitary Bake Houses.

One of the New York City dailies has recently been showing up the unsanitary condition of certain bakeries in New York and Brooklyn. The statements published, while of a somewhat sensational nature, are nevertheless supported by a number of illustrations of different bake houses from photographs taken on the spot. These photographs give a sufficiently startling impression of the condition of some of these places. They depict uniformly filthy subterranean dungeons infested by vermin, without natural light or any means of ventilation, and having absolutely no sanitary facilities. In one of these cellar bakeries is seen an open utensil which is used as a urinal. In two others are frowsy looking, unmade beds with dirty coverings; in others again insects are seen crawling on the wall, while the whole series of pictures reveals a general condition of dirt and unwholesomeness. All the disgusting features are in close contact with the tubs in which the bread sold in the store above is being made. It seems hardly credible that such a state of things should exist in these cities at this time. Yet the testimony is very circumstantial and should be thoroughly sifted by the health authorities, with the view of the suppression of such dangerous and disease breeding establishments. Meanwhile, it behooves those who buy baker's bread to satisfy themselves of the cleanliness and the general sanitary condition of the place in which it is made.

A Welsh Conspiracy.

English papers, led by the Temes, are fooling themselves with the belief that if any large proportion of the Welsh tin plate workers now in the United States can be induced to return home the American industry will be para lyzed. To accomplish this end a meeting of Welsh tin plate makers was held recently at the Swansea Exchange. when the matter was discussed and steps were taken to ascertain whether any of the men are inclined to return to Wales. It is thought that the shutting down of most of the American tin plate works pending adjustment of the wage scale, the news of which was, of course, joyfully received across the water, will throw a number of the Welsh tin platers out of employment, and that these men will be glad to return to their native country. The Welsh manufacturers are, in the meantime, warned by the British press to decline, for the present, in their own interests, any further American orders for black plates. It is contended that the American makers, foreseeing a long struggle over the wage question, "are endeavoring to keep their engagements by obtaining from Wales a sufficient supply of black plates, which they can tin by mechanical process and put on the market as American make." The warning does not seem, however, to have been much heeded by the Welshmen, for the Swansca Daily Post, in a recent issue, says that Welsh manufacturers are booking large orders for black plates received from the United States, and a case is mentioned in which the order for 500 tons was accepted by a local maker quite lately. "Such action," the Post claims, "if persevered in, must defeat the efforts now being put forth to impose a serious check on the infant industry in the States." The infant industry referred to is already too vigorous a stripling to be strangled by any such methods as those proposed above.

"Engraving by dynamite" is a somewhat startling aunouncement. And yet this process is actually carried out, if we may rely on the account given in a technical journal. It appears that this method of engraving is not adopted as a regular trade method, but is rather used in the nature of an experiment by those whose business it is to test the strength of dynamite, gun cotton and other high explosions. other high explosives. Fresh plucked leaves are placed between two plates of highly polithed ateel and cartridges are exploded on the upper plate. The rerecoil is so great and sudden that the upper plate is driven downward with auch force and rapidlty as to catch exact impressions of the leaves before their delicate ribs have time to be crushed by the force of the blow.

# THE LETTER BOX.

### Hard Worked Pump.

From P. H. W., Poughkeepsie, N. Y.—In the reply to "G. W. G." of Pawling, N. Y., under the head of "Hard Worked Pump," in The Metal Worker of October 6, it is stated that it would be impossible to lift water 36 feet, as shown in the drawing. In this I am prepared to disagree with you. Judging from the drawing, the object of the contractor was to avoid deep excavation. Taking into consideration the extreme length of the discharge and suction pipe, he should have increased the diameter of the pipe at least three sizes. If "G. W. G." will increase the size of discharge pipe (he cannot make it too large within reason), then increase the size of the suction pipe, filling the suction pipe before starting the pump, he can lift water 36 feet. The suction represents a reverse siphon which does not increase the lift over the 10 feet stated

Note.—It is a well established fact that atmospheric pressure alone will not force water higher than 34 feet. To raise water from a greater depth the pump rod must be lengthened so as to bring the piston well within the limit mentioned.

### Concerning Underclothing.

From G., Philadelphia.—I have several employees who desire to dress well, but their business calls them into boiler rooms and hot kitchens where the temperature is so high that they perspire very freely and destroy their good clothes. Can you recommend any preparation which might make underclothing water proof and so that it would not give off offensive odors when heated, and, furthermore, would not destroy the fabric? It would have to be sufficiently water proof to prevent the perspiration from striking through.

Note. - This inquiry is somewhat outside the province of The Metal Worker. but there are no topics that are not pertinent to the Letter Box. We suggest that our correspondent find some other means of overcoming this disagreeable feature of working in hot places. Undoubtedly, underclothing can be made water proof, or better still, it could be manufactured of water proof material. It must be borne in mind, however, that a material that will not let water through would be equivalent to dressing in rubber throughout. It might result in saving the clothes, but it would be practically impossible to work in it because of the discomfort. We do not think our correspondent will be successful in remedying the difficulty in the way he suggests. The only means of meeting the trouble is to wear heavy woolen underclothes, which absorb moisture like a sponge, and will thus prevent the destruction of the

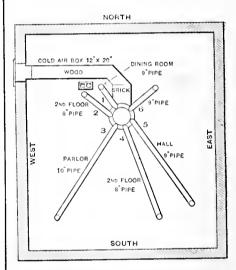

other clothes and at the same time not interfere with a natural secretion. Perspiration is the means taken by nature to relieve the excessive heat of the body, and any one who has had to travel much in rubber clothes knows how exceedingly unpleasant such garments are. Our correspondent must bear in mind that the office of the skin is a very important one, and he may have forgotton the case of the little boy in olden times who, to take part in some gorgeous pageant, was completely covered with gold leaf. The boy was a pretty sight for a little while, but the experiment killed him very quickly. Stopping up the pores of the skin is as effective a means of producing death as closing the windpipe with a hangman's

### An Unsatisfactory Furnace.

From C. F., Natick, Mass.—I send a sketch of a furnace job that does not give satisfaction, and would be glad to get some idea for making changes to get better results. The furnace is large enough, there is a good draft and the pipes have a rise of about  $3\frac{1}{2}$  inches in 8 feet, but the furnace does not seem to heat. Pipe No. 3 to the dining room heats very little; pipes 2 and 5 heat fairly, and the rest very indifferently. Pipe 4 is taken off from the front of the furnace over the furnace door.

Note. — From the plan and description presented it is improbable that specific information can be given for making the changes needed for better results, yet any suggestions our readers have to offer will be welcome. It will be well to search through the whole plant for anything that might interfere with the flow of hot air. The cold air duct has more turns in it than are desirable, yet a sharp turn is avoided. It should be air tight, and its dimensions should not be reduced at any point. From the fact that one part is brick it is possible that the furnace sets over a pit. If it does the pit should be as deep or deeper than the cold air duct and of the same diameter as the furnace casing. A pier should be built in the center of the pit about 12 to 14 inches square, with one corner pointing toward the entrance of the duct. This pier is for the ash pit of the furnace to rest on for support. . If the air duct connects with the casing it should preferably connect at the back, so that each side of the furnace will be supplied with air. Assuming that the furnace is put together properly, so that no air leaks would check the fire, there should be sufficient space between the top of the radiator and the top of the furnace for an air chamber, so that each

pipe may be amply supplied with air. A space of at least 6 inches should be provided, and more is better. The collars for the hot air pipes should be arranged to give the greatest pitch possible to the pipes, and if the collars are in the top they should be short and 45°, or round elbows should be used very short in the throat. It is sometimes better to make the top sunk in the center and high on the outside, so that the collars can be put in on the side. This throws the air to the outside, and it is easy to put partitions in the top to insure a flow of air into any or all pipes. The pipes should have a pitch of at least 1 inch to the foot, and more is better, but there is less than half this pitch in 31

An Unsatisfactory Furnace.

inches in 8 feet. It is natural that pipes leading to the hall and upper rooms have the best flow of air, and that a pipe over the ash pit and feed shute should be but poorly supplied. Pipes that run toward the north and west should always be shorter than those running in the opposite direction, and can be twice as long without disadvantage. In this respect the arrangement shown is not open to criticism. In calculating for registers their area should be twice the area of the pipes, as the newer designs used in register faces are not so open as the old patterns, which were figured one-third of the area off for the fret work. The register boxes should be ample in size, and so made as to aid the air in making an easy turn. Some means must be provided for the air in the rooms to be heated to get out or hot air cannot enter. A register of good size in the hall, with a pipe leading from it to the cold air pit or duct, and arranged with a shield or check valve, so that cold air

cannot come up, will aid in exhausting the air from the house to make room for the hot air.

### Tin Plate Terms.

From A. R., Newark, N. J.—I am a tinsmith and have handled a great quantity of tin, but do not and cannot, except by appealing to you, find out the difference between terme, charcoal, coke, bright and roofing plates. By explaining these terms in The Metal Worker, you will greatly assist me.

Answer .- We are not surprised that our correspondent has been puzzled by the terms used in the tin plate trade, for as we have often pointed out the words have little significance at present, and their meaning must be learnt the same as we would memorize the definition of some Greek word. In the beginning the words had definite application, but this has been lost through the changes in the process of manufacture. However, our correspondent asked for definite information and not for a sermon on the peculiarities of the tin plate trade. We would inform him, therefore, that a terne plate and roofing plate are the same thing. Both mean a tin plate in which the coating is largely composed of lead, giving it a comparatively dull appearance. A bright plate, oa the other hand, is, or should be, coated with pure tin and has a shiny surface. The terms "charcoal" and "coke" are now used to define the quality of the plate, and while they were formerly applied to both terne and bright plates, the words are now used only in connection with bright plates. The fine plates used for pieced tinware are known as charcoal tins, while the light coated bright plates, such as are used for canning purposes, are known as coke tins. We have not attempted to exhaust this topic, but merely give the information in a simple way so that our correspondent may no longer be confused by the terms.

### A Tin Roof Problem.

We are in receipt of a letter from the Kansas City Metal Roofing & Corrugating Company, Kansas City, Mo., respecting an article in the Letter Box of The Metal Worker of October 6, in which they refer to the necessity of getting a roofing eement that will not crack, and call attention to their elastic roofing eement, for which they claim particular merit. They also add that the recommendation to use coal tar is objectionable, as the sulphur and acid it contains are more or less injurtous.

From J. W., Wappingers Falls, N. Y.—If "B. J.," Indiana, will paint cloth strips over his standing seams, he will have a good and durable remedy for the leaky roof. He should use thin cloth for the purpose, cheeseeloth being a good article, although I should select shirting. It should he pasted on smooth with paint.

From O. R.—In The Metal Worker of October 6, in answer to "B. J.," Indiana, you advise him to paint his leaky atanding seams with tar, but I think

that is very bad advice. Tar put on tin in any way is injurious, and, further more, will not stand any length of time. If the roof was mine I would paint it up with white lead, putting on coats enough to make a sure job and being careful not to get too much on at one time. I think the leaks may be caused by the planking having shrunk. The seems should be gone over with iron and mallet, and if this was done at the same time the first coat was put on it is probable it would require nothing more.

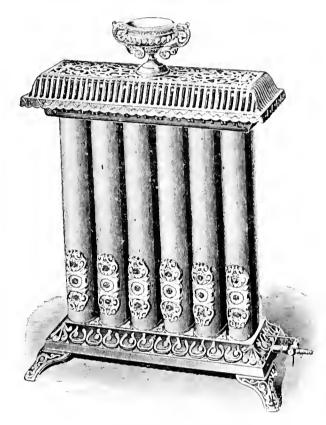

### Sims' Patent Gutter.

From Sims Meg. Company, Newark, Ohio.—We notice in The Metal Worker of October 13 a letter from "J. D. A.,"

into the first bath again. After that it is sufficient to put the aluminum in a solution of a salt of the metal, gold silver, &c., of which the coating is required. The layer is adherent and the metal can be soldered by the methods ordinarily employed.

### The Cort Gas Radiator.

The illustration presented herewith shows a new gas radiator that is being put on the market by J. H. Cort & Son, Adams and Water streets, Brooklyn. N. Y. In appearance the radiator is made attractive by symmetrical outline and the treatment of the cast iron parts.

The Cost Gas Radiator.

Remington, Ind. We wish to inform him that the Sims Mfg. Company of Newark, Ohio, are sole proprietors of the patents and sole manufacturers of the Sims patent gutters.

# Sheet Metal Patterns.

From M. D., Brooklyn, N. Y—Please inform me through the Letter Box where I would be able to obtain the sheet metal pattern plates that have appeared in The Metal Worker:

Answer.—If our correspondent wishes a work on pattern cutting, we would refer him to "The Metal Worker Pattern Book," published at this office, price \$5, which includes many problems similar to those that have appeared recently in The Metal Worker.

A process for coating aluminum with other metals, the discovery of Herr Neesen, is thus described: The aluminum is cleaned by plunging it in a bath of hydrochloric acid or of caustic soda. It is then immersed in a solution of bichloride of mercury, which decomposes and amalgamates the surface of the aluminum, which is then plunged

The base which supports the planished iron heating tubes is handsomely ornamented and the easting at the top is of an equally attractive style. At the base of the heating column an ornamental casting is used as a setting for colored glass jewels, through which the gss thames send the light in many colored rays. A handsome urn la used as a top ornament of the radiator and is designed to hold water to be evaporated to supply moisture to the apartment, in deference to the opinion that a gas radiator has a tendency to dry the air in an apartment, making artificial moisture necessary. The burner is arranged with a pilot light for use in lighting. Immediately below each of the hearing columns is a gas tlame, and the heating columns are provided with inner tubes which extend nearly to the top, through which the heated products of combustion rise and heat the top of the radiator, and then, as there is no outlet at the top, they descend on the outside of the inner tube to the bottom of the radiator and are discharged at the floor, thoroughly heating the radiator. By this means the lower portion of the radiator and the room are well heated. The radiator is made in several

# PLUMBING and GAS FITTING.

### The Culinet Boiler.

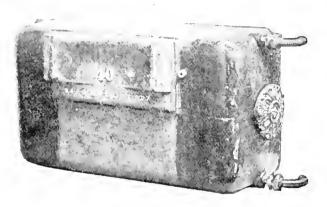

The illustration presented herewith shows the hot water boiler used in the Culinet range made by the Walker & Pratt Mfg. Company, 35 Union street, Boston, Mass. The boiler, which is made of cast iron in one piece without joint or seam, is of several sizes, the largest holding 40 gallous. The range with which it is used has an elevated oven and when the ordinary water back is not employed the Culinet boiler occupies the place usually reserved for an oven. As will be seen from the

iee, serious damage to property has resulted from the old plumbing system not being strong enough to withstand it. The use of a pressure regulator in such cases, after the repairs are made, avoids the expense of an entire new system and prevents further accident.

It is probable that the benefit attending the use of a pressure regulator on the gas supply is not generally understood or their use would become greatly increased. It is impossible for a gas company to maintain an even and proper pressure throughout their system. In consequence gas is burned at a much

water heaters. The Acme No. 6 is intended for use by doctors, dentists and barbers. Consuming 15 feet of gas per hour, it will raise a quart of water from 60° to 100° in 30 seconds and will boil the water in 3 minutes. The No. 7 Acme is the same heater with a tray for glasses at the top for bar and restaurant use. A large heater is made in the No. 9 Acme, which will raise 3 gallons of water per minute from 60° to 100°, or will boil 3 quarts of water in the same time. This heater is also made with a shower bath and a thermometer for showing the temperature of the water used. They should only be used where there is but a light water pressure or a water pressure regulator is employed, for, being made of sheet copper, they will not stand much pressure. They have been used with success in buildings where there was no other means of getting hot water for two lavatorles and two baths, the pressure being reduced to their strength.

trating three sizes of new instantaneous

The Culinet Boiler.

picture, a portion of the boiler is exposed to the direct action of the fire, occupying the back part of the fire chamber. It is claimed that the noise sometimes accompanying the use of water backs and boilers is avoided and that this device does not become clogged with sediment so as to interfere with the circulation. It is further stated that its location is such as to insure the rapid heating of the water, and as it is not exposed like the ordinary kitchen boiler, the water when heated does not become cooled by the aurrounding atmosphere. A 40 gallon boiler of this construction, it is stated, is equal to a 45-gallon boiler of the ordinary pattern. The boilers are intended for use where tanks or cisterns furnish the water supply and their hight above the boiler does not exceed 30 feet. Each boiler is carefully tested by water pressure un-der a head of 60 feet, and are treated by the Wells patent process to prevent the possibility of rusting. The service pipes may be connected at either end of the boiler, the cold water pipe at the bottom and the hot water pipe at the top. A circulating or expansion pipe may be connected when desired. An ordinary water back can be furnished when desired to take the place of the Culinet boiler, and may be coupled in the usual style.

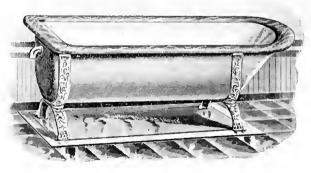

### Pressure Regulators.

The use of pressure regulators is so common and the advantages so well known that they are in demand by all who do steam fitting work. At this time pressure regulators for use on a water supply are being more generally used. In citics where an improvement in the water works system increases the pressure of the water on the house serv-

higher pressure than is economical or effective at a large percentage of the burners in everyday use. This not only leads to a large consumption but to waste and poor light, as under high pressure more gas passes through the burner than can be properly burned for illuminating purposes, and then the gas is said to be poor in quality. The use of a gas pressure regulator in a large number of such cases has had a surprising double effect, in reducing the gas bills and increasing the light. The sale and setting of these regulators has

### Aluminum Bathtub.

One of the new plumbing fixtures that is being put on the market is an aluminum bathtub made by the Aluminum Bath Tub Mfg. Company, Indianapolis, Ind., and shown in the illustration presented herewith. The tubs are made in both the French and Roman patterns, finished with wood rim and supported by ornamental cast iron legs. All the tubs are made with holes for No.  $4\frac{1}{2}$  Fuller bath cocks, but can be furnished for other styles of fixtures when so ordered. The dimensions of the tub are taken from inside of the tub proper, and they are made in  $4\frac{1}{2}$ , 5,  $5\frac{1}{2}$  and 6 feet lengths. But one thickness of metal is used, yet there is sufficient strength, it is claimed, to permit a heavy man to jump into the tub without damage to it. A support runs under the bottom of the tub and is fastened

Aluminum Bathtub.

been found very profitable by the plumbers in some of the larger cities and it is probable that the study and understanding of these appliances can be widely turned to profit.

THE INSTANTANEOUS WATER HEATING COMPANY, 838 Broadway, New York, are sending to the trade their supplement to catalogue No. 2, illus-

to the cast iron feet. The tub presents a bright polished appearance that may be continued indefinitely, as it is said the metal may be accured if necessary, as there is no coating to be destroyed. A circular that is being distributed by the company shows what they term the American system. It represents a pump connected with a water boiler, which is arranged to be heated by either gas or gasoline and is specially adapted for use

in country residences. Du Bois & Darrow, 61 Gold street, are the New York seents.

#### Progress in Plumbing.

The following is an extract from a paper read by J. W. Hughes of Montreal, Canada, before the convention of the American Health Association, held at Montreal in September. Taking for his subject "The Evolutionary Developments of Domestic Plumbing During the Past Thirty Years," Mr. Hughes said that the annual meetings of the association were the milestones that mark the progress made on the journey toward the goal which they hoped to reach in the not far distant future, or the rallway stations where the traveler stops over for rest and recreation, or changes cars and branches off to new routes. As the prudent traveler at such places would look back over the journey passed for the experience to guide him on the road to come, so should they, on an oceasion of this kind, review the past and see what has been done, with a view to shaping their course in the future, so as to save toil and money, for they were traveling for business, not merely for mental diversion and recreation. The faddists or dillettanti sanitarians, of which there were a considerable number, fully represented the latter class.

#### Trapping.

Thirty-five years of daily practice, Mr. Hughes considered, placed him in a position in which he could speak with authority upon his subject. All the great changes in men, methods and materials, that so greatly distinguish mod. ern plumbing, had taken place in that period. The great distinguishing difference between domestic plumbing in the remote past, as revealed in the writings of classical authors, and as shown in the ruins of ancient cities, and modern plumbing, arises out of the question of trapping. So far as Mr. Hughes' knowledge on the subject goes there is no reliable proof that the ancient craftsmen understood the virtues of the water seal trap as a safeguard against the entrance of disease germs into buildings, and it is within the past 35 years that the full importance of the subject has become known. To the intelligence of the modern plumber we are indebted in a large degree for those practical methsafe plumbing without which would be an impossibility. Trap siphonage was unheard of 30 years ago and back air venting was not thought of. Thirty years ago many of the city sewera were constructed of wood, and even where there were brick or tile street sewers the house connections were wooden boxes, in many cases conducted over the earth in the cellars. Today all interior drains must be constructed of heavy pipe, so put together as to be able to stand the water, smoke or peppermint test.

#### Use of Lead.

Years ago the material in universal use for soil, waste and water pipes was lead. Lead was used for bathe, sinks, eisterns and pumps. Then the plumber was rightly named. To day lead is almost a thing of the past for such purposes. It has been replaced very largely with cast and wrought iron, copper, brass and iron lined with glass, and the coming pipe would probably be aluminum. In no department of the trade has the change been so great as in the fixtures. The old foul, bad amelling

closet is no more seen except as an interesting relic. In its place are various kinds of porcelain closets, some of them works of art and science in their construction and decoration. The porcelam, iron, enamel, copper, German silver and fiber bath have replaced the old time lead one. Again, the change has been most complete in the meth ds of finishing the wood work. everything must be open to light, air, soap, water, proom and brush. The two most important questions for the up to date sanitarian are, in Mr. Hughes' opinion, overcrowding and ventilation. He appealed to the association to use its influence in the direction of encouraging the education of more skilled workmen in the plumbing trade. Special precautions are taken in educating minister and lawyer for the care of our souls and the protection of our property, and doctors for the care of our bodics, while comparatively nothing is being done to educate and train a class of men whose life work it should be to construct scientific and safe apparatus within our dwellings for the preservation of our health

"We cannot have public health," Mr. Hughes concluded "without health to the family and individual, and no one can contribute a greater share toward this than the plumber, or, as I believe he will be called, the practical sanitarian." Which of our great institutious of learning will be the first to afford proper facilities for the training of such men?

#### A Medal for Plumbers.

By order of the Court of the Plumbers' Company, one of the ancient guilds of the city of London, a very hand-some medal has been prepared, which will be competed for by the skilled workmen of the craft in England. The object of the guild in instituting this prize is to mark in a very conspicuous manner their sense of the supreme importance of fostering the highest skill in workmanship as the true essential of a technical education. The terms under which the medal is to be competed for are still under consideration. The medal itself, which is said to be a true work of art, is thus described in the Plumber and Decorator of London: The obverse of the medal gives a representation of St. Michael with outspread wings vanquishing the Spirit of Evil. archangel is armed cap-a-pie, and bears the white cross on a red field as opposed to the cross of St. George, borne by the eity of London. It will be noted that the figure of St. Michael, the arbiter of the fate of souls, forms the erest of the Plumbers' Company, and he is therefore chosen, in his capacity as Destroyer of Evil, to represent the work and aims of the company. Crowning the head of the archangel are the city arms, which not only indicate the association of the company with the city, but also appropriately record the fact that the master last year, Sir Stuart Knill, was Lord Mayor. The legend, "The Worshipful Company of Plumbers," frames the composition and completely fills the circle, the interlacing pinions of the angel and evil spirit forming a setting to their struggle. The reverse of the medal shows the coat of arms of the Plumbers' Company in exceptionally high relief, in order to harmonize with the treatment of the obverse. Inscribed are the mottoes of the company and the words, "First struck and presented for excellence of workmanship, National Workmen's Exhlbition, London, 1893."

#### TRAPS AND VENTS.

Thos, Killy & Bros., Chicago, have been awarded a beautiful broize medal by the I lines. Chapter of the American Institute of Architects for their exhibit of siphon and washout water closets and the Kelly Sanitary Siphon wash basins at the First Annual Chicago Building Trades and Material Exhibition, held in the Institute of Building Arts May 15 to June 2, 18.04. The obverse of the medal shows in harriler renowned examples of architecture set in the punch of a quarterfoil, while the reverse lears the name of the exhibition and "award for merit," within a handsomely designed scroll.

THE MARYLAND POLIFRY COMPANY, Baltimore, Md., are assuing a catalogue of 58 pages of handsome chamcled paper, bound in black cloth, with gilt side titles, consisting of name, address and trade mark. The title page is printed in red and black, and calls attention to the makers' specialty of vitreous china for plumbers' ware and sanitary spe-cialties. The first few pages are de-voted to terms, a special notice, the trade-mark, the qualities and superiority of vitreous china and the Maryland siphon jet closet. Then follows a pricelist of vitreous china, round and oval lavatory basius, plain and embossed; French closet bowls: urinals, flat, corner and with lip; hopper closets in different styles and with trap; a large variety of washout closets and pedestal and siphon jet closets. The last 10 pages are devoted to engravings showing the various goods made in all their details. The catalogue is just what the users of such goods will find a great convenience and can be had on application. Inclosed with it is a discount circular that will be interesting to buy-

A COMPLAINANT against the plumbers' examining board of Albany, N. Y., has found no sympathy with the public, as it was learned that he was given several examinations and failed in all. The board is very popular with the plumbers of the city.

RICHARD ALLEN has been granted a plumber's license at Bangor, Maine.

FRED B. WILSON, Carthage, N. Y., has sold out his interest in the plumbing business to his partner, D. F. Hubbard.

A. N. Sprague and Charles D. Moore have formed a copartneiship for the purpose of carrying on a general plumbing, stove and heating business, at the old stand of G. B. Gaylord & Co., Westfield, Mass. The store has been thoroughly renovated, furnished with a plate glass front, and filled with a full line of new and attractive goods.

B. P. OWEN, East Hampton, Mass., has resigned as examiner of plumbers, and George L. Manchester has been appointed to the position.

The Brockton Heating & Plumbing Company have started in business at 115 Montello street, Brockton, Mass., where they advertise to do repairing night or day. M. H. Kelleher of the company is from New York.

R. SMITU, Wilkes-Barre, Pa., in addition to the plumbing business, makes a specialty of gas fitting and fine gas lighting fixtures. He has the contract for supplying the gas fixtures for the new City Hall just completed in that eity.

Anour 200 members of the Master Plumbers' Association enjoyed an outing last week at the country residence of John Trainor of Baltimore. Everybody present participated in a number of football and baseball games. Mr. Trainor was sesisted in receiving his guests by his wife, Mrs E len Lynch of Yonkers, N. Y., Miss Kate Fells, Mrs. Henry Voke and Miss Helen F. Trainor.

THE FLUMBERS' SUPPLY MFG. COMPANY of La Crosse, Wis., it is reported, have adopted the profit sharing system

THE FIRM of Connors & Walford, plumbers, 1876 Niagara street, Buffalo, N. Y., have dissolved partnership by mutual consent. The business will be centinued at the old stand by the senior partner, H. L. Connors.

THE PLUMBING INSPECTOR of Kingston, N. Y., in his report to the Board of Health, stated that three different plumbers had done work without a permit or license to do plumbing.

A GREAT DEAL OF TIME has been given by the City Council of Woodland, Cal., to the discussion of the imperfect plumbing of water closets which are connected with the sewer system. It is contrary to law to have a closet connected with the sewer that has no trap or vent plpe, and the city attorney has been instructed to prepare notices for the sewer inspector.

Durino the past month a very agreeable increase in the sales of instantaneous water heating apparatus has been reported by the Instantaneous Water Heating Company of 838 Broadway, New York. The uses to which these heaters are adapted are being more thoroughly understood and appreciated by the plumbers, who find in them very acceptable means for supplying hot water in many cases.

ELECTRIC FLUSH TANKS for water closets are among the new things in plumbing goods. There is no chain to pull or lever to operate, but by pressing a button the electricity opens a valve and starts the flushing.

WILLIAM E. CONNOR died last week at 188 Pacific street, Brooklyn, N. Y. He was the son of George and Harriet Connor and was a member of the Fourteenth Regiment Band during the late war and for 14 years was a member of the Eighth Regiment, N. G., S. N. Y., Band under the leadership of his father. He was born at Fort Monroe, December 17, 1848, and moved to this eity at an early age. He was well known in the Sixth ward, where he carried on the plumbing business and had lived a long time. His last illness covered a period of five months during which time he suffered considerably. leaves a widow and five children.

THE ESTABLISHED REPUTATION of the soil pipe and fittings of the Monitor Iron Works, Centre and Worth streets, New York, keeps their foundries running busily. In addition to these goods they make a large line of sinks, drsin traps and plumbers' cast iron goods.

THE GOVERNMENT OF THE UNITED STATES, it is stated, requires that vitrified earthenware shall be used in the plumbing of the barracks and army buildings in the future.

W. H. FRENCH of the Armstrong Mfg. Company, Bridgeport, Conn., spent last Thesday at the New York effice, 141 Centre street. Mr. French reports a good demand for their popular stocks and dies, and that there is a growing demand for their machine tools for cutting and threading pipe.

They are making a push on their three-wheel interchangeable pipe cutter, which is becoming a favorite with the pipe fitters and those who cut iron rods and bars in shops.

THE City Solleitor of Des Moines, Iowa, has seeured an injunction against a plumbing house that failed to take out a license. This is a movement on the part of the city to enforce the plumbing ordinance, which the plumbers say is unlawful.

THE PLUMBING INSPECTOR Of Buffalo, N. Y., is still waging war against the plumbers who fail to comply with the city ordinances. Warrants for the arrest of 21 plumbers were issued last Monday.

Twenty-two master plumbers of Somerville, Mass., met last Tuesday evening at the effice of John F. Davlin, 10 Webster avenue, to consider the advisability of forming a master plumbers' association in Somerville. Mr. Davlin called the meeting to order and was chosen temporary chalman. William F. Bennett acted as accretary, and an address on the advantages of such an organization was made by ex-National Secretary David Smith of Boston. After a discussion on the subject it was voted to organize at an early date, and the meeting adjourned subject to the call of Mr. Davlin.

THE NEW PLUMBING ORDINANCE at Seattle, Wash., provides that the health officer shall call a meeting of the Examining Board of Plumbers within six days after the filing of an application for a license, and that the examination shall be public and consist of 20 questions on practical plumbing. Seventy. five per cent. of the answers must be correct to secure a license. In case the license is refused an appeal can be taken to the City Council. When a license is issued the recipient is required to When a license file a \$1000 bond with one or more sureties. All licenses previously granted remain in full force and may be renewed. The penalty for violating the ordinance is not over \$50 fine, or not over 30 days, imprisonment in the city jail, or both.

At the Congress of the Sanitary Institute of Great Britain, held recently at Liverpool, Sir Francis Sharp Powell, the new president, in his inaugural address, stated that England had spent \$273,600,000 on urban and rural and \$321,600,000 on other local improvements in the endeavor to realize good sanitation. The improvement in the public health, however, which had accrued in the same period fully justified, he said, that expenditure.

W. N. Wilson has arranged to transfer his plant for manufacturing plumbers' supplies and automatic flush tanks to Richmond, Ind.

Owing to the dealers in plumbers' supplies of Providence, R. I., re'using to sell goods to plumbers who were not members of the Master Plumbers' Association, legal action was taken which has resulted in the court granting a restraining injunction against what it terms a boycott.

Z. T. DARROW, who has the sewer contract at Marietta, Ohio, is preparing to open a sanitary plumbing shop on lower Front street.

ROBERT JOHNS will erect a \$12,000 residence, at 6463 Sheridan avenue, Chicago, that will be heated by hot water and have a plumbing system.

Montreal Master Plumbers.

The Master Plumbers' Association of Montreal and vicinity held their regular meeting Thursday, October 4. The principal business on hand was the discussion of the new city plumbing bylaws. At an early date a meeting will be arranged with the city officials, with a view to discussing the by-laws with them, as there are some clauses not quite clear. Another item of business taken up was the plumbing class, which is carried on under the auspices of the Council of Arts and Manufactures, one of the sub departments to the Government of the lirovince of Quebec. The class was started at the request of the Master Plumbers' Association some years ago and has already accomplished a great deal. Last year the class outgrew the facilities in the way of accommodations and additional premises are to be secured. The Government are now seriously considering the question of erecting a building for the accommodation of the classes, which number 11 in all. They are, freehand (advanced), model and objective drawing, freehand drawing (junior), mechanical drawing, architectural drawing, modelurawing, architectural drawing, modeling, wood carving, lithography, decorative painting, stair building and building construction, plumbing, and pattern making for boot and shoemakers. The attendance this year was 318. The plumbing class is superintended by a special committee of the Montreal Master Plumbers' Associa-

### Battersea Polytechnic, London.

Among recently established technical schools in London is the Batterses Polytechnic Institute. It has lately issued a prospectus for its second session, which opened on September 24. The instruction offered in the Institute covers a very wide field and includes subjects auitable for both men and women, the number of classes being no less than 133, in 71 different subjects. The instruction in all technical and science subjects is associated with laboratory or workshop work, the institute being fortunate in possessing laboratories for chemistry, physics, mechanics, and electrical science; and workshops for engineers, carpenters and joiners, plumbers, bricklayers and masons, plasterers and painters, and well fitted cookery schools and laundry.

Among the special features in the prospectus are the formation of "courses of classes," with a view to encouraging continuous and co-ordinated atudy, the effering of special afternoon classes for apprentices, and special classes in manual training and in acience for teachers only. Numerous scholarships are open to the students.

The institute is State aided, under the act of Parliament passed a few years ago for the purpose of promoting trade and technical education. Since the passage of this law, the growth of trade and technical schools throughout England, and especially in and around the metropolis, has been very satisfactory, notwithstanding the disfavor shown them by the trades unions and the oppositions offered by these organizations.

The heavy withdrawals of September caused a decrease of nearly \$10,000,000 in the value of goods left in the bonded warehouses on the last day of that month as compared with the figures for August 31.

## STEAM AND MOT WATER.

#### A Combination Heating Plant.

Through the courtesy of the Howard Furnace Company, Syracuse, N. Y., we are enabled to bring to the notice of our readers a very interesting heating plant which has stood a winter's test to the entire satisfaction of the owner. The house, which is located in Syracuse, has an unusual exposure, as it stands at the fork of two roads facing the main road, which leads from a

so arranged that the air may be taken from two points inside of the house, a 12 x 30 inch duct, Inside measure, being taken from the dining room and a 12 x 30 duct from the hall. Air is taken from out of doors through a 10 x 26 inch duct and the ducts are arranged to take a part of the air supply from the inside and a part from out of doors or all from the house to enable the house to be more quickly heated by a rapid circulation of air when the weather is cold.

TO SEASER

SND FLOOR

A Combination Heating Plant.-Fig. 1.—Cellar Plan, Showing Heater and Piping.

northerly direction. One of the Howard No. 23 double radiator combination air and water heaters is used for the work, affording a positive change of air by means of the registers and a positive heat from the radiatora. The registers used are made by the Tuttle & Bailey Mfg. Company, and the radiators are of the Perfection pattern made by the American Radiator Company, each radiator being decorated to harmonize with the room in which it is placed.

In this plant there are several features of peculiar interest. The air ducts are

This arrangement insures a warm dining room early in the morning, which is always desirable, but sometimes difficult to secure. Fig. 1 shows the cellar plan with the heater, the cold air ducts, the hot air pipes and the piping for the hot water system. Figs. 2 and 3 show the first and second floor plans, with the location of the radiators, registers and hot air flues.

Some difficulty has been experienced with combination heating plants when a part of the building is heated by hot air and a part by hot water radiators, as that part heated by the radiators is

made too hot or too cold unless the water heater and the radiators are of just the right capacity for the heater and the way it is fired. In this plant a register and a radiater in each room overcomes the possibility of trouble from that cause. The hot water plant is arranged on the circuit system, the flow and return to a radiator being connected with the same main flow main. which runs with a a gradual rise till the last radiator is reached, and it eventually becomes the return of the system. From the top of the heater a 2 inch main runs toward the front of the house, where a 11-inch branch runs to the side which has the most radiators and the coldest exposure, and a 14 inch branch runs to the other side. Before the 2 inch main branches it is tapped for a 14-inch flow and return to a radiator having 80 square feet of surface in the hall. From the 11-inch branch mair, 1-inch flow and return mains are taken to a 56-foot radiator made eireular to fit in the bow window in the parlor, and a similar radiator of 36 square feet in the chamber above. The branch is tapped with 1-inch pipe lead. ing to a 40-foot radiator in the library. and to a 32-foot radiator in the chamber above. It is also tapped for a 16foot radiator in the bathroom, a 16foot radiator in a back chamber and for a 20-foot radiator in upstairs back hall, and when it nearly reaches the heater it is again tapped for a 16-foot radiator in the back hall down stairs. From this point the main, which has been carried full size all the way, has a gradual fall to the heater. The 11-inch branch runs around the other side of the house, being tapped for a 36-foot radiator in the reception room and for a 32-foot radiator in the chamber above. The next connection is for a 24-foot radiator in the chamber above the dining room, and further on it is tapped for a 40-foot radiator in the dining room; then just beyond it is tapped for a 12foot radiator in the butler's pantry and for a 20-foot radiator in the nursery above. The main is tapped at a suitable place at the rear of the ceilar with a 1-inch pipe which runs to the sewer, a stop cock being placed to control it and to provide for emptying the system, and at the lowest point a draw off

cock is placed for emptying the heater. All of the piping in the cellar is covered with 4-inch halr felt and asbestos paper. The risers, with the exception of those at the back of the house, are in the walls and not exposed. The plant is run on the closed system, an ordinary safety valve set at a pressure of 75 pounds being placed on the expansion tank in the npper part of the house and arranged for the overflow to run into the sewer. In Figs. 2 and 3 are shown the plans of the first and second floors of the house with the location of the radiators, hot air flues and registers. A register and radiator are shown in all of the principal rooms, the exceptions being the butler's pantry, lavatory and rear hall down stairs, and the dressing room and rear hall upstairs.

In distributing the hot air, 10-inch pipes lead from the heater to 10 x 14

floor registers in the dining room, reception room, hall, parlor and library, and to a 5 x 12 inch tin flue to the chamber over the reception room. Nineinch pipes lead to a 3½ x 14 inch tin the to the chamber over the parlor and to a 3½ x 11 inch tiu flue to the chamber over the library. Eight-inch pipes lead to an 8 x 10 inch floor register in the lavatory, and to 3 x 101 inch tin flues to bathroom, chamber over kitchen, nursery, attic and dining room Circular top side wall regchambers. isters 8 x 12 inches in size are used in all of the upstairs room except the parlor and library chambers, where 9 x 12 floor registers are used. It will be seen that larger pipes and flues lead to the colder rooms, and that the combined area of the hot air pipes equals nearly 900 inches. When both the hall and dining room air ducts are open the air supply aggregates 720 inches, or more than three quarters of the outlet, but if they are both shut off one half and the outside air duct is opened full, the supply aggregates 620 inches, or more than two-thirds of the outlet. From these figures the furnace seems to be well supplied with air and ample provision made for circulation to secure rapid hearing and for a change of air to secure ventilation.

From the amount of surface exposed in the radiators in the different rooms and the cubic feet of space the rooms contain, it will be seen that those coming first on the flow main and receiving the hotter water are expected to heat the most space and to warm the colder parts of the house. The water in such a system would naturally reach the furthest radiator at a considerably lower temperature than it reached the nearest, and in this apparatus the provision made for this loss of heat and the extra duty required of the surface at some points seems to have been correctly calculated in apportioning the surface, as the plant has proven entirely satisfactory.

#### HEATING NOTES.

BATH, N. Y., is to have a new firm of heating contractors. The Havill Brcs., who have had a practical experience in ateam work, are making preparations to go into business.

THE NEW HAVEN Record gives a portrait of Col. W. C. Mowry, Norwich, Conn., who is candidate for the office of Secretary of State. The colonel can give the politicians some "Pages" on making steam that ought to carry any canvass.

"IT IS SUBMITTED as the handsomest radiator casting extant," is what the American Radiator Company, 92 Centre street, New York, say of the Detroit flue renaissance radiator at the entrance to their show rooms. Instead of being bronzed and decorated as their great variety of other radiators, it is shown just as it came from the foundry, in atrong contrast with their beautiful finish. That it will be popular is sure, but that the Perfection and National will ever be supplanted by it is improbable. They are well known prime surface and prime favorite goods.

THE ST. LOUIS RADIATOR MEG. COM-PANY, St. Louis, Mo., are running their works to full capacity. They are placing their radiators in a number of the principal buildings now being equipped in that city, as well as in those of aeveral leading cities of the West. Among the latest and largest contracts awarded the company was one for 30,- 000 feet for the new public schools now being finished in this city.

W. K. PIERCE AND HORACE WHITE, representing the Steam Heat & Power Company, Syracuse, N. Y., have contracted with the mayor for steam for heating the City Half for \$3000 for the coming winter. The same Company arc said to have received \$5000 for the same work two winters ago.

A SYSTEM of steam heating by piping the principal part of the city of Canton, Ohio, is talked of by the Canton Electric Light & Power Company. Their object will be to heat all the big build-

one in the United States Hotel to filter all the drinking water used, one in Hotel Capitol and one in L. B. Plimpton's residence.

THE WELLS & NEWTON COMPANY of Chicago, plumbers and steam fitters, are to be succeeded by the Wells Newton-Quay Company, with a capital stock of \$50,000. The incorporators are D. Milroy Quay, Samuel J. Felty, Croaby Adams and Henry M. Bacon.

THE GROWTH of steam and hot water heating is strikingly apparent to those who frequent Lake street and its vicinity in Chicago. Beginning at State street

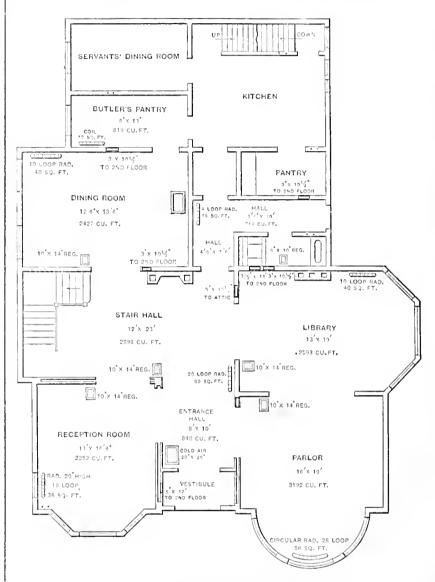

Fig. 2.—First-Floor Plan, with Registers, Radiators and Flues.

ings by the exhaust steam from their battery of boilers, adding some live steam.

WM. BLEVINS, formerly secretary and treasurer of the Bosworth Heating & Supply Company, has withdrawn from that company and taken the store 40 State street, Hartford, Conn., under the United States Hotel, where he will carry on a general hot water and steam heating business. Mr. Blevins has a number of contracts on hand at present, including the remodeling of the heating apparatus in Germania Hall, putting a hot water heater in J. Scrugham Quinn's residence, the heating of three greenhouses for Mr. Whiting, at West Hartford, using two Caswell hot water heaters. Mr. Blevins is also agent for the Wilson patent filter, and will put

and walking westward, large establishments are seen on both sides of the street, devoted to the sale of hoilers, radiators and general supplies, overflowing on Dearborn street and extending west on Lake street to some distance beyond the Chicago River. Few of these establishments have been located in their present quarters long enough to be time-honored institutions. Their appearance on Lake street can in most instances be counted in months more easily than in years. For some time past there has been hardly a month that has not seen a fresh addition to this ateam and hot water colony. Nearly all have quarters on the ground floor, so that their patrons are spared the discomfort of mounting even one tlight stairs to get figures on a job. Their warerooms are tastefully and

in some cases most elegantly fitted up, the radiator people shining conspicuously in this respect, the American Radiator Company having one of the finest showrooms to be seen in Chicago in any line. The progress of steam and hot water heating is further seen in the

logue is handsomely gotten up and the prices printed are all f.o.b. Chicago.

#### Safety Damper Regulator.

A device that will be interesting to those who install steam plants for house

steam and hot water apparatus added to their lines by the warm air furnace houses which are sandwiched among the concerns making a specialty of steam and hot water. The two lines seem to work well together, as many heating jobs are thus secured which would not come their way if they paid exclusive attention to steam and hot water.

A. A. GRIFFING IRON COMPANY, 34 Dearborn street, Chicago, are distributheating is shown in the two illustra-tions herewith of the Safety Damper Regulator made by the Poorman Mfg.

close the cheek damper and draft door to maintain the fire in a proper condition, keep the boiler steaming to supply the radiators without waste of fuel or permit the tire to become dead. Special claims are made for the efficiency and durability of the device, as the diaphragm is not liable to give way from weakness when under a maximum pressure during a cold spell and heavy firing. Fig. 2 is a sectional view showing the internal construction. The diaphragm is made of three copper disks, the lower one form ng a jacking between the plates of the regulator The lower plate has an annular V shaped groove on its outer edge and the upper plate has a corresponding V-shaped projection to fit into it, holding the lower disk accurely in place in a steam tight joint. The center disk is double seamed and soldered to the hottom disk near the center, having a 11 inch aperture. The top disk is solid and fastened in the same way to the cuter edge of the center disk. The disks are corrugated to give them spring, and in Fig. 2 they are shown as an expanded diaphragm, and in the small view they are shown in their normal condition, This diaphragm is said to be very sensitive in use and practically imperisha-

An English syndicate has organized, with \$450,000 capital, to develop the iron, mica and other ores in Frontenac, Canada.

The Mechanical World of London reports that a new bullet proof shield was lately tested at the works of Charles Cammell & Ce., Sheffield, England, with complete success. The shield, which is the invention of Captain Boynton and is manufactured by the firm above mentioned, takes the form of a plate of specially prepared chrome steel, with a slot in the top for the soldier's The weight is less than one-half riile. that of a life guardsman's cuirass, and the material has such powers of resistance to a sudden shock that it is proof against the service bullet propelled by cordite through a Lee Mitford barrel at 30 yards distance. A bullet which would pass completely through an oak plank 3 inches thick is powerless to do more than make a slight indentation in Captain Boynton's plate of steel only are inch thick. Mr. Tucker, R.E., fired hve shots at one plate from a Lee-Mitford rifle, and placed his shots as near

## ROOFING AND CORNICE.

Attaching Galvanized lron Cornice to an Old Brick Building.

From J. H., Cleveland, Tenn,-Will The Metal Worker illustrate the proper way of attaching a galvanized iron cor-

Attaching Galvanized Iron Cornice to an Old Brick Building .- Fig. 1 .- Side Elevation of Wooden Lookout Secured to Wall.

nice to a building that is completed, or in other words, an old brick building?

Answer. - In Figs. 1 and 2 is shown one method by which a cornice can be attached to a brick building, using wooden lookouts for the purpose, the

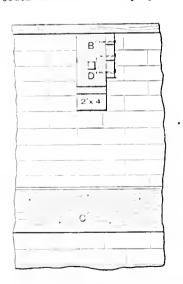

Fig. 2. - Front Elevation of Wooden Lookout Secured to Wall.

lookouts being secured without remov ing any of the brick work. In the side elevation, A represents one of the lookouts, which is fastened to B with nails, screws or bolts, as may be desired. To secure the lookout to the

wall a hole is first drilled, then the bolt D passed through the piece of wood B and through the wall, being secured by means of the nut. In the front elevation the piece of upright wood is indieated by B', the bolt by D' and the lookout by A'. To secure the foot molding to the wall, a strip of board (C) of the proper width can be nailed to the wall and the foot molding nailed to this. If the mortar joints in the brick work are not adapted to holding the nails, it may be found necessary to cut out the mortar and drive in wooden plugs into which the nails can be driven. In some cases it may be found convenient to remove an entire brick, its place being filled with a piece of wood of similar size, the same being

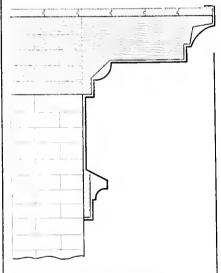

Fig. 3.-Wooden Lookout Placed on Top of Wall.

held in place by means of mortar or cement. Another method of securing the lookouts is shown in Fig. 3. The top of wall is removed so as to allow the lookouts to be placed in position, when they can be set in brick in the usual manner.

If it is desired to use iron lookouts for the cornice, they can be so eonstructed as to conform to the general outlines, the cornice being secured to the lookouts by means of bolts. As shown in Fig. 4, at E can be driven an eye for holding the lookout at this point. The eye can be made from 11 x tinch iron, and say about 7 inches long, with a suitable hole at the end for a bolt to pass through, and drawn out like a wedge at the other end. The mortise in brick or mortar joint should be cut as true as possible, and only a tritle wider than the eye. Pleces of thin board can be put in above and below

the eye so it will hold when driven. When driving the iron eyes a round punch can be put in the hole to prevent its being closed by the force of the hammer blows. The lookout has a hole iu its end at E, and is to be secured to the eye by means of a bolt. The top of

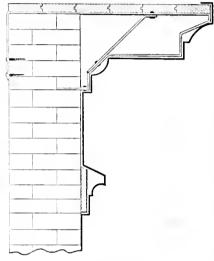

Fig. 4.-Iron Lookout Secured to Wall.

the lookout iron can extend down over the wall and be secured to the brick or roof as may be required.

#### Chicago Cornice Workers.

At Chicago, on the 11th inst., the Amalgamated Sheet Metal Workers' Union effected a settlement with their employers, the Metal Cornice Manu-facturers' Association, and the strike which has been so long kept up was declared off. Mutual concessions were made in the new agreement, which is to continue in force till January 1, 1896. We print below the provisions of the agreement:

1. Eight hours shall constitute a day's work; that the hours of labor shall be from 8 a.m. until 5 p.m.; one hour for din-

2. The minimum rate of wages shall be

2. The minimum rate of wages shall be 35 cents per hour from date of signature nntil January 1, 1896.

3. All Sundays, Christmas, New Years, Fourth of July and Thanksgiving Day shall be paid at the rate of double time; overtime at the rate of time and one half.

4. All workmen sent out of the city are subject to the same rules as while working in the city, and in addition thereto shall receive all actual expense, excepting, if unmarried they shall also receive board, provided they claim the same beforehand, but they may, however, waive such claim for

vided they claim the same beforehand, but they may, however, waive such claim for board and expenses.

5. All workmen shall be held responsible for their work, or the loss or destruction of tools, stock and all property of their employers when it is due to their negligence or other causes directly traced to their carelessness or incompetency.

6. Cornice makers who have sent in resignations or have continued work for associated bosses during strike or lock out shall be held blameless and not be subject to any hardship, punishment or fines by the Amalgamated Sheet Metal Workers' Union or any of its members. Union or any of its members.

7. Any dispute that may arise between the employer and employee concerning the meaning and intent of this agreement shall be settled by arbitration, three to be chosen by each party and the seventh by those so chosen, the parties hereto agreeing to abide by the decision of such arbitration.

tion.

That the Amalgamated Sheet Metal Workers' Union shall not allow any of its members to work or be employed by any one at their trade who is not a member of the Corpice Manufacturers' Associaone at their trade who is not a member of the Metal Cornice Manufacturers' Association of Chicago, and will send outside walking delegates to enforce the same and report jobs about to be built or in course of erection, their location, owners', architects' and contractors' names to said Metal Cornice Manufacturers' Association of Chicago at least once a week, not later than every Tuesday forenoon, by communication from the secretary, or any person he may delegate, such communication shall be stamped by seal of nnion and sent in sealed envelope.

9. That the card issued by the Metal Cor-nice Manufacturers' Association of Chicago nice Manufacturers' Association of Chicago be recognized in connection with the card issued by the Amalgamated Sheet Metal Workers' Union, entitling the owner to work for the firm whose name appears written on its face, and the names of three employers appearing on back of said Amalgamated Sheet Metal Workers' Union card certifying to the incompetency of the holder in his work shall disqualify him from receiving the minimum rate of wages.

19. Union cornice makers are not allowed to work with non-union men, and the Sheet

to work with non-union men, and the Sheet Metal Cornice Manufacturers' Association agree not to hire men who have not a card or agree to get one in one week from the Amalgamated Sheet Metal Workers' Union. This rule shall not apply to cutters, super-intendents, members of the firm or their

sons.

11. Any change in this agreement to be made between the association and the union shall be given notice of two months prior to the expiration of this agreement,

#### FLASHINGS.

THE E. E. SOUTHER IRON COMPANY, St. Louis, Mo., had an exhibit at the recent fair which was a nest one-story structure built entirely of corrugated iron, in which they presented a full line of corrugated sheets, showing corruga-tion of all sizes used for both ceiling and siding and curved for any purpose. They also showed their beaded siding and ceiling, steel brick siding, climax steel sheet roofing, V-crimped roofing, pressed standing seam roof, roll and cap ateel roofing, galvanized corrugated downspout, eave troughs, elastic roof cement and ready mixed paints for wood or iron work. Their exhibit was also used by the Fair Association for the fair grounds post office on account of its neatness and its being fire proof.

F. B. Musson, Derby, Conn, has the contract for the slating and steel ceiling for the new Congregational Church at Shelton.

AN EXCELLENT IDEA of the possibilities in architectural sheet metal work can be gained by a visit to the office of Gara, McGinley & Co., 23 South Seventeenth street, Philadelphia. The entire exterior surface of the building is covered with sheet metal and the in-terior walls and ceiling are of metal as well as some of the furniture. The firm take pride in this exhibition of their ability to do artistic sheet metal work.

THE BOSS EAVES TROUGH HANGER. patented, which has been manufactured in small quantities for some time by Proudman Bros., Meriden, Conn., who also make the well-known Yankee eave trough hanger, is being turned out in larger quantities and at a lower price to meet the demand for a less expensive hanger. This hanger, it is stated, will fit all sizes of heads. It is furnished with points that penetrate the trough just below the bead, thus holding it as

firmly as in the inner side, and is made of the best wrought metal, with straps of assorted lengths, and is packed one gross in a box.

THE CHAMP METAL MEG. COMPANY are to build a one-story corrugated iron building, 50 x 54 feet, for metal fur-naces, on Old Second street, below Fisher's lane, Olney, Pa.

THE EAST BIRMINGHAM IRON ROOF ING & CORRUGATING COMPANY of Birm ngham, Ala., refer to their iron roofing as possessing the combined qualities of being water, wind, fire and lightning proof. They state on a postal card which they are mailing the trade that they cannot go round and pry open the eyes of people, or knock the idea into their heads, but they will gladly furnish by mail any information desired.

H. O. SPRAGUE & SON, Westfield, Mass., have seenred the contract for furnishing and erecting the galvanized iron cornice work on the new R. W. arks five-story building in that town. The work is to be particularly elaborate and will be an exceedingly handsome piece of sheet metal construction.

THE TUCKERTON TIN, COPPER & SHEET IRON WORKS are a new concern started at Tuekerton, N. J., to do all kinds of work in sheet metals. The firm make tinware to order and do roofing and similar work.

A. L. & F. GEDGE have bought the new Porter Corrugated Iron Works, at Anderson, Ind. It is stated that the new owners will double the capacity of the plant.

EDWIN E. NOYES, manufacturer of cornices, at 584 West Lake street, Chicago, made an assignment on the 15th inst. in favor of Walter II. Browne as assignee. Assets were scheduled at \$10,000 and liabilities at \$4000.

J. J. Colvin, 159 La Sille street, Chicago, reports the following contracts: Copper work for that building of W. A. Preidler, Belden avenue and Fremont street; copper work for residence of M. Ryan, Humboldt boulevard and Linden street; galvanized iron work for new shop of the Vulcan Iron Works, Kinzie street and Oakley avenue.

THE KNISELY & YELDHAM COMPANY, 68 to 74 West Monroe street, Chicago. have contracts for the copper work and slate roofing for the residence of E. A. Woods, Vincennes avenue and Forty-fifth street, and the copper cornices, bay windows and Monson slate roofs for the residence of W. II. Jones, Evanston, Ill.

J. C. McFarland, 2511 to 2519 State street, Chicago, has the following contracts: Copper roofing for new McCormick Library Building, Belden avenue and Halated street; Ludovici tile roofing and copper work for the Jewish Synagogue, La Salle avenue and Schiller street; copper and slate roofing for St. Peter's Church, north side; Akron red Spanish tile roofing for realdence of P. D. Armour, Jr., Michigan avenue and Thirty seventh street; copper work and three large skylights for Reliance Building, State Washington streets; copper work and Monson slate roofing for residence of J. W. Janney, Greenwood avenue and Forty seventh street.

The Lick Manual Training School, established and endowed by the founder of the great Lick Observatory, has been opened for work in San Francisco.

#### Luropean Wages.

A prominent business man of Roch-N. Y., who has recently returned from a teur in Europe, publishes in the Express of that city some interesting statistics regarding wages gathered by him in various European cities. statistics, it is stated, were gathered directly from the wage carners themselves, and the work was done with no view to publication for political effect, but slmply for the gratification of the business man's own curiosity. The result is given as follows:

in Constitutinople, the wages were as tol-

Policemen arcent a day
Cabiner
Street cleaners
Carpenters 55 cents a day
Masaus
Farm laborers in provinces — Picents a day
Street car drivers . 40 cents a day
Street car conductors Ta cents a day
Porters for earrying treight. 140 cents a day
Shoemakers
In Algiers the wages were somewhat
higher:

si to silan a day si to \$1.40 a day .... Si a day

The wages paid in Florence, Italy, are:

In Athens the wages paid are as follows:

It is reported that the will of Mrs. Charles Lux of San Francisco, which has just been admitted to probate, sets aside nearly \$3,000,000 for a manual training school. One third of her estate is given outright for "the promotion of schools for manual training, industrial training and for teaching trades to young people of both sexes in the State of California, and particularly in the city and county of San Francisco—it being my desire to assist in furnishing facilities for the education of young children from the time they leave the kinder garten schools and while they are still quite young in what is known as 'manual training, and in all kinds of training looking to the acquisition of useful trades by and through which habits of industry will be acquired and practical knowledge of those things which are useful in earning a living may be acquired."

A board of army engineers has been appointed to prepare an estimate of the cost of deepening the harbors of Duluth and Superior to 20 feet.

### HEATING 20 PLUMBING.

#### NEW WORK AND CONTRACTS.

A NUMBER OF CITIZENS were recently invited to examine the heating and ventilating system which has been ventilating system which has placed in the Fairview School Building, Market street, Harrisburg, by E E. Palmer of Harrisburg, State heating engineer for the J. F. Pease Furnace Company of Syracuse, N. Y. Mr. Palmer is engaged in placing the same system in the Franklin Annex B. The Moravian Parochial School has been using the same plant for six years with perfect satisfaction.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until November 7 for all the labor and materials required for the interior finish, plumbing and approaches for the United States Post Office Building at York, Pa. Drawings and specifications may be had from the superintendent, at York, Pa.. or of the Supervising Architect, at Washington.

THE ROBINSON HEATING COMPANY OF Altoons, Pa., have been awarded the contract for heating the Allegheny street residence of Councilman John H.

THE FULLER & WARREN COMPANY, 147 and 149 Lake street, Chicago, are to install a combination warm air and hot water heater in the residence of C. A. MacDonald, 1563 Sheridan road.

Business is good with the Sperl Heater Company, Carbondale, Pa. Among recent sales of the Sperl heaters are the following: John Wade, P. J. McDonough, J. P. H. Raynor, T. C. Robinson and M. Garvey of Carbondale; J. L. Morgan & Co., Forest City; Calvin Perrin, Luzerne, Pa.; Vandling School district, Vandling; Richmondale School district, Richmondale; Mahan's Hotel, Olyphant; Ziegler & Schumacher, Scranton; C. H. Brink, Middletown, N. Y.; C. W. Boyden, Susquehanua.

CLIFFORD & Hood, Concord, N. II., have been awarded contracts for the heating, gas piping and plumbing of the Y. M. C. A. Block and the house of Mrs. Goodwin, on South street, and for the heating of the residences of George N. Lander and John H. Albin, and the block of Martin & Luscomb. The heating apparatus in each case is a Dunning

OLDS & WHIPPLE have contract for the heating in a \$10,000 residence being erected by Thomas Evans, at Hartford, Conn.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, have the contract for steam heating in the residence of A. S. Stevens, La Salle

HOYT & FARRELL, the Noble avenue, Bridgeport, Conn., plumbers, have the contract for plumbing two new houses on Iranistan avenue for C. II. & E. J. Botsford, the carpenters. They also have the plumbing of a house in the East End which John Dillon is to build for Samuel Corby.

THE BRIDGEPORT STEAM HEATING COMPANY, Bridgeport, Conn., have se cured the contract for placing a steam heating apparatus in J. Donovan, Jr.'s two new blocks in South Norwalk.

M. J. DALY, Waterbury, Conn., has JONES & JAEGER are using two large a large contract on hand at Torrington Electric boilers in heating the flats of

overhauling the boilers of the Coe Brass Mfg. Company and putting in new ones. He is also putting in a new fire hydrant system for the Waterbury Watch Company and one for the Waterbnry Clock Company, and will put an H. B. Smith heater in one of F. B. Rice's new houses.

THE new Turn Hall in Meriden, Conn., which has just been completed, is heated throughout by the McCormsck steam heater, installed by J. H. Mc-Cormack, the manufacturer of the boiler, whose place of business is in Wallingford. Mr. McCormack has also just completed the plumbing and heating of the new showrooms of Wallace & Sons, at 226 Fifth avenue, New York.

FINCH & COLWELL, Warwick, N. Y., have the contract to put in a steam plant in the residence of Dr. G. F. Pitts on Oakland avenue; also to furnish and on Oakland avenue; also to furnish and lay 1800 feet of iron pipe for William R. Welling, at New Milford. Mr. Welling has a fine water supply from the mountain above his farm, with a pressure of about 40 pounds. He will probably put in a water motor to do light work.

THE TEMPLE EMANUEL at Forty-third street and Fifth avenue, New York, is to be heated with two large size Electric boilers, by Gillis & Geog-

MERTZ BROTHERS, 107 Twenty-second street, Chicago, are to place a com-bination gas heater in the residence of J. L. Shortall, 1604 Prairie avenue.

LEVI CASE & Co., the sauitary plumbers and heating engineers, of Glens Falls, N. Y., are gathering in big contracts from people of Glens Falls, and surrounding villages. Among their latest contracts is one for equipping the Commercial Hotel, at Whitehail, with a double Florida steam heating apparatus, and St. Mary's Church, of this village, with the same; A. W. Sherman's new residence with a single Florida steam; McAuley Academy, at Keeseville, with a hot water heating plant, and for fit-ting J. E. Sawyer's residence with new plumbing. They have just finished a big job of plumbing in George Do-remus' residence; also in Richard Teff 's residence at Sandy Hill, and S. D. Kendrick's May street reside ce.

THE L. H. PRENTICE COMPANY, 203 and 205 Van Buren street, Chicago, Ill., are to install a steam heating plant in the Field Columbian Museum, Jack-

CHAS. RUEGE, Brooklyn, N. Y., is using a Champion atcam boiler to heat the dancing academy and billiard parlors of Albert Bantle.

THE S. WILKS MFG. COMPANY, 113 to 123 South Clinton street, Chicago, have received orders for Wilks heaters to be placed in the market buildings of Swift & Co., at Port Huron, Mich.; Oshkosh, Wis.; Indianapolis, Ind.; Springfield, Ill., and Lincoln avenue market, Chicago.

ED. SMITH, Nyack, N. Y., is using a No. 5 Champion hot water heater in his residence and No. 4 Champion for hot water is being used in the Sisters'

THE KELLY & JONES COMPANY, 48 to 52 North Clinton street, Chicago, have the contract for the steam heating in Cumpock Hall, Northwestern Univer-sity, Evanston, Iil.

J. Loonie, at Eighty-fifth street and Amsterdam avenue, New York.

L. J. GRIFFIN is putting in a new steam heating apparatus for Fred. King, at Barre, Vt.

T. W. CORBETT, New Haven, Conn., has the contract for the plumbing in a fine residence being erected by bank president Arthur D. Osborne.

DIRBLE & HURLBURT, West Winsted, Conn., have been awarded the contract to do the plumbing in Frank Curtiss' new house on Hinadale avenue.

THE BOARD OF SUPERVISORS met at New City, N. Y., and awarded the contract for heating the new jail to Bedell Bros. of Haverstraw.

E. J. RAWLINS, Salem, Mass., has been awarded the contract for putting in the heating apparatus at the addition to the Carlton School, he being the lowest bidder.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, have the contract for ateam heating in the Baptist Hospital, Center street and Racine avenue.

JOHN P. SCHAFFER, heating and ventilating engineer, 18 Wood street, Pittaburgh, Pa., reports the outlook for the future as exceedingly promising. Among dwelling houses recently fitted up by Mr. Schaffer with the Novelty hot water heater were those of J. L. Scott, Edwin street, Pittsburgh; James Booth, Boquet street; Mrs. J. S. Hanna, Friendship and Negley avenues; H. C Bair, Negley and Baum streets, and many others. Quite a large contract secured by Mr. Schaffer recently was the steam heating for the shops, office building, freight and passenger stations of the Central & Pittsburgh Railroad, at Elkins, W. Va. Mr. Schaffer also has the contract for the steam heating for a hotel and hank at the above named The exhibit of Mr. Schaffer at the Pittsburgh exposition is most conveniently arranged and attracts a great deal of attention from the visitors. The exhibit consists of a full line of Novelty furnaces for hot water, steam and hot air heating; also a range which will burn either coal or natural gas.

R W. DARBY of Georgetown, D. C., was awarded the contract for the plumbing and ateam fitting work for the barracks and officers' quarters to be built at Fort Myer.

Amono the contracts recently taken for ateam heating by the Theo. Jacobs Company, 72 and 74 Market street, Chicago, can be mentioned the following: Oakenwald apartment building of B. Tobin, Thirty third street and Cottage Grove avenue; building of I. Stein, 415 Madison street; apartment building of Miss Stevens, Forty-fourth street and Cottage Greve avenue.

OLDS & WHIPPLE, Hartford, Conn., have the contract for the heating and plumbing in the residence being built by G. A. Kellog.

E A. KUHNLEY of Rockville, N. H., has contracted to pipe Park Building for steam heat. Steam will be supplied from the hoilers in the hotel building.

H. A. R. DIETRICH, Bethlehem, Pa., who installed the steam heating plant in the Municipal Building, one morning last week got up stram in the boiler and tested the pipes and radiators. In a short time the entire building was comfortably heated. Fifteen pounds of steam were used to test the radiators, which are of the latest improved type.

Cold air is admitted at will through an opening in the wall immediately beneath each radiator. The boiler now in use is only temperary; the boilers which will be used permanently are not yet ready to be put in place.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago, are to supply the Siphon Eduction closet ranges for the Illinois Central depot, South Water street.

I. B. Davis is building a \$25,000 residence at Hartford, Conn., and the plumbing is being done by W. J. Pinney, who is using Sanitas fixtures, porcelain baths and nickeled work throughout. Mr. Pinney also has the plumbing of Andrews & Peck's seven tenement block on Kingsley street.

MRS. M. MEYER, Selma, Ala., is about to erect a four story crice building to be heated by steam.

THE LITHUANIAN CATHOLIC PARISH, at Waterbury, Conn., is to build a new church that is to have a heating plant.

M. J. Daly, Waterbury, Conn., has the contract for heating the new achool house and will install the hot water system of Hopson & Chapin, New London, Conn., using a large Pequot boiler.

B. D. DUGGAN, 207-209 Lake street, Chicago, is to place six Richmord warm air furnaces in the apartment building of E. H. Comer, 62-64 North Central Park avenue.

MURRAY & MAHER, New London, Conn, have taken the contract for the plumbing and heating of F. II. Parmelec's new house. They will put in one of the American Boiler Company's Soleil heaters. They also have the plumbing of Walter C. Brown's double house and the plumbing and tinning of the hospital addition.

The Foskett & Bishop Company, New Haven, Conn., have completed the heating and plumbing in the residence of L. A. Beecher and are doing the heating and plumbing in the St. Anthony Hall. They also installed a hot water heater in the house of Mrs. D. C. Lombard.

J. GILLIE, Kingston, N. Y., has received the contract to put the atcam heating apparatus in the Kingston Opera House Building.

HECTOR CHAPMAN, Glastonbury, Conn., has the contract to heat John Lave's new house by ateam. He will put in a No. 2 Plummer heater.

THE TOWN HOUSE COMMISSION OF Cumberland, N. H, has awarded the contract for the ateam heating apparatus to the Pawtucket Steam & Gas Pipe Company. The contract calls for two 8-foot boilers of the Allen make. The gas piping has been awarded to Otts Skinner and the plumbing to George W. Thornley of Providence.

B. D. DUGGAN, 207 Lake street, Chicago, has closed a contract for placing a No. 55 Victor Richmond steam heater in the flat building of Miss Fltzgerald, 286 Homan avenue.

CLIFFORD & HOOD of Concord, N. H., have been awarded the contract for installing the steam heating apparatus in the new Catholic church in Peterboro.

Daniel Hoddon of Somersworth, N. H., has the contract for putting the heating apparatus and the plumbing into Dr. Wallace's new house.

CHAS. J. RILEY is erecting at 6032 Indians avenue, Chicago, a two-story

apartment house, to be heated by steam.

AT THE SPECIAL TOWN MEETING held last week in Berwick, N. H., it was voted to put in the direct system of steam heating in the new high school building.

THE CARMAN, THOMPSON COMPANY of Lewiston, Maine, have the contract to steam heat the new Garcelon Block in Lewiston.

THE NEW BUILDING of the Helping Hand Society, at Fifty-fifth street and Ninth avenue, New York, will have a heating plant installed by Frank Dobsen, using a large electric boiler.

McCall & Stevens, Chippewa Falls, Wis., have the contract to put in steam heating apparatus in the Ferguson Block.

P. II. Crowe will erect at Fortyninth street and Calumet avenue, Chicago, a 50 x 70 feet three-story apartment house, to be heated by steam.

THE CONTRACT has been awarded for building a high school building at Temple, Texas, which is to have a heating plant not yet contracted for.

THE WALSH HOLYOKE STEAM BOILER WORKS, Holyoke, Mass., have just been awarded a contract by the city of Medford to build a steel stand pipe 35 feet in diameter and 60 feet in hight that will require about 75 tons of steel.

SOTTER BROS., Pottstown, Pa., have been awarded the contract for the steam heating plant for the City Hall.

M. II. CRANE & Co., Cincinnati, Ohio, were awarded the contract at \$1635 for heating the City Building, at Urbana, Ohio.

GEO. L. ROOD, 79 Lake street, Chicago, is to place Royal warm air furnaces in the eight houses of T. G. Dickenson, Prairie avenue and Sixtieth

GEORGE FRANKLIN, 142 Centre street, New York, is remodeling the steam heating plant in the large dry goods establishment of Ehrich Brothers, at Sixth avenue and Twenty-street, New York.

THOMAS WEATHERED'S SONS, 244 Canal street, New York, are erecting a conservatory in connection with the residence of Jacob Lorillard, at Westchester, N. Y. They are also constructing a greenhouse of three apartments for H. R. V. Kennedy, at Hempstead, L. I. Both of these buildings will be heated by Weathered's boilers and their system of hot water heating.

William E. Correll, Lakeville, Conn., secured the contract for heating and plumbing the new cottage at the Hotchkies School, at Lakeville.

THE ALBERENE STONE COMPANY, 217 Lake street, Chicago, are to furnish 32 laundry tube for the flat building of Dr. Bash, Jackson boulevard, near Halsted street.

THE AMERICAN RADIATOR COMPANY, 111-113 Lakestreet, Chicago, are to furnish American radiators for the elevenstory Hennen Bullding, New Orleans, La

Stevens & Gilchrist, Wilkes-Barre, Pa., report a considerable amount of work on hand. In Wilkes-Barre they, are plumbing and heating the residence of Samuel Walten, using a No. 521 Richmond hot water heater with 600 feet of radiation; also the double residence of N. B. Weil, using two No. 50 Richmond Victor heaters, with 1100 feet of radiation. The residence of T.

M Dollard is likewise to be heated with a Richmond boiler. They have also a good deal of work curside of Wilkes-Barre, including the building for F. A. Kare, Minooka, and another building for W. H. Leisenring, at Nanticoke. The plumbing goods to be used in these buildings are made by Henry Huber & Co.

The Supervising Architect, Chas. E. Kemper, at Washington, D. C., will receive bids until November 13 for a low pressure steam heating and ventilating plant for the United States Court House and Post Office Building at Sioux Falls, S. D.

F. I. BRAY, Derry, N. II., has taken the contract to put the steam heating apparatus into C. W. Abbott's house, in which he also did the plumbing.

WICKS, HUGHES & Co., Utica, N. Y., have secured the contract for doing the plumbing at the Butterfield House. It is said to be one of the largest plumbing contracts ever let in Utica.

BYRNE & DREW, Redlands, Cal., bid \$2923 and were swarded the contract for a steam heating plant for the asylum at San Bernardino, Cal., and Geo. M. Cooley, San Bernardino, secured the plumbing contract for \$1550.

G. K. Shoenberger, 97 Washington street, Chicago, has the contract for steam heating in Judge Lambert Tree's unique Studio Building, at State, Ohlo and Ontario streets.

THE BAKER & SMITH COMPANY, 193-197 Van Buren street, Chicago, are to install a steam heating plant in the Hotel Clarendon, New Orleaus, Ls.

THE KEWANEE BOILER COMPANY, 96 Lske street, Chicago, report the following sales of Haxtun base burning steel boilers: F. D. Ferguson, houses, four No. 4; H. L. Hossock, store building, one No. 12; W. W. Twist, residence, one No. 4½; S. Stevens, flat building, one No. 6½; P. J. Doyle, flat building, one No. 9; J. S. Calley, flat building, one No. 9; J. S. Calley, flat building, one No. 6½; Waubansee Club House, one No. 6½; Waubansee Club House, one No. 6½; Dunlop's new bank, Oak Park, Ill., two No. 10; S. W. Jones, flat building, one No. 4½; Keegan & McCartby, store building, one No. 9; George Eichert, for school building, one No. 10; Wm. Williams, residence, one No. 6½; Wm. Fisher, residence, one No. 6½; E. F. Henshaw, flat building, two No. 12½; Z. E. Patriek, residence, one No. 9½; James Donovan, flat building, one No. 9½.

THE contract for heating St. Mark's Church by steam has been let to L. A. Weston, Adams, Mass.

THE contract for the placing of steam heating apparatus in Engine Houses Nos. 3 and 4 was awarded by the Fire Commissioners of Camden, N. J., last Tuesday evening to Clarkson, Scott & Co. of Philadelphia.

THE new heating plant just erected by Armitage, Herschell & Co., Tonawanda, N. Y., was started up last week and was up to the expectations of the enterprising proprietors.

The contract for the plumbing and roofing of the new Gleaner Building now in course of construction in Lee, Mass., has been given to James Me-Manus of Great Barrington, Mass.

THE New Court House Commission met in Troy, N. Y., last week, and awarded the contract for putting in the fan system of heating and ventilating to Mulligan & Schermerhorn at \$8085.

## THE RETAIL STORE,

#### Trimo Giant Pipe Wrench.

The accompanying cuts represent a chain pipe wrench offered by the Trimont Mfg. Company, Roxbury, Mass. The wrench is described as having a solid forged head with detachable interchangeable gripping jawa made from a fine quality of tool steel. The chain used is the best quality of cable chain. It is explained that the head is so made

If the retailer is so unfortunate that he cannot light his store naturally let him light it artificially.

Keep the store light all the time, in dull times and in good.

Folks think they see unseen dirt in a half lighted store.

I have yet to find a first-class, progressive and profitable business run without plenty of natural or artificial illumination.

Do not try to convince the public

Fig. 1 .- Trimo Giant Pipe Wrerch.

that the chain is held securely without danger of falling out, as is liable to happen with other aimilar wrenches, while, it is stated, the chain can readily be released at the will of the operator. The wrench is made and adapted for all kinds of work and for hard and rough The manufacturers claim that 1199ge. with the wrench there is no slipping, locking or lost motion. The wrench is made in six sizes, to take pipe from \$ inch to 16 inches in diameter, with levers from 27 inches to 84 inches in On the three larger sizes the length.

Fig. 2.-Enlarged View of the Head.

manufacturers will make the length of the handle to order, with or without ring, at an extra coat.

#### Hints for Dealers.

BY AN EXPERT.

Ninety per cent, of the failures in advertising have been because the advertiser expected his advertisements to do the sciling.

The appearance of a store has as

much to do with successful business as has the advertising, the goods or the

clerks.

A fly specked electrical battery will ring just as many bells, but it won't sell well.

Rusty tools won't sell for half their value.

A little elbow grease will make a

stove worth 25 per cent, more.

The appearance of anything to be sold has as much to do with the sale as the actual intrinsic value of the article

It is just as essential, so far as selling is concerned, to have the package clean as to have the goods inside clean. Light and cleanliness are the two

great essentials to selling.

A dark store is never as profitable as a light one.

that your business is so solid that you can do as you please.

There never was a man free to do as he pleased. You have got to do as others want you to do, or do no business.

A dirty, ragged clerk can sell goods, but a well dressed clerk, who isn't a dude, can sell more.

A poor but well brushed suit of clothes, with a clean collar and a pair of polished shoes on a clerk have almost as much to do with the selling quality of that clerk as has the ability of the clerk.

Do not make the mistake that some storekeepers do, of having the front of the store light, bright, clean and attractive, and the back of the store like the inside of a cave.

Dusters and brooms don't wear out

very rapidly.

Some folks believe that in economy is the success of business, that what you save is as important as what you earn-and they are right. But the successful business man, in not forgetting to save, figures that what he makes has as much to do with his success as what he saves.

It is better to put out \$1000 and take in \$2000 than put out \$500 and take in \$1000.

Everybody knows that profit is the difference between expenditure and re-ceipt, and yet fully one half of the business men make more effort to cut down expenses than to increase business.

#### A Stove Dealer's Conscience.

"We are expected to prevaricate some," said a retired atove dealer. is absolutely necessary if a man would succeed. If you don't you lose your trade. Now, this is the work time of the year for us. It's all on account of the weather. If there is one cold day we women all wanting their steves re-psired. Some want new brick, others want to swap an old stove for a new one, while many want grates of all descriptions. We don't keep such things in stock, and if they are not ready when you premised them (and they are not) there is trouble. You don't want to lose their trade, so you tell them you had to order the brick from Pennsylvania, or that they are all out of that

kind of grate at the factory. women ask hundreds of foolish questions: 'Why does the smoke come out of the doors? What's the best kind of coal to use in that stove? Will that stove bake bread on the hottom?' and things like that. Most of these people have not used their stoves all through the summer. They have been using gas stoves. Their stoves get clogged up with soot. The grate cracks and the brick falls out. It keeps me in hot water at the hegipning of ever fell and water at the beginning of every fall and it takes me the rest of the serson trying to square myself with my conscience."

#### Nail, Washer and Nut Bins.

Among the many convenient fixtures in the Hardware establishment of Frank Miller, Johntown, N. Y., are the Bins for Nails, Washers and Nuts represented in the accompanying illustration. The counter is 34 inches high, 3 feet wide and 15 feet long, made of white wood in natural hard oil finish. There are 32 openings for Nails, each of which is 12 inches high, 13 inches wide and 16 inches deep, holding a keg of Nails each. The special feature of the counter, however, is the provision for Nuts and Among the many convenient fixthowever, is the provision for Nuts and Washers under the Nails. The openings for these goods are 8 inches high and 13 inches wide, extending back to the center of the counter. The sizes of Nails, Nuts and Washers are marked on 2-inch strips running lengthwise of the counter separating the tiers of bins.

Nail, Washer and Nut Bin.

In connection with the Nail bins a chute is used for filling the bins. chute is funnel shaped, 20 inches long and 4 inches high, made just wide enough to slide inside the bins. On the lower end of the chute are iron catches to hold it in place in the bins and at the upper end are sliding legs adjustable in length for use on the upper or lower bins. Nails are emptied from the keg into the chute by one man and alide into the bins.

BRIGGS & FORD, Fredonia, N. Y., make a specialty of the goods manufactured by the Fuller & Warren Company of Troy, N. Y. They carry in stock a fiae line of P. P. Stewart Signators nal Diamond, Germania and Diamond ranges; the Art Splendid and the Splendid Stewart heaters, together with

the company's hot air furnaces. The firm also handle the Electric oil heating and cooking stoves and the Eagle oil heaters.

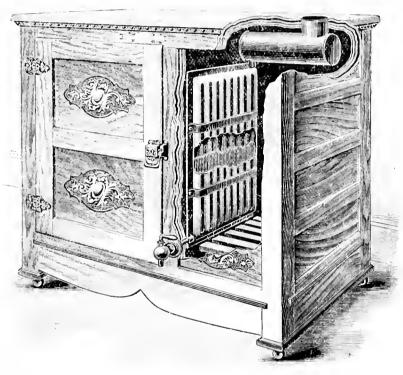

## Automatic Water Cooler Attachment.

The Columbia Refrigerator Company, Northville, Mich., are offering an improved water cooler attachment in connection with their refrigerators, of which a cut is shown herewith. The cooler is described as having its sides made of corrugated copper sheets with both surfaces tinned, and a flat sheet

proved Roaster and Baker. It is a pictorial representation of the article, the cover of which when raised discloses a turkey in process of roasting. On the unside of the cover is a list of the sizes manufactured and their prices.

#### Christensen's Line Fastener.

The line fastener shown herewith is offered by Herman C. Larsen, 23 East Fourteenth street, New York. The fastener is cast in one piece and galvanized. In use the clothes line is passed through the fastener as shown

Automatic Water Cooler Attachment.

riveted between them, dividing the cooler into two compartments. The cooler forms the division between the ice chamber proper and the storage chamber of the refrigerator. From the upper rear corner of the cooler a pipe extends upward to the storage tank, which is placed in the upper back corner of the ice chamber. It is explained that when the apparatus is filled the cooler operates automatically, and that the water is kept in constant circulation from the fact that the water in the side of the cooler next to the ice will be colder than that on the side next to the storage chamber. This will cause the water, it is further explained, to fall on the cold side and to rise on the warmer side, the openings at the top and bottom allowing the water to pass freely from one compartment of the cooler to the other. The cooler, it is pointed cut, is only 1; inches in thickness, leaving a thin but large body exposed to the ice, cooling it quickly and causing a rapid circulation. When water is drawn from the faucet it is immediately replaced in the cooler from the atorage tank above. The point is made that the device is especially valuable where the water is so impure as to make boiling it before using a wise precaution. It also obviates the necessity of putting ice, with all the im-purities which may be concealed in it, into the water itself.

MATTHAI, INGRAM & Co., Baltimore, Md., are sending out a novel folder descriptive of their Maryland Im-

in the cut and the end drawn through the open slot. This binds on the rope above, preventing slipping. It is explained that the fastener insures a tight line, which may be instantly loosened when desired; that as the line becomes slack from usage it may be tightened in a moment, and that it obviates the

economy, and the twists and turns to which he has resorted can be continued even in better times. As a matter of economy in store renting I have found one source of relief that has not only saved one-half in my rent, but has materially increased my trade. I gave up nearly one-half of my store to a real estate man, and find that it is the most natural combination I could have made. His houses are the source of orders for lots of repairs, and the work, of course, comes to me The good results do not end even at that, for we are often obliged to be out of our offices, and with the short experience of two months we are both well enough posted on each other's affairs to answer questions and take orders or collect payments one for the other. We try to arrange it so that one or the other of ua is in the office all the time just for this purpose. Instead of taking a little narrow store that could hardly be seen, we have one 20 feet wide at \$30 a month. The tin work is done in the rear, thus leaving the front clean. My part of the establishment is kept as neat in appearance as the other. side of an ordinary store gives all the showroom that is needed for a moderate trade. In large cities where the dry goods stores keep house furnishing goods it is absolutely useless to compete, for they buy in such quantities that no small dealer can avoid injury in aelling against them, for he must overcharge. We have got to stick to our trade, and it is a good one if properly attended to. If any objection is made to my plan, as for instance that it is not easy to find a real estate man, I will say that there are two of them here to one stove man, and the latter has himself to blame if he cannot keep himself and his part of the store in such shape that they will feel at home in his company. In my case it works to a charm and has come to stay.

A beautiful soft bronze color is now imparted to metals, says the New York Sun, by rubbing with a mixture of bloodstone and graphite, the application being made with a brush. Antique green effects are secured by dipping the metal into a solution of 10 parts by weight of salt, 10 parts cream of tartar, 10 parts acetate of copper and

Christensen's Line Fastener.

necessity of tyling the line, the knot of which pulls tight and is difficult to untie.

## Economy in the Retail Stove Trade.

A member of the retail stove trade doing business in the City of Churches, and who is well qualified to speak on the subject about which he writes, sends us a letter from which we quote as follows: The past year or more of poor business is not without its lesson to the retail dealer, who has had to study

20 parts of carbonate of soda, in 200 parts of vinegar. The satin finish is produced by green vitriol of copperas and subsequent treatment with wax. Old green is obtained by several coats of acid and a final coat of wax.

Experiments recently made at the laboratory of the Underwriters' Electrical Bureau in Chicago have demonstrated the destructive effect of electric currents on subterranean piping. Iron piping, through which the current was directed in this return, was badly pitted after being subjected to the treatment for the short space of 1333 hours.

#### SCRAP

FOLLANSBEE BROTHERS COMPANY, Pittsburgh, Pa, successors to James B. Scott & Co., advise us that, although their Blairsville rolling mill is shut down at the present time pending adjustment of the wage scale, their factery in Pittaburgh is in full operation manufacturing their special guaranteed brands of rocting plates-namely, Scott's Extra Coated, and Triumph Old Style. These plates they are still in a position to furnish with comparative promptness. The prices on these plates have been revised, but, nevertheless, Messra. Follansbee state that they are determined to maintain in them the same high qualities adhered to for these brands in the past. The new corpora-tion of Follansbee Bros. Company is formed of the surviving partners of the firm of James B Scott & Co., with associates. B. G. Follansbee is president and Wm. U. Follansbee accretary and treasurer of the concern. Their address is 122 and 124 Second avenue, Pittsburgh.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., paid over \$6000 in wages to their work people last week. The amount will be increased in the present week, the new mills having been put into operation with an increased force.

THE FALCON SHEET & TIN PLATE COMPANY, Niles, Ohio, are reported as about to enlarge their tin plate works very considerably. The erection of a tinning house has been begun and a new pickling machine is being installed.

TIN AND TERME PLATES in bond in New York warehouses on September 30, 1894, were valued at \$439,128, against \$383,867 on August 31 last and \$190,849 on September 30, 1893. The total quantity in bond on the last day of September, 1894, was about 200,000 boxes. This amount had accumulated pending the reduction of tariff on October 1, and most of it has since been withdrawn from bond.

THE CINCINNATI Commercial Gazette reports that Edwin Stevens, formerly of Cinciunati, and Col. I. L. Morris of Hammond, Ind., have about closed a deal to locate a tin plate plant at Tipton, Ind., 10 miles west of Elwood. The proposed plant would employ about 300 hands.

A CABLE DISPATCH from Swansea, Wales, reports that 5000 tons of tin plates were loaded at that port on October 16 on board steamers bound for the United States. The stocks of tin plates at Swansea are lower than they have been for many months past.

A LEAFLET distributed by Sidney Shepard & Co., Buffalo, N. Y., calls attention to their Seneca brand of American roofing tin, described as an oil finished, squared plate of superior quality.

THE WORKS of the Blaina Tin Plate Company, Blaina, Monmouthshire, and those of the Resolven Tin Plate Company, Clyne, Glamorganshire, have started up this week, the former having an 11-mill capacity and the latter 3 mills. Other large Welsh tin plate works are reported to be on the point of resuming after shut downs of varying lengths.

The Mobewood Company, manufacturers of tin plate at Gas City, Ind., have started up their plant with a full force at the old scale of wages, with the agreement that they get the advantage of any wage reduction at other works.

Some time ago mention was made in these columns of the granting of a charter of incorporation to the Monongahela Tin Plate Company of Pittsburgh. Additional information indicates that this concern are closely identitied with the Oliver Iron & Steel Company of that city, but at the same time it is a distinct organization. Contracts have been let to the Robinson-Rea M'g. Company of Pittsburgh for the erection of nine hot mills 24 x 32 inches in size. The plant of the concern will be located on the site formerly occupied by the Fifteenth Street Mills of the Oliver Iron & Steel Company, all the buildings having been dismantled with the exception of one plate mill. The engines formerly used to drive the mills of the Oliver Iron & Steel Company will be used to drive the mills of the Oliver Iron & the mills of the new concern. It is proposed to engage in the manufacture of tin and terns plate on an extensive scale, and contracts for the necessary additional machinery, such as tinning pots, pickling machines, &c., will likely be let in a short time. II. W. Oliver of the Oliver Iron & Steel Company is understood to be prominently identified with the new venture.

THE NEW TIN PLATE MILL at Anderson, Ind., is being built by the National Tin Plate Company. The dimensions of the main building, now under construction, are stated at 87 x 486 feet. Six mills are to be built at once, but the project contemplates 12 in all.

GROUND was broken on the 9th inst. for the erection of buildings for the new tin plate mills, at New Lisbon, Ohio. The main building will be 160 x 240 feet. There will also be erected three smaller buildings, each having dimensions of 100 x 160 feet. The establishment will have four sheet mills and a finishing department.

H. R. DE MILT & Co., tin plate and metal merchants, 238 Water street, New York, are distributing blotters in many colors advertising the merits of the Cleeve brand of roofing tin. These are referred to us as imported plates, manufactured by the old process, hand dipped and very heavily coated. Messra. De Milt & Co. are also agents for the sale of the Llanlode roofing terne, as well as for the well known American terne plates, Laufman's Apollo.

GOLDSMITH & LOEWENBERG, New York and Portland, Ore., the well-known importers and jobbers of tin plates and metals since 1871, have about perfected their arrangements for the erection of a tin plate plant at New Kensington, Penn. This is a vigorous and growing factory town, about 18 miles from Plttsburgh, on the Allegheny River, favorably situated for both river and rail transportation. The contracts have been awarded for a four-mill plant with eight-mill power, to allow for increased capacity as occasion warrants. Ground was broken October 20, and the company about to be organized, with Philip Goldsmith as president, expect to turn out goods by February 1 next. The capacity, we are advised, will be 60 tons of tin plates per day. From 200 to 300 people will be employed at the start, and the process will begin with the billet, and followed through the various stages of rolling, &c., to the finished plate. Distributing points will be Pittsburgh, New York and Portland. Ore.

Child labor has been aboltshed in the large Diamond Plate Glass Works, at Elwood, Ind.

### Trade Notes.

The Windows of the large store at the Havemeyer Building, corner of Church and Dey streets, New York Church and Dey streets, New York City, in which is located the Eastern office of the Pittsburgh Reduction Company, manufacturers of Aluminum, present a spectacle which attracts the attention of every passer by. In them are displayed Aluminum in every shape and form, Ingots, Bars, Sheets, Wire and the metal manufactured into an extraordinary variety of articles. A visit to the store will give an excellent idea of the multitudinous uses to which the new metal can be put. The store, which was opened last month, is the only establishment of its kind in the East devoted exclusively to Aluminum. James C. McGuire is the New York agent of the Pittsburgh Reduction Company. Mr. McGuire says that the business done in the short interval of time since the store was opened has largely exceeded expectations, and already threatens to outrun the capacity of the present store.

GEO. E. MERRY, 535-547 West Fifteenth street, New York, whose advertisement appears in another column, will carry on under his own name the Tin Plate and Metal business lately conducted at the same address by the firm of Merry & Clark, and not under the firm name of Merry & Co., as stated in a former issue. Elton W. Clark has resigned from the concern.

T. M. Barnes of the Acme Wire Works, Bridgeport, Conn., has recently completed a large job of wire work for the Government Building in New Haven.

F. Borcler, St. Louis, Mo., has closed a contract for covering the cylinders, pipes, &c., of the Worthington pumps at the Chain of Rocks with the Magnesia pipe covering, for which he is agent; also with the Kupferle Bros. Mfg. Company for covering the steam piping at the same plant.

THE PACKARD ENAMELING COMPANY, Warren, Ohio, send circular letters to the trade announcing that all their Pail Woods, Tea Kettle Handles and other goods of like character produced by their factory, are now inspected after being enameled, and every piece requiring it is reamed and thus perfected in that respect. They have recently improved and doubled their facilities for the manufacture of Pail Woods. They also direct attention to their line of Handles and Knobs.

D. SAUNDER'S Sons of Yonkers, N. Y., manufacturers of Pipe Cutting and Pipe Threading Machinery, have begun the erection of a four-story brick addition to their factory. It will have a frontage of 108 feet and a depth of 95 feet.

THE COLUMNUS WIRE WORKS, Columbus, Ohio, state that they are behind with orders and are now working more men than at any former period in the history of the concern, but still find some difficulty in securing workmen such as they require to do their special fine work. They say they have a good trade in all their Wire Specialties and regular product.

The pottery industry at Wheeling, W. Vs., which resumed work about a month ago at a reduction of 12½ per cent. in the wage scale, is reported to be very active, and as giving employment to more skilled labor than ever before.

# STOVE TRADE NOTES.

The New York Stove Trade.

The cold wave which spread over this section on Monday and has continued with only a little abatement all the week has made a vast difference to the local stove trade, and the hum of business on account of it has been sweet music in the ears of manufacturers and retail dealers as well.

The atove trade in September and the first of October was a disappointment to all concerned in it, and was less than during the same period in 1893. The volume of the September trade was less than in September for several years past, and the warm weather in connection with the general depression was undoubtedly the cause. But very few stock orders were placed and half the dealers in the city did not take enough interest in the stove business to bring out their stoves carried over from last year and put them on their sample floor. Indifference pervaded the whole retail trade, due in a large measure to the knowledge of the retailer of the conditions, means or circumstances of his customers or of the people in his neighborhood. The effort of salesmen to provoke enthusiasm among the dealers was fruitless, and they took but little more interest in winter stoves than they displayed in July. Nobody was looking for stoves, nobody inquired about them, they said, and all conditions pointing to prospective sales were lacking.

If the trade, however, continues throughout October as it has been during the last week, the volume of it will probably be as much greater than October, 1893, as September was less. That the warm weather was responsible for much of the falling off in September sales there is no doubt, as the repair business, which last year increased as trade in stoves declined, was this year light itself, while, considering the continuation of hard times, it should have been much better. There are several elements which go to show that the trade for the whole fall will not be very satisfactory to the manufacturers, as shipmenta were delayed so long that many countermands have been received and continue to be received from manufacturing districts in which the demand for stoves has not developed as expected, or has been as limited as was feared when the order was placed. The hope of the trade is, of course, in the weather. New atoves will not be purchased because the ones in use look badly, but because they are unfit for use. Bad as they may be, they will not be renewed unless the weather is cold

enough during the fall to indicate a long and severe winter, which it would mean suffering to be unprepared for.

#### The Chicago Stove Trade.

The conservatism of country merchants, which made business so dull during the summer months when advance orders are usually placed, has caused the stove trade to become quite active at this time. Almost without exception, the Chicago stove houses report a very good volume of business. Merchants who were very slow about placing first orders, and were almost inclined to think that stoves would be unsalable this fall, are now coming in with good lists and are of course urging prompt shipment. It rarely happens that more than one or two of a kind are wanted, but in numerous instances the quantity covered amounts to a carload. The caution still shown in confining orders to so few of a kind indicates that merchants are sure of disposing of them, if indeed they have not sold them in advance of their receipt. This argues a healthy state of trade, as there is more certainty under such circumstances of the goods being promptly paid for when bills mature. Up to the present time the volume of business is believed to be far ahead of last year. It will be remembered that the closing months of 1893 covered a period of gloom and discouragement in the stove trade as well as in other lines of business. The shock of the panic of June was still severely felt, and predictions were rife that the worst had not even then been seen. Distrust existed everywhere, and if a merchant had sufficient faith and courage to order a fair bill of goods his credit was obliged to undergo the test of the severest scrutiny.

This condition of affairs has been radically changed. 'Confidence has been restored in great measure by the lapse of time and the steady improvement in commercial and manufacturing lines. Instead of regarding the future with uneasiness and daily expecting something still more direful than had happened, manufacturers and merchants are again looking forward to a betterment of existing conditions. Even the crop failures in some sections could not check the growth of confidence in the future, as it was seen that the misfortunes of one set of farmers would be beneficial to another set. It was not a national calamity like the monetary panic which had upset all calculations. The better feeling is elearly perceptible among stove manufacturers when they

attempt to forecast the immediate futurc. They look forward to a continuance of the good trade in November and December, when second orders are naturally to be expected as a result of the conservatism shown in present purchases. Some go so far as to say that December will be a very heavy month and a good trade may be expected to extend beyond the first of January. If this should fortunately prove to be the case, the year 1894 will wind up with a far better record than was deemed possible in July and August. And yet there is no "boom" nor the semblance of one. It is simply crowding the business of the year into a somewhat later period than usual.

The manufacturers of oil heaters are doing remarkably well. Their sales are running ahead of those of last year, and some concerns appear to have struck a phenomenal gait. It is a feature of this trade that it seems to have opened up a genuine want of the people without interfering with the sale or use of other heating appliances. Oil heaters are being purchased very freely by those whose houses are heated with furnaces or even steam and hot water, as well as stoves. Their use has grown rapidly in recent years with the perfection of business, the avoidance of smoke or smell of oil and the evolution of great heating capacity. As the oll lamp has worked its way into houses illuminated by gas or electricity, so the oil heater is working its way into houses heated by what are usually considered thoroughly satisfactory methods.

Manufacturers are now making their plans for the coming gasoline stove season. They promise improvements which, when shown, will be highly appreclated by the trade.

## The Hobrecker Stove Company

of Omaha, Neb., favor us with a copy of their new 148-page catalogue of stoves and ranges. This is an exceedingly creditable publication and its is sue marks the company as men of enterprise. They handle the following well-known goods: Crown and Globe line of the March-Brownback Stove Company, Pottstown, Pa.; Golden Rule line of the Duffy-Trowbridge Stove Mfg. Company, Haunibal, Mo.; Norman line of N. H. Galusha, Rochester, N. Y.; Ideal line of the Cleveland Steel Ringe Company. Cieveland, Onio; stoves and ranges of the Leibrandt & McDowell Stove Company, Philadelphia; the Arlington line of the Joseph Bell Stove Company, Muncie. Ind.; the Victor line of the Victor Stove Company, Salen, Ohio. They are also Western agents for Insurance Vapor Stove

 Company. The ranges illustrated are the New Norman, Model Norman, Victor Model, Golden Rule, Welcome Globe, New Expert, Western Globe, Cozy, Olilo. Victor Grand, Farmer's Daughter, all cast ranges, and the Ideal and Grand Ideal steel ranges. In cooking stoves they show the Victor Prize, Golden Rule, Western Globe, New Home Rule, Home Rule, Arlington F. Victor Favorite, Mystic Norman, Farmer's Daughter and Elm Rule. In heating stoves the catalogue presents the Crown Circulator, Imperial Norman, Norman Jewel, Peerless Norman and Royal Norman base burners; Junior Crown and New Crown return thue; New Crown, Junior Crown and Victor Jewel direct draft; Norman Queen, Norman Cottage, Victor Cottage, Victor Lark and Rocket parlor stoves; Arcola dining room stove, Art Frankliu open and heater, Sir Franklin fire place heater, Franklin, Franklinite, Magnet Franklin, Golden Rule and Omaha oaks, Polo sheet iron, Polaris portable heater, Po'aris cylinder, Iron Age and Red Jacket cannons, Morning and Evening Light Todds, &c. Other goods shown are the Crown furnace, Majestic oil heaters, Spleudid oil heaters, Novelty oil heaters, lamp stoves and stove furniture. The company's trade week. pany's trade mark is unique, being a rebus founded on their name. A man is shown breaking a hoe over his knee, A man while beside him stands a stove, the whole being inclosed in the letter C with a small o as an ornamental appendage.

## The Peck-Williamson Heating & Ventilating Company,

formerly known as the Bennett & Peck Heating and Ventilating Company, of Cincinnati, have issued a valuable publication entitled, "Warm Homes in Wintry Winds and Frigid Climes." It is a manual for salesmen and local agents, and contains a great deal of information, compiled with much labor and research by W. II. Martin, manager of the company's Chicago branch, at 82 West Washington street. The first 27 pages of this work are devoted to matters directly pertaining to Favorite furnaces. These are presented in such a way as to impress the reader with the belief that Favorite furnaces have been designed to meet the special requirements of warm air heating. point is taken up and thoroughly discussed, cogent reasons are given for peculiarities in design, and illustrations are happily conceived to back them up. Not only are the several standard styles of the furnace shown, but views are given of batteries designed for heavy work. A battery consists of two furnaces, which are set separately and have separate casings, their tops being united in a common heat chamber, from which, it will be seen, a large number of heat pipes can be led to heat many 100ms. Illustrations are given of both portable and brick set batterics. School room ventilating heaters and school heaters of very large capacity are also shown. The company make a laundry dryer and iron heater, to meet the growing demand for euch a convenience in modern house building. Some 25 pages are devoted to tables of use to furnacemen. These comprise standard price lis's of registers, standard furnace fittings and special fittings, together with tables showing net cost at different discounts from list of registers, borders, register faces and registers and borders combined. These

tables will be very convenient to dealers and save much time and annovance. Tables relative to the circulation and conditions of air, which are of great value for the successful operation of heating and ventilating apparatus, comprise the estimated air capacity of pipes and registers, the weight of air at various temperatures, the velocity and pressure of wind, the expansion of air, the number of cubic feet of air that pipes will discharge per minute, the relative value of non conductors, the gauges and weight per foot of black sheet iron and galvanized sheets, the area and circumference of circles, &c. Estimating blanks and forms of contracts make a fitting conclusion. The book is handsomely printed and tastefully bound.

#### The Grander Stove Company

of Royersford and Philadelphia, Pa., favor us with a copy of a very neat catalogue and price-list which they have issued from the press. It is a volume of 90 pages, carefully printed on calendered paper, is profusely il-lustrated and bound in colored covers, with embossed side title in silver and bronze. The frontispiece is a bird'seye view of the company's works. The makers state that for the accommodation of the trade tributary to Philadelphia, New York, Buffalo and St. Paul, they have established agencies in those places. The positiou of honor in the volume is given to the Bride, a first class six-hole range, for coal or wood. Some of its special features are duplex grate, ventilated oven, extended fire box, heavy brick linings, large ash pan, patent oven door opener, automatic oven shelf and ornamental base. It is followed by the Mentor, adapted for hard or soft coal or wood; the Aline, Major, Malta, Lenor, Umpire, Iona, Garfield, St. John and Junior ranges. The Junior is made with horizontal boiler, elevated above the high shelf. The slove is made with right or left oven, and with five or six boiler holes, as may be desired. The cook stoves are represented by the Oakland, Black Warrior and Miner's Home. The second half of the catalogue is given up to heating stoves, of which the Bride, a full revertible flue base burner is the first presented. During the time the stove has been on the market it has established a gratifying reputation, and the manufacturers expect for it a large sale in the future. The Volga is a double heater of attractive exterior; the Mars is a single heater made in four sizes; the Torrid is a direct draft heater for soft coal or coke, and the Milton is a new direct draft double heater. The latter is of rich ornamentation and is low in price. There is also presented an assortment of sheet iron cylinder surface burners, globe and cannon Following these we find an il stoves. lustrated notice of the Victorious furnace, made in portable form and also for brick work; illustrations of open grates and fire place plates, a varied assortment of gas cooking and heating stoves, with directions for using; price lists of hollow ware, mica, fire brick, &c. An alphabetically arranged index is a feature of the closing pages.

An English manufacturer is laying great stress on the improvement in combustion and increased efficiency of the fuel gained by the use of fuel cones. They are perforated pyramids open at the bottom and are set on the

grate projecting up into the fuel, diffusing a greater quantity of air that is heated through it.

#### Selling Furnaces.

BY HOT AIR.

He came rushing into the salesroom when I was busy, and, saying he hadn't time to stay, poked a paper at me which I found to be an order for a furnace on an opposition house from one of our customers. He said he had promised them to come and look at "Incandes-cent," but his mind was made up to get a "Lukcwarm." I had been taking his dimensions and reckoned we'd have a "go," so I told him the order he gave me wasn't for us. This took him back a litte, and, after fumbling in his pocket, he produced another order with a written request to make him see where true merit was to be found. He was a business man with the accent on the B. that was plain, for he was about to go when I concluded to "drop the bottom" on him at once. Now, do not misunderstand that to mean price, for we never said a word about it. I said, "As long as you are here, could you spare 2 minutes and 30 seconds to investigate and imbibe the features of our furnace?" and I took my watch out. He said he could and we went to a furnace of the size his order called for and I gave him construction, erection and operation condensed as close as a No. 3 iron in a chill mold, and wound up by saying "and we can ship it to day." He laid down his duster, dropped his grip, pushed back his hat, asked for a piece of paper and drew the plans of two floors of an old roomy farmhouse that he was remodeling, and asked, "How can I heat those three rooms?" I explained three methods, saying "pay your money and take your choice." He tore up the other order and we shipped the furnace to a Congressman, and I concluded I was cut out for a lobbyist.

Ordinary methods would not have caught that order. Crisp, concise, positive points pinned it. Another time a dignified, aristocratic, yes, and rather self sufficient well dressed man stepped in and to my "Good morning" was deaf. I followed to see if I could be of service, while he never noticed but looked first at one then at another furnace, till finally he asked "What is the price of that ?" pointing to the furnace. I said, complacently, "What is that to you?" He swelled up at what he considered my impudence, asking what I meant by such impertinence. I answered, "Just what I nence. I answered. "Just what I said," at which he observed me more closely and remarked that he might wish to purchase. "Then you don't want to know the price, you want to know the furnace, for if it is not of the character and quality you want you don't care whether they sell at 1 cent a carload or \$1,000,000 apiece." I un loaded on him the experience of several years in shop, cellar, drafting room, desk and on the road, and then told him the office boy could give him prices.

Then he got square with me, saying, "I don't want to get prices. I am going home, and will tell Bill Jones the tinker to get one of these furnaces and put it in according to the suggestions of the impudent wiseacre I met here, and if it fails to do all you claim you will hear from me." Bill got a furnace from us for this man, and as it worked well I never saw him again. I afterward learned from Bill that another turnace had been selected, but after my talk ours was substituted. Selling fur naces is different from selling most anything else. It takes grit and gumption.

#### ODD PLATES.

Cole & Cole, 41 Main street, Council Bluffs, Iowa, are vigorously pushing the sale of their air tight heater, which is so made as to burn wood, cobs, straw, &c., and is claimed to hold fire for 48 hours. It is made in three sizes to suit requirements, and can be had in both smooth and Russia iron. M. M. Gowdy of Springfield, Mass., is agent for the heater in the New England States, New York and Pennsylvania.

THE DANGLER STOVE & MFG. COM PANY of Cleveland, Ohio, announce to the trade that for the season of 1895 they will offer a Process stove, possessing ments which cannot fail to interest dealers generally. The frame of the stove is made in a very substantial man-ner, with an end shelf, giving a large top surface. The rods supporting the cones to the base are fitted with thumb nuts, so that they can be easily taken out. The cast iron burner bottoms with sub flame in one are nickel plated inside and out to protect them from rusting, while the upper parts of the burners and connections are protected by cast iron covers. The cabinet ranges have an extra large burner on the steps and in connection with the ovens. Heavy brass drums and connections are used, as well as a handsome oblong brass plated tank, with separate valves of German silver with sight feed. The disk is made ad-justable, so that it may be taken out for cleaning and firmly replaced. The cleaning and firmly replaced. The manufacturers refer to the durability, style and operation of the Process stove as being such as to render it very pop ular.

THE CINCINNATI Commercial Gazette says that the stove founders at Wheeling, W. Vs., are finding a great deal more to do than was expected. Most of them are reported to be running on full time. The brightening up of business generally in that section has increased the call for stoves, and jobbers and retailers are ordering goods freely.

THE FAVORITE STOVE & RANGE COM-PANY, Piqua, Onio, are employing 300 men at their works, with a fair amount of orders in hand.

A. WEISKITTEL & Son of Baltimore, Md., have issued a descriptive catalogue of Fire King gas heating stoves for the fall of 1894. The concern for the fall of 1894. The concern enjoy exceptional facilities for the manufacture of these goods, all of which are carefully inspected and tested before shipping, and are also neatly wrapped in impervious paper and securely crated. The illustrations represent a varied assortment of heaters, covering gas grates, radiators, sheet iron cylinder stoves, burners, gas ranges, &c. The descriptive matter is ample for the purpose, and in connection with the engravings are tables giving the size of frame, style of finish, dimensions of mantel openings, price and telegraphic code words. A number of testimonials are given relative to the Fire King gas stoves and ranges, and the 42 page catalogue closes with an index, telegraphic code and reasons why gas for fuel should be used.

THE REDUCED FREIGHT RATES on stoves from Chattanooga to points in the territory of the Central Traffic As sociation went into effect on Monday of last week. The rate from Chattanooga to Cincinnati, Evansville, Ind,

Brooklyn, Ill., Belmont, Mo., Lexington, Ky., and other points in the States mentioned, is 19 cents per 100 in any quantity, the previous rate to Cincinnatibeing 57 cents in less than carload lots, and 40 cents in carloads. The rate to Nashville was reduced from 32 to 9 cents. The rate to St. Louis is now 29 cents, and to Memphis 15 cents.

THE CINCINNATI STEEL RANGE & FURNACE COMPANY of 153 West Fifth street, Cincinnati, Ohio, send us a copy of a mammoth poster illustrating the Burton steel range, which is referred to by the manufacturers as the "best on earth." The poster is printed in red and black and will form a conspicuous object in the store of the dealer handling these goods.

THE PATERSON, N. J., Gaslight Company announce \$1.50 per 1000 feet as the price of gas in future. At this price gas can be used for cooking with economy and in some cases for heating. The live stove dealer will profit by the change.

RATHBONE, SARD & Co, Wabash avenue and Randolph street, Chicago, state that their Aurora foundry is running full time and turning out a large number of stoves which are being shipped as fast as made. They are making every day a considerable number of Acorn radiators, their new air tight soft coal stove, for which the demand is fully up to their capacity. This stove is meeting with much favor in the East, shipments being made frequently to the soft coal districts of Pennsylvania. Rathbone, Sard & Co are now receiving a gratifying number of carload orders for stoves. They are beginning to think of vapor stoves and are making improvements to be introduced in their New Process stoves the coming season. Their line for next year will be much larger than ever before, and they will therefore be better equipped than at any previous time for handling their vapor stove trade, which they have now been engaged in for some twelve years, with a steadily ad. vancing reputation for high grade stoves. Their new vapor stove catalogue will be out in about a month.

The Plumler and Gas Fitter's Review of London calls attention to one deficiency which strikes and chills the foreigner in France, which is the absence of all system for heating large offices and public buildings. In most houses, even large, handsome, well built blocks, there are no arrangements for heating other than small grates and stoves. The grates and open fire places are almost invariably ill constructed. The cold is often severe in many parts of France, and cities like Lyons, St. Etlenne, Grenoble and Clermont Ferrand really suffer from the want of proper artificial heat. Surely, says the journal above referred to, if our English manufacturers of heating apparatus would but make a determined effort they ought to be able to develop a good market in France.

THE ENGLEWOOD STOVE COMPANY have been incorporated at Chicago with a capital stock of \$12 000. The incorporators are Alfred Anderson, Claus A. Johnson and Frank A. Winblad.

The Cleveland Foundry Company, Cleveland, Ohio, have met with a serious loss by fire, in which their four-story building was entirely lost. This part of their factory contained their machinery, mounting floors and stock rooms. They saved the greater part of their patterns and of their foundry, japanning rooms and tinning rooms. They

expect to be in temporary quarters at once, and will be in shape to till orders in from 20 to 30 days. Their loss is well covered with insurance. On behalf of their many customers they solicit all reasonable patience in the case of unfilled orders, and a continuance of their past patronage for the future.

THE PLYM UTH STOVE COMPANT have been increporated at Boston, Mass., with a capital stock of \$25 000, for the purpose of manufacturing, buying, selling and dealing in stoves, &c. The incorporators are Francis P. Arnold, president; William M. Bowman, treasurer, and Herbert L. Baker.

The Western Stive & Mfg. Conrany is the name of a concern incorporated last week at Milwaukce, Wis., with a capital stock of \$15,000. The company will manufacture and deal in gasoline and gas stoves and ranges as well as hardware. The incorporators are Leopold Kreielscheiner, Max Hirschfeld and G. W. Levy.

The stove plant of Eugene Munsell & Co., at Elizabethport, N. J., commenced running full time the first week of the present month. Business is good and the work of production is being pushed with more vigor than for a long time past. A local paper states that the goods shipped by the company average from 14 to 15 tons a day.

The Quick Meal Stove Company, St. Louis, Mo., advise us that all their traveling men have started out and the trade can now look for them any day. The company have made improvements in their Quick Meal gasoline atoves which will be embodied in their catalogue now in course of preparation. This company are now sending out a pamphlet containing engravings and descriptive matter of their Electric coal oil heaters. This pamphlet contains a full description of these stoves, together with prices for the different styles.

WILLIAM J. H. GLUCK of Baltimore, Md., has issued supplementary sheets and list prices of ranges and stoves which he handles. Among these may be mentioned the Ideal Fortune and Acme Fortune ranges, the True Fortune sheet iron surface burner, made as a double heater; the Art Fortune, a powerful soft coal double heater, and the Coin Fortune, a surface burner provided with Rinsom's patent duplex or draw center grate and nickel trimmings. Mr. Gluck has also issued a pamphlet illustrating the Active Fortune range, with horizontal circulating boiler; the West Side range, which is made in sev. eral sizes; the Home Fortune, the Regal Fortune and the Star Fortune, the latter being arranged for brick setting. Attention is slee given to Franklin stoves and to a line of furnaces made under the name of Popular Fortune. Other advertising matter which Mr. Gluck issues relates to ovens for oil, gas and gasoline stoves, price-list of stove boards and the Gluck cook stove, which is made by Mr. Gluck and is said to represent the culmination of 20 years' experience. We also have a pamphlet relating to Reliance and Reliance Safety gasoline stoves, and also a catalogue of over 200 pages illustrating the goods manufactured by Mr. Gluck. These include stamped ware, both deep and shallow; japanned ware, pieced tinware, brass and copper goods, galvanized sheet iron ware, milk cans, enameled sheet iron agate ware, apoons, metallic sieves, wire goods, tinners' stamped trimmings and miscellaneous supplies, hollow ware and miscellaneous goods.

SAM S. UTTER, 113 Beckman street, New York, advises us that he recently shipped one of his Sam Ranges on a long journey. It was purchased by the American Board of Foreign Missions, to be sent to Rey. Albert Foote, at Alahaabad, India. He also shipped last week six cooking stoyes to go to South Africa.

Chas. O. Lyon, president of the Thatcher Furnace Co., 246 Water street, New York, has returned from the Adirondacks after a brief vacation of two weeks. He would have remained for a longer term, but his stay was cut short by a telegram requesting his presence in the city. We are advised that the company shipped last week a number of carloads of furnaces and ranges to agents and customers in the New England and Western States.

FREDERIC W. GARDNER, Western manager of the Michigan Stove Company, is in receipt of a letter from Mr. Palmer, the company's agent at Britt, Iowa, which reads as follows: "We have a Family Garland standing here that went through the cyclone. I think \$\frac{1}{2}\$ will cover the cost of repairing it. I told the boys no other stove on earth would have stood the shock." Mr. Gardner says that his company have never recommended their stoves to withstand the effects of a cyclone, and this evidence that they will do it is particularly gratifying.

THE PENINSULAR STOVE COMPANY are now distributing display cards of a neat and striking character to be used by their local agents. They are printed on heavy cardboard. One bears the company's trade-mark in gilt on a black ground, and another has the words, "Peninsular Stoves—Furnaces—Ranges," in white on a black, making a very conspicuous sign. Manager Harrahan of the Chicago branch reports an excellent condition of trade, with a good demand for the air tight Peninsular. Dealers write that it goes out when competing stoves stand on the floor neglected.

A FURNACE COMPANY have been organized at Marion, lowa, known as the Marion Heating Company. O. M. Boyles, with Heury Dart's Sons of Rock Island and Hiram Robinson, for a number of years with the Davenport Steam Heating Company, are members of the firm. Mr. Boyles will continue to travel for Henry Dart's Sons, but will talk furnaces whenever he can find time. Mr. Robinson will act as contracting agent for the company, and is now at Nevada superintending the heating of the new First National Bank of that city. The local press predicts a bright future for the new firm.

#### Determining Size of Pipes and Registers to Heat a Given Amount of Space.

BY GEORGE D. HOFFMAN.

There is hardly a question in the erection of a furnace job that causes the amattur, and sometimes the expert furnaceman, more worry than what size the pipe and register shall be used to give the best results in the room to be heated. As the system of furnace heating is one of displacing all the air in the room to be heated, and replacing it with warm air from the furnace, it stands to reason that perfect results can only be obtained by the inlet and outlet pipes and registers being properly pro-

portioned. Leaving out the question of ventilation and simply considering the one of heat, the matter resolves itself simply into a determination as to how much sir, or in other words, how many times must the air in a given room be changed per hour to maintain a uniform temperature. The reader can readily appreciate that this depends, 1, on the amount of cooling surface in the room, and, 2. on the temperature and volume of the air coming through the register. In the writer's opinion a higher temperature than 140° F, should never be calculated on, as a higher temperature than this almost always signifies an overheated furnace, with all its attending evils.

Taking it for granted that the proper size of furnace has been selected, with power sufficient for the total amount of work, the only question to be decided is the proper volume of air required by the different rooms, which of course is very largely determined by the size of the pipes and registers; with properly adjusted pipes and registers it would be impossible to overheat the furnace with-

out overheating the house.

In order to determine the volume of air necessary to heat a given space we must determine the amount of cooling The basis for all calculations surface. of this kind is glass surface, and all exposed wall surfaces should be reduced to their equivalent in glass in making these calculations, and this result then added to the actual amount of glass will give the total amount of cooling surface in glass. The leading authorities seem to agree that with the conductibility of glass rated at 1000 the conductibility of an ordinary wall surface is about 75. If therefore we wish to reduce exposed wall surface to its equivalent in glass we simply multiply the amount of exposed wall surface in square feet by 75 and divide by 1000, adding this result to the actual square feet of glass, and we have the total amount of glass surface in the room.

The writer has demonstrated that if we multiply the total square feet of glass by one and one-half, the result will be the total square inches of round pipe and register in the room in ques-This rule, however, will only apply to average runs of plpe. If a room is particularly favored by being close to the furnace, or particularly ill-favored by being remote, the size of pipe should be reduced or increased 1 inch in diameter accordingly. Second floor rooms can be figured in the same manner, but unless the rocm is remote from the furnace, it is entirely safe to reduce the diameter of pipe 1 inch from result obtained. For an everyday rule where one does not want to stop to estimate glass surfaces, &c., the writer has found the following to be safe and conservative: First floor rooms with two sides exposed, divide contents of room in cubic feet by 25, and the result will be the area of the register in square inches. For first floor rooms with one side exposed, divide by 30. For second floor rooms with two sides exposed, divide by 30, and with one side exposed by 35

So far, in this srticle, I have simply treated of the inlet or hot air pipes and registers. As I stated in the beginning of the article, the system of furnace heating is one of displacing all the air in the room and replacing it with warm air from the furnace. When we displace the air in a room we must have a place for it to go, and in a properly constructed job of heating by furnace heat, where the air is taken from the outside, arrangements should always be

made to ventilate each and every room connected with a warm air register. In the writer's opinion the outlet register should be from one to two sizes smaller than the inlet register in all residence work, thus insuring an equable pressure of air in the rooms at all times, and doing sway with the liability of drafts from a too rapid movement of air into and out of the room. For instance, in a room where the warm air register is equal to a 10 x 14, the outlet register should not be larger than an 8 x 10. This would give a rapid enough movement to insure a uniform temperature in the room. Other sizes should be gauged proportionately.

# TRADE REPORT.

### The Iron Market.

Pig Iron — Eastern Pennsylvania makers are endeavoring to get slightly better prices on Mill Irons, but since there is only one consumer in this vicinity the matter possesses little interest for the New York market. There has been some inquiry for prices ou standard Irons for next year's contracts, but nothing whatever has been done in that direction. The majority of founders are doing little work, and are buying in a hand to mouth fashion. Some small belated inquiries are coming in for Cast Iron Pipe. The majority of the shops are very busy and some of them are unable to take work before the end of the year, when the season practically closes. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2, at tldewater. Southern Iron, same delivery, \$11.50 @ \$12 for No. 1; \$11 @ \$11.25 for No. 2; \$10.65 @ \$10.75 for No. 3; \$10.90 @ \$11 for No. 2 Soft, and \$11.15 @ \$11.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.40.

Our Philadelphia correspondent ad vises in regard to that market as follows: Reports are a little contradictory in regard to the condition of the Pig Iron market. The truth seems te be that in low grade and standard Mill Irons there is something of a scar-city, but Foundry Irons are in full sup-ply. At \$10.50 Philadelphia, or \$10. \$10.25 Schuylkill and Lebanon valleys, there is as much good Mill Iron as buyers want, but at 25¢ less offers have been turned down. No. 2 Foundry of good quality is nominally \$11.50 @ \$11.75, but buyers claim that they can do better than that-in some cases less than \$11-although to cover their tracks it is called No. 2 Plain. Foundrymen say they get Iron in every way suitable for their purposes at \$11, and what-ever name may be given to it they wish nothing better than what they are getting. It is a curious feature that these transactions are nearly a'll in amall lots, carloads up to 100 or 200 tona each. Formerly a low price was given as an inducement to take a large lot, or for spot cash, or some induce-ment of that kind, but in these times the objectaeems to be to break into somebody else's trade, so that it is cheaper to make a low price on a small lot than on a large one. All the same, it un-settles prices and makes it extremely difficult to quote the market satisfactorily. General quotations are about as

 Standard No. 1 Foundry X
 \$12.50 @ \$12.75

 Standard No. 2 Foundry X
 11.50 @ 11.75

 No. 2 Plain
 10.75 @ 11.00

 No. 1 Soft
 11.50 @ 11.75

 No. 2 Soft
 10.75 @ 11.00

In the Chicago Pig Iron market trade continues active in local Coke Iron. The business now doing is well distributed, covering a good range of buyers. Prospects are excellent for the immediate future. No very large contracts have recently been placed, yet the volume is good owing to the large number of small orders. Quotations on local Irons are unchanged and there is little probability that

they will be higher. The Southern furnace companies have had better trade the past week than for a long time. Sales are reported up to 500-ton lots. Inquiries are improving for Southern Irons, and, at the same time, prices are being reduced so as to more nearly meet buyers' views and the competition from Northern brands. Lake Superior Charcoal is quiet. Quotations are given as follows for cash.

Lake Superior Charcoal	\$13.00 @	\$15,00
Local Coke Foundry, No. 1	10.25 @	11.00
Local Coke Foundry, No. 2	10,00 @	10.25

Southern, No. 2, Soft	10.25 @	10.50
Alabama Car Wheel	17.50 @	18,00
Jackson County Silvery	15.50 @s	16,00
Other Ohio Silvery	14.25 @	14,50

Reports from the Pittsburgh district indicate that the continued dropping each week in the price of Bessemer Pig has evidently been checked. While the output is very heavy, the maximum of production seems to have been reached, while consumption has apparently kept right up with production. There is more inquiry for Foundry Iron, but prices are unchanged. Quotations are given as follows, for eash:

The demand for Pig Iron during the week in Cincinnatti has been almost wholly from the jobbing foundries in that district, and has been freely met at previous prices. Much Iron has been melted by the Iron Pipe works, but this was all contracted for in August and September. The stove and agricultural works, while increasing their output of product moderately, continue to be restricted buyers of the raw material. While the demand for Pig Iron is comparatively small, the furnaces are so well under contract that they are not urgent sellers and are able to obtain pretty full prices for what they have to offer. While there is no urgent demand in sight, there is undoubtedly a steady increase in the consumption of Iron, and this has already cut down surplus stocks in the South and is likely to bring the market into a better condition in the not remote future. The demand from the East is comparatively small. Quotations are as

The increased production of Pig Iron is making itself felt in St. Louis in prices, which continue to be shaded. No large sales are reported, but the number of moderate sized lots which are being taken is increasing, so that the total business is fairly satisfactory. No. 2 Foundry is quoted at \$10, f.o.b. cars St. Louis, and it is reported that in more than one instance this price has been shaded. We quote as follows for eash, f.o.b. cars St. Louis:

#### Metal Market.

Pig Tin.-Prices in the wholesale market have moved almost steadily downward, particularly on prompt and near future deliveries, the decline being from 0.15¢ to 0.30¢. The deeline on later futures was not in proportion, and in this fact there is circumstantial englesses that the constitutions of the constitution of the constitutions of the constitution cumstantial evidence that the scarcity of spot Tin that was talked of a week ago existed in imagination only, and that manipulation alone has kept prompt and early deliveries at a premium over futures. Distribution has doubtless been liberal, but the records show that importations during the first half of the month amounted to no less than 1360 tons, and it is a reasonable presumption that some increase in atocka in first hands has taken place. fall in spot prices is suggestive in that connection. Shipments from the Straits during the first half of the month amounted to 1300 tons, including 100 tons to the United States, 580 tons 10 London and 625 tons to the Continent, against a total of 1450 tons during the corresponding period last year. Transactions during the week on 'Change and outside are said to have aggregated upward of 1000 tons. The consumptive dem ind has been rather tainer than last week. Prices for small lots of Straits from store remain on a basia of 174¢ ₽ lb.

Copper.—Small lots have been more freely offered, with the effect of weakening prices a trifle, but the market is a very narrow one at present and the significance of the change in values during the week is problematical. The potent fact remains, however, that a large portion of consumers are securing Copper on old contracts at prices much below those now generally asked, and rumor has it that some are quietly taking profits on resales of a part of their stock instead of working it up. For small lots of Lake Ingot, jobbers ask 1014 ? Pilb.

Sheet Copper.—There is a very fair consumptive movement in Sheet and other manufactured Copper, but it shows little beyond the fact that consumers' stocks have become latterly so utterly depleted that they are constrained to fill their immediate requirements. Individual orders are almost entirely for comparatively small quantities, large contracts being still very much the exception. Prices are firm and inquiry good.

Pig Lead.—Orders have been placed for nearly, if not quite, 1000 tons, Oztober and November shipment from the West, at 3 10¢, wholesale price, laid down here or at common point. The greater portion, it is understood, goes to large consumers. The retail demand is modera e and jobbers prices for small quantities range from 3½¢ to 3½¢

Lead Pipe and Sheet.—The demand is moderate in this section and prices are firm and unchanged, at former quotations.

Spelter.—Nothing more than routine business has been effected in this market. The demand continues exceedingly tame, and sellers appear to be weakening. At all events Western brands in large lots have been offered at a shade under former quotations. For small lots of Western from store, 41¢ † lb is about the ruling rate.

Antimony.—Only routine business is passing and the demand is slow. Jobbers' prices for moderate sized parcels remain at about 10½¢ for Cookson's and 9½¢ for Ilaliett's.

Nickel.—There is a wide range of prices. Nothing more than routine business is passing.

Tln Plate.-The stock on hand this week has been cleared up as fast as unloaded from ship, a large proportion going in delivery on previous contracts. Considerable quantities of Plates have been taken out of bonded warehouses also, and, upon the whole, the movement into consumptive channels has been fairly large. In a few lines, for instance, in 20 x 28 Ternes, there is some scarcity and prices are strenger. Otherwise prices exhibit little change from those of last week. The assortment is considerably broken up, apart from these, but large shipments are now on their way and due within a week or ten days, which will relieve the scarcity, at any rate for the moment. Mean-time stocks, while not increasing here, are shrinking rapidly on the other side, and, as the demestic output has been very much restricted by the closing down of most of the American Tin Plate works, the chances are that prices will not exhibit much, if any, shrinkage in the near future, American makers have been revising their quotations, but rates for domes-tic Plates are quite irregular, and have not yet gotten down to anything like a The Tin Plate wage settled basis. question in this country offers as yet no signs of an early solution. Manufacturers are standing out for a reduc-tion of about 25% in the scale, while the workmen say they are unwilling to sceept more than 10 %, and the situation appears to be in the nature of a desdlock. One or two large works have, however, resumed, the proprietors of one of the largest in the country doing so on the understanding that the employers are to get the advantage ultimately of any reduction made by the other works. The demand for high grade Roofing Plates of American make is pretty active. Canners' requirements have all been filled, so that the demand for Coke Tins from that quarter is In November and Decemquiescent. ber the Can makers are went to place their orders for Plates for delivery in January and February. Should the demand from this interest be up to the average in volume, some stiffening in the prices of Cokes may be looked for, the stock of these Plates not being excessive on either side of the Atlantic. Jobbers report an excellent and improving retail business. While individual orders are usually for small amounts, the aggregate volume is larger than it has been for a long time past. It is ex-clusively a spot business that is now being done. Futures are neglected, being done. although inquiry in this direction shows a notable incresse.

The Tin Plate market has been quiet and easy. Transactions at the quarterly meetings were limited to small lots at bottom prices. Sellers refuse to make further concession, but merchants are bearing the market. Sellers are reserved owing to reduction in stocks, but their position is weakened by the fact that several large works are starting up. Swansea quotations are as follows:

Bessemer Cokes, IC	. 10/ @
Chambers Calus IC	. 10/03/09 ****
J. B. Steel Cokes, IC	. 10/ @
Dean Ternes, 20 x 28	. 20/ @
Charcoals, IC	11/ 110.
Charcoals, IC	11/

Large orders for Black Plate have been placed at late prices.

Sheet Iron.—The demand for Sheet Iron is reported to be very heavy, and, with some of the mills idle on account of the Tin Plate wage dispute, the difficulty in getting anything like prompt shipments has increased. Some mills are completely sold up for the next month or so, and most of the leading mills will make no assurances of delivery before the middle of November. Although under these circumstances prices might be expected to advance materially, as a matter of fact they have not yet done so, makers continuing to quote old rates whenever they are open to book an order. The jobbing demand for Galvanized Sheets in this vicinity is referred to as being very heavy. They are quoted at 75 and 5 % to 75 and 10 % off.

The monthly statement of the Bureau

The monthly statement of the Bureau of Statistics gives the following details of exports of Copper during August:

#### CONDITION OF THE

## Hardware Trade.

BUSINESS is moving along without special change from the conditions which have existed the past few weeks. Orders are large in number and carefully assorted, but the aggregate in dollars and cents is not in all cases satisfactory owing to the comparatively small quantities in which purchases are made and also the lower prices which prevail on many goods. The practice of the trade in ordering in much smaller lots than has been usual, even though orders are more frequent, adds not a little to the cost and trouble of doing business, as business of this character often keeps a concern as fully occupied as it would be if orders were for usual quantities. It is also a matter of frequent remark that in order to keep business up to its present standard a good deal of special effort is necessary, and travelers refer to the hard work which they have to do in securing orders. Reports from the retail trade indicate a very general though not very marked improvement in general business conditions. While the trade at the present time does not come up to the more sanguine expectations which were entertained there is a general feeling that business is steadily improving and that a good trade may be anticipated before very long.

Advices from Chicago.—The Shelf Hardware jobbers report a considerably better movement than in September. Some jobbers report that the first two weeks of this month have been with them the best of the year. Quite a number of new ventures are reported, and sales of new stocks are breaking the monotony of continuously entering small orders. The small orders, however, are still a leading feature of the business, and the invoices present a remarkable array of writing and figuring for the small amount footed up at the end. Trade is improving in some sections of the West which were regarded as almost hopeless. Kansas is doing better than had been expected, and other Western States are coming up in much better

shape. Orders are being steadily re-ceived from the silver States and from other mining sections which have so long been depressed. Heavy Hard-ware has had au exceedingly good week. Orders are still small, but they are plentiful. This branch of business has experienced considerable benefit nas experienced considerable benefit recently from the large purchases of lumbermeu's supplies for lumber camps during the coming winter. Carriage manufacturers are still entering contracts for their season's supplies. Wagon builders, however, appear to be doing year, little at years. plies. Wagon builders, however, appear to be doing very little at present. It is expected that their trade will come forward later, and perhaps be better for the present dullness.

#### Notes on Prices.

Wire Nails .- There is little change in the market since last week. There is a good deal of irregularity in the price at which Wire Nails are sold by jobbing houses, some of the prominent ones, in the West especially, selling freely at \$1.10 to \$1.15. The market is not regarded as being in a settled state, and buyers are watching it carefully to see whether or not the manufacturers will succeed in the efforts to which we have before referred to eliminate disturbing influences.

Advices from Chicago. - The condition of business shows little change from that reported last week. quiries are considerably better, but the volume of business can hardly be said to have gained anything. Jobbers are selling small lots from stock at \$1.10, and show no disposition to advance this price, although they will be unable to replenish their stock at the same cost if manufacturers maintain their present attitude. The situation is, therefore, interesting from the standpoint of jobbers.

Cut Nails.—There is a fair but not heavy movement and prices are without material change. Small lots from store in New York are held at \$1.05 to \$1.10 on a 60-cent average.

Advices from Chicago. - Local manucoming in, but only of a character to supply the immediate wants of merchants. Nobody seems disposed to enter contracts for future delivery. Small lots from jobbers' stocks are quoted at

Barb Wire. - There is little doing in Barb Wire and prices are without change, Four-Point Galvanized being quoted as follows, in carload lots, dequoted as follows, in carload lots, delivered at the points named: Pittsburgh, \$2 to \$2.05; Cleveland, \$2.05 to \$2.10; Cincinnati, Allentown, Chicago or New York, \$2.15 to \$2.20. Negotiations between manufacturers with a view to consummating arrangements which have been under consideration for some time still continue, and are understood to be progressing favorably.

Advices from Chicago. - Manufacturers are in receipt of fair orders from a few sections of the West, but generally speaking, trade is quite disappointing. Jobbera are also doing only a light business. Small lots of Galvanized are quoted at \$2.25 from stock, and \$2.15 from factory.

Screen Wire Cloth .- The manufacturers of Screen Wire Cloth have recently determined upon prices for the coming season. They are based on the quotation of \$1.45 per 100 feet for small lots, with concessions for quanti-ties similar to those which were made last aeason, but giving a slightly lower extreme price.

Aluminum Ware.-In addition to their regular list, the Illinois Pure Aluminum Company, Lemont, Ill., have issued the following list of new goods. It is subject to a discount of 15 per cent. :

Berlin Sauce Pans.

No. 1, per dozen, \$13; No. 2, \$15; No. 3, \$18; No. 5, \$22; No. 7, \$26.

Berlin Kettles.

No. 1, per dozen, \$13; No. 2, \$15; No. 3, \$18; No. 5, \$22; No. 7, \$26.

Conver S. Pans.

No. 2, per dozen, \$14; No. 3, \$16; No. \$19.50; No. 6, \$24; No. 8, \$25.

Convex Kettles.

No. 2, per dozen, \$14; No. 3, \$16; No. 4, \$19.50; No. 6, \$24; No. 8, \$28.

Convex Cook Pots

No. 1, per dozen, \$13; No. 2, \$15; No. 3, \$18; No. 5, \$22; No. 7, \$26.

Muffin Covers.

6-inch, per dozen, \$10; 7-inch, \$12; 8-inch, \$17.

1-gallon, per dozen, \$18; ½ gallon, \$13.30; 1-quart, \$8.70; 1-pint, \$5.30; ½-pint, \$3.30.

Bevel Cups.

14-pint, per dozen, \$2.20; 34-pint, \$2.65 1-pint, \$3.20; 11-pint, \$3.60.

1-quart, No. 4, per dozen, \$7.50; 2-quart, No. 5, \$9.50; 4-quart, No. 6, \$12.

Individual Soup Tureen.

1-pint, per dozen, \$13.

Miners' Cups.

1-quart, per dozen, \$6.30; 2-quart, \$9.30.

Fry Pan.

6 inch, per dozen, \$6 50.

4-quart, each, \$3; 5-quart, \$3.25; 6-quart, \$3.59; 7-quart, \$3.75; 8-quart, \$4.

Water Pitchers.

3 pint, per dozen, \$31.50; 4-pint, \$32; 5-pint, \$32.50; 6-pint, \$33; 7-pint, \$53.50; 8 pint, \$34.

Soup Tureen.

112 gallon, each, \$3.75.

Service Stropping Machine .- This article is put on the market by E. Lothar Schmitz, 92 Reade street, New York, for whom Hermann Boker & Co., 101 Duane street, New York, are sgents. A description of it was given in our iesue of October 6. The Stropping Machine is sold to the trade at \$15 per dozen, net.

Sash Weights .- The Sash Weight market is in an unsatisfactory condition and prices are low and very irregular. Some manufacturers advise us that it is necessary to make large concessions from what they consider a fair price in order to secure business and the result is that current prices are unprofitable. There is a wide range of prices quoted by different manufacturers. A fairly representative price is perhapa \$15 per ton, f.o.b. factory, for lots of 1 ton or more, smaller lots being held at \$16. These prices are, however, ahaded, and considerably lower prices are made by some foundrice, the matter of price being determined to some extent by the quality of the goods. The condition of the market is referred to in the following terms by a well-known Eastern manu-

Prices continue at ruinously low prices, or, to be more exact, Sash

Weights are being sold to day at from \$1 to \$3 per ton less than the actual cost of manufacturing. Prospects for the immediate future are not encourag ing. There is still a large stock on hand, which the manufacturers seem anxious to dispose of, and there is also a preity general feeling among manufacturers in all lines that we are only at the beginning of an era of low values, and that the wage scale and prices of raw ma terial will be lowered to conform to the present prices of manufactured goods. Manufacturers must have some relief soon, as the present conditions are simply a butchery of their resources and cannot continue long.

Old Metals.—Business in Old Metals has been quict. The demand for Scrap Iron from buyers in this district is very limited. Prices show no radical change.
The following quotations represent about the rates paid by New York dealers:

| 1.50 @ 8.50 | 1.50 @ 8.50 | 1.50 @ 8.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 | 1.50 |

Old Rags, Paper, &c .- The market is irregular, some descriptions of Paper stock being in demand and others very Prices paid by dealers, New York delivery, are quoted as follows:

Old Rubber.—Dealers' purchasing prices, New York delivery, are about as follows:

THE ROLLING MILLS of the McCullough Iron Company, North East, Md., were damaged by fire on the 9th ics., caused by an explosion of lamps in the engine room. Two of their three sheet mills escaped injury and are working without The roof over the third interruption. mill was burned and the bar mill was destroyed. The forge and other buildings were not harmed. The loss is amply covered by insurance, and the company will repair the damages at once. There will be no interruption to business. Their other sheet mills, at Wilmington, Del., and Rowlandsville, Md., are running on full time.

#### Young Men Without Capital.

The first of the year is approaching, and at that time many business opportunities will be presented. Some men will want to sell out their interests, others who have a good business and good prospects will need more capital and assistance. There is no place so natural to look for the assistance as among the young men in the same line of business. Many of these young men fill positions requiring business acumen and capacity. They are ambitions to get along, and feel that they have been misnsed if some other young man of less reputation for ability is given an opportunity to take an interest instead of them. A man who wants to sell out is often asked, Why don't you give your man a chance? or, Why don't you sell to your employees? Then a look of disappointment comes over his face, for he knows they have never had enough business capacity to "live at a profit," and that any business to be successful must be done at a profit. His men have never saved a dollar, though they are excellent salesmen, bookkeepers, workmen, foremen and superintendents. So he must sell to a stranger what they have helped to build up. Some men have tried the formation of a stock company, keeping a controlling interest, and found that their employees could not buy even a small amount of stock without horrowing. Such stock companies have often failed of success, and the old merchant has been forced to reassume control to save a loss, because men who have never lived at a profit lack the characteristics to do business at a profit. The young man who resolves that inside of another twelve months he shall have saved \$100, will have acquired a trait of character and a kind of information of so much value that, if he had to lose either, he would throw the dollars away. The mere possession of so small a snm does not count for much,

but the ability to accumulate it will develop into the ability to get more and is the stepping stone to competency.

The Habit of Saving.

The habit of saving brings an idea of the values of all sorts of business opportunities and a ready decision from a common sense standpoint that makes a good business man. It reduces the tendency to extravagance and speculation and increases the vigilance to let no opportunity escape and to be industrious and on the lookout continually. A young man who is saving learns that he can save so much this week. and that means so much in four weeks or a month. The successful business man carefully arranges for his regular trade and as carefully plans for the future, weighing all the possible and probable conditions. The principles guiding both men are similar and that is why the young man who has saved money is preferred, for he not only has the small capital needed but has what is far more desirable—the business training that is invaluable. The business year always has an ending and at the ending there are always some who want to sell out or get more capital, and the young man who resolutely denies himself the luxuries that attend the expenditure of his entire salary and provides a saving fund as a part of his necessities will be in a position to take advantage of these opportunities.

#### Confidence.

We have heard a great deal during the past year about loss of confidence in financial circles. We are told that everything has gone wrong because of this loss, and this we may well believe. But do we in turn appreciate how disastrous it is to any business for employer and employee to lose confidence in each other? It may be in some cases that such confidence has never existed and that harmony of action and sympathy between the two has never been possible. It is this lack of confidence that is at the bottom of all troubles. The capitalist will not trust the workman, and in turn the employee doubts the words of his employer. Most assuredly, however, the blame is not all npon one side. Upon the purchaser of labor there rests a great responsibility. but the workman who shall read these lines may also well take them to himself and ask to what extent the golden rule has controlled him in his conduct toward the one to whom he sells his labor. If he had tried harder to do by his neighbor in quality and quantity of work, in words spoken and thoughts unspoken, just what he sincerely desired that his employer should do by him, would his lot seem as pitiful,

would be not see two sides to the question, and would there not be a far better opportunity for the adjustment of all difficulties: Certainly confidence begets confidence, and very few are the natures that are not ultimately affected thereby. Evidence is not lacking that the employer who is implicitly trusted by those whom he employs receives from them better service, avoids many a subject of controversy and withal secures hearty co-operation in all that he undertakes.

#### Prison Labor.

A good deal of attention at the present time is being directed to the question of the employment of prison labor in the manufacture of goods which enter into competition with those made by free labor. The injurious effects of this practice are pointed out, as prison labor is furnished at a price which is exceedingly low and in many cases may be termed nominal, and the result is that manufacturers are compelled to reduce their wages in a corresponding manner, or, when this cannot be done, to abandon the manufacture of such goods altogether. There has thus been caused a great deal of injury both to the manufacturer and to the workman.

To prevent this condition of things some of the States have laws which prevent the employment of prison labor in competition with free labor, and others in one way or another have legislated, or are considering legislation, to minimize the evil as much as possible. Thus, for example, in the States of Ohio, Massachusetts, New York and others it is provided by law that the number of inmates in all of the penal institutions of the State employed at anyone branch of labor shall not exceed 5 per c-nt. of the total number of persons in the same State employed in the same kind of labor. The matter has recently been carefully considered in the Constitutional Convention of the State of New York, and among the proposed amendments of the Constitution is one which bears directly upon this problem:

The legislature shall by law provide for the occupation and employment of prisoners sentenced to the several State prisons, penitentiaries, jails and reformatories in the State, and on and after January 1, in the year 1897, no person in such prisons, penitentiaries, jails or reformatories shall be required or allowed to work while under sentence thereto at any trade, industry or occupation wherein or whereby his work or the product or profit of his work shall be farmed out, contracted, given or sold to any person, firm, association or corporation.

This section shall not be construed to prevent the legislature from providing that convicts may work for, and that the products of their labor may be disposed of to the State or any political division thereof, or for or to any public institution owned or managed and controlled by the State, or any political division thereof.

The above proposed amendment recognizes, it will be seen, the desirability, or necessity almost, of giving employment to the prisoners and attempts to leave room for work which will occupy their time and keep them from the evil effects of absolute idleness, while at the same time guarding manufacturing interests from the demoralization and injury which would be caused if the products of prison labor were put on the market.

As discussing this question in a practical and forcible way and illustrating the effects of competition with prison made goods, the following letter from the Stuart-Peterson Company, Burlington, N. J., manufacturers of Hollow Ware, will be of interest:

Our goods are made in prisons at Auburn, N. Y., Baltimore, Md., Columbus, Ohio, and Jeffersonville, Ind. We understand that Sing Sing, N. Y., will soon engage in a new line also. In regard to the effects of the same we will state that one hollow ware company in Philadelphia has gone out of existence on account of the prison octopus, and that we left Philadelphia in order, under reduced expenses, to cope with this great evil. No better evidence of the terrible effects of this conspiracy to wrest the bread and butter from the mouths of the families of honest labor can be found than that in a letter we have received from a Savannah, Ga., company, in which they refused to pay our bill because we charged them a reasonable per cent. over wages paid free labor, but which made the goods nearly double that of prison labor. This means we must either force our men from between \$2 and \$3 per day down to 40 cents in order to compete or quit the line. We cannot do the latter, pay forty cents, and thus must add one more item to the long list of goods we have ceased

to make because we cannot compete.

Another article this year has been forced down to such an extent that to compete we must lay \$1 worth down in New York for 79 cents. It is not the tariff-with all off we would still be under English prices—but it is the State farming out prison labor at 40 cents per day, and furnishing the plant, and asking us to pay taxes virtually to shut our own doors. Honest men go hungry that the politician con tractor may wax fat, and if you were to scratch the back of some men in high places we know of, you would find prison deal "under the skin. We can cite the case of a very large concern with all of the modern appliances, but who, despairing of competing with prison labor, now buy their goods of the prisons, block them over to change appearances, and sell them as their own make, thus wresting the work from their own workmen and adding prosperity to the prison contractor. How long this will continue, or how long the wheels of toil outside the prisons will continue to turn we cannot say. The Repubto turn, we cannot say. The Republican party promises protection to its voters, but in the direct need it forgets the prison and its baneful influence on honest labor. The Democratic party promises emancipation from the con-vict system, but aside from a feeble attempt at righting the wrong, the procession moves on as of old.

The laboring man strikes for higher

The laboring man strikes for higher wages from employers (already burdened with non-dividend paying plants), but forgets to help said em-

ployer at the polls by forcing this issue and thus securing higher wages by bettering his condition. In proof of this Hon. John O'Neill of Missouri, author of the pending bill in Congress to regulate prison labor, says: "It is a crying shame that the protests come from the manufacturing interests, not the laboring classes. The latter admit the evil, know that their families suffer, yet seem to feel that their influence is too small to have any effect. Thus what is everybody's business is nobody's, and the evil goes on apace."

#### SCRAP.

PRESIDENT MCMURTRY of the Apollo Iron & Steel Company, Apollo, Ind., has returned from a trip to Europe, in the course of which he visited many of the leading Welsh tin plate works, with the view of studying their methods.

A CORRESPONDENT of the Cincinnati Commercial Gazette, writing from Elwood, Ind., says: From present indications Elwood will soon have another tin plate factory, which is to be a four-mill plant. It is being organized by a leading stockholder of the American Tin Plate plant, who wants to enter the business on a larger scale than at present, and it will be a joint stock company, composed of local capital. It will have a capacity of 2500 boxes per week and employ 250 men. This will make the tin plate output of Elwood factories 8500 boxes per week as soon as the American plant gets to running at full capacity and will give employment to nearly 1000 men in this industry.

Nine new tinning stacks were put in operation last week at the works of the American Tin Plate Company, Elwood, Ind., and the establishment is now reported to be in full work in all departments. The men are paid at the old scale of wages, with the understanding that the company will get the advantage of any reduction that is eventually made by the other tin plate works.

WORK has been commenced on the buildings for the newly organized National Tin Plate Company, at North Anderson, Ind. The main building will be 480 x 87 feet in area. Contracts have been let for the necessary machinery for the rolling mill and tinning departments. The new plant will, it is said, provide employment for 700 men.

THE BEAVER TIN PLATE COMPANY, New Lisbon, Ohio, were incorporated on October 17, with a capital stock of \$200,000. The directors named are James C. Dent, W. J. Howell, B. M. Caldwell, J. A. Topping and William T. Graham.

A DISPATCH from Belle Isle, Va., states that a project is on feet to establish a tin plate works at that place.

PHILLIPS TIN PLATE COMPANY, Philadelphia, advise us that their works are at present running full, with five sets, on orders in hand.

A Washington dispatch at that Secretary Carlisle has informed customs officials that it is deemed desirable to continue the collection of correct statistics of the importation of tin and terne plates into the United Sta'es. Collectors are therefore instructed to require importers of such plates to specify and separate on their entries of tin and terne plates such as are lighter in weight than 63 pounds per 100 square feet, and such as weigh 63 pounds per 100 square feet and over.

MACKINTOSH, HEMPHILL & Co., Pitts burgh, Pa., have decided to engage in the manufacture of tin and terne plate on an extensive scale. As yet the plans for the new venture have not all been worked out but will be in a short time. The concern will not erect a bar mill, but will buy their sheet bars in the open market. It is proposed by them to erect a model plant in every respect. The engines for driving the mills will be especially heavy and driving will be done direct. In this connection we desire to state that the report that this firm would abandon the manufacture of ateel castings is without foundation. The firm will continue in this line as herectofore and have never contemplated giving it up.

THE APOLLO IRON & STEEL COMPANY of Pittsburgh, with works at Apollo, Pa., and manufacturers of galvanized iron and steel sheets and the and terne plate, deny the report that they contemp'ate the erection of a number of additional tin plate mills.

It is now some time since the daily papers quit making fools of themselves in confounding the terms tin and tin plate. The educational effect of the tariff discussion and the actual establishment of tin plate works in this country have not, however, permeated all the editorial recesses, as is evidenced by an article in a prominent New York daily of recent date, from which we extract the following entertaining sentences: "Putting tin on the free list reduces the mechanic's wages, if it does not put him out of work altogether.

. . There are now waiting in Liverpool and Cardiff for transportation to this country after October 1, when the new tariff, so far as it affects tin plate, goes into operation, 5000 tons of the product of Welsh mines."

Comptroller of the Currency James Eckels, who a few days ago addressed the Bankers' Club of Chicago, took s very hopeful view of the financial situation throughout the country. Hestated that the recent marked revival of business was by no means confined to the great financial centers. The last call for a statement from the national banks, made on October 2, showed an increase in reserve cities since July 18 of \$38,-000,000 of loans and discounts. estimated that, in addition to this, there was an increase of \$20,000,000 in outside cities. It was not confined to the financial centers but seemed to come from every section of the country, indicating a very general and healthy re-vival. Compared with the atatement of one year ago, however, the increase is phenomenal-more than \$150,000,-000. All this indicates a restoration of public confidence and more liberal investments.

In his annual report, Commodore George W. Melville, Chief of the Naval Bureau of Steam Engineering, makes the following pregnant statement in regard to the cruisers of the "new navy:" "In the 'Minneapolis,' the 'Columbia,' the 'Olympia' and the 'New York' we have produced," he says, "a quartet of cruisers which in point of speed are unequaled by a like number of ships of any navy in the world. Their trisls were more exhaustive and the result such as to leave absolutely no doubt as to the real speed. Subsequent examination of the machinery failed to disclose any weakness or defect of any nature whatever."

#### Iron Pipe Coupled to Lead.

We illustrate herewith the system used by the Star Coupler Company, St. Louis, Mo., in connecting the gas grates in the New Planters' House in St. Loui.

even, steady illumination. A number of mill men who have examined this room are of the opinion that it would not be light enough for weaving, although suitable for braiding, and others doubted its adaptability to a room containing many belts and col-

Iron Pipe Coupled to Lead.

It will be noticed that two couplers only are used, which, in conjunction with a piece of light lead pipe, an iron nipple and street ells, complete the connection. The point is made that by this system a great saving of time is accomplished. In this contract there were 104 grates connected, which work was done by two men in four days. The company state that if all iron pipe had been used as has been the custom heretofore, the work would not have been accomplished with two men in less than 14 to 15 days.

#### A Novel Method of Illumination.

Some months ago an English manufacturer made a number of experimenta to determine the best method of illuminating his cloth mills. According to an exchange, gas jets, incandescent lamps and arc lights were all tried and found wanting, because they either failed to give light enough, gave too much light or cast heavy shadows. Finally, a Continental idea was adopted. The walls of a room were painted white, and under each of a number of arc lights was suspended a reflector which threw all the light up to the white ceiling, from which it was reflected to the room below. This system was successful from the outset and has attracted considerable attention among English weavers. It was examined by Darius L. Goff, of the Goff braid mill in Pawtucket, and he has adopted it to light a braiding room 50 feet wide and 200 feet long, only seven arc lights being used for the pur pose. The room is admirably adapted for auch a system of illumination, as there are no columns in it and but a few belts near one wall. On entering it there seems to be an absence of proper light, but in a few minutes the feeling of dusk disappears in the unusually umns. Mr. Goff is to give it a practical trial in such a room, however, which will settle the question definitely.

#### Fire King Gas Grate.

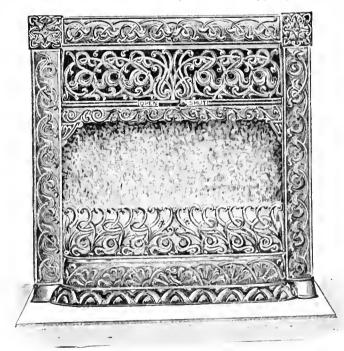

Among the goods which A. Weis-kittel & Son, Bultimore, Md., have

refer to the design, finish and heating capacity of the device, and state that the burner used is something new in that line. It is so made as to produce when in operation a solid wall of fire at the back of the grate. A combination cock is used, enabling the householder to adjust it to suit any kind of gas.

Another feature referred to is the damper, which is easily operated from the outside, and can be set to carry off the products of combustion without permitting an undue escape of heat to the chimney. It is well known that in the consumption of some gases more ventilation is required than with others, and the claim is made that this damper enables the operator to give the grate proper ventilation. It will be seen from an inspection of the engraving that no maker's name appears in sight to mar the beauty of the design, but It is placed in such a position that it can be readily found when desired. The manufacturers refer to the construction of these grates as being such that they heat by reflection, radiation and circu-They are made in various styles of finish, such as chony, oxidized, bright brass, &c. A catalogue of Fire King gas stoves has just been issued by the company.

A process for coating aluminum with other metals, the discovery of Herr Neesen, is thus described: The aluminum is cleaned by plunging it in a bath of hydrochloric acid or of caustle soda. It is then immersed in a solution of bichloride of mercury, which decomposes and amalgamates the surface of the aluminum, which is then plunged into the first bath again. After that it is sufficient to put the aluminum in a solution of a salt of the metal, gold silver, &c., of which the coating is required. The layer is adherent and the metal can be soldered by the methods ordinarily employed.

The first shipment of copper from the large new copper plant at Salt Lake

Fire King Gas Grate,

lately added to their extensive assortment of gas burning appliances is a grate which is made under the name Fire King, and illustrated in the accompanying engraving. The manufacturers

City, Utah, was made last week. It consisted of two carloads of 61,832 pounds' weight, one car of which went to a Chicago manufactory and the other to Pittsburgh.

# THE LETTER BOX.

#### Durable Galvanized Iron.

From G. C., Dorer, N. J.-1 inclose a sample of galvanized iron, about 24 gauge, cut from the bottom of a tauk lining that has been in constant use since 1871. This sample is not the best or the worst part of the bottom, but is about the average of the whole lot. The tank began to leak October 16 and since that time I have replaced the iron with 16 oz. copper, but I doubt if the new bottom lasts as long as the old one did, for I find that the lifetime of copper in our town is from 10 to 15 years. I took the copper lining out of a tank a short time ago that had not been over 11 years in use, and it was perforated in many places. In this case and in the case of the galvanized iron tank, the water was collected from the roof and raised to the tank by a pump. I would like to ask the question if one quarter of a century is not a good lifetime for sheet iron under water, for the tank has not been known to be empty during that whole time? It supplies the house with hot water and the fixtures in the bathroom, so you see it had to be kept full continually. There are some parts of this iron on the outside face (next to the wood) that are as bright as the day the iron was put on. Furthermore, the metal seems to be very tough, for in taking it out it had to be cut with a chisel, while very often old iron will tear, but it would not in this case. I have made vessels from the iron manufactured at the present time that would rust out after short use. The sample I send seems to be far better than the iron of the present day, and I send the sample with this account of it, as I think it will interest the craft.

Note. — The sample our correspondent sends us fully bears out the account he has given. Iron that has been used for nearly 25 years cannot be expected to have the bright, fresh look of a sheet just from the mill, but is, however, in an excellent state of preservation and is merely dulled as if from weathering, while the inside shows very little trace of rust.

#### Front Wall Trap Regulations.

From J. J. R., Brooklyn.—Will The Metal Worker please state whether the plumbing regulations of New York City require a trap at the front wall and a fresh air inlet to the plumbing systems of all new buildings? In altering the work in an old building, does the same rule apply? Are the lectures on steam and hot water heating at the New York Trade School published in book form; if so, what is the price?

Answer.—A front wall trap and a fresh air inlet are required by the plumbing laws of New York City, and the same laws that apply to New York apply to old work or alterations. Some discussion on the use of front wall traps will be found in The Metal Worker

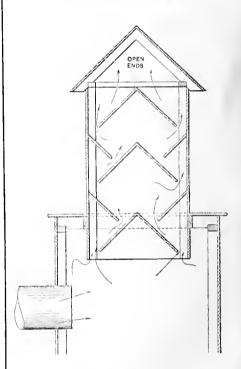

of June 2 and 9. The first regular course in steam and hot water heating given by the New York Trade School will begin January 2, 1895; consequently the lectures are yet to be given and have never been printed. The instruction given at this school in other classes ineluded printed question sheets, on which there is space for the pupil to write the answer. The lecturer writes the answers on a blackboard and the pupils copy them on the question sheets. This gives a writing lesson, and then each question and answer is explained at greater length by the lecturer, whose remarks are guided partly by the questions asked and his experience, and are not in the form of a speeially prepared lecture. None of the lectures have been printed in book form, as it is deemed that the pupil re ceives greater benefit from the present method of imparting information.

#### Dust Collector.

From N. & K., Wisconsin.—As we always find the Letter Box very profitable, and as our brothers in the craft are called upon to take a hand at almost everything, we thought we might get some help by submitting to you our difficulty. We are about to put in a fan in a planing mill to take away the shavings, sawdust, &c. We think we understand about attaching to the different machines, but we are at a loss how to make a proper receiver for the shavings, &c. We have seen them advertised, but for what we have to do we imagine we could construct something to fill the bill for us to cost but a trifle in comparison with the cost of the manufactured articles.

Answer. - A dust arrester or collector is certainly a necessity with any satisfactory system of removing shavings and sawdust from wood working machinery by the use of a fan. The common form of the sheet iron dust collector acts upon the centrifugal principle, the air laden with the refuse material entering longitudinally near the base of an inverted conical receptacle. By a proper arrangement of guides and deflectors within, the air, freed from dust, is permitted to escape at the top while the deposited shavings and sawdust pass down and out through a pipe connecting with the apex of the cone. This type of collector is, however, so extensively covered by patents that we can neither advise our correspondents to make one on their own responsibility nor can we furnish drawings which we could guarantee as embodying no infringements. Therafore, if a collector of this kind is desired

our correspondents will have to apply to the manufacturers. It is possible, however, by providing a settling chamber of sufficient size with a suitably arranged outlet therefrom, to secure fairly good results in the attempt to prevent the refuse from being blown into the open atmosphere. Such an arrangement is shown in the accompanying sketch. The discharge plpe from the fan should just enter the chamber at one side so that the material may be well scattered therein. The increased area of this chamber causes such a reduction in the air velocity that it no

A Dust Collector.

longer has power to prevent the particles from falling to the bottom. For the best results this chamber should have an area, in plan, not less than 15 to 20 times that of the pipe. Escape for this air is provided through the ventilator above. The baille boards serve to prevent, so far as possible, the direct discharge of any auspended material to the outer air. The full outlet area through this ventilator should be at least twice that of the discharge plpe from the fan. So far as we know there is no patent upon this device. Of course, the bottom of the chamber must be so constructed or arranged that the material deposited there may be easily removed. It is also evident that such a device can be easily made up of galvanized iron, although here shown as of wood construction.

## The Principles of Furnace Heating.

From W. R, Philadelphia. — The hints given to "C. F." in reference to an unsatisfactory furnace in The Metal Worker, October 20, are very good. He may be still further helped by having some of the principles that govern the movement of air pointed out. When there is no wind to move air its motion is due to the difference in its weight at different temperatures. Cold air is heavier than the same quantity of warm air and will sink, forcing the warm air to rise, creating a motion that will continue as long as there is a difference in weight. In order to show how little power exists to bring about this move ment the weight of air at 22° and at 230° is compared. These temperatures are selected as temperatures likely to be found at the entrance of the cold air duct and at the register face. The weight of a cubic foot of air at 22° is about eight one hundredths (0.08) of a pound, and at 230° a little less than six one hundredths (0 06) of a pound. From this it will be seen that there is a difference of but about two one-hundredths (0.02) of a pound in the weight of a cubic foot of the air that enters and flows from the furnace. From this slight difference is the force that must overcome all of the obstacles to a rapid movement, such as friction of the passages and turns in supply duct, irregular course through the furnace, turns from furnace to hot air pipes, turns to flues, restricted or badly shaped flues and the obstruction of the register face. It also has to overcome a pressure when the heating pipe runs toward the prevailing wind, or a suction when the wind blows away from the entrance to the supply duct. This the entrance to the supply duct. is the only force to drive the air out of a room already full of air to make room for a new supply of warmer air. The resistance met is by no means small when there is no fire place or ventilating ducts and leaks around doors and windows afford the only escape. With so little power it is wonderful that some furnaces work at all, and shows plainly that in successful work nature must be assisted without consideration of first cost, if the final cost is to be the minimum. In considering the bulk of air, the volume at 32° is used for a basis and put at 1.000, and the same air at 22° has a volume of 0.980; at 230° it has a volume of 1.407, and to double its bulk or volume the air would have to be heated from 22° to nearly 550°. In "C. F's" plant the cold air duct has an area of 240 square inches and the combined area of the heating pipes is about 360 square inches. Assuming the air entered at 22°, it would have to expand in volume one half to fill all of the pipes, and if heated to 230° it would not quite do so.

Assuming that this deficiency is the only hindrance to the heating, it is natural that the pipes leading to the hall and upper rooms would be fully supplied if the other pipes were not. If the air supply is insufficient, the flow of air through the pipes to the lower rooms is apt to be spasmodic, sometimes a good flow of air to a room and again no flow. This condition may be transferred from one pipe to snother without apparent cause or by the opening of a door or a sudden movement of persons in a room. Furnaces have been known to take the air from one room to another where the air supply was not sufficient. In any careful calculation on heating, the velocity with which air moves at different temperatures and the

friction inust be taken into consideration, also the cooling effect of the building to be heated or its capacity to retain heat. Enough, however, has been given to show the importance of doing furnace work with the head as well as with the hands.

#### Eels in Corporation Taps.

From G. F. S., Washington, D. C .-I read with interest the article on "An Eel in the Corporation Tap" in The Metal Worker, October 13, and give an experience of a similar kind here. of the taps used here are screwed into the mains by a patented process. We have to take eels out of the pipes here so often that little thought is given to the matter, but it happened so frequently at a warchouse near my place and caused the owner so much expense that he thought he would try a saving experiment which proved costly. He had an "all around" workman in his employ who offered to remove the obstruction once when the water supply was stopped. He opened the street and uncoupled the tap connection and found an eel in the tap and fussing and pulling at the eel the tap came out. As it was in a 12-inch main carrying a pressure of 60 pounds he was unable to get the tap in again. The water shot up higher than a telegraph pole near by and the water department refused to shut off the water on the main. The superintendent remarked that it served them right; they should have bired a plumber. I was sent for and went to work, laying a door across the ditch, having men to hold it down until the ditch was full of water. Then I got a wooden pole and sharpened the end till it was tapering and about the size of the hole. I stood on the door and felt around with the pole until I found the hole in the main, then drove the point of the pole in tight for a plug. After this I dipped the water out of the ditch till I could work on the main. Then carefully and by degrees I cut off the pole till I could drive the short piece of it that remained into the main with the tap which was then screwed in tight and the connection made.

#### Protection Against Rust.

From a Subscriber.—Can you give a good formula for a dressing for planished iron as a proof against rust? Some of our stoves, made up in early spring, notwithstanding they were well wrapped in paper, show rust spots, and of course are considered damaged by our customers. Any information leading to a good dressing will be thankfully received.

Note. - This is an opportunity for our readers to give the recipcs for the protectives they use. A protective that has been used with satisfaction by a large manufacturer of sheet Iron stoves is made by dissolving good beeswax in benzine or turpentine, so that when applicd with a soft brush a thin film will cover the surface. When it dries it will protect the iron from moisture, and so prevent rust. It does not interfere with blacking, and no wrapping of the stove with paper is necessary. The mixture should be kept in a covered can to prevent evaporation, but if it should become too thick it can be readily thinned.

#### Tar on Tin Roofs.

From W. N., New York, -I note in the issue of the The Metal Worker of October 20, 1894, the criticism of the use of tar for repairing tin roofs on account of its injurious effects on tin plates. Although not an advocate of tar rooting, I believe tar is of great value in closing up troublesome leaks in tin roofs, and experience has shown it to injure the tin very little. I have in mind a standing seam roof of which some of the standing seams were in a leaky condition, and after repeated tria's with thick paint and paint skins, tar was used over the seams and kept them tight without any further trouble. I also have in mind five flat pitched tln roofs, which it was impossible to get water tight and on which the use of paint skins and solder was but a loss of time and money, but where by coating the entire roofs with tar the leaks were stopped and no trouble since, and that is about five years ago. I would sooner favor the ripping off of a leaky tin roof and replacing it with tin or slate; but when the owner of a huilding desires it repaired we use as a last resort, when solder or paint skins fail, a coating of tar, which gives good results.

From J. E., Brooklyn, N. Y.—In The Metal Worker of October 20, two of your correspondents claim that tar is injurious to tin and will not last any length of time. I do not know what chemicals are in tar, but I do know that I have put on tin flashings on flat roofs, the flat portion as well as the flashings being covered with tar, and I have had no trouble with the tin corroding. This work was done over six years ago.

#### Labor in France.

The recently published report to the State Department of Stephen H. Angell, United States Commercial Agent in France, shows the condition of labor in that country to have been in some respects even worse than in our own during the summer. Quoting the figures of the Central Labor Bureau in Paris, Mr. Angell shows that a very large proportion of workmen were without employment in the month of August last. From 645 labor unions, representing a membership of over 129,255, reporting at the central office. it is shown that about 14.4 per cent. of all the laborers of the country are still without employment. Of these unions 53 report the situation to be worse than it was one year ago. In the agri-cultural districts over 67 per cent. of the laborers are still without work, and in the wine districts this percentage is increased to about 80 per cent. The report enters fully into the condition of the workingman in all branches of trade and industry, and makes a startling exhibit of the extent of the industrial depression in France.

The Cotton States and International Exposition, to be held at Atlanta, Ga., has secured a chime of heits, which is said to be the finest ever assembled in this country and larger than that at the World's Fair in Chicago. They are to be placed in a tower 150 feet high, on the big Manufactures and Liberal Arts Building of the exposition.

A new cordage concern, under the title of the Western Twine Company, have been organized to undertake the speedy sale of the 20,000 tons of twine held by bankers as collateral security for loans to the old National Cordage Co.

## STEAM AND HOT WATER.

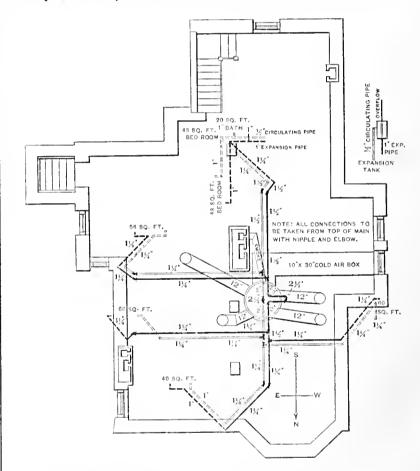

## A Tested Combination System.

Various methods are used for heating buildings by a combination hot air and hot water apparatus. The system described and illustrated is in a residence at Plattsburgh, N. Y., where it has been in use one winter, giving entire satisfaction. The method followed is to heat the upper floor by hot water radiators alone, and the lower floor, with the exception of the hall, by hot air registers. The plant was arranged by W. M. Mackay, New York manager of steam and hot water department of Hart & Crouse, Utica, N. Y., using a No. 53 Prince Royal combination heater. Fig. 1 shows the cellar plan, with the hester and its equipments. Fig. 2 shows the first floor and Fig. 3 the second floor. The heater is located central floor and Fig. 3 the second floor. trally in the cellar, as shown in Fig. 1, and is supplied with cold air by a 10 x 30 inch duct leading from a western exposure outside. This duct has an area of 300 square inches and feeds four 12 inch pipes leading to 12 x 15 inch floor registers in the front and back parlors, hall and diaing room, as shown in Fig. 2. These pipes have a combined area of about 450 square inches, so that the air supply is a little less than three-quarters of the delivery. This insures a positive change of air in the house, as there are two fire places to aid in disposing of the air in the house to make room for the constantly incoming supply of fresh air. The use of floor registers avoids otherwise necessary turns in flues and a probable reduction in size, which retards the air flow, and so reduces the efficiency of the heater and increases the coal bill. From the water heater a 21 inch flow main rises to T, from which a 2 iuch branch main runs toward the front and the back of the house. The back main is reduced to 11 inches after passing a 11 lneh branch, which runs to a radiator of 56 square feet of surface placed in the chamber over the dining room. It then runs back to a point where it terminates in a 11 inch riser, which has a 1-inch branch to a radiator of 48 square feet of surface in the chamber over the back parlor and another 1-inch branch runs to a radiator of 20 square feet of surface in the bathroom, as shown in Fig. 3. After passing the bathroom radiator a 1 inch circulating pipe is taken to the expansion tank, which is placed in the bathroom, as shown. This is to cause a circulation in the expansion tank to keep the water warm and prevent its freezing. Return pipes of the same size as the flow pipes are connected with the return end of the radiators and follow the flow mains back to the heater. In the bathroom a 1-inch pipe is run from the return pine of the radiator to the expansion tank to provide for the expansion of the water in the entire system when it becomes heated. From the top of the expansion tank a 1 inch pipe runs above the roof for an overflow; also for an air vent or steam vent. The connections to the expansion tank are shown in the diagram at the right in Fig. 1. The flow main to the front of the house has a 1?

inch branch to a radiator of 68 square feet of surface in the downstairs hall. It then is reduced to  $1\frac{1}{3}$  inches and runs to another  $1\frac{1}{3}$  inch branch, which feeds a radiator of 60 square feet of surface in the chamber over the front parlor. This main then continues  $1\frac{1}{3}$  inches till it terminates in a 1-inch riser to a radiator having 40 square feet of surface in the chamber over the hall. The method of apportioning the heating surface required in the chambers is the same as is generally used in calculating surface for an all hot water heating plant. Some difficulty has been experienced in com-

reply from Colorado Springs was to the effect that the Buffalo fans in a high school were giving perfect satisfaction; another from Salt Lake City was that the plant was most satisfactory and the economy in fuel notable. There were four schools and a hospital in that city using the system. Still another reply from Denver was that the system, which was used in the Denver schools, was both efficient and economical.

THE IDEAL BOILER COMPANY, 36 Dearborn street, Chicago, Ill., send out an advertising card showing a large

A Tested Combination System,-Fig. 1.-Cellar Plan, with Heater and Piping.

bination heating in getting the heating surface in the rooms warmed by radiators so proportioned that the furnace when fired properly will warm the air heated rooms. In this system, after the upstairs radiators are supplied, the surplus capacity of the water heater is utilized in the radiator in the hall and the surface it exposes seems to have been correctly determined, as the plant has been entirely satisfactory to the owner.

#### HEATING NOTES.

The St. Louis School Board recently investigated the claims of the Buffalo fan system of heating and ventilation, and in reply to inquiries sent to several places where the system was in use received the following. One

section of the nipple joint used in the new Ideal boiler with brief reference to its advantageous features. A small sectional cut of the entire boiler shows its construction and arrangement of the heating surface.

A STEAM HEATING COMPANY has begun the work of laying pipes on Broad street, Chester, Pa.

ONE of the new things on Centre street, New York, is a black shield with a red band hearing in gold letters the address of the Holland Radistor & Mfg. Company.

IN THE ADVENTISEMENT in last week's issue of The Metal Worker of the Magee Furnace Company, it was erroneously stated that the hot water capacity of their combination heater was from 75 to 100 square feet of radiating surface.

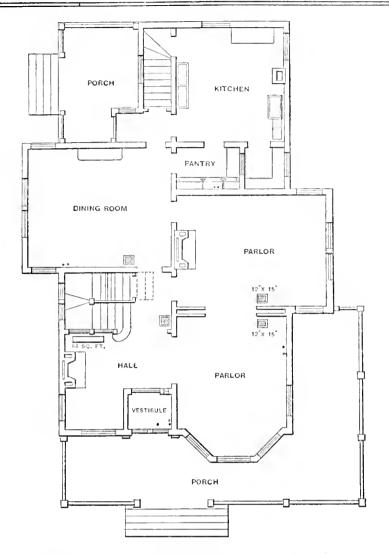

Fig. 2.—First-Floor Plan, Showing Registers and Hall Radiator.

The figures should have been from 75 to 700 square feet of radiating surface. Our readers will notice that this is a decided difference and shows the extensive range of the combination apparatus.

Berlanger & Bosse are a new firm in the heating business at Montreal, Canada.

D. R. McCallum, the manager of the New York (ffice of the J. II. McLain Company, Canton, Ohio, has made a requisition on the foundry for three carloads of assorted Humber, Cambridge, Yale and Sandow steam and hot water heaters. A carload that has just arrived is being distributed, and a satisfactory trade is reported.

UNITED STATES HEATER COMPANY, Detroit, Mich., issue a small poster calling attention to the Capitol and Hecla steam and hot water heaters. On the card are illustrations of many buildings in which these apparatus have been installed.

One of the ornamental attractions of the showroom of Blake & Williams, 188 South Fifth avenue, New York, is an oak sample board on one of the walls in a handsome frame. Arranged on it is a full line of their pipe hangers for attaching to wood, iron girders or brick work, all finely tinned and displayed with artistic effect. The showroom contains a variety of steam and hot water apparatus, their own hoiler, of course, filling the place of honor. A number of water and steam gauges, damper regulators and direct and indirect radiators are shown.

Through their agents, the Providence Engineering Company, the Mason Regulator Company of Boston have installed during the past month the following boiler feed pumps in the city of Providence: American Electrical Works, No. 8 pump; Kent & Stanley Company, No. 6 pump; Continental Steambost Company, two pumps; American Dagras & Chemical Company, Brownell, Field & Co., Providence Journal Company and Butman & Tucker.

J. II. Colman, Jr., representing the New York office of the J. H. McLain Company, Canton, Ohio, starts to-night for a trip among the steam, hot water and hot air furnace trade of New England.

C. M. Converse, Western manager of the Elwood Iron Works, 96 Lake street, Chicago, is distributing blotting pads with numerous useful features. An ensmeled card is fastened to the blotter, which is marked off as a 9 inch rule, bears an October calendar, states postage rates and incidentally calls attention to the new E wood radiator.

The Lord & Burnham Company, Irvington-on-tht-Hudson, N. Y., issue handsome publications relating to greenhouse heating and ventilating apparatus. One of the pamphlets is a catalogue and opens with illustrations, sectional and general, together with descriptions of their hot water bollers, which are made in a variety of sizes. Their steam boiler is similarly illustrated. Their self feeding hot water boiler, which is a somewhat smaller construction, is designed for heating greenhouses, conservatories, baths and other buildings where their regular boilers would be too large. Their hot water stove is another construction; then comes a variety of cast iron pipe and fittings adapted to this sort of work. Vapor pans and expansion tanks are

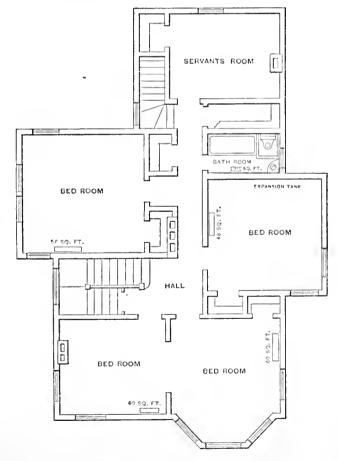

Fig. 3.-Second-Floor Plan, Showing Radiators.

next noted, then the ventilating apparatus and other greenhouse fittings. At the close are a number of testimonial letters. A second publication is devoted to illustrations and descriptions of greenhouses that have been erected by the Lord & Burnham Company recently in different parts of the country. Some of the structures are exceedingly elaborate and comprise houses for various uses. Both the volumes are finely printed and present a most attractive appearance.

A COUPLE of small publications, somewhat larger than leaflets and somewhat smaller than pamphlets, issued by the Gurney Heater Mig. Company, 163 Franklin street, Boston, Mass., will be appreciated by the trade. One of them is called "Opinions," and is a little, yellow bound, four page publication addressed to the dealer handling the Gurney heaters and gives him some valuable pointers on how to impress the customer with the merits of these apparatus. The second states that an Arabian horse with a mule's head and a zebra's tail is not an Arabian horse—similarly, the Gurney apparatus if installed with unsa'isfactory radiators is thereby lessened both in value and usefulness.

THE ROYAL STEAM HEATER COM-PANY, Gardner, Mass., have been rushed with business ever since the new factory was opened. Some of the men, it is reported, have had to put in over 70 hours a week lately to keep up with the work.

The Engineering Magazine has in its October issue inaugurated a "Review of the Industrial Press," the aim of which department, as explained in the magazine, is to give expert reviews of the most important publications of the month in every field of applied science; to supply a complete index to all the leading articles published in the scientific and industrial journals of all the English speaking peoples, and finally, through a press clipping bureau, to furnish the original and full text of the articles so noted. This feature of the magszine will be much appreciated by those whose time is so limited that they cannot themselves scan the multitude of trade and technical papers that are issued every week.

The Heath & Milligan Mfg. Company of Chicago, the well-known paint manufacturers, have sustained a loss in the death of Mouroe Heath, president and founder of the company, which occurred suddenly at Asheville, N. C., on the 21st inst. Mr. Heath was born March 27, 1827. He was one of the prominent citizens of Chicago, having been honored with the cilice of Mayor.

Arrivals of steerage passengers from Europe at New York are beginning to show an increase over the figures of the past few months. Last week's arrivals were the highest for a long period. Most of these people are, however, not new immigrants, but have already been in the United States and are returning after visiting their native countries. True immigration into this country is still below the emigration out of it.

The announcement is made of the discovery of a new and rich gold field in the Calico mining district of Californis.

#### The Phillips Gas Heaters.

The Phillips Gas Stove Works, 92 East Eighth street, Cincinnati, Ohio, have recently placed upon the market some new designs in gas heaters, illustrations of which are given herewith. Fig. 1 represents an open front reflector au attractive asbestos flame plate. The flame plays over the asbestos in such a way as to cause it to become lineandescent, producing a brilliant effect, while throwing out at the same time an intense heat. These designs are referred to by the manufacturers as being rish and artistic and well calculated to meet

The Phillips Gas Heaters .- Fig. 1.-Heater with Polished Copper Reflector.

heater suitable for use in dwellings or offices. The ornamental top, front and base are made of cast iron, while the casing is of Russia iron. The reflector

with a large sale. The heater shown in Fig. 1 is 35 inches high, 25 inches wide and 20½ inches deep, with a reflector opening 16 inches square. The con-

Fig. 2.—Asbestos Gas Heater.

is of highly polished corrugated copper, and the makers state that the burners give a flame free from odor and powerful in effect. Fig. 2 represents an asbestos gas heater having highly polished corrugated copper reflector with

sumption of gas, as stated, is 21 feet per hour. The asbestos heater shown in Fig. 2 is 36½ inches high, 26 inches wide and 21½ inches deep, with reflector opening 17½ inches square, and consumption of gas 231feet per hour.

## PLUMBING and GAS FITTING.

#### Master Plumbers of Arkansas.

The Master Plumbers' Association of Arkansas held its first annual convention at the Richelieu Hotel, Little Rock, Ark., last week for the purpose of or-Ark., last week for the purpose of organization. J. A. Monagan of Eureka Springs, State vice-president for the National Association, and about 35 others were present. The following is a partial list of those who attended:

J. A. Monahan of Eureka Springs; M. F. Smith, W. H. Bruce and A. Richert of Fort Smith; W. H. Bonner and J. W. Millmine of Hot Springs; F. A. Stanley and A. J. Robinson of Pine Bluff; W. J Buhrman of Texar-kana; C. H. Barnes, representing the American Boiler Company of Chicago; L. B. Yeiser, representing Ahrens Oct Mfg. Company of Louisville; Nick Peay, A. Rogoski, J. M. Dungan, J. J. Coughlin, W. B. Brooks, E. C. Platt, L. and A. Mandelbaum, A. Melcher, John Hughes and Smith Glidewell of Little Rock.

After organizing and discussing the work of the association the following officers were elected: President, Michael Smith of Fort Smith; vice president, Frank Stanley of Pine Bluff; treasurer, A. M. Melcher of Little Rock; secretary, John M. Dungan of Little Rock.

Executive Committee: H. W. Bonner of Hot Springs; Nick Peay of Little Rock; J. A. Robinson, Pine Bluff.

Sanitary Committee: A. V. Rogoski of Little Rock; F. J. Hughes of Little Rock; A. A. Mandelbaum, Little Rock; J. W. Millmine, Hot Springs; Aug.

Richards, Fort Smith.

An informal banquet was tendered the delegates by the meater plumbers of Little Rock at the Richelieu at which covers were laid for 30.

#### Illinois Plumbing Ordinance.

The Illinois Master Plumbers' Associstion are appealing to their members to work for the passage of a State law for the regulation of plumbing work that has been drawn up for presentation to the State Legislature. The bill, which is printed below, deserves the warmest support of all who are in terested in the cause of sanitation and good health:

good health:

Section 1. No person, firm or corporation not now engaged in or working at the business of plumbing, shall hereafter engage in or work at said business in this State, either as a master or employing plumber or as a journeyman plumber, unless such person, firm or corporation first receives a license therefor, in accordance with the provisions of this act.

SEC. 2 Asy person desiring to engage in or work at the business of plumbing, either as a master or employing plumber or as a journeyman plumber, shall apply to the board of health having jurisdiction in the locality where he intends to engage in or work at such business, and shall, at such time and place as may be designated by the Board of Examiners hereinatter provided for to whom such application shall be referred, he examined as to his qualifications for such business. In the case of a firm or corporation, the examination and licensing of any one member of the firm or the manager of the corporation, shall satisfy the requirements of this section shall not apply to cities quirements of this act; provided, the provisions of this section shall not apply to cities

or towns where the inspector of buildings has control of the regulations regarding

has control of the regularious plumbing.

SEC 3. That there will be in every city and each town of five thousand inhabitants or more, and in each town having a system of water supply or sewerage, a board of examiners of plumbers, consisting of the chairman of the board of henlth, and in cities or towns having an inspector of buildings, the inspector of buildings of said city or town, who shall be members ex-officio of said board, and serve without compensation, and a third member who shall be a master plumber. Said third member shall be appointed by the mayor of said city or town within three months from the passage of this act, for the term of one year from the first day of May, in the year of appointment, and thereafter annually before the first day of June, and shall be allowed a sum not exceeding five dollars for ench day of actual service, to be paid from the treasury of such city or town; provided, that if in any city or town there is no inspector of buildings, said board of health shall appoint a second member of said board of examiners who shall be a master plumber, and whose term plumbing.
SEC. 3. That there will be in every city and said board of health shall appoint a second member of said board of examiners who shall be a master plumber, and whose term of office and compensation shall be the same as is heretofore provided for said third member. The common conneil of all cities shall annually insert in their tax levy a sufficient sum to meet the expenditures incurred under the provisions of this act; and all expenses incurred by the several boards of examiners in the execution and perform.

all expenses incurred by the several boards of examiners in the execution and performance of the duties imposed by this act shall be a charge on the respective cities, and shall be andited, levied, collected and paid in the manner as other city charges are audited, levied, collected and paid.

SEC. 4. Said board of examiners shall, as soon as may be after the appointment of said third member, meet and organize by the selection of a chairman, and shall then designate the times and places for the examination of all applicants desiring to engage in or work at the business of plumbing within their respective jurisdiction. Said board shall examine said applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilagage in or work at the husiness of plumbing within their respective jurisdiction. Said board shall examine said applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilation, and if satisfied of the competency of the applicant, shall so certify to the board of benith or inspector of buildings, as the case mmy be, in their respective city or town. Said hourd of inspectors shall thereupon issue a license to such applicant authorizing him to engage in or work at the business of plumbing, as master plumber, or employing plumber, or as a journeyman plumber. The fee for a license for a master or employing plumber shall be two dollars; for a journeyman plumber it shall be fifty cents. Said license shall be valid and have force throughout the State, and shall be renewed unnually upon payment of a fee of fifty cents. In case of removal beyond the jurisdiction of the board or inspector issuing the original license, it may be renewed by any hoard having like authority.

Sec. 5. The board of health or inspector of buildings of each city or town, mentioned in section three of this act, shall, within three months from the passage of this act, appoint one or more inspectors of plumbing, who shall be practical plumbers, and who shall hold office until removed by said inspector for cause, which must be shown. The compensation of such inspectors shall be determined by the board or inspector appointing them, and be paid from the treasury of their respective cities or towns. Said inspectors shall inspect all plumbing work for which permits are hereafter granted in their respective tities or towns. Said inspectors shall nespect all plumbing work for which permits are hereafter granted in their respective tities or towns. Said inspectors shall nespect all plumbing work for which permits are hereafter granted in their respective tities or inspector all violations of any law, ordinance or by-law, relating to plumbing work, and also perform such other appropriate duties as may be required.

Sec. 6. Eac

priate duties as may be required.
SEC. 6. Each city and town of tive thousand inhabitants or more in this State, and every town having a system of water supply or sewerage, shall by ordinance or tylaw, within six months from the passage of this act, prescribe rules and regulations for the materials, construction, alteration and inspection of all pipes, faucets, tanks, valves and other fixtures by and through which waste water or sewernge is used and charted, and provide that no such pipes, tanks, faucets, valves or other fixtures shall be placed in any building in such city or town, except in accordance with plans which shall be approved by the board of health of such city or town, or such person or persons as said board of health may designate; and shall further provide that no plumbing work shall be done except in designate; and shall further provide that no plumbing work shall be done except in case of repair leaks without a permit being first issued therefor upon such terms and conditions as such city or town shall prescribe.

scribe.

SEC. 7. Any person violating any provision of this act shall be deemed guilty of a misdemeanor, and be subject to a fine not exceeding tifty dollars for each and every violation thereof, and his license may be revoked by the examing board provided for in section three in this act.

SEC. S. All acts and parts of acts inconsistent herewith are hereby repealed.

#### Mayor, Lane & Co.,

128-132 White street, New York, are completing the show of plumbers' goods in their sample room, having moved into their large seven story building early in the summer. The sample room covers a space of 100 x 150 feet. At the entrance Mr. Mayor of the firm has a small office, where all queries concerning the infinite variety of things required in the plumbing supply trade are answered. At the rear and extending across the showroom, under a skylight, is the accounting department. At the front of the showroom are showcases, in which are arranged all the small tools employed by the plumbing craft, while against the east wall are arranged hatchet bolts, round irons and a number of other tools, as well as soldering furnaces using charcoal and gasoline. Another showcase displays against a black silk velvet background a variety of basin cocks and fixtures. On the west wall, at the entrance, a handsome decoration is made of round and oval lavatory bowls, plain and embossed and ornamented in gilt and colors in flower designs and scenes. The columns supporting the building are also employed to support decorations formed of the same goods. An Italian marble platform extends along the east wall, on which are arranged water closets of various descriptions, their Puritana siphon closet occupying the position of honor, followed by the Meritana, Pil-grim, Perfecto and Plymouth wash out closets, all of which are connected with flush tanks and can be shown in oper-A portion of this wall is occupied in the display of shower baths of different styles and character, the most attractive being a bath fitted with all the sprays used in sanitariums. After these are shown a variety of slop sinks in porcelain lined cast iron, white porcelain and earthenware. Parallel with this exhibition is a line of handsome lavatories of onyx, Numidian African, Tennessee and Knoxville marbles, fitted with open work plumbing fixtures and a variety of atyles of basin cocks, all nickel plated. Some of the lavatories are supported by ornamental legs, while others rest on brackets. On the opposite side of this row are still other lavatories, including the double

lavatory adapted for use in barber shops, with shampoo and shower bath attachments, and some handsome pantry sinks with marble slabs and nickel fittlngs. Across the aisle from this dis play are arranged bathtubs of various styles and finishes. The first to catch the eye are two handsomely decorated Roman baths of enameled cast iron, followed by roll rim French baths, wood rim baths, &c. After these come a varied line of steel clad baths in different shapes and sizes. These baths are fitted with various styles of supply and waste and some with shower bath attachment. Across another aisle is a handsome display of water closets arranged five tiers in hight, each tier forming a complete circle, topped by a circular crown supporting five Puritana water closets in different stylcs of decoration and finish. This is a novel show and very attractive. At the back of the showrooms are displayed a variety of laundry tubs of slate, sospstone, brown Yorkshire and porcelain, as well as a varied assortment of hopper closets, ranging from the plain cast iron construction to the porcelain lined and carthenware. The most fascinating of the various attractions is found in two small rooms, fitted up as modern bathrooms. One room is floored with white tile laid in blue cement, the joints giving a very pretty effect. The side walls are walnscoted with cream colored tile, decorated with gilt fleur-de-lis, a richer shade of buff being carried from the top of the tiling to the ceiling, which is ornamented with a stucco design, the relief portlons of which are gilded, while the ceiling is finished in similar style. In the center of the ceiling is placed a large electric globe, with smaller globes at each corner. The fixtures consist of roll rim Roman bath and onyx lavatory with gilt trimmings and Puritana water closet.

A shower is arranged in connection with the bath, and the entire room is likely to prove a source of interest to all who may visit it. The second room is floored with sea green tile, while tile of a light blue color wainscot the side walls. The walls above the tile wainscoting are finished in a blue tint, forming a very pretty contrast. At one side of this apartment the wall is divided into two panels, one of which is handsomely ornamented and the other beautified by the use of a French glass mirror. The ceiling is finished similar to the one previously described and the fixtures in this room are as elaborate in their appointments as those contained in the apartment already mentioned. Besides these rooms several styles of urinal stalls and fixtures are shown.

#### TRAPS AND VENTS.

THE 1894 CATALOGUE A just published by the Bailey-Farrell Mfg. Company, Pittaburgh, Pa., is an elaborate and handsome volume. In size it measures 10 x 13 inches, is bound in cloth, with a gilt title and contains over 200 pages. This firm, who are well-known manufacturers of sanitary plumbing goods, have in this catalogue, so they advise the trade, presented only such articles as are of a high sanltary quality and have, in consequence, eliminated much that was heretofore illustrated. They have made many additions of new goods and a general revision of prices. trade and architects are invited to visit their showrcom at 621 Smithfield street, where the goods illustrated are set up for inspection. The opening pages show bathroom interiors in various arrangements. Porcelain lined batha

are next noted, 24 pages being given up to this one class of goods, the large and finely executed engravings showing the articles to excellent advantage. Then articles to excellent advantage. follow 12 pages devoted to Corinthian percelain lined roll rim baths in various Other roll rim baths, the Hyperion and Plutus, come next, then the Brighton and after them the Amphiou. diagrams of floor space required for the different baths being an excellent feature of this section of the catalogue. Other different styles of baths follow. Then come six pages of colored representations of finely decorated porcelain lined rell rlm baths. The different styles are illustrated and an excellent idea obtained of the tasteful decoration of these goods. Foot and seat baths are next noted; then attention is given to wash trays, lavatories, wash stands, slabs and bowls, ainks, alop sinks, slop hoppers, kitchen sinks, &c. The next general division of the work is devoted to flush rlm hoppers and hopper closets for valve and tank supply, this being followed by hopper traps and other goods. Special santtary fixtures take up the next division and shower baths, closets, ncedle baths, sinks and urinal stalls complete the work, which ends with an alphabetical index. Altogether it is a very well arranged volume and will be appreciated by the trade.

THE TIRRILL GAS MACHINE COM-PANY, 39 Dey street, New York, have recently placed a gas machine in the residence of Mrs. Stewart, at Kent, Conn. They have also put a mschine in the new residence of Arthur Duane in Sharon, Conn.

R G. WALKER has moved his plumbing establishment from the Odd Fellows' block to the brick block nearly opposite his old location at Muskegon, Mich.

H. L HURLBURT Williamsburg, Pa., having been appointed to superintend an extensive plumbing contract in Philadelphla, has sold his plumbing shop at the corner of Hay street and Rebecca avenue to the new firm of Barton & Murray. The members of the firm are James H. Barton and James C. Murray. Mr. Barton is an experienced gas fitter and brass worker, having been engaged in work of that description for over eight years with the Westinghouse Air Brake Company at Wilmerding. Mr. Murray comes from Pittsburgh, where he has been engaged in the plumbing business for five years.

L. A. GARRETT has opened a tinning and plumbing shop at Cobleskill, N.Y.

THE ILLINOIS MASTER PLUMBERS' ASSOCIATION is a new corporation without capital stock that has filed papers at Peoria, Ill., to advance the interests of the plumbers' trade. The incorporators are John M. Slmpson, John O'Neill, Jr., John Nailon, Daniel O'Connor, John H. Redmond and W. W. Murphy.

H. D. BERNER, 43 Centre street, New York, 18 issuing a 40-page catalogue, interesting to the plumbers who fit up beer pumps. It includes all of the fixtures made by the Cleveland Faucet Company, Cleveland, Ohio, and the illustrations show the various methods of using them. Two pages are devoted to small illustrations of the various parts for repulrs, with prices.

THE PLUMNERS' SUPPLY ASSOCIATION of Boston, Mass., held their monthly meeting and dinner at the Quincy House last Saturday evening. F. J. Knox presided. Twenty five members were present.

W. N. BAILEY, a well-known plumber who had a shop on Aliso street, Los Angeles, Cal., died recently of blood poisoning and typhoid fever. He had been ill only a few days and his death was the result of an accident. He was working at an earthen closet pipe and jarred it with his hand to get it loose, when the pipe burst and a mass of the foulest refuse fell all over him. His hand was also cut by the pipe and some of the poisonous matter got into the cut and caused the blood poisoning. He leaves a wife, but no children.

W. A. MYERS has removed bis gas and electric fixture and supply store to 147 West Third street, Williamsport, Pa.

THOMAS MARKEY, who has been in business in Indianapolis, Ind., for the past 12 years, is now located in room 7, Builders' Exchange, where he is conducting a business in plumbing, gas and steam fitting.

S. Davison, 56 Beekman street, New York, informs the trade that on September 12 the agreement between the Steel Clad Bath Company of New York and himself was canceled by mutual consent. Mr. Davison has concluded arrangements with the Day-Ward Company to represent them as their sole selling agent. Referring to the Ward steel cased bath made by this firm, it is described as having a patent overflow and non-conducting lining of asbestos between the two metals, hesides being rust proof.

B. & H. II. Sommer, 50 Cliff atreet, New York, are issuing an illustrated six-page sheet of their plumbers' marble goods, lavatories, water closets, porcelain laundry tubs and enameled cast iron bathtubs, with a variety of basin and bath fittings.

WALTER RISTINE has gone into the plumbing business at Stockton, N. J.

The Creditors of the Archer & Pancoast Mig. Company, New York, representing 80 per cent of the liabilities, through their committee, consisting of Col. S. V. R. Cruger, John C. Granger and William S. Fearing, have decided on a plan of reorganization of the company.

AMERICAN FAUCET COMPANY are a new corporation with their principal place of business at San Francisco, Cal. The capital stock is \$800,000, and the following are the directors: J. F. Chandler, John L. Howard, A. F. Gunn, Wallace Everson, J. W. Phillips, C. W. Randall, B. E. Handy, Charles D. Pierce, Oakland; Joha Martin, Berkeley; George H. Merrick, San Francisco.

JOHN L. DUNN, Indianapolis, Ind., has been in the plumbing business over 40 years and has done the work in some of the largest buildings in the city.

THE PLUMRING, STEAM AND GAS FITTING in some of the largest buildings in his State have been done by Geo. W. Keyser, Indianapolls, Iad. He makes a specialty of heating work.

THE PLUMBING FIRM of C. Aneshaensel & Co., Indianapolis, Ind., make a specialty of gas and electric work, their showrooms containing a bandaome display of these fixtures.

IN DESCRIBINO the characteristics of an up-to-date plumber a local paper writes as follows of Wm. L. Manton, 47 Manton avenue, Olneyville, R. I.: "Those who occupy the front ranks in the trade are men of brains, of ideas; they are men who have added to a naturally acute mental outfit—observation, study, research; they are men who

are filled to the brim with a comprehension of the latest discoveries and inventions in their lines; who adopt the newest ideas, tools of the most modern design and methods of work that are conceived by the brightest thinkers of the age. To be a popular sanitary plumber now-a-days means to be in touch with the foremost minds of inventive genius. No dullard need apply if one seeks to win renown as a plumber. The old ways have given place to new methods that combine knowledge, originality, expertness."

IN AN ITEM in The Metal Worker of October 13 we referred to the firm of Reilly & Mabec, Amsterdam, N. Y., as having been granted a plumber's license. The name of the firm was, however, erroneously stated and should be Pillig & Mabec of 52 Wall street, Amsterdam, N. Y.

E. W. BLATCHFORD & Co., Chicago, Ill., issue circulars relating to their specialties that will interest the plumbing trade. One is devoted to Babbitt metal of varied composition. A second alip refers to their S traps, made extra long at both ends. Also § S and P traps of similar design. Cuts show the dimensions of the traps. The third circular refers to traps and bends.

James Wilson of Buffalo, a plumber, is about to locate in Franklinville, N. Y.

ISAAC L. VARIAN has opened a plumbing establishment in the building on Railroad place, Danbury, Conn.

#### Trade Notes.

JOHN J. STEFFEN advises the trade under date of October 20 that he has removed from his former residence, 1503 South Eighth street, Philadelphia, to Norristown, Pa., post office box 172.

Through the courtesy of the Indiana Wire Fence Company, Crawfordsville, Ind., we have received a souvenir copy of the Crawfordsville Journal, which contains a description and shows a half tone engraving of their plant, which has recently been enlarged.

THE H. W. JOHNS MFG COMPANY, with New York office at 87 Maiden Lane, issue a pamphlet entitled "Heat Insulation and Fire Protection in Prominent Buildings." It is published in the interest of their asbestos pipe and boiler coverings and consists exclusively of fine half tone engravings of buildings, boiler rooms and other places in which their asbestos material has been smployed. The first page shows two boiler rooms, together with pictures of the cruisers, "Castine," "Machias" and "Marblehead." The front page of the publication shows an engraving of a block of asbestos with the name in Greek characters printed

Joseph Dixon Crucible Company, Jersey City, N. J., and 68 Reade street. New York, advise us that their trade in Lead Pencils and Graphite Paints is particularly good, the demand for this kind of Paint for roofs and metals continually increasing. The paint is put up in cans of 10, 25, 50 and 100 pounds, ground in oil, and in barrels of 450 pounds. Thinned and ready mixed it can be had in lots of 5, 10, 25 and 50 gallons.

THE CHAPMAN TIN Mrg. COMPANY have removed from Clifton Springs, N. Y., to Newark, N. Y.

THE ASBESTOS MANUFACTURING PLANT of the Philip Carey Mfg. Company, Gilbert avenue, Cincinnati, was completely destroyed by fire, caused by the boiling over of a pot of pitch, on October 24. The loss is estimated at \$55,000, with an insurance of about \$33,000.

IN THEIR FULL PAGE ADVERTISEMENT in this week's issue the Excelsior Mfg. Company, St. Louis, illustrate a few of the many Electros which they have in stock, and which will be sent to the trade on application. These Electros are made to be used in either single or double column in newspaper advertising as may be preferred. They are set up in attractive style, and the dealer using them will doubtless be rewarded by the increased demand for the goods made by this enterprising firm.

C. M. AVERY has been appointed as the direct representative of the Horton Mfg. Company, Fort Wayne, Ind. The company manufacture Washing Machines in a variety of styles, also Corn Planters, and have, we are advised, largely increased the facilities of their already well equipped plant. The Western Combination Washer is referred to as a new special machine at a very reasonable price.

W. W. FERRY, with C. W. Dunlap, 88 Chambers street, New York, has been made sales agent of the Avery Stamping Company, Cleveland, Ohio, for the New England States, New York, New Jersey and the cities of Philadelphia, Baltimore and Washington. A sales office has been established at the above address.

THE DAVID MAYDOLE HAMMER COMPANY, Norwich, Chenango County, N. Y., makers of solid crucible cast steel Hammers, issue an illustrated eatalogue and price-list, which shows a large number of new styles of Hammers, as well as those already known to the trade. The manufacturers remark that the same high standard of work which has for 50 years characterized these goods will be maintained on Hammers bearing their old trademark. On different pages throughout the catalogue are given illustrations of some of the awards made to Maydole Hammers by different expositions.

THE ADVERTISEMENT elsewhere of the Estate of A. Froelich, 289 Peurl street, New York, directs attention to the extensive stock of stove repairs and stove dealers' supplies which they manufacture and carry in stock. The trade are invited to send for catalogue which has just been issued.

THE PLANT of the National Brass & Iron Works, Reading, Pa., is reported as running night and day with 225 hands. Orders are being received from every section of the country.

A New York daily has been collecting statistics from the various labor unions in regard to the unemployed workers in this city. In all trades the number of persons at present out of work is estimated at 110,500. Of this number, metal workers, including tinsmiths, roofers, molders, brass finishers, &c., are credited with 10,000 unemployed.

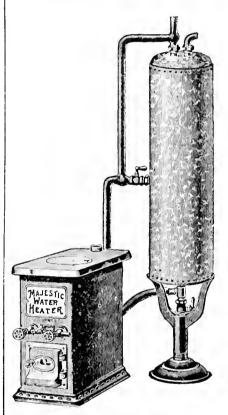

Custer City, South Dakota, has just had located there a plant for the manufacture, among other goods, of stove blacking and mica for the stove trade.

The production of Spelter in Silesia for the first six months of 1894 amounted to 45,824 tons, as against 44,-

788 tons for the same period in 1893. The deliveries during the first six months of 1894 amounted to 44,305 tons, as against 44,898 tons during the same period in 1893.

The Majestic Water Heater.

The subject of our illustration is the Majestie gas water heater, made by the Majestic Mfg. Company, 2004 and 2008 Morgan atreet, St. Louis, Mo. It is designed to furnish hot water where no range or stove with a water back is convenlent for connection with the boiler. The heater is said to present a direct tire surface of 1368 square inches and has a capacity for holding 4 quarts of water. It occupies a space 9 x 14 inches on the floor and is 23 inches high. It will be noticed that it is connected to the boiler at both the side and top, and when the stop cock at the side connection is closed, it is claimed that it will

The Majestic Water Heater.

supply hot water direct, raising the temperature from 70° to 118° in ten minutes, and when the side connection is open it will heat a 40-gallon boiler in 60 minutes. It is said that a number of these water heaters sold have given excellent satisfaction. Circulars can be had on application which explain the advantages claimed for the double connection and give full particulars in reference to it.

Press reports state that a combination has been formed by the coal and coke operators of the Kanawha and New River Valleys, W. Va., with the object of reducing selling expenses and fighting the railroads on the question of rates.

The contract for the foundation of the Manufactures and Liberal Arts Building of the Cotton States and International Exposition, Atlanta, Ga., was let last week and contracts for the nine principal buildings are about to be given out.

# THE RETAIL STORE.

### Reversible Towel Rails.

Robert Ferguson, 51 Mcrcer street, New York, sole manufacturer for the patentee, is introducing the reversible towel rail as shown by the accompanying illustrations. This device censiats of three polished and lacquered brass arms, 12 inches long, held by nickeled balls on both ends in a nickon being opened the food is drained and early handled.

Santariet is the name of a liquid preparation sold by George Starrett, 227 Water street, New York, that is said to absolutely prevent the rusting or corresion of either cast or sheet iron stoves that are coated with it. It should be applied with a soft brush, or on sheet

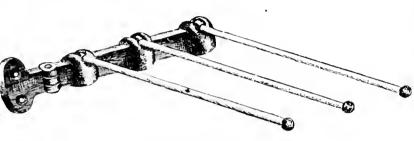

Fig. 1.—Hinged Towel Rails.

eled hinged bracket 63 inches extreme length. The bracket is alike on both sides and can be acrewed to the front or back of a washatand on either right or left side, or can be attached to door or window jambs, or other wood work. When not in use the arms can be lifted upright and allowed to drop, hanging perpendicularly, or in use all or part can extend to the front or rear,

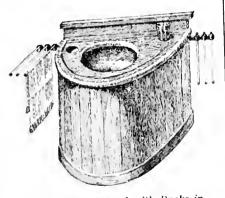

Fig. 2.—Washstand with Racks in Position.

whichever is most convenient. Fig. 1 shows the bracket with sockets alike on both sides. Fig. 2 shows the racks in and out of use on a washstand. In lots of five gross sizes from 7 to 14 inches can be furnished to order at the same price. The smaller sizes can be used as clothes racks.

#### MEMORANDA.

A. W. OBERMAN, 59 South Fifth avenue, New York, is putting on the market a new rice boiler of enameled ware. It is a perforated ball made in two parts hinged together, and when closed fastened with a spring. It is said to be excellent for cooking meats, fish, puddings, fruit or vegetables, without scorching them. It is designed to be suspended in the boiling water, and when the cooking is finished the ball may be lifted out of the water, and

iron with a soft woolen cloth. Sheet iron stoves coated with it can, it is said, be stored in cellars without damage, and no difficulty is found in blacking them.

TRETHAWAY BROS., Parson, Pa., who have hitherto done only a retail trade in stoves and tinware, have commenced to manufacture tinware in all its branches. They are about putting an improved dinner pail on the market.

Joseph Lennon of Islip, L. I., is among the few fortunate dealers whose business can hardly be said to have been affected by the general depression. During all of 1893 and so far this year he states that his business has been good, and he has all the work he could do.

Sidney Shepard & Co., Buffalo, N.Y., issue catalogue and price-list No. 58, illustrating and describing the goods manufactured and sold by them. The book, closed, measures 8½ x 11 inches, and contains 236 pages bound in flexible cloth covers. Full page views of the company's Buffalo and Chicago offices and warerooms, also of factories A and B, occupy positions at the front of the book, and are followed by an alphabetically arranged index. The goods are arranged in departments, as follows: Pages 13 to 92 include the company's manufactures; pages 93 to 221 are devoted to outside goods for which they are agents and other goods which are also carried in stock, and pages 222 to 236 give lists of goods which the company can ship direct from the points of manufacture. The book is well printed on a good quality of paper and blank ruled pages are interleaved at convenient distances apart for making memoranda of new goods, prices, &c. The company have recently added to their manufactures a line of Kitchen Ware made from pure aluminum. They now supply and have in preparation the following goods, which are made in all the regular sizes: Dish, Bread, Fry and Jelly Cake Pans, Tubed Cake and Muffin Pans, Coffee Pots, Milk and Dripping Pans, Pie Plates, Perfection Tins, Mountain Cake Pans, Dippers, Corn Cake Pans, Tea Steepers and Tea Kettles. The

other lines of goods illustrated are Stamped Ware, Pieced Tinware, Polished and Retinned Pieced Tinware, Japanned Ware, Toilet Ware. Water Coolers, Galvanized Ware, Coal Vases, Elbows, Baking Pans, Oil Tanks, Milk Cans and Can Stock, Freezers, Tin Plate, Galvanized Iron, Metals and Tinners' Supplies, Granite and American Blue and White Enameled Steelware, Kitchen Utensils, Tinners' Machines and Tools. &c.

chines and Tools. &c.

The Wells & Nellegar Company, 72-76 Lake street, Chicago, issue a catalogue comprising 1160 pages, beautifully printed, handsomely illustrated and strongly bound in half morocco, arranged to lie flat when opened at any place. It begins with Carpenters' and Woodmen's Tools, in which are included related lines. Next follow Tools of a miscellaneous character and Farm and Garden Tools. Builders' Hardware then takes up a great deal of space. Horse Furniture and Wheelwrights' Supplies are next in order. After these come House Furnishing Goods in great variety. Cutlery is an important section, which naturally runs into Table Ware.' Guns and Sporting Goods take up considerable space. Oil Cans and Stove Furniture come next. A large section is devoted to Pieced and Stamped, Granite, Blue Enameled and Aluminum Ware, with Kitchen Utensils. The closing pages are taken up with Tinners' Stock and Tools. Not only is the arrangement of the contents very convenient for reference, owing to the method employed, but extreme care has been taken with the illustrations so as to present them in a way pleasing to the eye rather than to economize space. Those who receive these catalogues are special'; favored by having their names stamped on the back in gilt letters, which is a graceful compliment that will no doubt be highly appreciated by the recipients.

THE HORTON MFG. COMPANY, Fort Wayne, Ind., makers of Washing Machines and Corn Planters, issue an 1895 catalogue and price-list which shows the Western Combination Washer, Western Washer, American Washer, Wayne Round Washer and the metal bottom Western Washer, also the Superb and American Corn Planters. Their special Machine, the Western Combination Washer, is referred to as being sold at a very reasonable price and as having been received in the market with gratifying favor.

The Congress of the Argentine Republic is now engaged on the consideration of a bill which aims at a material reduction of customs duties. In some cases the proposed reduction amounts to 25 per cent. on foreign importations, but the average change will be about 15 per cent. Many goods of American manufacture, particularly agricultural implements, lumber and kerosene, will benefit by the proposed new rates.

It is stated that H. B. Plant of the Plant system has bought the Florida Southern Railroad, which runs through 250 miles of the richest agricultural and phosphate lands in the State, for \$2,000,000.

# ROOFING AND CORNICE.

#### Patterns for Chimney Top.

I From C. A. B., Decatur, Teras.—I send a sketch of a chimney top that is used a great deal in the Panhandle, where the wind is so constantly blowing. It is impossible for a flue to smoke that is provided with a top of this description. For the benefit of the younger members of the craft I would like to have the method of obtaining the patterns for top published in The Metal Worker. The side pipes should be at an angle of 45°.

Answer.—In Fig. 1 is presented a view of the chimney top for which pat-

their respective sections, as shown by A B C D, A B C D and A B C D. Commencing at the same points in each, space the three profiles into the same number of equal parts. From the points thus obtained carry lines parallel with the sides of pipes, and from the points of intersection draw the miter lines F G F' and J K J'.

For the pattern of E F G F' E', proceed as follows: On E E' extended lay off a stretchout of A B C D, as shown by W W', through the points in which erect the usual measuring lines. With

take the length of lines in E F G F E', and, using attrethout line W W as the base of measurements, set off on lines of similar number the length of lines in E F G F' E'. Through the points thus obtained trace lines, as shown.

For the pattern of horizontal pipe, on II H' extended, as R' R, lay off a stretchout of A' B' C' D, through the points in which draw the usual measuring lines. Place the T-square parallel with H H', and, bringing the blade against the several points in miter lines F G F', cut measuring lines of corre-

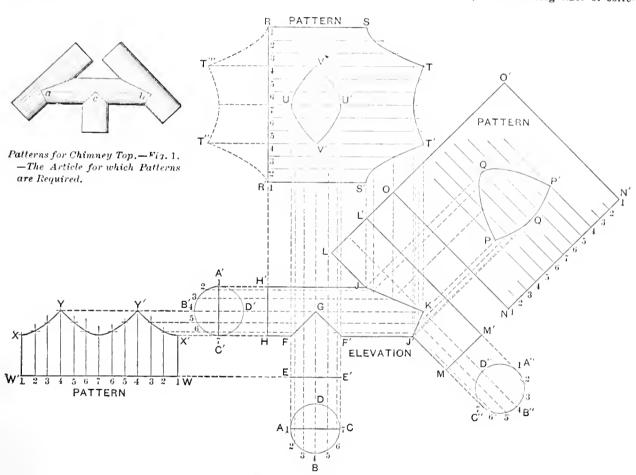

Fig. 2.-Method of Obtaining the Patterns.

terns are required. An inspection of the figure will show that the horizontal pipe a b is joined to the two angling pipes at a and b, and these two joints are similar; also that the perpendicular pipe c intersects the horizontal pipe a b at right angles. In Fig. 2 the joint at a is omitted on account of space and for convenience in obtaining the patterns, as the pattern for b will answer for that at a. Then, in Fig. 2, let E F G F' E' represent the perpendicular pipe, H' J K J' H part of horizontal pipe, and L L' M M' the pipe at an angle. In line with the three pipes draw

the T-square placed parallel with E E', and bringing the blade against the several points in the miter lines F G F', cut measuring lines of corresponding number drawn through the stretchout W W', as indicated by the dotted lines. Trace lines through the points thus obtained, as indicated by X Y Y' X'. Then X Y Y' X' W W' will be the pattern for part of article shown in elevation by E F G F' E'. If it is not convenient to obtain the pattern by means of the T-square, draw the stretchout line W W' and erect the usual measuring lines. By means of the dividers

sponding number, as indicated by the dotted lines drawn from F G F'. Lines traced through the points thus obtained, as shown by V U' V' U, will give the shape of opening to be cut in the pattern for the pipe E F G F' E'. If an edge is desired for turning over after the two pipes are joined, the opening can be cut smaller than indicated. With the T-square placed parallel with the stretchout line R R', bring the blade successively against the points in the miter line J K J', and cut measuring lines of corresponding number, as indicated by the dotted lines. Through

the points thus obtained trace lines, as indicated by S T T S', thus forming the required pattern. S T T S eau be used for marking off the other end of pattern, as indicated by R T "T" R'. For the pattern of pipe L L' M' M, proceed as follows: Extend L L and M M, as shown. On M M extended lay off a stretchout of A" B" C" D", as shown by N N, and, with the T-square placed at right angles to N N', draw N O and N O', also the measuring lines, as shown. To obtain the shape of opening in pattern represented by miter line J K J, it is only necessary to draw lines from the points in stretchout line corresponding with points in the miter line J K J, as indicated by lines drawn from points 4 to 4 in stretchout line. Place the T square psrallel with M M, and, bringing it successively against the points in miter line J K J', intersect the corresponding measuring lines. Trace lines through the points thus obtained, as shown by P Q P' Q', thus obtaining the desired shane.

#### FLASHINGS.

A. H. BUCKINOHAM, New Haven, Conn., has taken the contract for all the copper and metal work on the new Normal School Building. He has put up the copper bays and cornice on F. C. Cannon's double house on College street, and also has the metal work on E. Borges' new block on State street.

PARKER GRACE will erect a fourstory apartment house at 50 Oak street, Chleago, that will have copper faced bay windows.

J. R. BRYANT & Co., Crawfordsville, Ind., are finding an increased sale for their Crestile conductor, which serves as a ridge roll and is made of galvanized sheet steel. Special excellence is claimed for it as a protection against lightning.

MILTON II. BURK is one of the live tin and slate roofing and cornice men of Crawfordsville, Ind.

C. B. RICKERT, 194 Clark street, Chicago, has contracts for the copper work, skylights and slate roofing for the Chicago Public Library Building, Marquette Building, State and Van Buren streets; Trinity Parish House, Michigan avenue and Twenty-sixth street; copper work and tile roofing for the residence of President Harper, Chicago University.

The new Central School House, at Webb City, Mo., has a zinc roof, and being in the midst of the zine mining district of Missouri the citizens are very proud of it, and are using every endeavor to extend the use of zinc for roofing.

The ill-fated new Louisville and Jeffersonville bridge across the Ohio River was the seene of another accident on the 17th inst. Three men were hurt, one perhaps fatally. The accident was caused by the falling of a part of the false work under the fourth span, which had just been completed and locked. The men were engaged in removing the false work which is to be transferred to the fifth and last span. They were at work on the first bent or division of the structure. The top timbers had nearly all been removed when the remainder of the section collapsed.

#### Electric Light Standard.

We illustrate an electric light standard, two of which were made by the Ludlow-Saylor Wire Company of St. Louis, Mo., for the new Union Station in that city. They are made entirely of iron, with black iron finish, and stand 9 feet in hight. They are placed on either side of the port cochire, which extends beyond the main entrance to the station, and the port cochire is also

that 2394 representative manufacturing industries located in 46 cities paid out in wages in 1892 \$50,838,383.41; same in 1893 paid out \$43,903,857.57, a decrease of \$6,933,516.

The British Board of Trade returns for September show a falling off in the values of both exports and imports as compared with the corresponding month of last year, although the figures at that time were reduced by the great coal

ELECTRIC LIGHT STANDARD.

surrounded by an iron area rail, a portion of which appears in the engraving. There is some 75 feet of the area rail, which is finished the same as the standards. Both the standards and area rail were made from drawings by the architect of the entire structure, T. C. Link. We understand that these standards are the first of their kind ever made in St. Louis.

A City of Mexico special to the Boston Herald reports that the importations of railway iron and steel from Europe into Mexico show considerable increase over the same period of last year.

The coming report of the State Commissioner of Labor, in Ohio, will show strike. The imports are valued at \$145,200,000, a falling off of \$5,424,000, equal to 3 per cent.; and the exports of British and Irish goods at \$84,480,000, a decrease of \$4,008,000. The largest decreases in imports are in food stuffs, oils and metals. In exports the greatest falling off is shown in textile fabrics, machinery and wearing apparel.

A wail comes from Hamilton, Ohio, because that usually bustling little city is not recovering from the lethargy into which its mannfacturing Interests fell at the beginning of hard times. Business is referred to as being stagnant, while the number of unemployed is very large, with no prospect of work during the coming winter.

### HEATING & PLUMBING.

#### NEW WORK AND CONTRACTS.

THE UNIVERSALIST BUILDING COMMITTEE have closed a contract with C. W. Dewey, Galesburg, Ill., for a complete steam heating and ventilating system for their new Universalist Church Building, now being erected, and will use a No. 158 Florida steam boiler.

AT Forty-seventh street and Calumet avenue, Chicago, M. M. Brown will erect 19 three-atory flat buildings that will be heated by steam from three central plants, and hot water will be furnished from central plants also.

P. J. DULANTY, Ashland, Wis., has secured the plumbing contract for the new Booth Packing Company's building.

AT A SPECIAL SCHOOL MEETING at Amityville, N. Y., last week, \$5000 was voted to heat and furnish the new school house.

COOK & CHICK, 253-255 Kinzle street, Chicago, have the contract for steam heating the 3-atore and 14-flat building of T. J. O'Neil, Lincoln avenue and George street.

II. J. IRWIK, Carthage, N. Y., is putting a new ateam boiler in Hotel Elmhurst.

JOHN S. GREPE is building a \$20,000 residence at South Evanston, Ill., to be heated by hot water and fire places, and gas ranges will be used for cooking.

Russell B. Powell will erect a three story apartment house at Forty-seventh street and Prairie avenue, Chicago, to be heated by steam.

THE Boynton High School House, at Eastport, Maine, is to have a modern system of heating. The old furnace has been removed and a hot water heater is to take its place. E. S. Martin and Albert M. Bibber have the contract for fitting the building, at an expense of about \$600.

C. M. CHASE, Weat Winsted, Conn., made a contract to heat the Town Building, and will put in a Volunteer steam heater.

THE St. Paul's Episcopal Church, at Windsor Locks, Conn., is to have a new steam heating apparatus for the church building.

THE ALBERENE STONE COMPANY, 217 Lake atreet, Chicago, are to furnish 18 combination sink and laundry tubs for the Reyworth Apartment Building, North Halatead atreet and Oskdale avenue.

THE FULLER & WARREN COMPANY, 147-149 Lake street, Chicago, are to place their warm air furnacea in the following residences: J. G. Tait, Forest-dale avenue; Callagan Bros., West Adams atreet; J. L. Cochran, Edgewater; H. A. Wische, Argyle Park; H. N. Taylor, Wilmette.

GOULD & NOWLEN of Bath, N. Y., are putting the steam heating fixtures in the *Herald Block*, at Hammondsport, N. Y.

M. J. Burke will erect at 4213 Wabash avenue, Chicago, a three-atory apartment house at a cost of \$15,000, to have steam heat and modern plumbing.

SHICK & HAUSMAN, Catasauqua, Pa., have the contract to furnish A. H.

Hahn's Grand Vlew Hotel with a steam heating apparatus.

HUELETT & HAY of Racine, Wis., have been awarded the contract for putting in ateam heating in a \$10,000 residence to be erected on Washington boulevard, Chicago, for George A. Rose.

IN REFITTING the Gymnasium Building, at Colorado College, Denver, Col., a steam heating system and shower baths will be put in.

E. E. PARKER, Woburn, Mass., will install Richmond boilers in the residences of J. W. Hutchinson, Peter llorn and U.S. Richardson, at Winchester, and will use a Gurney steam boiler in a large building at Winchester Highlands.

TAYLOR & TAYLOR, Meriden, Conn., were awarded the contract to put in the ateam heating apparatus at the Pavilion, at Hanover Park; also for the carrousel.

W. HACKETT has awarded the contract for the plumbing in his new apartment house to J. A. Campbell & Co., New Haven, Conn.

SHEAHAN & GROARK, New Haven, Conn., have the contract for the plumbing in the new house of John Cronan.

THE town of Westerly, R. I., has voted to build a new high school building at an expense not to exceed \$30,000.

J. L. Cochran will erect, at Edgewater, Ill., two residences to have modern conveniences and furnace heat.

A FOUR STORY APARTMENT HOUSE will be erected at 194 Cess street, Chicago, by Oliver & Hill, at a cost of \$20,000, to have steam heat and a plumbing system.

F. L. Bray, Derry Depot, N. II., has completed the installation of a hot water heating plant in the residence of John Taylor, at Salem, N. H.

G. A. SUTER & Co., 139 South Fifth avenue, New York, secured the contract for the steam heating plant for the new building of the American Surety Company, at about \$50,000. They will use Babcock & Wilcox boilers.

Purves & Rockway, 215 Fifth avenue, Chicago, have the contract for steam heating in the 24-flat building of W. E. Press, Wabash avenue and Forty-fourth street.

HEEBNER & Sons, Lansdale, Pa., have received the contract for putting steam heaters in the residences of Abram M. Hunsicker, Abram H. Freed and Monroe B. Gabel of Perkssie.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, have the contract of hot water heating in the residence of Julius Mark, Rogers Park.

THE AGARD HARDWARE COMPANY, Torrington, Conn., have the contract for the plumbing in the addition to the Town House, at that place.

Baker & Shevlin, Saratoga Springs, N. Y., have the contract for placing a steam heating plant in the Town Hall.

JOHN M. ASH, Pittston, Pa., has been awarded the contract to furnish and erect the heating apparatus in the new Town Hall in Exeter Borough.

CALHOUN & STEWART, Middlebury, Vt., have quite an extensive job at the Reform School at Vergennes, the steamheating apparatus and plumbing of which are to be thoroughly overhauled in accordance with recommendations of the State Board of Health.

The American Radiator Company, 111-113 Lake street, Chicago, are furnishing 15 carloads of American radiators for the Marquette Building, Dearborn and Adams streets.

JACOB G. WEBBER, 244 North Clark street, Chicago, is to do the plumbing and gastitting in the apartment building of Robert C. Berlin, 3171 Malden street, Sheridan Park.

JOHN MALLMAN & Co., 134 Center street, Chicago, have the contract for plumbing in the store and flat building of T. J. O'Neil, Lincoln avenue and George street.

John Degnan, 3304 Cottage Grove avenue, Chicago, is doing the plumbing in the residence of W. S. Forrest, 3264 Groveland avenue.

MEYER BROS., 4146 Cottage Grove avenue, Chicago, are to place a warm air furnace in the residence of Mr. Randell, 102 Fifty-third atreet.

METZ BROTHERS, 107 Twenty-second street, Chicago, have the contract for hot water heating in the residence of G. S. Bullock, 2935 Michigan avenue.

JAMES E. DEVENEY, 2306 Cottage Grove avenue, Chicago, has the contract for plumbing in the apartment building of Nichols & Adock, Wentworth avenue and Sixtieth street.

GEORGE E. MATHEWS, Jacksonville, Ill., has obtained a contract for putting in steam heating apparatus in the business house of George Little of Rushville.

CALHOUN & STEWART, Middlebury, Vt., have completed the ateam heating plant at the college buildings, heating Painter Hall and the Chapel.

HULETT & HAY, Racine, Wis., have been awarded the contract to put in a new heating apparatus in the Y. M. C. A. Building. They have also been awarded the contract for the plumbing and heating in the new residence of Geo. A. Rose of Washington boulevard, Chicago.

THE HUNTINGTON PLUMBING COM-PANY, Huntington, W. Va., have been awarded the contract for putting in the steam heating apparatus for the Algonia Coal & Coke Company in their plant at North Fork.

AN ENTENSIVE heating plant will be introduced at the Friends' Asylum, Frankford, Pa.

SMITH & WOODHALL, Southbridge, Mass., are putting a steam heater in Peck & Co.'s store.

JAMES WIGHT, Rockland, Maine, is putting a steam heating apparatus in the tenement owned by A. Ross Weeks and F. W. Wright's house.

THOMAS K. LEMON, 626 Columbus avenue, New York, is installing the steam heating plant in ten flats for John Casey on Ninety-eighth street and ten more flats on Eighty-fourth street.

Simon Lake of Baltimore claims to have invented a serviceable submarine boat which is capable of being readily submerged to any desired depth and again raised to the surface, and of being propelled either above or below water, as required. The crew, he says, can live comfortably in the boat under water. The inventor is about to build a boat of his pattern at Baltimore, under the auspices of the Lake Wrecking & Submarine Company.

# STOVE TRADE NOTES.

#### The Cooking Carnival.

Soon all the kitchens in the United States will be the scene of such a roasting and cooking as is always occasioned by that time honored and delightful institution, the Thanksgiving dinner. Does the stove man sufficiently appreciate his opportunity to gather in the shekels of his brother through the weakness for the flesh pots at this season? The arrival of a circus in town is sufficient for the butcher, the baker and the candlestick maker to prepare special and tempting displays. His sister, the and tempting displays. His sister, the milliner, and the dry goods man also need but little exense for "a grand opening." Then why not "a grand showing of "cooking furniture" and "kitchen tools" about November 1? There are "Thanksgiving turkeys," "Thanksgiving puddings and pies." Why not "Thanksgiving ranges," "Thanksgiving roasters," and a thousand and one other things for which the sand and one other things for which the cook would give thanks if she had them? Thankagiving grates, bricks, covers and centers are bought because they are necded, and not because the stove dealer calls attention in advance to these Thanksgiving necessities.

That preparation for a Thanksgiving stove diaplay would make extra work right in the midst of a busy aeason is no excuse for not making it. The stove season is a short one and no exertion should be withheld that will increase its fruitfulness. Plan ahead for the display so as to have the goods ready, then light up your store at midnight and work till daylight, getting your attractions in conspicuous array. This will be enough to make you the town talk and bring every sister, cousin and aunt to see "the biggest bargain extant"--"A range that always bakes." Then show your roasters, pie plates, cake tins, egg beaters and all the things that your wife says are needed in a luxuriously furnished kitchen. Don't slight the men; invite them to come with their wives and point out that the greatest bane of a woman's life is a balky atove.

The stove dealer does not take hold of his opportunities. You should sound loudly your ability to supply all of the apparatus and appliances that are required to make a Thanksgiving dinner a glorious feast. Keep scintillating these facts in every direction as persistently and as brilliantly as the nickel trimmings on your stoves present their glistening brightness. This occasion should enable all sorts of stoves to be disposed of and the sales and profits for the year materially increased if the entire working corps are enlisted in the Thanksgiving enterprise with enthusiasm. The stove business is changing; so ring this change in on your people just once for a trial.

THE ELLWOOD GAS STOVE & STAMPING COMPANY OF Ellwood City, Pa., call the attention of the trade to the Ellwood gas heaters and radiators by means of a neat pamphlet of 16 pages, which has just been issued from the press. The gas heaters are shown in varied assortment, while the letterpress

makes mention of the salient features. The company state that the Ellwood gas heaters are manufactured on true principles, and suggest that dealers always order by numbers and specify the kind of gas to be used. The pamphlet is bound in colored paper covers and is arranged in a manner to interest dealers generally.

#### Philadelphia Stove Trade.

While a good deal of business has been done this month it was not of a steady character, and the volume for October will not be much larger than that for the corresponding period of last year. No business, perhaps, is governed by the state of the weather so much as the stove business, particularly in this market. A day or two of cool and chilly weather brought a large amount of trade orders, in most cases being accompanied by requests for immediate shipment; while a return of warm weather induced a condition of flatness very discouraging. The situation, therefore, is very little improved. and the bulk of business will not, in all probability, be done until cool weather acts in. There seems to be a disposition among buyers to force manufacturers and jobbers to carry their stocks as long as possible, and when there is a change in the weather everybody wants goods in a hurry. The month of November will most likely prove to be a good one as far as the volume of business ia concerned. Many orders will come in because they can no longer be withheld.

There is very little stock in the hands of retailers, and with the improvement in the general business condition of the country there should be a demand for heating goods much larger than that of last winter. The experience of last season was that it was a season of patching and repairing. In many cases repairs were made on a stove as a sort of "forlorn hope" that the stove would be able to survive the winter. The effeet of this patching will undoubtedly be felt as the winter approaches, and the activity shown during the recent cold spell may be taken as a criterion of what may be expected later on.

Oil and gas heating goods are in strong demand. The amount of business being done in these lines is really remarkable, and dealers cannot get the goods from the fectories fast enough to keep up with their orders.

Furnaces and cooking goods are moving steadily, the demand for them continuing fair. Collections are somewhat better, but they are still far from the average.

#### The Ohio Stove Trade.

Reports from the stove and range manufacturers throughout the State of Ohio, as well as from various sections in Michigan, Indiana and Kentucky, continue to be extremely encouraging. Mail orders continue to grow as the season advances, the advance in the volume of trade in September being fully maintained during the current month. Some of the foundries lay special stress upon the fact that they are drawing orders from dealers who have not been solicited. Owing to the policy of both dealers and manufacturers to keep light stocks, which feature has been previously noticed, and the rapid and liberal increase in the demand, not a few of the foundries are behind with their contracts, but as the past week or ten days have been unusually warm there has been less pressure from dealers than there might otherwise have been. The tone of some of the letters received is even jubilant and encourages the opinion that an expansion in capacity which several foundries report as under way is well founded. No complaint is made regarding collections, while on the contrary several communications specify that payments are gratifying. Individual orders do not seem to increase in size, but collectively they are growing.

It is evident from a general canvass that the West is in advance of the East in the recuperation in progress.

The situation in Cincinnatl reflects the spirit of the trade indicated in the replies received; pay rolls are gradually increasing and the outlook for the next month is favorable.

## The Kernan Furnace Company.

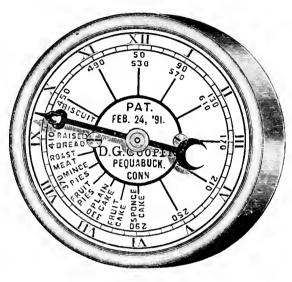

A 144-page catalogue is received from the Kernan Furnace Company, Utica, N. Y., which they call a descriptive and reference estalogue of warm air furnaces and the Kernan system of heating and ventilating. In the first few pages of the book they compare direct and indirect radiation, pointing out the base burning stove as the original exponent of direct radiation and the hot air furnace as the pioneer in indirect radiation. The importance of a good system of ventilation and also the economy of using a furnace of ample capacity are dwelt on. The next 20 pages are used in describing the different series of Kernan furnaces and combination air and water heaters, with illustrations and half-tone engravings of the complete furnace and the furnace knocked down, showing the different parts. Under the title of "Heating and Ventllation 'the next 20 pages are de-

voted to the Kernan system, showing that without some system of ventilation it is net possible to warm a building with indirect radiation, and as an illustration they say that when a pail is filled with water, no more water can be added until some has been discharged, and in a room filled with air, until some of the air has escaped mere cannot enter. Engravings are shown of School No. 19 in Utica, N. Y., with the floor plans and their system of heating and ventilation, which not only makes a continual current of warm air into the room, but at the same time exhausts the air in the reem through the ventilating shafts. A full description of this plan is given with the temperatures found in the different rooms with the air being changed several times an hour. They also show the floor plans of a house in which their system is used. In the Kernan system a heating chamber is placed on top of the furnace and connected by means of a pipe with the ventilating shaft. Into this heating chamber ex-haust ducts from the different rooms

make its appearance it is not time to predict, will be the greater because of the change in demand to stoves of less durability.

#### An Oven Thermometer.

D. G. Coeper, Pequabuck, Litchfield County, Conn., is the manufacturer of an oven thermometer of which a full-size picture of the dial face is shown herewith. The temperature registering parts are contained in a box about 31 inches in diameter, having lugs extending on two sides for fastening to an oven door. The dial extends about ½ inch in front of the lugs and the box about the same distance back of them. for attaching the thermometer to an even door a hole of sufficient size to permit the dial face to pass through should be cut in both the tin lining and in the casting. Then the lugs rest on the inner side of the tip with an asbestes washer between, and the thermometer is fastened by means of  $\frac{3}{16}$ -inch bolts. The dial hand is moved by pinions and

An Oven Thermometer.

connect. Fifty pages of names of those who have used the Kernan furnaces in different parts of the United States are given, after which 30 pages are devoted to the Kernan amoke consumer for burning soft coal. This furnace operatea by discharging at the top of the burning fuel, equally at all parts of the fire chamber, a volume of highly heated air to secure the combustion of that portion of the fuel which ordinarily cloga the furnace and pipes when soft coal is used. Several engravings are used to illustrate the construction of this furnace, so that its operation may be thoroughly understood, after which a number of pages are deveted to testi-monial letters from those who are using it. The last few pages of the book are given up to the Kernan agricultural furnaces and kettles, the Kernan double oven range, the Model Welcome, Welcome and Magic Welcome ranges and a line of several series of Welcome square

THE EFFECT of the hard times upon the stove business is apparent from the increasing number of cheap sheet iron surface burners that are being sold at the expense of the higher priced cast iron parlor stoves. As the life of such atoves is much shorter than that of the others the beom, which it may confidently be believed is in store for the stove industry, though when it will

a cogged segment of a circle operated by an arm made of two thin curved strips of metal, steel and copper, which are fastened together. These have what may be termed a normal shape at a low temperature, which begins to change at 130° owing to the copper expanding mere than the steel, when the segment is moved and the hand on the dial records the change. In use it has been found that the temperature required for baking, rosating, &c., as recorded by an accurate thermometer, varies with different atoves, so that a temperature of a certain degree is not always satisfactory. This is due to the construction of the oven door, and stoves having tin lined oven doors that are very much bulged will have a hotter even at the same recorded degree of temperature than steves having a flat tin lined door where the thermometer is more directly acted upon. Owing to this the use of a clock face has been found to give better satisfaction. A number of noted coeks, it is said, have used these thermometers, and they have also been used in some of the principal cooking achools with good results. is claimed that cooking failures may often be avoided by keeping the article out of the oven until the necessary temperature is recorded on the dial, also that aervants more readily understand the use of the cleck dial than the use improvement the company deem it betof degrees of temperature. The oven ter to put in sufficient help to do the

thermometer has been used by some manufacturers for their high grade goods with satisfaction.

#### The Bellaire Stove Company

of Bellaire, Ohio, send us a copy of Catalogue No. 3 which they have Issued relative to the Star stoves and ranges. The volume is made up of over 70 pages of letterpress carefully arranged and printed. The makers state that their assortment of stoves and ranges has been increased and a number of improvements in construction and design incorporated. The goods are classified under ranges, cooking steves and heating stoves, the first named occupying 15 pages of the catalogue. The goods are offered under the name of Brilliant Star, a new six-hole range embedying the latest improvements, and the Merning Star, a low priced four-hole range made in two sizes and seven styles. The cook stoves are represented with the Peerless Star, a fourhole construction, in the leading place. It is made in four sizes and six styles, adapted for hard or soft coal, wood or natural gas. The Morning Star, attract-ively decorated and offered in four sizes; the Star Torchlight, a four-hole coek, improved for the present season; the Bellaire Torchlight, made in two sizes, and the new Indianola, a heavy wood cook, are some of the other goods to which the attention of the trade is invited. The heaters occupy the latter half of the catalogue and are represented by the Model Parlor, a new cottage stove; the Star Adina, a first-class fancy square heater; the Star Franklin, with open front; the Oakland Star, made in three sizes, for hard or soft coal, wood or natural gas; the Torrid Star, a new cannon stove, and the Glenwood Star, an attractive box stove. A miscellaneous assortment of goods covering hollow ware, &c., completes the velume.

#### ODD PLATES.

THE WESTERN STOVE & MFG. COM. PANY have secured a conveniently located building at 66 to 70 Third street, in the heart of Milwaukee, Wis. They have just completed fitting it up with special machinery of the latest improved patterns, and will manufacture for the coming season a full line of gasoline atoves (except process) and some gas stoves. The capacity of the plant is about 300 stoves per day. Their aim will be to turn out a perfect article at the least cost. The superintendent of the factory was formerly employed in the same capacity by two of the largest gas and gasoline steve concerns in the country. The company expect to have their stoves ready for the market on or about December 15. L. Kreielsheimer is president, Jos. Bach vice-president and Max Hirchfeld secretary and treas-

THE E. P. CARPENTER COMPANY Of Pawtucket, who gave one order for 350 Magee Grand ranges, write the Magee Furnace Company of Boston, Mass., under date of October 17, as follows: "Sold ten Grands at retail yesterday."

THE CENTRAL OILGAS STOVE COM-PANY began on the 18th inst. running their works at Flerence, Mass., nine hours a day. This plan will probably continue until the days get shorter, when the works will run only eight hours and thus save lighting up. While it is true that business is showing some

work and not light up, as in this way the benefits of labor are a little more widely distributed.

BARSTOW STOVE COMPANY, with New York office at Beekman and Water streets, have brought out a new low priced range which is called the Home, for use in apartment houses and dwellings. It has six 7-inch holes, an oven 17 x 18 inches, a low hot closet, and is designed for use with a horizontal boiler having a warming shelf beneath. The fire chamber has a duplex grate.

An ELECTRIC COOKING APPARATUS has been installed in Queen Victoria's palace, at Osborne, on the Isle of Wight.

J. F. Bannon & Co, 1804 Lafayette avenne, St. Louis, Mo., have issued a circular containing the names and addresses of some of those in St. Louis who are using Economy furnaces, which the firm sell. The list is printed upon a strip of paper about 7 inches wide by 3½ feet long, and shows that in some streets Economy furnaces are exceedingly popular. For example, on Page avenue, between 3865 and 4470, there are 40 people using these furnaces, while on Cooke avenue there are 28, and on Delmar avenue 24. There are also a dozen or 15 on West Bell place, aeveral on Morgan street, while Fountain avenue, Westminster place and Windsor place are well represented.

THE CENTRAL OILGAS STOVE COM-PANY held their annual meeting at Portland, Maine, on Wednesday, October The various reports presented showed the company to have enjoyed a fairly prosperous year, not with standing the general depression in business circles. The officers elected were: President, John C. Hammond of Northampton, Mass.; first vice-president, E. A. Thissell of Northampton, Mass.; second vice president, C. W. Conant of Gardner, Mass.; treasurer, W. H. Wilder of Florence, Mass. These officers, with C. H. Hill of Chicago; Dwight S. Smith of Jackson, Mich.; L. H. Littlefield of Pawtucket, R. I.; Harlan P. Wilder of Gardner, Mass., and Henry P. Field of Northampton, Mass., constitute the Board of Directors. Mr. Thissell has been president of the company for several years past, but retires, we understand, on account of impaired health. He will, however, divide his former work with Mr. Hammond, who takes his place. The treasurer, Mr. Wilder, is well known from his connection with the manufacture of oil stoves since 1884, when he was treasurer of the American Oll Stove Company. Mr. Field is a new director and is the law partner of Mr. Hammond, who has identified himself with various enterprises and acquired a large property.

The Lion Gas Stove Company, 141-143 Ontario atreet, Chicago, Ill., are distributing to the trade an attractively printed catalogue of gas cooking and heating appliances which they manufacture in varied assortment. The engravings show the designs of the grates to be rich and artistic, while the descriptive particulars call attention to the salient features. The grates are finished in several styles so as to meet different requirements. In the opening pages of the catalogue are suggestions for the connecting of gas grates. The goods are referred to by the manufacturers as being substantial in construction and original and artistic in design.

WE UNDERSTAND that the molders' strike at the foundry of Charles Fawcett, at Sackville, N. B., is practically

over, and that nearly all the vacancies have been filled. The trouble began shortly after Mr. Fawcett occupied his new building, when he made an agreement with his molders to resume operations at a 10 per cent. reduction in wages. The men worked three days, thus keeping, as they claimed, their part of the agreement, and then they struck for an increase of 10 per cent. advance on the original wages paid.

CHARLES SPECHT, well known in the wholesale stove trade in New York and especially to the retail dealers on the East Side, died on Monday evening of this week of apoplexy with which he was stricken while at work. He will be remembered as the East Side expressman who for many years did nearly all the expressing of stoves and materials for the retail stove dealers on that side of the city. For the past four years he was employed by the Union Stove Works as a porter.

FLETCHER, RUSSELL & Co., Limited. Warrington, England, favor us with a copy of the October issue of their catalogue of gas cooking and heating appliances. It is a volume of 135 pages, profusely illustrated, and presenting ample descriptive particulars relative to the goods shown. In a supplement which accompanies the catalogue attention is invited to a line of stoves designed for use in shops and offices where it is inconvenient to connect with a flue. The stock patterns are made for use without flues, but can be supplied the other way when so ordered. The goods are shown under the name Ruby and are made in various styles.

ADAM GRANDER of the Grander Stove Company, Royersford, Pa., was one of the visitors among the New York stove trade during the week.

P. B. Acker, treasurer of the Union Stove Works, New York, has been confined to his home about three weeks with aggravated bronchitis and a slight touch of pneumonia. His friends will be glad to learn that he has about recovered his health, and expects to return to business in a few days.

ABENDROTH BROS., Beekman and Pearl streets. New York, one day this week, had their shipping department crowded with large boxes, in which were packed cooking stoves for shipment to a South American customer.

Runel & Brother is the name of a concern recently incorporated at Chicago, Ill., with a capital stock of \$15,000, for the purpose of making a line of ranges. The incorporators are Frank D. Rubel, Louis L. Rubel and Louis Adler.

THE CHICAGO & ERIE STOVE COM-PANY of Erle, Pa., are distributing circulars of their Invincible fire place burner and of the Sapphire gas stove. The former is provided with a multi-radiating gas burner, a portion of which is formed by the entire back of the heater where there are nearly 400 small openings. When the gas flowing through these is lighted the entire back, covered with asbestos fiber, is an incandescent sheet of light. The makers state that the large number of small jets of gas render the device particularly powerful. The Invincible is finished in a varied number of styles, such as ebony, bronze, brass and nickel plate. As the ascending heat is always liable to overheat the top of the outside frame, the company have a protecting and reflecting plate connected with and under the hood in order to prevent, as much as possible, discoloration. The inside top of the

heater can be removed by taking out two nuts, so that the hand can be inserted to fasten the frame in place. This top has a slide in it which can be opened or partially closed to make the exit passage larger or smaller according to the draft of the chimney in connection with which the heater may be used.

ONE NOTICEABLE IMPROVEMENT in the New York stove business this fall over that of last year is the promptness with which the dealers pay their bills, due to the fact that their jobbing has been better and their purchases of stoves more conservative.

THE MONITOR VAPOR STOVE & POWER COMPANY of Grand Rapids, Mich., filed articles of association with the county clerk on Saturday, October 13. The capital stock is \$32,000, and the company will manufacture and sell motors, engines, machinery, bosts, &c. The stockholders include William S. McCoy, T. Stewart White and Thomas Friant.

A PATENT for a cook stove was granted early in the month to Stanhope Boal of Piqua, Ohio. The object is to provide a wood cook with a low down hearth and square oven of such form and construction that it can be readily turned into a coal stove if desired. Another object is to provide a swell form of door and side plates to which the oven doors are hinged so as to increase the capacity of the flues as well as of the oven, while at the same time adding to the attractiveness of the stove without increasing the cost.

THE DAYTON MFO. COMPANY of Dayton, Ohio, are rapidly pushing to completion the addition to their plant, and expect by November 1 to have everything in readiness for the manufacture of gasoline goods.

THE WROUGHT IRON RANGE COMPANY of St. Louis, Mo., have lately commenced active operations looking to the asle of goods in Northern New York, by M. D. Carter taking possession of the Berkley Vance house and barn, on Elm street, Norwood, N. Y., as headquarters of the business. The team employed for traveling through the country round about consists of a wagon made for the purpose and drawn by a pair of mules. The latter were shipped from Missouri and are said to be remarkable for their size, fine condition and good looks. The name of the company appears on the box of the wagon, and we understand it will travel through that section until the public is supplied with Home Comfort ranges.

THE PITTSTON STEEL RANGE COM-PANY, Pittston, Pa., report a very satisfactory local trade, and intend erecting a new building shortly which will give them increased facilities. The concern is a comparatively new one, and make a specialty of Our Home steel ranges.

The Moon Range Company of Columbus, Ohio, favor us with a folder of the Interchangeable gas heater, a new candidate for popular favor at the hands of the trade. The grate employed is 8 x 15 inches and the burner is 2 x 10 inches, with holes drilled around the entire edge. The heater stands 34 inches in hight and measures 33 x 23 inches at the base. It is so arranged that the entire top portion can be lifted off and a grate substituted, thus adspting the stove for cooking purposes. In the operation of the stove a portion of the heat is deflected toward the floor from the asbestos plate, while a portion passes through the openings at the top of the deflector into the drum, the lat-

ter having a pipe collar with a sliding damper. The makers refer to the device as being economical in operation and that no points of the heating appliance have been sacrificed to gain the cooking attachment. The Interchangeable is meeting with a good demand and the manufacturers expect it will increase in popularity as its merits become known.

ISAAC A. SHEPPARD & Co., Philadelphia, are developing some improvements in their line of furnaces, which, when introduced, will be much appreciated by the trade. They are also working on a new line of ranges which, in beauty of design, will rank well with the leading ranges on the market. The firm are strong advocates of art in stoves and heating goods, and their pattern makers are busily engaged in reproducing the ideas of some of our most skillful artists in the way of stove ornamentation.

The Baxter Stove Company of Mansfield, Ohio, report "trade about 20 per cent. better than for the same time last fall, although our business last fall was pretty good."

Chas. Noble & Co., Philadelphia, with their accustomed forethought, are providing each of their customers with calendars for distribution to the trade. The calendars this year comprise eight different designs, lithographed in colors, the subjects being of a kind which will insure appreciation.

THE LITTLEFIELD STOVE COMPANY of Albany, N. Y., have commenced the erection of a large storehouse adjoining their foundry on North Pearl street in the city named. At the present time the manufacturers are very busy on orders, and are said to be having about all they can do to fill them without operating the plant overtime.

IN A COMMUNICATION RECEIVED from the Monarch Stove Company, Mansfield, Ohio, successors to the Baxter Stove Company in the manufacture of gas and vapor stoves, Emmett C. Baxter, the general manager, states that there seems to be a prevailing impression among the trade that the separation from the latter concern is not a bona fide one, and to correct such impression, desires to state that it is and that he has disposed of his entire interest in the Baxter Stove Company, having acquired the sole ownership of one-half the business of the Monarch Stove Company, two brothers, Edwin D. and Berry A. Baxter, jointly owning the remaining half. The Monarch Company lease the second and third floors of the immense factory building of the Baxter Stove Company, in the front end of which they have fitted up in very handsome style two offices, with steam heat, electric light and all modern con-veniences. They have just moved into these quarters and are now ready for business. The manufacturing department, under the supervision of Berry A. Baxter, the superintendent, will have additional machinery installed, which has been contracted for, consist-ing of new stamping and drawing presses of large capacity for making steel tops, ovens and other parts, while the entire shop is undergoing radical changes having in view the best possible arrangement for the most perfect and rapid production of goods. It is expected that everything will be in readiness for turning out completed vapor and gas stoves by November 15, and patterns for many new improve-ments and original features to be em-

braced in the Monarch line will be ready for samples by the 1st prox.

THE GIRARD STOVE & FOUNDRY COMPANY of Youngstown, Ohio, write: "We have had a fair trade this fall. We have had enough orders to keep going, but are not accumulating."

THE EXCELSION STOVE PATTERN COMPANY, Detroit, Mich, are distributing neatly printed cards calling the attention of the trade to their facilities for turning out stove patterns of artistic design. One card carries an illustration of an open Franklin stove and the other of the Excelsior oak. With regard to the latter, the company state that it is rich in design, satisfactory in construction and up to date in every particular. They also call attention to their fine assortment of cork pine, and state that they can promptly fill orders for any thickness.

THE ART STOVE COMPANY of Detroit, Mich., write: "We are glad to report that with the incoming of October our mail orders took a tremendous jump. We are running full force, and are a good many hundreds of stoves behind."

RATHBONE, SARD & Co. of Albany, N. Y., are mailing to the trade a sheet showing nearly 100 different styles of trade-mark and advertising cuts, together with samples of new stationery for dealers' use.

THE FAVORITE STOVE & RANGE COMPANY of Pequa, Ohio, are complet ing a brick building for core ovens which, together with the new machinery they have purchased, adds to their capacity, which the orders being now received indicate will be fully needed.

F & L. Kahn & Bros. of Hamilton, Ohio, state: "Our trade is beyond all reasonable expectation. Orders are remarkably distributed. Our September sales were about 40 per cent. ahead of those of 1893 for the same month. October promises to show a similar improvement. We have recently improved our new square Oak Radiator."

Cole & Cole, Council Bluffa, Iowa, are sending to the trade a circular calling attention to Cole's air tight heater, which they claim is the best in its class. The circular referred to contains a mass of interesting information concerning their stove which will be appreciated by the retail stove dealer. The circular also states that the C. W. Hackett Hardware Company, St. Paul, Minn., are agents for Minnesota, and Lee-Clarke-Andreesen Hardware Company, Omaha, Neb., are agents for Nebraska.

THE SHINNICK, WOODSIDE & GOB-BONS MFG. COMPANY of Zanesville, Ohio, report business "booming," with orders for their new pattern 1894 Sensation cook, Gem Franklin and Red Oak especially active.

THE QUICK MEAL STOVE COMPANY, St. Louis, Mo., have already commenced booking orders for next year. Among the first accured by them is one calling for seven carloads, or 1800 stoves in all. This is a very propituous beginning and is an indication that the coming season will more than compensate for the falling off experienced during the season just closed.

Buck's Stove & Range Co., St. Louis, report a phenomenally heavy demand for their Buck's Royal air tight heater and Buck's steel ranges. The former is adapted for either hard or soft coal or coke and will, it is said, keep fire for 48 hours. The manufacturers are at present making between 30

and 40 daily, but are unable to keep ahead of their orders. Their steel ranges are about as popular; in fact, they have been compelled to deplete their sample room of ranges to fill their orders.

Hess, Snyder & Co. of Massillon, Ohio, have made some improvements in their wind mill pumps and are preparing an engraving to circulate among those interested. They report orders for their furnace much better than expected.

J. D. Marvin and Edwin A. Keating, representing Rathbone, Sard & Co., at their New York salesroom, at 254 Water street, are issuing an invitation to the trade to call and see a full sample line of the Acorn ranges and parlor stoves. Special attention is called to the promptness with which they can fill orders and the question is asked "Have you seen our new catalogue of specialties for your trade?"

THE EXCELSION MEG. COMPANY OF St. Louis, Mo., illustrate the Junior Hot Blast surface burner by means of a circular which they are distributing to the trade. It is a parlor stove designed for using soft coal, hard coal or coke, and so made that it can be converted into a self feeding hard coal stove by means of a magazine which the makers furnish. The stove is neat in appearance, the ornamental fretwork surrounding the inside structure of the lower half of the stove and the space between the body and the casing serving to heat the air which finds its way in at the bottom through a number of openings made for the purpose. The circular also carries an illustration showing the top section dismounted, the arrangement being such as to facilitate the making of necessary repairs.

CLEVELAND CO-OPERATIVE STOVE COMPANY of Cleveland write they are extremely busy, and orders are flowing in without particular solicitation. Business promises to be very satisfactory in volume.

Speaking to a representative of the Philadelphia Ledger a day or two ago about the present aspect of business among the Schuylkill Valley industries, President Charles S. Prizer of the Reading Stove Works, Reading, Pa., is reported as saying: "The situation today is much better than at this time a year ago. All indications point to a sound and steady improvement in business, although there is nothing to warrant an extraordinary increase of trade. This year there is a feeling of confidence and security throughout the country. We are constantly receiving orders from sections with which we did not do any business last year."

AT A SPECIAL MEETING held this week the Dippo Mfg. Company, Chagrin Falls, Ohio, decided to change their name to the Ferrosteel Company. The president of the concern and the directors, we understand, are highly gratified with the reports that have been received from dealers and others who have used Ferrosteel ranges or any of the products of Ferrosteel. The general offices of the company will be at Cleveland and the works at Chagrin Falls, as heretofore.

Petroleum exports from the United States in the month of September were 75,656,000 gallons, as compared with 81,526,000 in the corresponding month last year. Total exports since January 1, 1894, have been 650,971,000 gallons, against 644,304,000 gallons in the first nine months of 1893.

# TRADE REPORT.

## The Iron Market.

"After the elections" is the time now fixed for the frequently predicted revival. One grimly humorous Iron man suggests that then the date will be shifted to the next 29th of February.

In reality all the points brought up as bearing upon the situation are of minor significance when compared with the attitude of capital. As an old financier is quoted as saying: "There is only one thing more timid than \$100,000, and that is \$200,000." Until moneyed men sgain become venturesome our industries and commerce must drag along, and any happenings must simply be measured by their effect upon the courage and temper of the holders of idle dollars. It will do little permanent good to be either sanguine or impatient.

Developments in the Iron trade show a curious mixture of good and bad news. On the whole, the Eastern trade seems to feel a little more comfortable, while the West displays symptoms of

weakness.

The Wire trade throughout is in a very unsatisfactory condition, with

The Wire Rod market, too, is very weak and \$22.50 has become a general quotation.

Some Southern Iron makers are erowding the markets again and have

been lowering prices.

Pig Tin had some severe pounding last week and has dropped below 15¢. The Ricard syndicate seems to have a good deal against it in its bull campaign. Rumor has it that a large Copper deal is under way for the first quarter of next year. In some grades of Tin Plates a hardening tendency is developing.

Plg Iron. — Current business in the New York market is on a fair scale, but no large sales are reported in this immediate vicinity. Very little is being done in the Csst Iron Pipe trade, the only larger order closed lately being about 1800 tons for Beaver Falls, Pa., taken at \$19, delivered, by the Addyston works. We quote standard brands \$12.50 @ \$13 for No. 1; \$11 @ \$12 for No. 2; \$10.50 @ \$11 for No. 2 Plain, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12 for No. 1; \$10.75 @ \$11.25 for No. 2; \$10.25 @ \$10.75 for No. 3; \$10.50 @ \$10.75 for No. 2 Soft, and \$10.75 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.40.

Phlladelphia advices in regard to the Pig Iron market at that center are as follows: The condition of the Pig Iron market appears to be in favor of the selling interests, although the change from last week is very slight. Furnaces are well sold up, and deliveries are called for in a manner that leaves little or nothing on hand for spot de mand. Consumers are, of course, amply supplied for current requirements, but new contracts at the extreme low figures recently accepted are not easily placed, and in the majority of cases are promptly declined. The increased output, aggregating 40,000 tons per week

The volume of business in the Chicago Pig Iron market has fallen somewhat below the standard of the past month. Large sales are less frequent and inquiries are not so numerous. This, however, is not accepted as an indication that trade will now be dull, as October and November are almost invariably months of good business, and the general demand from all classes of foundries is expected to keep up. Southern Coke Iron is in less demand than noted last week. The leading companies claim to be well sold up again through business entered in other markets, but the smaller concerns are pressing for orders in the Western field and are again quoting close prices, thus making the market weaker. Lake Superior Charcoal is quiet. Quotations are given as follows tor cash.

	910 OU O	
Lake Superior Charcoai	\$13.00 @	
Local Coke Foundry, No. 1	10.25 @	-11.00
Local Coke Foundry, No. 2	10.00 🔞	10.25

Other Ohio Silvery	14.25 @	14.50

The output of Pig Iron in the Pittaburgh district is as heavy as ever, but it is being taken eare of and there is no disposition being shown to push the market for sates. Foundry Iron is unchanged, No. 1 ruling at \$11.65 and No. 2 at \$10.75, Pittsburgh.

There has been only a moderate volume of business in the Cincinnati market during the week, but stocks of Southern Iron have been reduced rather than otherwise. There is a pretty good jobbing demand in that district, there have been sales of some round lots to go East, the largest being 3000 tons, and so there is no orgency to sell such as would make lower prices in the past. There is cuite a firm undertone to the market in general, although there are some weak spots, which are found among the weaker furnaces, but still there are no lower prices quotable. The large con-sumers are getting all the Iron they require on previous contracts and are not purchasing now, but the current consumption appears to be equal to the production, and so there is no accumulation

of stocks of consequence. Quotations are as follows:

Southern Coke, No. 1	10.75
Southern Coke, No. 2 9.75 @	10.00
Southern Coke, No. 3 9.10 @	9.25
Oblo Soft Stone Coal, No. 1 14.50 @	<b>15.</b> 00

Lake Superior Car Wheel and	
Malleable 14.25 @	14 75

In the St. Louis market the situation is reported as showing decided improvement as regards the volume of business, but prices are not at all satisfactory. The heavy buying at this season would seem to indicate that prices have pretty nearly reached bottom. No. 2 Foundry has been the leader, selling at \$9.75, f.o.b. cars St. Louis. This is equal to \$7, Birmingham, and is about as low as this grade has been sold. The outlook is not very encouraging for any improvement in prices, but a steady volume of business for the balance of the year seems assured. We quote as follows for eash, f.o.b. ears St. Louis: Southern Coke, No. 1 Foun-

## Metal Market.

Pig Tin.-Since the date of our last report prices for Straits Tin have dropped about 16 B lb. On the decline some 500 tons changed hands, including contracts for delivery up to and including April, 1895. Early in the week good purchases were made by consumers and jobbers. Latterly orders from those sources have been rather light, chiefly because of the demoralized condition of the market and intimations that the syndicate have shifted their burden where it may or may not be well taken care of. Apropos of the syndicate maneuvers, it may be interesting to note that Tin is cheaper now than when the brilliant deal was under full headway. There is more Tin to be taken care of, as well; probably more than the regular statistics would indicate. Arrivals since the first of the month have aggregated about 2200 tons. demand from small consumers is moderate. Prices for small lots of Straits Pig from atore remain on a basis of 171¢ ₩ lb.

Copper.—Wholesale dealings have been on a moderate scale. The demand in this line has shown no spirit whatever. In fact, hardly any movement has taken place aside from deliveries on old contracts, although lower prices have been made in a few instances to attract new business. There is some talk of another large deal being made between leading producers and large consumers for deliveries extending into the first quarter of next year, but confirmation of the same is, as usual with such deals, not forthcoming. Jobbing business in Copper is on a limited scale, with prices firm at 10½¢ for Lake Ingot in small

lots;  $10\phi$  for Ansonia grade Arizona, and  $93\phi$  for Casting Copper of the same grade.

Sheet Copper.—The movement in Sheet and other manufactured Copper is of the same nature as that described in our report of last week, that is to say, it is still confined to orders for comparatively small quantities needed to fill present requirements. Large contracts are still few and far between, but the inquiry is good. Prices for Sheet Copper remain unchanged in accordance with the list—i. e., on a net basis of  $1\xi \notin \tilde{\mathbb{F}}^2$  lb.

Pig Lead.-Opportunity has been offered buyers to duplicate purchases at prices that were accepted last week for round lots, shipment this month or next, from primal point. A few car-losds were taken, but buying interest generally has been very tame, and the market is, at this writing, showing rather weak tone. The views of the larger consumers as to prices do not come up to those of the holders of the metal, and it is rumored that in order to bring the price down to a certain level purchasing of foreign Lead may be resorted to in case of need. One large Philadelphia consumer is reported to have already provided himself with a considerable supply of Lead from abroad. The jobbing trade in Ameri-can Pig is far from brisk, purchases partaking of a hand to mouth nature. For small retail quantities the usual rate asked by jobbers is 35¢ @ 35¢ ø ib.

Lead Pipe and Sheet.—Business in this section is merely of a routine character, and mainly confined to small jobbing quantities for current use. Prices are firm and unchanged at former quotations.

Spelter.—A certain amount of strong statistical position is claimed for this metal. Eastern consumers are very indifferent buyers, however, and it is yet the fact that no advance on the late prices for ordinary Western brands has been obtained here. Relatively better prices do not appear to have been secured in other quarters, although Western purchases have doubtless been relatively larger. For small parcels of Western from store 4½¢ is about the ruling rate.

Antimony.—A very fair jobbing business has been effected. Prices for small lots remain steady at  $10\frac{1}{4}$ ¢  $\Re$  lb for Cookson's and  $9\frac{1}{4}$ ¢  $\Re$  lb for Hallett's.

Tin Plate.—A very fair spot business has been done at slightly irregular prices. Ordinary Cokes have been taken more liberally for future delivery, and some improvement is noted also in ordera for bright Charcoals, the spot supply and assortment of which are rather poor. On this account Charcoals have realized higher prices on the spot. Ordinary Cokes, ou the other hand, being more plentiful, are a shade off. Terne Plates have remained almost stationary as to price. The American product is in good demand, but several well-known brands are temporarily out of the market, owing to the closing down of many of the domestic works. The solution of the wage question appears as far off as ever, although a few of the larger Tin Plate works are again running on a conditional agreement with the men. Prices in general, both for imported and domestic Plates, are still somewhat unsettled. A more stable market is, however, looked for when the liberal supplies now in transit arrive, and the prospects are that something unforeseen must happen to carry prices higher.

A special London cable dispatch to The Iron Age, dated October 24, reports on the British Tin Plate market as follows: Tin Plate has been dull and weak. Sellers more plentiful and pressing, Wasters and Ternes particularly. More interest abown in light weight Cokes the last few days, but purchases confined mostly to rather small lots. Large amounts of Plate are loading for Frisco without affecting the market, as stocks increase under recent increased production. The Earlswood works are restarting. Swansea quotations are as follows:

Bessemer Cokes, IC	10/ @	٠
Siemens Cokes, IC	10 3 6	6
J. B. Steel Cokes, IC	10, 6.	
Dean Ternes, 20 x 28	20/-6	b
Charcoals, IC	. 11/ a	D.

Sheet Iron.—The active demand for both Black and Galvanized Sheets continues, and with the mills all practically sold up forthis month and some well into November, buyers have considerable difficulty in getting prompt shipments. Prices are firm and there is talk of an advance before long.

# Chicago Report.

Scrap.—A much better demand is noted for all kinds of Old Material. Dealers quote the following list of buying prices, Chicago delivery:

Per i	net tcn	.Per Do
No. 1 Wrought Scrap	\$7.00

THE GEO. M. SHIRK REFRIGERATOR COMPANY, 114 Like street, Chicago, were burned out on the 15th inst., suffering considerable loss in stock. Temporary quarters have been established at 110 Lake street.

# CONDITION OF THE Hardware Trade.

REPORTS as to the volume of business still indicate a good deal of irregularity and unevenness, some sections and some houses experiencing a considerably better demand than others. From many parts of the West and South and Southwest reports are very gratifying, but in portions of the East business is not in quite so satisfactory a condition. There is, however, on the whole little reason for complaint, and it is evident that a great many goods are moving, most of them in comparatively small parcels.

Prices are not strong and in many lines lower quotations are ruling than some time ago. The fact that goods are thus cheap and with a declining tendency keeps down the aggregate of business, as expressed in dollars and cents, and the state of the market is at the same time such as to deter buyers from purchasing beyond their immediate requirements. There is, however, apparently a gradual and steady improvement in the business situation, and it is believed that the foundation is being laid for a good trade in the future.

Advices from Chicago.—The movement in Shelf Hardware and related articles keeps well up to the volume of the first half of the morth. Sales will therefore be considerably in excess of those of September. This is attributed to the conservative buying in August for future delivery, which was not so conspicuous a feature this year as previously. Merchants are being compelled to buy frequently now in order to supply their customers. Winter goods are doing quite well, and a better demand than expected is noted for Holiday Goods, Table and Pocket Cutlery, Silver Plated Ware, &c. The demand for staple goods has also improved to some extent, and even Barb Wire is moving better. Tinware and Tinners' Stock are doing satisfactorily. Aluminum Ware is winning its way remarkably well, considering its higher cost compared with Tin or Enameled Ware. Some manufacturers are hardly able to keep up their stock to meet the demand.

## Notes on Prices.

Wire Nails.—There is a good deal of inquiry and a fair volume of business. The market is, however, in an unsettled state and characterized by a rather weak tone. In the matter of price it is represented by the quotation of 95 cents for carload lots at mill, but this figure is shaded more or less freely, some of the manufacturers quoting as low as 90 cents, f.o.b. factory. Competition between the manufacturers is active.

Advices from Chicago.—The inquiry has considerably increased during the past week. Merchants show an inclination to stock up, especially in localities which may be affected by the closing of navigation. It would not be surprising if some heavy transactions should take place within the next week or two on this account. Jobbers report a good demand for small lots from stock and continue to quote at \$1.10.

Cut Nails.—The demand for Cut Nails continues good, though not as large as it was a little while ago. There is not much change in price, but the market is not quite as strong as it has heen. Small lots from store in New York are quoted at \$1.05 to \$1.10, with the usual average.

Advices from Chicago.— Manufacturers report a continued demand for small lots, which keeps their volume of business up to the average of the past month. Quotations on factory lots are unchanged at 90 cents, Chicago, for 60-cent averages. Jobbers are selling small lots from stock at \$1.

Barb Wire. — There is not much movement in Barb Wire at present, but inquiries for future delivery are coming in more freely. The market is somewhat weak and slightly lower prices than have recently prevailed are being quoted. The market is represented by the following quotations on Four-Point Galvanized in carload lots, at the points named: Pittsburgh, \$1.95 to \$2; Cleveland, \$2 to \$2.05; Cincinnati, Allentown, Chicago and New York, \$2.10 to \$2.15.

Advices from Chicago.—Spring orders are now being booked to some extent by the local factories, and prospects are excellent for a good volume of business of this character. Fall trade, however, is quite light and not much is received by manufacturers in the way of orders for immediate shipment. Jobbers are quoting small lots of Galvanized from stock at \$2.25, while direct shipments from factory are being made at \$2.15. They report an improvement in sales of small lots.

Cast Steel Garden Weeder.—This implement was described in *The Metal Worker* of October 13, as put on the market by Sheble & Klumm, Frankford, Philadelphia, Pa. The Weeders are sold to the trade at a discount of 60 to 60 and 10 and 2 per cent. from the Philadelphia list, and 70 to 70, 5 and 2 per cent. from the Western list.

Glass .- There are no encouraging features in the American Glass market for the manufacturers, nor is a falling market a desirable one for the merchant. Prices continue irregular and weak, while the number of Glass factories in operation continues gradually to increase. Trade is quiet and only immediate requirements are being provided for. Pittsburgh quotations are reported as being 88 per cent. discount for single, and 90 per cent. discount for double strength Glass in carload lots. with slight concessions for with alight concessions lots. larger quantities. Jobbers are quoting from 85 and 10 to 85 and 15 per cent. discount for single, and 85 and 20 per cent. discount for double strength Glass. If these prices continue to rule it is difficult to see how factories with pots can continue in successful There is nothing new in operation. the American Plate Glass situation. Plate Glass is moving in satisfactory quantities and prices remain unchanged. Imported Glass is firm at 60 and 10 and 5 to 70 per cent. discount in any quantity, from the new list of October

Old Metals.—The demand is irregular, but prices remain at about the same level that has prevailed for the past few weeks. The following quotations represent about the rates paid by New York dealers:

Heavy Copper 15 61/20
Light and Tinned Copper # 15 6 ¢

A Boston banker, says the Engineering News, recently received a letter from a Kansas institution soliciting bids for certain Kansas county bonds. In reply, the Boston banker stated that he could not find customers for county bonds in those States which espoused silver or Populists' ideas. "If the bonds were offered on the basis of pig sllver," wrote the banker, "a customer might be found, but on a gold basis there was no market for them in the East." And most Eastern bond dealers will bear out the Boston banker's objection to Western bonds.

The cost of fuel for the ships of the United States Navy is set forth in the annual report of the Chief of the Naval Bureau of Equipments as having been \$191,291 last year in excess of the year preceding, on account of the increased activity of the navy, due to the Brazilian, Salvadorian, Mosquito Coast and Hawaiian troubles. During the past year there were purchased at home 42,-190 tons of coal, costing \$178,163, of which quantity 9505 tons were purchased on the Pacific Coast at an average cost of \$7 per ten and 32,685 tons on the Atlantic Coast at an average cost of \$3.33 per ton. There was expended abroad \$462,192 for 52,146 tons of coal, an average cost per ton of \$8.86. Of a total of 56,722 tons of coal used by the new ships of the navy during the year, 40,521 tons, or 71 per cent., were for steaming purposes and 16,201 tons, or 29 per cent., were for auxiliary purposes, including electric lighting, distilling, heating, flushing, cooking, ventilation and ateam cutter service.

The Lick Manual Training School, established and endowed by the founder of the great Lick Observatory, has been opened for work in San Francisco.

#### System in the Shop.

"System" is of prime necessity in the successful conduct of a business of any kind. The absence of it foredooms to ultimate or at any rate to comparative failure the most promising undertaking. Industry, skill and moral rectitude will go far to secure success, but system must supplement these qualities in order to insure it. A good working system, then, for any branch of trade-that of the roofer and sheet metal worker, for example, is a valuable and desirable acquisition. It is not, however, to be secured except through experience and intelligent observation: but where it is so obtained and put into practice in a shop, the results are bound to be highly satisfactory. In this issue is printed a very valuable artic'e, by Ross F. Rainey. entitled "Shop System of Keeping Track of Sheet Metal Jobs," to which we would wish to draw the particular attention of our readers. Mr. Rainey's system, the result of practical experience, is explained by him with singular clearness and simplicity. The study of his paper and of the accompanying diagrams will, we feel sure, prove of benefit to others in the same line of trade who have not been able to formulate a good working system of their own.

#### Convict Labor on Roads.

The subject of the competition of prison made goods with those manufactnred by free labor was lately referred to in these columns, and the evil effects of the practice of employing prison labor in a manner which in any way inflicts injury on the free workingman, either by reducing his wages to meet the competition of prison made goods or by narrowing the demand for labor in his special line, was commented on. How to employ the energies of convicts so that their labor may be made really

the cost of their maintenance, while at I morrow, rest contented with things as the same time the product of their work shall not contlict with that of honest men outside of prison walls, is one that presents many perplexing features. Perhaps the most satisfactory solution of this question yet found is the employment of convicts in road making. This is an occupation that is not very much sought after by the ordinary laborer, while the condition of the average American country road presents a wide margin for improvement. The subject was recently discussed very thoroughly, after investigation by a committee, at a "good roads" convention in North Carolina, where the system of convict labor on the roads has been in operation for some little time. According to a report presented here the convict made roads in that State were examined and found to be as level and well surfaced as most town streets. The cost of labor per convict was 21 cents per day, including board, clothing, shelter, medical attendance and pay of guards. The actual cost of 50 convicts working 30 days on the roads was \$315 · while at ordinary rates for free later-not always easy to obtainthis work would have cost at least The convicts are also said to have performed 25 per cent, more work in the same time than the ordinary workingman of that section would have accomplished. It would seem that this method of utilizing the energies of criminals might with advantage be adopted more largely than is now the case.

#### Special Tools and Dull Times,

A peculiarity of dull times, with their resulting sharp competition, low prices and meager demand, has always been the fostering of special machines and appliances of every description. At such periods there is a vigorous eall for tools that will produce more of a certain article; that will do the work better, and that will require less attendance. This is true even though, as now, wages have been reduced to a low level and the price of raw materials has struck bottom. In modern times there is, of course, a constant cry for special tools, but there is an uncommon impetus given to this demand during a period of stagnation. When the demand for any product is in excess of the output, and prices are such as to yield the maker a handsome profit, then it is only the progressive and aggressive manufacturer who thinks of the advisability of perfecting his equipment by the introduction of special machinery designed to do his particular work. Those builders who follow in the rut, taking no thought of useful to the State and at least cover | the changes to be wrought by the |

they are. The result is that when prices fall and trade nearly vanishes, the progressive man controls the market because of the facilities he possesses. He also has the experience and skill and can cope with reverses. His neighbor has two courses open to him: to perfect and bring his plant up to standard, or to attempt to meet the reduced prices by the use of inferior material or cheap and unskilled labor. He has not time, and perhaps not money enough, to accomplish the former, and therefore he, of necessity, has recourse to the latter. During periods like this the shop and business methods of the progressive man assume the greatest prominence. Invariably the establishments watching for and anxious to obtain special appliances are those in which the best shop methods prevail and where the business department is managed well. The same spirit pervades and animates each branch of the concern, and from an inspection of one of them an accurate estimate can be formed of the composition of any other. A collection of tools in the shop, fit only for the scrap heap, means an aggregation of beings in the office for whom, unfortunately, there is no scrap heap in this world.

The Mentreal (Canada) Gazette announces the formation of a new corporation in that city, whose object is to acquire the control of bankrupt estates, either by purchase or otherwise, and to realize the same in the most profitable manner possible. The Assets Company, which is the name of the concern, have a capital of \$200,000, and propose to hold weekly sales by auction for the disposal of merchandise acquired. It is understood that gooda will only be sold in limited quantities at a time, so that steeks will not be disposed of en bloc to retailers, as at present. The main aim of the company is said to be, however, to prevent the breaking up of the markets by the slaughter of bankrupt stocks. The company will remove all merchandise which they purchase from the premises of the insolvents to their warehouse, where it will be put in salable shape and disposed of in lots, so that no dealer will possessed of an estate to the injury of his neighbor. The operations of the company will be watched with great interest, and if the enterprise proves successful, it may be followed by the establishment of similar concerns in other cities of the United States and Canada.

According to Government returns recently published, the total imports into Japan in 1893 amounted in value to \$88.257,171, or \$17,000,000 in excess of 1892 The exports for 1893 were \$89,-712,864, a falling off of \$1,389,890 from the previous year, and showing an excesa of exports over imports of \$1,455,-693. The principal exports were silk,

# THE LETTER BOX.

#### An Appreciative Reader.

From T. II., Walker, Iowa.-I want to say that I think I appreciate The Metal Worker as much as any subscriber you have, for the following reasons: When a young man I embarked in the hardware business with a partner, and the result was a failure within two years, leaving us with \$2000 less than nothing. My partner skipped the country and I have uever seen him since. I commenced over again without any capital except my brain and muscle. assumed the debt of \$2000, paid it, and now have a business of my own, with a capital of \$7000. I compromised on none of the debt, but paid the whole account in full. Now, I'll tell you how I did it. I subscribed for The Metal Worker first; then I bought a set of tinners' tools, and after perusing the pages of the paper I commenced. From it I gained my instruction, or, rather, learned my trade and did my own work of all kinds. I saw some dark days while educating myself in that way, but was persistent and finally won. I not only followed the trade for 16 years or over, but have taken four apprentices in that time, who, after serving for three years with me, are holding jobs in first-class shops at from \$50 to \$90 per month. I would say, further, that I never worked a minute in my life under any other instructor than that above mentioned, and never had a job in the line of tinsmiths' work that I could not turn out in a satisfactory manner. have had five competitors in the hardware line during this time, some of whom gave me three months to sell out to them or go to the wall (for they were big concerns). They are all things of the past now, and I have a larger business than ever. So you see I have reason to thank The Metal Worker, which I do, hoping it may prosper and be published "as long as wood grows or water runs."

I notice quite a number of inquiries as to the best way to lay a flat seam roof. Some ask if 3 pounds of solder is enough for a box of 20 x 28 tin. My experience is, square your tin, make a j-inch lock, nail it, lay without cleats, put on from 6 to 7 pounds of solder to the square, and you will have a roof of which the seam is the best part, and if laid on the right kind of lumber for foundation the roof, with proper painting, will last a lifetime, providing the owner dies when he ought to.

#### A Thanksgiving Window.

From Husband, Nebraska.—My wife, who is very much interested in my business has talked to me for some time about having a Thanksglving window. When The Metal Worker came last week and we read the article on "A Cooking Carnival," she said that we must give a description of our project which will materialize on November 1. My store has a double front with plate glass windows which are about 6 feet wide and 4 feet deep from front to back. It is our intention to pull the curtains

down on this window for the first three days of the week in order that we may trim the window and at the same time excite the curiosity of our citizens. We have written out a bill of fare such as would be found on a table of our New England ancestors after church on Thanksgiving day. This will be pasted on the window on one side. On the opposite aide of the window we have written a list of all the articles that appear in the window with the prices at which they are sold. Of course the central figure in the window is one of the ranges on which I make a special run and which has been very satisfactory in my neighborhood, and over it a sign "Thankagiving necessities." To the range is attached a neat label bear-ing the words "One of the Finest." The oven door of the range is open and in the oven is a patent roaster bearing the label "He's in it" and a picture of a fine turkey cock and the words "Taken from life." As the roaster does not quite fill the oven, sweet potatoes rest on the bettom alongside. On top of the atove, which has six holes, is an aluminum tea kettle marked 'Very light and easy to handle." side it is a steam cooker with three compartments labeled "Potatoes," "Turnips" and "Rice." Beside this is an agate boiler labeled "Plum Pudding," as well as a copper stock pot labeled "Bean Soup." A small sauce pan is labeled "Cranberries." I have fitted up shelves at one side of the window and on these shelves I intend to arrange mince pie, pumpkin pie, apple pie with two crusts, and apple and cranberry tarts, all labeled and supposed to have just come out of the oven previous to the roasting of the turkey. On the shelves are arranged drip pans such as we use for baking bread, with the bread in them, and deep tin pans, one to contain a fruit cake, and a deep stamped ateel apider hanging on the wall beside a pan of doughnuts which have been fried in it. Beside these are milk pans, pudding pans, egg beaters, potato mashers, alaw cutters, gravy atrainers, basting spoons, flesh forks, vegetable knives, flour sifter and spice box, and as the window is being trimmed it is quite probable that a number of other things that would be useful in the kitchen will be selected from the stock. On the floor besids the stove is a galvanized iron coal hod full of coal, with a fire shovel, a pair of clinker tongs and a cold handled poker. At the other side of the stove is a tin dipper and a tin water pail with a dish pan and a wire dish washer. Immedi ately behind the atove is a broom, dust brush and dust psn and an ash sifter. On the cast iron warming shelf on the top of the range are two supports on which set a tea and coffee pot, and on the shelf proper are dishes warming for From the top of the shelf the dinner. the stove pipe is run over and con-nected to the wall at one side of the window. My wife being a famous cook I have had printed receipts for preparing and cooking all the articles that are included in our bill of fare, and these are pasted on all the utensils used in preparing them. If my venture is suc-

cessful this year I intend to make November 1 hereafter a day for an annual display of goods in my atove department, as at this season a good many buyers have bought from necessity and others can only be induced to buy by special attractions. In order to get my store in shape to entertain visitors I realize that I shall have to do some night work, for I want the store and the stock to look well. I intend to distribute through the town small pieces of brown paper which have been torn, rather than cut, bearing this inscription: "You are invited to inspect a Thanksgiving factory," and with my address in one corner.

# How Can Hot Water be Supplied.

From R. J. C., Harrisburg, Pa.-One of my customers finished a house last spring which is all plumbed for hot and cold water except the range, water back and boiler. Stop cocks were put on the ends of the pipes where necessary, and as money was scarce he concluded to wait till fall to put in the water heating apparatus. All summer the cooking has been done by two two-burner gas hot plates, using an oven on one for baking, and water was heated on the other for household use, but more hot water will be needed this winter. As the kitchen was so located that it could be readily heated from the hot air furnace, a pipe has been run from the furnace for that purpose. It has now been decided to do without a coal range and cook with gas, so there will be no water back to heat a boiler if I put one in. I would like to get suggestions from the readers of The Metal Worker for supplying hot water.

Note. - We shall be glad to have our readers make suggestions and describe their experiments under similar conditions. In the mean time some information that may be useful will be found in The Metal Worker, August 4 and September 1. Some of the following methods may answer the requirements: A hot air furnace being in use a small pipe coil might be placed in it, but as there would be no fire in the furnace in aummer some objection might be found to this method. As gas is the fuel used, one of the many gas water heaters on the market that are designed to be a substitute for a water back might be used in connection with a boiler. The burner, however, accomplishes no other work than heating the water, and if run continually the cost of heating the water assumes considerable proportions. If only lighted when hot water is desired objection may be raised against the delay of 45 minutes to one hour that is necessary to heat a 30-gallon boiler, though some hot water may be had sooner. Some gas ranges have a water back heated by an independent burner, to which the above remarks are likewise

applicable; others are made with the water back arranged to be heated by the cooking burners, so that as often and as long as cooking is being done water is being heated. Another method of supplying water would be to use one of the quick heating devices of sheet metal These heat water in a construction. satisfactory quantity, as fast as it runs through them, to a sufficiently high temperature within a minute or two after the burner is lighted, one of their objects being to burn no more gas than is needed to heat the water required. They are made so that the gas is turned on and off by the same movement that turns the water on and off, in order to prevent any unnecessary consumption of fuel. Some of these, though, made of light sheet metal, will stand only a light pressure, probably up to 5 pounds, consequently a water pressure regulator would be necessary. Some reduction in pressure would be effected by setting the apparatus near the ceiling, and hot water would go up to the bathroom when the burner was running and the faucets were opened, and no difficulty would be experienced in getting hot water in the kitchen. By arranging a amall pilot light to burn continually it would be a mere matter of detail to arrange chains or levers to turn the water and gas on and off either from the bathroom or kitchen. Such an apparatus would probably cost no more than an ordinary boiler and its attachments.

#### A Hydrostatic Question.

From J. B., Fitchburg. Mass.—Please inform me through the columns of The Metal Worker what is the difference in the pressure of the water at the lowest points shown in the pipe arrangement in the two accompanying sketches? Also what would be the difference in the pressure between the pressure of an air test and a water test?

Answer. - We have not deemed it necessary to reproduce our correspondent's sketches, for the matter can be handled intelligently without them. The drawings are of a horizontal drain pipe with soil pipes leading to it. One sketch shows a single soil pipe and the other shows three soil pipes. We judge from the figures that the pipes are the same hight in both cases, and if so the answer to our correspondent is that the pressure of water is exactly the same in the two instances. The pressure of water is entirely due to the hight, and practically speaking is not influenced in any way by the number of pipes, the shape of them or the size of them. A single pipe 1 inch in diameter and 50 feet high will give just as great pressure to the square inch of aection at the bottom as a pipe of the same hight and as big round as a barrel. Referring to our correspondent's second inquiry, we cannot answer what would be the difference between the air pressure and the water pressure without knowing more particulars. The water pressure would depend upon the hight of water in the

pipes, amounting to 0.434 pound for every foot of altitude, while the air pressure depends upon the length of time the pump is worked. Perhaps we have misunderstood this last question and if he will explain it more fully we will be glad to give it further consideration in a later issue.

#### A Fish Story.

From Helper, Camden, N. J.-Having read about the ecls in the corporation taps in The Metal Worker, my ideas have become so "squirmy" that I cannot hold them. The nourishment in the water of the two citics where the cels have caused trouble may account for the ability of some of their citizens to scoop millions of "spawndulix," and the disposition of more honorable (?) citizens to either fish or cut bait during long sessions. Our city is somewhat over-shadowed by Wanamakerville, even though a real live "duke" lives in our suburbs, but cur town goes the more famous cities one better in the quality of its water supply. The boiler ln a printing office near my place was blown off one Saturday afternoon, and on Monday the engineer could get no water to fill it again. Having had a similar experience before in the winter, when the supply pipe was frozen, he forgot he was smid August humidity and heat, and said, "The blessed water pipe is frozen again," which made the "devil" of the office laugh when he was immediately sent for me. I found the obstruction in a stop on the main in the street, and on cutting off the pipe on the house side of the stop I found a good sized fish in the stop. The engineer was standing directly in front of the stop, and as I worked it open and shut the fish finally shot out, atriking him in the face, and as he started back he fell over the "devil," who gave a yell, and both were well drenched before I recovered from laughing and thought to shut off the stop. The pipe being clear, I wiped a new joint on the house connection and there has been no trouble since.

## Cleaning Nickel.

From G. L., Glendive, Mont.—Please give me a recipe for cleaning up nickel trimmings such as arc used on stoves.

Answer.—Those who are near a nickel plating establishment prefer to have any badly tarnished stove trimmings renickeled as the only satisfactory method of restoring their polish. There are, however, a number of materials sold for this purpose. A good method is to clean with whiting and a weak solution of ammonia, such as is used in cleaning the silver of the household. After thoroughly cleaning, the parts may be dipped in very hot water and then rubbed with chamois or soft woolen cloth to get the whiting off. The friction and heat leave the parts dry enough to prevent further rusting.

A Grand Rapids syndicate of furniture manufacturers, who recently opened a warehouse and sample room in Manchester, England, are reported to have already captured some heavy contracts, in competition with English firms, from British wholesale concerns, which will

provide a large amount of work in making the goods for the factories at Grand Rapids, Mich., during the approaching winter.

# Important Advances in Freight Rates.

From Chleago comes the information that some advances in freight rates, on articles of iron and steel manufacture, were decided upon at the recent meet ing of the Central Traffic Association held in that city. The advanced rates apply from Pittsburgh and points taking Pittsburgh rates, and are on articles of iron and steel manufacture, which now take fifth class in carload lots and fourth class in less than car-loads. Heretofore Pittsburgh has been on what is known as the 40-60 per cent. basis, or, in other words, freight rates from Pittsburgh to Chicago and other Western points of shipment have been on the basis of 40 per cent. of the through rate from New York, the line making the haul from New York to Pittsburgh getting 60 per cent. of the through rate. At the meeting of the Central Traffic Association above referred to it was decided to put Pittsburgh on a 50 per cent. basis, or in other words, make the same rates apply from Pittsburgh to Chicago as apply from New York to Pittsburgh. new rates from Pittsburgh to all the Western points of shipment have not been agreed upon as yet, but we present below the new rates to a number of the principal points of shipment, as follows:

Rates on Articles of Iron and Steel
Manufacture.

		ess than
Pittsburgh to.	Carloads. o	
		Cents.
Chicago	18 (1716)	21 (20)

The Mechanical Engineers Test Bars.—It will interest our readers to know that the 4 tons of test bars made by W. J. Keep for the Committee on Standard Tests are being tested by Prof. R. C. Carpenter of Cornell University and by Prof. C. II. Benjamin of Case School of Applied Sciences. A full chemical analysis of each set of test bars is being made by R. N. Dickman of Cleveland and by Dickman & Mackenzie of Chicago.

The tests of coal carried on at the New York Navy Yard consist in running a marine boiler for 24 consecutive hours with the coal to be tested under as nearly as possible the conditions of actual service. The same boiler is used in all the experiments and the same firemen employed. The rate of combustion is 12 pounds of coal per square foot of grate per hour; all the water evaporated and coal burned is carefully weighed; steam is carried at a uniform pressure; ease or difficulty of firing with the coal under trial noted, as well as the character of the flame, smoke and deposit. In short, a complete record is kept of everything that will enable a just estimate to be formed between the different coals.

### The Flow of Water and Gases Through Long Pipes.

BY G. D. HISCOX, M.E.

The practical conditions controlling the flow of fluids and gases through long pipes are much of the same nature, consisting of the element of pressure, or its equivalent, gravity due to static hight, and the retarding influence of friction. The laws in relation to the flow may be briefly stated as follows:

1. Static hight or head, vertically, is an equivalent of static pressure in terms of their weight in both fluids and gases.

2. The dynamic head is a variable, due to velocity and friction.

3. The loss of velocity due to friction is exactly in proportion to the length of the pipe with equal velocities through-

4. Friction increases nearly as the square of the velocity.

5. Friction decreases with the increase of diameter of the pipe for a given length and velocity.

6. Friction varies with the area of rubbing surface and increases with its roughness.

Friction is independent of pressure with water, but becomes a factor in the friction of air and other elastic gases. Compression increases density in all elastic bodies.

In order to utilize the full flow of water through pipes by gravity or pressure the entering end should be conically enlarged from a distance of ten dismeters to twice the area of the

pipe.

The formula for the flow of the water through long pipes is,  $\sqrt{\frac{a^5 h}{l}} \times 4.71$ 

= volume in cubic feet per minute.  $d^{i} =$ internal diameter raised to its fifth power, or multiplied by itself four times. Thus the fifth power of 2 is 32, of 3, 243, and so on. h = verticalhight in feet, or when pounds pressure is given, multiply the pressure by 2 3 for h. l, length on the line of the pipe in feet. 4.71, a coefficient applicable to the varying relations of the square root of the other terms of the equation.

For example, what will be the flow of a 2-inch pipe 1000 feet long with a

fall of 25 feet? Then 
$$\sqrt{\frac{2^5 \times 25}{1000}}$$
 ×

4.71 = volume in cubic feet per minute. The fifth power of 2 is  $\frac{32 \times 25}{1000}$ =

 $\frac{1000}{1000} = 0.8$ , and  $10.8 = 0.894 \times 4.71$ 

= 4.21 cube feet per minute.

For the velocity, which is the basis for computing loss of head due to friction, and also for loss of head by bends or

elbows, we have volume in cube feet area in square feet

volume × 144 square inches area in square inches locity in feet per minute.

As in the preceding case,  $\frac{4.21 \times 1.14}{3.1416}$ 3.1416

= 192.1 feet per minute, and  $\frac{183}{60}$ 

= 3 2 feet per second.

For a pipe line by gravity the friction loss is involved in the terms of the equation for flow and only requires a change in the diameter of the pipe (d) for an easy approximation to suit the standard sizes of pipe.

For the loss of head or pressure on pumping lines, where an approximate velocity may be known by the action of the pump, the formula  $C imes rac{l}{d} imes rac{ ext{velocity}^2}{5.4}$ = friction head in feet, which divided by 2.3 = the pressure per square inch in the water cylinder of the pump to overcome friction, C being a coeffi-cient that decreases with the velocity of the water, which for 1 foot per second = 0.0317; 2 feet, 0.0266; 3 feet, 0.0244; 4 feet, 0.0231; 5 feet, 0.0221; 6 feet,

0.0215, and proportionately for fractional velocities. For the loss of head due to each elbow,  $\frac{\text{velocity}^2 \times 0.98}{\text{twice gravity}} = \text{loss of head}$  per elbow, 0.98 being a coefficient and

twice gravity = 64.33. For example, as above, to pump 4.21 cubic feet per minute through a 2 inch pipe, 1000 feet long, the expression for friction will be  $0.0241 \times \frac{1000 \text{ ft.}}{2 \text{ in thes}} \times \frac{10.24}{5.4}$ 

= 22.77 feet head, and  $\frac{22.77}{2.3}$  = 9.9

pounds per square inch for friction alone, to which must be added the pressure due to elevation.

Then, if there are six elbows in the line, we have as per equation above for

elbows, 
$$\frac{10.24 \times 0.98}{64.33} \times 6 = 0.986$$
 feet

head, and  $\frac{0.936}{0.2} = 0.4$  pound to add to 2.3

9 9, making the total friction equal to 10.3 pounds per square inch.

Where there are two sizes of pipe in a long line, the velocities and friction

must be computed in detail. The flow of steam, air and other gases through long pipes is retarded under similar conditions in the formulas, as with water; only that steam, air and gases are elastic, and, therefore, their measured volume of flow varies with the density caused by pressure, making a variable measure of friction according to their natural density, together with their acquired density due to compres-

The retardation in velocity in long pipes, due to friction, lessens the initial pressure, and through their elastic nature expands their volume, and in this way makes the problem of transmission much more complicated than with nonelastic fluids.

Thus steam, vapors of all fluids and the gases are subject to the variable conditions due to their elastic properties

and temperatures.

The volume of their flow through pipes and orifices for equal diameters, pressures and temperatures is in inverse ratio of the square roots of their respective densities.

The following general formula for elastic fluids is approximately correct for ordinary use and will apply to the delivery of long pipes for steam, air and gases for the volume of their flow in pounds avoirdupois for a given loss from the initial pressure, with stated lengths and sizes of pipes:

$$87\sqrt{\frac{D(p-p)d^3}{L(1+\frac{36}{d})}}$$
 = weight of an

elastic fluid flowing per minute from a pipe at the point of delivery, the total weight divided by the weight of a cubic foot giving the volume in cubic feet.

D =density or weight of steam, air or gas per cubic foot at the initial pressure by gauge. p = initial pressure; p', final pressure

at end of pipe by gauge.  $d^5$ , fifth power of internal diameter of pipe in inches (d = diameter in)inches).

L = length of pipe in feet.

The other terms are a general expression for friction and expansion along the pipe.

As an illustration of the application of the formula, say for steam at a boiler pressure of 70 pounds and 200 feet of 3-inch pipe, with an assumed loss of 5 pounds pressure at the engine, what will be the volume of steam delivered per minute and its indicated horse power?

We find by the published steam tables in engineers' pocketbooks the density or weight of steam at 70 pounds pressure = 0.198 pound per cubic foot.

The expression then becomes

87 
$$\sqrt{\frac{0.198 \times (70 - 65) \times 3^5}{200 \times (1 + \frac{3.6}{3})}}$$
 Solving,

$$\sqrt{\frac{240.57}{440}} = \sqrt{0.5467} = 0.7395 \times$$

87 = 64.33 pounds of steam per minute, and again by the steam tables the density or weight of steam at the last pressure of 70 - 5 = 65 pounds is 0.187

pound per cubic foot; then 
$$\frac{64.33}{0.187}$$
 =

344 cubic feet of steam delivered per minute at 65 pounds pressure.

The horse-power that may be obtained from the flow of steam under the above conditions varies with the eco-nomical form of the engine, as known by the weight of steam they require per indicated horse power.

The common slide valve engine, using 30 pounds of steam per hour, to the compound condensing engine, using 15 pounds only, will be the range, which, when reduced to the minute unit, will

be, in the first case, 
$$\frac{64}{0.5} = 128$$
 horse-  
power, up to the last case,  $\frac{64}{0.25} = 256$ 

power, up to the last case, 
$$\frac{64}{0.25} = 256$$

horse-power, that may be utilized under the conditions of 70 pounds boiler pressure and 200 feet of 3 inch pipe, with 5 pounds loss of pressure at the engine.

The same formula, when applied to the transmission and volume of air through long pipes, must have the weight of air per cubic foot and at the initial pressure used for D in the formula.

The mean weight of free air at 60° F. is 0.0769 pound per cubic foot which must be multiplied by the increased density due to the initial pressure. This is found by dividing the total pressure, plus the atmospheric pressure, by the atmospheric pressure and multi-plying the quotient by the weight of free air, as above.

For example, if at 60 pounds pressure,  $\frac{60+15}{2} = 5 \text{ volumes in one, and}$  $0.0769 \times 5 = 0.3845$  pound per cubic foot of air at 60 pounds pressure. Then for 1000 feet of 3 inch pipe the expression will be for a loss of 5 pounds press-

ure due to friction:  
87 
$$\sqrt{\frac{0.3845 \times (60 - 55) 3^5}{1000 \times (1 + \frac{3}{3} \frac{6}{3})}}$$
 Solving,

$$\sqrt{\frac{467.16}{2200}} = \sqrt{0} \ 2123 = 0 \ 461 \times 87 =$$

40.1 pounds flow per minute at 55 pounds terminal presssure. As free air weighs 0.0769 pound per cubic foot, or 13 cubic feet per pound, then 40.1  $\times$  13 = 521.3 cubic feet, the delivery of

free air per minute.

For the flow of illuminating and other gases under very low pressure a more simple formula than the above is used to avoid detailed fractional elements, in which the pressure is in inches of water h, density G, referred to the density of air, and the length l in yards. Then  $1000 \ \sqrt{\frac{d^3 \times h}{s}} = \text{open}$ 

yards. Then 1000  $\sqrt{\frac{d^s \times h}{G \times l}}$  = open end delivery in cubic feet per hour. 1000  $\sqrt{\frac{d^s \times h - h'}{G \times l}}$  = delivery with

the difference in initial and final pressure. In ordinary gas distributing serv-

The Parker Portable Heater.

The Charles Parker Company, Meriden, Conn., and 97 Chambers street, New York, are putting on the market the Parker portable heater, as shown in the accompanying engravings. The stove complete consists of an ornamental base of east iron, nickel plated, to which a heavily ensmeled sheet metal cylinder is bolted. This extends slightly more than half around the base and is highly polished on the inner side to make a strong reflector. The top piece is east iron with an opening about the size of an ordinary stove hole, directly over the lamp. This is partially filled in with

ration. The manufacturers refer to the heaters as being an advance in oil heating practice, more like a parlor stove in construction and appearance, simple in construction, powerful for heating, and absolutely free from offensive odors and smoke.

Shipping men in New York aver that imports of goods from other countries to this port have been steadily increasing since the coming into effect of the new tariff and that the movement is general from all parts. The amount of freight sent hither, while not excessively large, is decidedly larger than it was a few months ago. In illustrating this fact, the following figures are given

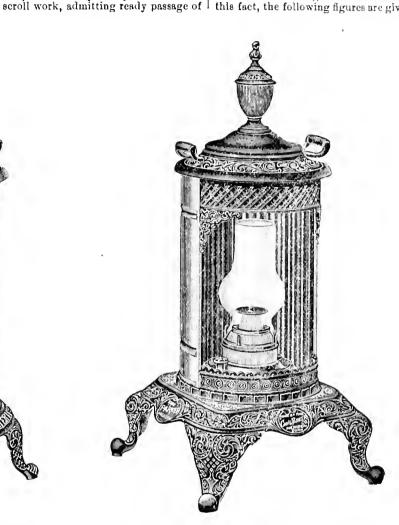

Fig. 2.—The Parker Portable Heater No. 5.

ice with a pressure from gas holder of 2 inches water and a terminal pressuer of 1 inch at 1000 yards, the delivery of a 3-inch pipe will be for gas at 0.42 (air

1) : 1000  $\sqrt{\frac{d^5 \times (2-1)}{0.42 \times 1000}} = \sqrt{\frac{243}{0.5785}}$ =  $\sqrt{0.5785} = 0.7605 \times 1000 = 760$  cubic feet per hour.

President C. P. Huntington, of the Pacific Mail Steamship Company, says that negotiations are in progress between his company and the antagonistic steamship lines backed by the Panama Railroad Company, which he expects will lead to a peaceful settlement of the present rivalry. It is understood that the Pacific Mail will lease the Atlantic service to the Columbian Steamship Company, and that the Pacific Coast business will be surrendered to the Pacific Mail Line.

heat, forming a rest for culinary utensils and preventing small articles from dropping through to the lamp. When not in use for cooking this is surmounted by a handsome metal ornament in harmony with the general design of the heater. The lamp, which is a Parker Mammoth central draft, rests about 2 inches from the floor, and is held firmly in n cast iron basket which is bolted to the base. This receptacle holds the lamp so that it cannot be upset even when the heater is being moved, as may essily be done by mesns of the handles, one at either side of the top piece. At present this heater is made in three numbers, of which No. 3, the smaller, weighs 30 pounds, stands 37 inches high and has a diameter at base of 14½ inches. This number is nickel finished, while Nos. 4 and 5 are pollshed nickel plated. The No. 4 is a little larger than the No. 3, and has a square base similar to No. 5. Other sizes and styles, we are advised, are in course of prepaby the Journal of Commerce: A certain steamer belonging to a regular line, coming from London, brought on a trip in May last 1416 tons of freight; in July the same ship brought 1451 tons and on her last trip this month she brought 2638 tons. Another ship in the Antwerp trade brought to this port in July 1475 tons of freight and on her last trip this month 1819 tons. Another vessel from Hull brought 550 tons in July and 1600 tons in October. Some of this business in October is accumulative business—that is, freight has been piling up waiting for shipment—but the increase is still noticeable.

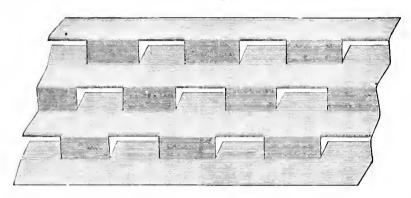

The benefit of ship canals in promoting the commercial prosperity of cities is becoming widely recognized in this country. Pailadelphia, Cincinnatl, Pittsburgh and other commercial centers are actively pushing projects for the construction of such waterways to those cities.

# ROOFING AND CORNICE.

#### American Metallic Lath.

I iThe American Roofing Company, St. Louis, Mo., have placed upon the market a new improved metallic lathing,

The apertures in the face of the sheet being cut below the crown of the corrugation the trowel moves across a smooth surface, there being no sharp edges to cut the plaster from the tool.

American Metallic Lath .- Fig. 1 .- Front View of Lath.

made by special machinery that was built under their direct supervision. They have given the matter much study and have sought to produce a lath that would be rigid, use little mortar and would not cut the mortar from the trowel and so interfere with rapid and economical covering. Fig. 1 shows the front of the lath, while Fig. 2 is the back of it, and shows the way the plaster keys. The lath consists of a sheet of steel having angle corrugations lengthwise to insure the necessary rigid-Apertures are cut in one side of the fold or corrugation and a tongue open on three sides is pressed back, admitting passage of the mortar. This tongue acts as a guard to prevent too large an amount of mortar passing through the aperture and as a guide to force the mortar against the recessed side. In this way, it is pointed out, the line of the plaster is directly from the main body, and is held in place by the tongue and pressed by the workman's trowel against the other angle of the corrugation on the reverse side of the sheet, spreading it out on the reverse side of the apertures in sufficient quantities to key securely without

The workman, in covering, strikes the trowel across in the usual way.

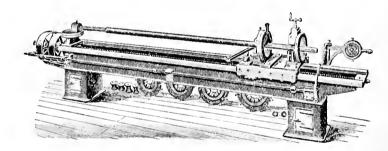

#### Ten-Foot Corrugating and Seaming Machine.

The accompanying illustration shows a 10-foot conductor pipe corrugating

machine. In the operation of this machine the carriage which sustains the corrugating and seaming heads is driven by a screw, which is referred to as making it very powerful and positive. The corrugating and seaming is done in one operation. The mandrels are held in position by a swivel head which allows them to swing forward toward the op-erator, past the grooving head, permitting the pipe to be placed upon the maudrel. Then with one hand the op-erator returns the mandrel to the center of the head and with the other pushes the lever that engages the clutch in the driving pulley, which starts the carriage with its grooving heads on the forward motion. When the carriage has reached the end of the machine it automatically reverses and, by a stripping device, discharges the finished pipe from the man-drel during the return of the carriage, when it stops by a self-acting device. The machine, which is 16 feet 6 inches in length, requires but one man to operate it.

#### FLASHINGS.

N. & G. TAYLOR COMPANY, Philadelphia, are offering to the trade what they call roofing tin in rolls. These are referred to as sheets of tin

Ten-Foot Corrugating and Seaming Machine.

and seaming machine, manufactured by the Poorman Mfg. Company, Canton, Ohio. It is described as of an entirely

new design, not built for a cheap machine, but for long service and heavy

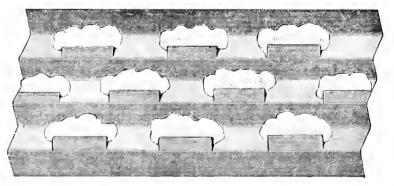

Fig. 2.—Back View of Lath.

The corrugations are only deep enough to stiffen the sheet and to hold the depressed tongue so it does not take a large amount of plaster to fill the corrugations or cover their crowns before facing the plastered side of the room. | for corrugated pipe are a part of the |

and rapid work. It is furnished with mandrels and heads for making plain and corrugated pipe from 2 to 6 inches, inclusive, and 10 feet 6 inches long. Five mandrels for plain pipe and five

thoroughly soldered and painted on one side, ready to put on the roof. They are made in widths of 10, 14, 20 and 28 are made in widths of 10, 14, 20 and 25 inches, 100 square feet in a roll, of IC and IX thickness, and can be furnished in any quality that may be desired, from the Old Style brand of heavy coated roofing tin down to the cheapest grade. The rolls are referred to as particularly desirable for dealers who keep no tin man, or work at a distance, as the tin is ready for use at a moment's notice. The rolls are in straight lengths and require no resquaring. The seams are said to be well soldered by hand.

THE NEW YORK METAL CEILING Company, New York, bid \$1895 and secured the contract for the metal ceilings for the new school at Paterson, N. J.

C. W. CLARK of Bridgeport, Conn., has the contract for roofing the addi-tion to the factory of the Salts' Textlle Mfg. Company.

J. O. LARY & Co., Norwich, Conn., have taken the contract for roofing a building for the Flint Granite Com-pany. They are also putting a roof on a structure for the W. II. Page Boiler Company.

# STEAM AND HOT WATER.

The Steam and Hot Water Trade.

A joint meeting of the Executive Committeee and Advisory Council of the Master Steam and Hot Water Fitters' Association of the United States was held in New York, September 20, and to dispose of the trouble arising from unsatisfactory protection to their members a series of resolutions known as the "trade resolutions" were passed. On the same day the manufacturers of heating boilers, who had held meetings, as noticed in The Metal Worker, to form an association, met at the Hotel Imperial and effected an organization. A delegation from this latter association composed of Geo. E. Downe, F. A. Herendeen, C. B. Boynton, J. C. Blackmore and John K. Allen, the secretary, waited upon the joint committee, asking a conference with a view associations. The following reply was made to the delegation by the joint committee: "To be in harmony with this association we suggest that members of your association do not sell their wares to any person or firm other than a master steam fitter regularly in business, having a properly equipped shop and engaged in construction work. We also suggest that your members do not make plans and specifications for any person whatsoever." Circular letters conveying this information are being sent out from the headquarters of the Master Steam and Hot Water Fitters' Association, Cable Building, Broad way and Houston street, New York. Both the "trade resolutions," which went into effect Ontober 15, and the communication to the boiler mak-ers have attracted wide attention. Copies of the "trade resolutions" have been sent to all manufacturers of goods used by steam fitters with a blank and circular letter asking the manufacturers to use the blank to signify their feeling toward the "trade resolutions." A list of the manufacturers in accord with the resolutions has been prepared and the additions to the list are mailed weekly to the members.

#### HEATING NOTES.

The catalogue of the Economy combination heaters and warm air furnaces manufactured by the J. F. Pease Furnace Company, Toronto, Ontario, is at hand. The pamphlet opens with an account of the warm air and combination system of heating. It also treated the Pease apparatus, the illustrations presenting broken and general views of the combination boilers and furnaces. These cuts of the heaters are scattered through the pamphlet and are alternated with pictures of prominent buildings in Canada warmed by the Pease apparatus. In connection with the buildings there are also letters from prominent Canadians who speak in high terms of the efficiency of these heaters. Altogether it is an exceptionally tasteful pamphlet and is worthy of the well-known concern who issue it.

THE 1895 illustrated catalogue and [ price list of the Lunkenheimer Company, Cincinnati, Ohio, is a handsome publication describing an extensive line of steam specialties. The volume, of steam specialties. which is bound in red cardboard, opens with a full description of the Lunken gate valve, of which many illustrations are shown, so that its entire construcare shown, so that its entire construc-tion may be comprehended. Full lists of sizes, weights and prices are given. This specialty is followed by an ex-tended assortment of check, globe, angle, radiator, gate, throttle, pop-safety and other valves. Steam whistles, meter cocks, water gauges, fusible plugs, water columns, gate cocks, lubricators, &c., follow. Injectors, oil feeders, grease cups, oil cups and shaft oilers of various sorts are illustrated and described, and at the close attention. tion is given to loose pulleys and valve wheels. The book is got up with exceptional neatness and is indexed. In the introductory note the statement is made that all the steam goods of this concern are made according to the United States Government standard of steam composition. A smaller pamphlet issued by the same concern shows, in a little compass, a number of the goods illustrated in the larger cata-

THE SPRINGFIELD COIL BOILER COMPANY, Springfield, Mass., have established agencies for their boilers with the following firms in the State of Connecticut: Andrews & Creedon, Hartford; Curtiss & Pierpont, New Haven; John Kesrns, Bridgeport; Monaher & Breed, Norwich. Also with the Pawtucket Steam & Gss Pipe Company, Pawtucket, and the Capital Heating Company, Providence, R. I. The company are turning out boilers rapidly, and have recently shipped boilers to Allston, North Andover, Palmer, Barre, Westfield, Holyoke, Greenfield and North Adams, Mass. Two boilers were recently put in a church at Wellsboro, Ps.

THE WARREN WOODWORK COMPANY will shortly begin the work of laying steam pipes through some of the streets of Washington, N. Y., for heating purposes.

W. A. Russell, 89 Center street, New York, reports great difficulty in keeping a stock of the Quick Closing steam and hot water valves made by the Detroit Lubricator Company of Detroit, Mich., his trade in these goods having exceeded his expectations. He reports a very satisfactory business in the Niagara radiators made by the Niagara Radiator Company of Buffalo, N. Y.

J. R. Morrison & Co., 51 Charleston street, Boston, Mass., are making a specialty of the steam and hot water goods of the J. H. McLain Mfg. Company, having closed an arrangement with J. H. Coleman, Jr., during his recent New England trip for a line of the Humber, Cambridge, Sandow and Yale boilers.

SOMETHING OF A NOVELTY in the heating line was seen in front of the Nason Mfg. Company's office at 71

Beekman street, New York, this week, one of their radiators made of brass pipe, attracting no little attention.

The Kennedy Valve Mfg. Company of 52 Cliff street, New York, will after November 1 occupy their new quarters at 75 John street, and will there keep a stock of all sizes of their gate, globe, angle, radiator, swinging eheck and indicator valves, indicator posts, hydrants, &c. They will then be in position to ship all orders, even in the larger sizes of gate valves, immediately upon receipt.

#### A Wonderful Record.

The annual report of Geo. W. Melville, chief of the Bureau of Steam Engineering, U. S. N., contains the following statement, which bears evidence of the truly wonderful work done by this department:

In all its designs for machinery, whether for a tug, a battle ship or cruiser, the bureau has, in spite of much adverse criticism, insisted on a fair proportion of weight for power, especially in the boilers; as a consequence the department has been spared the annoyance of failures on trial trips; and, without exception, all machinery built from its designs has done all, and more than all, that was required of it on the first trial, and without distress, accident or injury of any kind. Such a record is unique, and, when the high powers and unprecedented speeds of some of the vessels are considered, it is one to be justly proud of.

In the opinion of the buresu, much of this success is due to its uniform practice of allowing ample power for the speed required with a given displacement, as determined from the carefully observed performances of similar vessels, and to having every design, before final adoption, carefully scrutinized by an engineer officer who has performed service at sea in charge of machinery, this being the only way in which much of the information absolutely essential to the successful designing engineer can be obtained.

English advices intimate that the final liquidation of the great Baring estate will shortly take place. The liabilities, which were originally over \$100,000,000, have been reduced to a little over \$12,000,000. It is expected that a large surplus will be secured ultimately.

It is announced that Mrs. Cleveland, wife of the President of the United States, has consented to name the new Atlantic liner "St. Louis." The exercises attending the launch of the vessel from Cramp's shippard, Philadelphia, will take place November 9.

The statistician of the Department of Agriculture, after an investigation of several months' duration, estimates the acreage of cotton planted in the United States in 1893 at 19,525,000, and the number of bales harvested at 7,493,000.

# HEATING DO PLUMBING.

#### NEW WORK AND CONTRACTS.

FAY & SCOTT, Dexter, Maine, are doing considerable work in the line of putting in steam heating apparatus. They have recently made contracts to fit Henry Hudson's residence in Guilford, the Town Hall at Pittsfield, the Court House at Dover and the Memorial Building.

THE BUILDING COMMITTEE of the School Board of Newport, Vt., are examining heating plants with a view to adopting some system for their new school.

GOULD & NOWLEN, Bath, N. Y., are putting in the steam fixtures in the Hammondsport Herald office.

Perriman & Simpson, Middletown, N. Y., the plumbers, have just finished putting steam heat in the Wallkill House.

A. A. McLauohlin, Worceater, Mass., has secured the contracts for the plumbing in several schools. The Dartmouth Street School at \$1186; the Upsala Street School at \$846; the Ward Street School at \$737.

SECRETARY JAMES T. McNaB of the Paterson, N. J, Master Plumbers' Association bid \$3800 and accured the contract for the steam heating plant in the new No. 1 School Building, and Nealon & Farnon secured the plumbing, gas fitting and tinning contract at \$2820.

THE HEATING COMMITTEE of the Board of Education of Newark, N. J., awarded contracts to the Edward Dunn Company for the heating of the Waverly Avenue, Elizabeth Avenue and Charlton Street Schools. The direct ateam system will be used and the cost will be: Waverly Avenue, \$2100; Charlton Street, \$1647, and Edzabeth Avenue, \$635

GEORGE TREFETHEN, CHARLES DON-NELY AND NED BAWLEY OF PORTSMOUTH, N. H., are putting a steam heating apparatus into Benjamin Lowell's house in Saco, Maine.

BABN, WITHAM & KELLEY, Bangor, Maine, will fit the Bangor Hospital with steam heating apparatus.

Howe Brothers, Canton, N. Y., are fitting the Curtis House out with a system of hot water pipes and furnaces for warming the hotel. George Main is in charge of the work.

STEVENS, STEWART & SAVAGE, Passadens, Cal., have secured the contract for the steam heating and ventilation of the new insane asylum at Highlands.

THE BOILERS for heating the new Masonic block, at Mason City, Ind., have been ordered by S. C. Blake.

Broul & Appell, Sandusky, Ohio, received the contract for the plumbing work for the Middle Bass Club House, also the contract for placing hot water heaters in the residence of Louis Biehl and Carl Neilsen.

HEEBNER & Sons, Lonsdale, Pa., have received the contract for putting in a large steam heater in the newly erected church, Bucka County.

JOSEPH LONGINUS, Pottsville, Pa., bid \$1139 and secured the contract for the steam heating plant for the County Alms House.

CLERKIN & McDonald, New Haven, Conn., are putting in two Gurney hot

water heaters in II. E Franklin's two-family house on Howard avenue. They are putting in a Volunteer steam heater at G. W. Audrewa' residence and have the plumbing on two new houses for John Lowe. They have also been awarded the contract for the plumbing in A. McGinty's aix apartment block and Mrs. Sheridan's new house.

THE ARNOLD COMPANY, New Haven, Conu., have taken the contract for the plumbing and heating of F. E. Hill'a new house. They also have the plumbing and hot air heating of Chas. H. Hamilton's house and John Carr's new house and for new open work plumbing in J. P. Hopson's house.

THE WATROUS HOUSE, on Elm atreet, West Haven, Conn., which was recently sold to a New Haven man, has been thoroughly overhauled and is now a first-class residence. A. B. Wilkinson put in new plumbing and the Foskett & Bishop Company a hot water heater.

A. B. WILKINSON, West Haven, Conn., has contracts on hand for the plumbing and tinning of three houses for Humphrey Bros., the hot air heating of Don Thompson's house, the heating of Michael Larsen's house, the plumbing of the Ellis house on Main street, and the plumbing in L. H. Warner's new house.

EDW. LYNCH, Bridgeport, Conn., has the contract for the plumbing in the new residences of Richard Irwin, H. S. Pearson, Mrs. J. S. Phalen and Chas. N. Ruggles. He is putting in a Gurney heater in one house, a Mahoney heater in another and a Furman, Jr., in his own residence.

DONAHUE & BERTILSON, Bridgeport, Conn., have the plumbing, tinning and gas fitting on four new houses for Warren H. Lamson, one for W. F. Randall, one for C. F. Noren and three houses for Jas. McGee.

L. H. Toucey, Waterbury, Conn., has just finished roofing a house for the Waterbury Clock Company, he has the plumbing of two houses for F. B. Rice, the renovating of the plumbing of B. I. Hotchkiss' house, overhauling the plumbing of Ralph N. Blakeslee's house and is just finishing the plumbing of a double house for the estate of Alexander Mintie.

C. U. NEUMANN, New Haven, Conn., has just finished putting a modern plumbing system in Harry F. Ackrell's house in West Haven, and is putting plumbing and a hot water heater in G. W. Hoggan's new house on Ellaworth avenue. He has also taken the contract for the plumbing and hot air furnace in Wm. H. Bartlett's house.

THE BUILDING COMMITTEE of the School Board of Worcester, Mass., have awarded the contract for heating the Ward Street School to the Fuller & Warren Warming and Ventilating Company of Boston at \$1900.

CHARLES II. AISTHORPE, East Norwalk, Conn., is placing the steam heating apparatus in the new drying shed, which was erected in the rear of the Randall mill.

THE WALCOTT-HURLBUT COMPANY, 175-177 Lake atreet, Chicago, have received an order for two siphon eduction closet ranges of aix and nine sections respectively, to be placed in a school building at Detroit, Mich.

THE THEO. JACOBS COMPANY, 72-74 Market street, Chicago, have the contract for hot water heating in the residence of B. Eckhardt, Ashland avenue.

Flanders & Zimmerman are the architects.

THE SMITH & ANTHONY COMPANY, 219 Lake atreet, Chicago, are to place a Hub warm air furnace in the building of E. Valles & Co., Michigan avenue and Randolph atreet.

THE STANDARD RADIATOR COM-PANY, 167-169 Lake street, Chicago, are to furnish radiators of their manufacture for the Safety Building, State and Van Buren atreets.

KEHM BROS. & MERTZ, 289 E. Kinzie atreet, Chicago, are to furnish a ateam heating plant for St. Anthony's Church, Twenty-fourth place and Canal street.

J. S. FARRELL & Co., Indianapolis, Ind., have the contract for steam heating in the seven-story apartment building of Gen. Lew Wallace, using two of the United States Heater Company's No. 411 "Hecla" boilers.

GEORGE M. Ellis, Norwalk, Conn., has installed 53 heating plants in the past 14 months. He is now engaged in installing Volunteer heaters in the office building of the Norwalk & New York Transportation Company and in the residence of Dr. Main, at Stonington, Conn. He has contracts for installing heating plants in the residences of A. Moran, C. R. Gallop, Mrs. Trowbridge, and an All Right hot water boiler for Mr. Dawley.

R. W. Meios of New Haven, Conn., is about to erect a new residence which will have a modern system of plumbing, for which Peck Brothers & Co.'s fixtures will be used throughout and a system of hot water heating for which a Perfect hoiler has been specified.

W. H. Conning of Bridgeport, Conn., has the contract for the plumbing in a two-family house that is being erected by Z. V. Hewitt.

FERRIS BROTHERS, South Manchester, Conn., are using the Richmond hot air furnace for heating two cottages that are being erected for Mrs. William H. Cheney.

J. D. Kane, Joplin, Mo., is putting in the heating apparatus at the new school building recently erected at Neosho.

THE BOARD OF WORKS Of Oakland, Cal., have accepted the sysem of closets put in by Dalziel & Moller of that city.

GODFREY & ALLEN, Old Town, Maine, have the contract for fitting the residences of C. W. Mullen and M. L. Jordan for hot water heating.

BENJAMIN F. VAY, Rochester, N. Y., has completed the installation of a No. 132 Fox furnace in the St. Peter's Church of that city.

J. R. Morrison & Company, 51 Charleston street, Boston, Mass., are installing a hot water heating plant in the residence of Dr. Leslie, at Ameabury, using a Humber boiler.

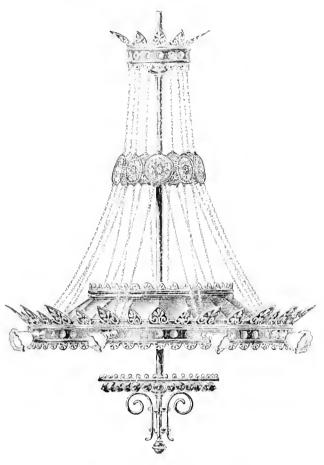

THE IDANO PLUMBING & HEATING COMPANY, Boise, Idaho, have the contract for installing a hot water heating plant in the Catholic Hospital in that city. They will use a Kewanee horizontal boiler and Perfection direct-indirect radiators.

L. W. Roninson has awarded the contract for the heating of the new First National Bank Building, at New Haven, Conn., to the New Haven Heating & Plumbing Company, and the plumbing to Joseph H. Buckley.

#### Combination Chandelier and Reflector.

New Style 50-Inch Power Square Shear.

The accompanying picture shows a We show in the accompanying illusnew combination gas and electric chantration a machine just put on the

Combination Chandelier and Reflector.

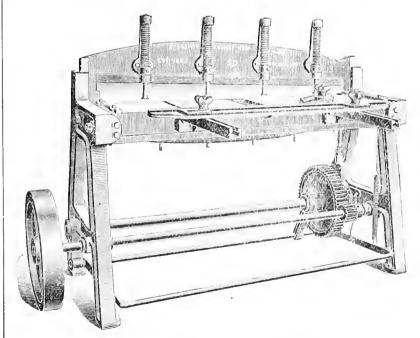

deller and reflector, designed by I. P. Frink, 551 Pearl street, New York, for St. Peter's Lutheran Church, at Berlin, Ont. The chandelier has a large illuminating capacity, the reflector being 72 inches in diameter, and when suspended from the ceiling hangs down about 12 feet. When gas is used for lighting, 48 gas jets are arranged beneath the reflector, which is designed to reflect a brilliant light over the entire audience room. The electric lights are arranged on two circuits, nine lights being placed around the outer edge of the reflector, so that when desired they can be used in connection with the gas for lighting. Under the reflector there are 40 electric lights on a different circuit; so that either may be used and lighted independently of the other. The reflector is constructed on the same principle and of the same materials that have established a reputation for these goods. The fixture shown represents the advancing tendency in these goods, for with the use of electric lights it has been necessary to arrange the reflectors so that both gas and electricity can be used. In ornamentation, the space around the edge of the reflector may be finished in colors and designs similar to those used in ornamenting the church, or decorated with sheet metal designs, as shown in the illustration. The sheet metal is finished in either polished brass or differently colored bronzes, as is preferred. It is claimed that the efficiency of the reflector enables a much more powerful light to be shed than when the same number of burners or electric lights are used without a reflector.

market by Jacob Brombacher's Sons, 30 Cliff street, New York, which they refer to as their new style 50-inch power square shear. It is of the light

connection with the bed, which serves to keep the ways for the cutting bar perfectly in line, thus insuring, it is pointed out, smooth and easy running. The bed has a screw adjustment for stopping the blades, and is arranged so as to lock the bed in position when set, rendering it impossible for it to shift. The clutch is referred to as powerful and not liable to get out of order. The treadle for operating the clutch extends the entire length of the shear, so as to be always convenient for the operator. Four poppets are used for holding down, and these are held by spring pressure, which, we understand, is found very efficient. They adjust themselves automatically to different thicknesses of metal, and avoid the possibility of breakage through faulty adjustment or unevenness of atock. Another advantage alluded to is that the poppets leave the cutting knife clearly in view, so that any mistake in adjustment is readily detected. The fly wheel is 21 inches in diameter with a 3-inch face, and should make form and a 200 and should make from 250 to 300 revolutions per minute. With the machine are furnished a full set of back, front and bevel gauges, also a screw adjustment for the back gauge.

The German Government has forbidden the importation of American

The grant by the British Government of a lease of the tin mines of Lower Burmah to Captain Menzell of Singapore has, it is stated, given a considerable stimulus to the tin mining industry in that district, which has been in a depressed condition for some years. Under the terms of the lease, Captain Menzell has the exclusive right of mining in the Msliwun township of the Mergui district, the only part where tin is known to occur in any considerable quantity—until 1898, except in aress already occupied by native miners; furthermore, if the concession be worked in a satisfactory manner, he will have the option of renewal for a further

New Style Fifty-Inch Pawer Square Shear.

pattern style, is geared four to one, and will cut as heavy as No. 14 iron. The will cut as heavy as No. 14 iron. The side frame and lega are cast in one piece, and there is a tongue and groove

period of 21 years. The concessionsire has already begun operations by importing a large number of Chinese miners from the Straits Settlements.

# Shop System of Keeping Track of Sheet Metal Jobs.

BY ROSS F. RAINEY.

IN CONDUCTING A SHOP IT IS necessary that the workmen be governed by some such conditions as the following: The foreman should have absolute control over all the men in the shop and should exercise judgment as to who are the proper men to work on the several jobs. Some man may be experienced in one line of work and could work to better advantage in that line, while in another line he could not work to as good advantage.

The foreman should distribute his men so as to get the best results, and should not show too much authority over them. It is better to treat them civilly, as they will show more respect and will do better work.

It is not generally best to discharge a man without the consent of the proprietor, but at the same time the foreman should give his men to understand he has that right.

The shop should be thoroughly cleaned once a week.

In a great many shops there is no avstem in regard to keeping the men's tools. The general rule in some shops is that the man who gets to the shop first gets the preference. In our shop, we have a large cabinet containing a large number of drawers, giving each man one drawer, with a key for the same; the keys not passing. The foreman keeps a duplicate key of each, and each man is held responsible for his tools.

#### Diagrams.

The books and slips used in this aystem of keeping track of jobs and shown in this article are as follows:

Fig. 3A.-Record Book-Job Entered.

specifications. He takes a copy of the specifications in a memorandum book which he carries, as well as the measure- both the specifications and messure- the building and are ready to work.

All material sent out by the foreman book, Fig. 6,

the following words are used in the cost and extensions: woulds fair. 123456 7890

After the job is written up in the bid book, a written bid, as shown in Fig. 2, is sent to all the bidders. We then have our man keep his eye on the job until it is let to the successful bidder, who we in turn have our representative see, and if we are the lowest bidders on said work or stand in with the contractor, we get the job, which in this case it is taken for granted we did. The contractor represented in my method is A. P. Adams.

We then enter the job in our record book, Fig. 3A, from the bid book, Fig. 1, itemizing only the material and brands specified. At the same time we enter the job complete, precisely as in our bid book, in our foreman's order book, Fig. 4, so that he will know what kind of material to make up. The tinners then go to work and get the material ready to deliver to the job, and any galvanized iron work is turned over to our galvanized iron workers to get ready. The job is thus entered up in every detail, and material ready to be delivered to the job as soon as the word to go ahead and put on the roof is received.

When the word to go ahead is received, we have the material to be put on first delivered to the job, per dray slip in Fig. 5, also showing the time of delivery, &c. The balance of the ma-terial is delivered when needed. The tinners in the meantime have arrived at

and marked whether contract or repair work, and if repair work, what the charges are. Each evening the time checks, one of which is shown in Fig. 7, which were given to the men in the morning, are marked O. K. by the foreman, who in turn delivers them to the office together with the charge book already referred to and the credit book,

Referring to the printed time check, it will be found that each man keeps the time spent on each job, and the time going and coming is charged up to said job. In repair work all material used on said job is itemized on the time check as well as in the charge book. Nothing but the time on contract jobs is posted from the time checks. The other charges coming from the charge book are kept by the foreman.

book are kept by the foreman.

Each evening the time on contract jobs is posted to the different jobs in the record book to cost of time, Fig. 3B; also all material to cost of material sent out, Fig. 3C, and any credits to cost of materials returned. Fig. 3D

set out, Fig. 3C, and any credits to cost of materials returned, Fig. 3D.

All repair jobs are posted from the foreman's charge book each evening in the regular day book. The receiving book, Fig 9, showing everything coming into the shop, is kept by the foreman.

man.

When jobs are complete the tinner working last on said job is supposed to notify the foreman of the fact, or in some cases it is best for the tinner to note it on his time check, Fig. 7A.

The method of keeping a job as explained in the various departments of the record book I think an excellent.

The method of keeping a job as explained in the various departments of the record book I think an excellent one. A book is used which, when opened out, measures about 22 inches. The left hand page is divided equally in two parts. The original contract and time are kept on the left hand page, and the material sent out, cost of same, car fare, drayage, &c., and the material returned and cost of same are kept on the right hand page, thus showing the condition of the whole job at a glance. The men's time is figured at the several prices, also the cost of material sent out, including car fare, drayage, &c. Adding these together gives the total cost. Subtracting from this amount the material not used gives the net cost. Subtracting this from the original bid gives the net profit according to my method. The job is then charged upon the day book at the original contract price as noted under the contract price, Fig. 3A.

#### Cash Sales.

Referring to the manner in which cash sales are treated, I would say: Our office and shop are 100 feet apart. A person comes into the office and wants a piece of tin, zinc, copper or speaking tube, and wishes to pay for the purchase at the time. We give an order on the tln shop, as shown in Fig. 10. When the goods are furnished the same are charged to the office in charge book, Fig. 6. This is necessary in order to keep a complete record of everything going out of the tin shop.

The estate of the late Thomas S. Clarkson of Potsdam, N. Y., who was an ewner of sandstone quarries, gives \$150,000 with which to establish and maintain a technical school for civil and electrical engineering, mechanical drawing, &c., at Potsdam.

The Sultan of Johore, an East Indian potentate, decorates his shirt front with a miniature electric light instead of a stud.

How I was Cared of a Big Head.

A Salesman's Nurrative.

BY AMBROSE.

When I was in the agricultural supply business two or three years

business, especially about "drumming" the trade. I used to see our traveling men lying around the store, when they ran in to get posted up; noticed they were smoking good cigars, looked sleek and free from sin, but growling occasionally at hard luck, which I imagined was only a bluff to

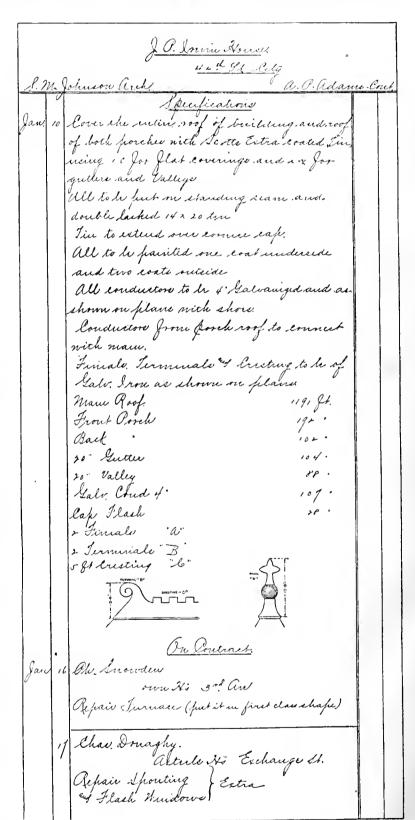

Fig. 4.-Foreman's Order Book.

I knew it all—the proprietor of the business and fellows who had grown gray in the service could give me no pointers. I had the big head. You all know how it is, boys; most of you have been there. I was just at that age when I thought myself "just fit to kill" and knew all branches of the

keep good men like myself off the road. I had visions of rides in palace cars, buggies, steamboats, elegant hotels, customers waiting in the doorway with open arms, all smiles, with orders as large as the circulation of *The Metal Worker*, all ready for you and the house paying all expenses.

#### Young and Fresh.

Well, I pestered the "Boss" hard and persistently to let me go out, but he knew I was too young and fresh to be any good; but I bothered him so much, to get rid of me he planned a nice little soak for me that was a crusher. So one morning he said: "We have decided to put you on the

you." Oh, wasn't I feeling jubilant? I swelled out like a pouter pigeon—told the boys around the store they were "Jays," "Not in it," "N. G.," &c.

#### Short on Hayseed,

I immediately went out and bought a couple of the largest eigars I could, for, of course, I could not be a

you to understand what a "fat" territory I was assigned to. It is one great, flat heap of sand surrounded by salt water, where they live on the side of a hetring all winter. The only vegetation is a few scrubby oak and dwarf pine trees and a coarse, brown sedgy grass which looks like blonde whiskers on the face of Mother Earth. The Old Colony Railroad, with its single line of

said he, running his finger around on the skate-like projection of Cape Cod, Mass., "that's a territory that is very little worked in our line. We have nobody covering it. As far as I know, it must be a beautiful agricultural district. You can work it up and have it all to yourself and go there just as often as yon please; so get ready to start Monday morning, and God bless

more saw horses and wheelbarrows and discussed with our seedsman the possibility of getting short on hayseed and cranberry vines. Monday morning, bright and early, I struck out for Provincetown via the small screw steamer "Longfellow," the "seasickest" boat on the coast of North America. Have yon ever been down on the end of the Cape? No. Well, it is impossible for

track and sleepers, looks not unlike some monster reptile creeping thirstily out from civilization over the hot and sandy peninsula, seemingly avoiding the bitter sea water on either side, but crawling on and on expecting to find some fresh and cooling sea in which to slake its iron thirst. It gets as far as Provincetown, curls up on the sand and expires. A few intoxicated poles supporting an aeolian harp of telegraph wires operated by a raw east wind with a fog accompaniment playing "Where Is My Wandering Boy Tonight" and the "Moaning of the Tide" relieve the monotonous landscap". Siberia is thickly populated compared to it,

#### A Crisp \$50 Bill.

I knew no more about it than a dude does of Hawaii. But I digress. As I say, Monday morning bright and early Istruck out, loaded down with samples, including models of horse rakes, mowing machines, wheelbarrows, samples of hayseed, beans, turnips, fertilizers, a well bucket, a broom, a saw horse, two brand new yellow grips filled with linen, stationery, price books, catalognes. &c. 1 had a hair-ont, a clean shave, tenement collar, oil shine on, an extra plug hat (for the jobbing trade) and a crisp \$50 bill in my pocket—everything brand new. I took possession of the whole cabin, and with my numerons traps almost filled up the small saloon.

While I was tracing out my route on a map, which I spread out with a flourish on the table, two or three old-timers were sizing me up, and to my questions about the most expeditious way "to do up the Cape" one of them, in the most innocent way, volunteered information as follows: "You want to do Provincetown this afternoon, then take the horse car down to Truro and Wellfleet; then the electric line to Orleans, Chatham, Harwich through to Hyannis, and from there you can

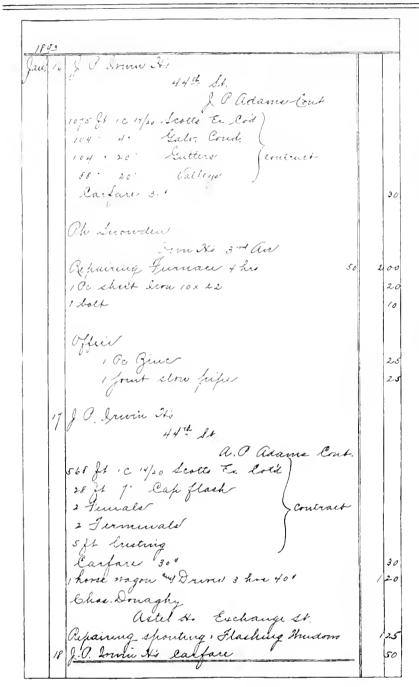

Fig. 6.-Charge Book.

get a train every hour via the "Air Line" to Middleboro. Do you intend stopping at Nantucket? Well, take the Cape Cod ship canal, the canal will get to Nantucket as quick as it gets anywhere." "Ain't that so, Ed?" but "Ed" had rushed up on deck with his fist in his mouth. I heard him explode into convulsions outside.

"Your friend is seasick," I remarked

marked.

"Yes, he wrenches pretty bad when he heaves.

But say, young feller, when you go to Provincetown you want to stop at say, young iener, when you go to Provincetown you want to stop at s. It is the best hotel in town. Excuse me, please. I must look after my friend."

And those two bad drummers had another fit. I was so excited I never tumbled.

#### A Wheel Curry Comb.

Well, the first move I made when we landed was to get dinner. I went to the place recommended by my "friends," paid 50 cents to a man with rings in his ears, who looked like a re-tired pirate, got only a tough clam chowder, stringy lamb, sloppy tea, moldy cake and had my saw horse stolen. I hustled all over that hot, fishy, sandy old town, with its long, narrow, crooked, winding street all the afternoon, without selling a cent's worth. "Do you want any of these to-day?" I asked a storekeeper in a want-some-fish-ma'm voice, at the same time shoving horse rake model under

"What is that," he asked, eying it curiously—" a fish scraper?"
"No. no," I answered; "it's a horse

rake.

"Oh, yes, I see, sort of a wheel enery comb." Great Scott! what a farming community I thought, and got out without another word. Another man, to whom I showed some Red Top grass seed, thought it was good stuff for mattresses.

"Where do I take the horse car for Truro?" I inquired of a slonehy policeman.

man. "Where did you come from,

sonny?"
"From Boston," I answered, with as much dignity as I could assume, with a stable broom and a dung fork under either arm.

"Yer'd oughter brought one wid yer. De woods is full of dem up there." He thought 1 was stringing him and he left me.

#### The Way-Freight Caboose.

There was no passenger train out until 5.30 on the morrow, so I boarded the way-freight caboose without any supper; the conductor was about to make out a freight bill for my traps, but a "J. A." cigar fixed him o. k., and about 11.45 p.m. I crawled off with all my props at Truro, the smallest town in Massachusetts, looking for a hotel and business blocks. Holy Moses of Egypt, what darkness! What desolation! I could not even hear the train when it got out of sight; nothing but lation! I could not even hear the train when it got out of sight; nothing but the moaning sough of the wind and nearby tide. I could hardly see the shiny yellow grip in my hand. I couldn't smell—no, not even the phosphate in my sample case, which hung to me like eau de Colegne all the time; now it too deserted me. I felt as if I was the only thing left on the earth was the only thing left on the earth after a deluge. I was about to make some kind of a move, when suddenly a light crept into the lonesomeness. I hoked toward it and discovered a

a k-oked toward it and discovered a lantern with a man en it.
"Hello, there!" he said. "Has the train come through? That so? Well I've been looking for it."
"Say," said I, "where is the town here?"

here?"
"They ain't no taeown here. What

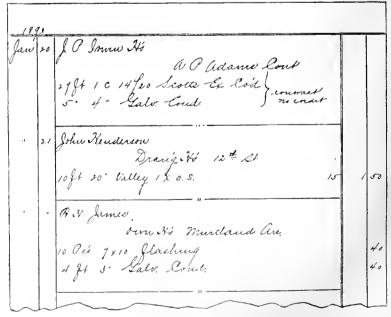

Fig. 8.—Credit Book.

yer pedlin? Washboards? Ain't no store nearer than North Truro, seven miles from here, nor no placeter putup."

I bunked in (or rather out) that first night with him, an entire stranger, under an open freight shed hedged in

pecting to find him, but, alas! he is still out of sight.

#### It Saved My Life.

Talk about "blues" boys, Great Scott! I never want to feel that way

by my traps and flanked by barrels of oil, bundles of rope and a quintal of salt fish, &c., with a Chatham fog around me for a blanket. I was sick, hungry, cold, disgusted, clean skunked and penniless, for I had buried my pocket book in the sand fearing to be robbed and I could not find the hole again. You bet, I thought hard and loug that night. I commenced to tumble. I knew I was getting it in the neck from the boss and the wicked drummer, whom I dreamt I saw, not singing in Paradise, but singeing in the other place, opposite and down a flight.

### Half a Dozen Clam Diggers.

Next morning I took the 5.30 regular passenger train to Wellfleet, another beautiful agricultural town (I didn't in quire for the electric), hired a team for \$4, hustled all over Eastham, Orleans and way stations, and all I sold on the whole trip was one-half dozen Clam Diggers. I sold the Clam Hoes to a man who was digging with a shingle. He was alone. I had him corralled between myself, my samples and the rising tide. I talked so earnestly and almost fiercely on the absolute necessity of his having the best thing in the world to do that kind of work in order to live that he really thought I was off, and as his teeth were chattering with the cold, his basket floating off, the water lapping the basement of his pants, escape was impossible. He cried out, "For God's sake send me half a dozen and let me go!"

I was so rattled at having struck an

I was so rattled at having struck an order that I hunted all through my chattels for an order book without finding one, although I had a dozen

with me.

"What is your address?" I asked after I found the book, but the fellow had disappeared as if into the ground, and, great Cæsar! my nice new yellow grip with all my linen and mileage book went with him. He vanished so mysteriously I really thought I was dreaming. I yelled after him, cnrsed, swore, prayed, kicked up the sand, ex-

hat and my theories exploded. I sneaked in at the back door, threw my traps behind the elevator shaft, and crept up in the loft where the lumpers were piling up fertilizer. Ob, how I did envy them their job. I poured out my tale to a poor old darky and took him into my confidence. I did not want any of the boys to know I got back. I would take consolation from a dog just then. I stayed out of sight like a strange cat in a garret, only showing up at meal times. I did not have the gall to get my wages from the cushier's desk. The conceit was knocked clean out of me. It was the best lesson I ever

learned.
The boss met me in the doorway one evening as 1, was speaking home.

evening as I was sneaking home.
"Hello A——!" said he, "Had a good week! I'll look you over in the morning. Make up your mind where you'll go next week. Lay your orders on my desk."

on my desk."

Well, he could not club me away from there for three years after that, and ever since, when he wants to guy me, sometime when I am hitting him up for a raise, he will turn to page 17 of his memo. (I'll remember that page as long as I live) and read: Provincetown, Trnro, Chatham, Wellfleet, &c., expenses \$24.50; sales, \$1.75—15 dozen Clam Diggers. Then he winks his other eye.

An engineering work of considerable importance, which has been commenced lately, is the piercing of two railroad tunnels through the mountain barrier separating France and Spain. The tunnels, which will each be about 5

again. I went up to the dock at Wellfleet, intending to jnmp overboard, but the tide was out and while waiting for it to come in the afternoon train for Boston hove in sight; it saved my life. I pulled myself and sample show aboard and landed home with tail feathers all down, able to wear a 614

miles in length, are for the use of two international lines of railway, each having its own separate tunnel. The first of these lines will start from St. Giron in France, having for its objective point the town of Lerida in Spain, while the second will start from Cloron

in the Basses Pyrenees and join the main line from Laragassa to Barcelona. A period of ten years is assigned for the completion of the entire scheme.

Purity of Air in Cars.

Recent tests of the air in sleeping cars, chair cars and ordinary cars, says the Hartford Courant, show that the

atreet, Philadelphia, is very nearly completed. Workmen are busy day and night in giving the finishing touches to the structure, which when complete will be one of the finest railroad stations in the world.

President Cleveland has appointed a board, consisting of Gen. Thos. L. Casey, Chief of Engineers of the Army; Col. W. F. Craighill, in charge of river

ware River, which, in its judgment, should give the greatest facility to commerce and will be best adapted for national defense. The report of the board must be completed in the next four months, as it is to be submitted to Congress at its next session.

#### The Work of the Wreckers.

The World's Columbian Salvage Company are making rapid progress in the work of wrecking the buildings of the late World's Fair at Chicago. The entire southeastern portion of the grounds has now been completely cleared of the numerous structures which stood there, including the Shoe and Leather, Dairy, Anthropological, Sewerage and Sawmill buildings, the Stock Pavilion and the once famous Colonnade. The Forestry Building was removed by other parties. The wrecking of the great Transportation Building has about been completed. The Fisheries and Woman's buildings and the Choral Hall have been leveled. The handsome dome of the Horticultural Building is being carefully taken down, to be re-erected at some point in Ohio. The Government Building is the only large building which has not yet been touched. The Manufactures and Liberal Arts, Electricity, Mines and Mining, Administration, Machinery and Agricultural buildings and the Terminal Station were all burned in the great fire on the grounds, and nothing remains of them but the iron and steel, which ag-

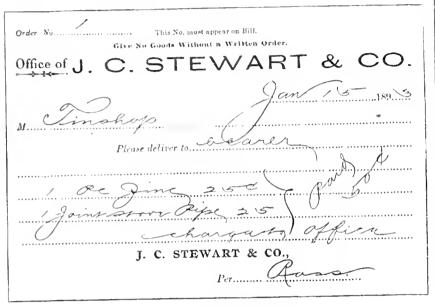

Fig. 10.-Order Slip on Tin Shop.

best air was found in the chair cars, the next best in the ordinary cars, and the worst in the sleeping cars. This is about what any one would expect, but it is worth noting that in each kind of car the air was worse than the lowest standard allowed where intelligent efforts to provide pure air are made. Thus good authorities hold that the carbonic acid in the air should not exceed seven parts in 10,000, three or four being as much as exists in what may be called pure air. In the cars tested the lowest average for the number of observations was 10.7 parts in 10,000, while in the sleeping car the lowest ratio was 11.3 parts, the average 18.0 and the highest 22.0.

There is no good reason why travel-

There is no good reason why travelers should be made to breathe bad air. It is possible, even with the present appliances, to obtain decent ventilation if the supervision of the work is put in competent hands and passengers are not allowed to interfere.

What is greatly needed is a system of ventilation which shall introduce clean air, with a proper quantity of vapor of water, exhaust the foul air, and be so contrived that passengers cannot interfere with it.

There is not much risk in saying that a auitable scheme of ventilation can be had very soon after the railroad companies give the impression that they really want it. The subject has been thoroughly investigated, the requirements are pretty well understood, and there is ingenuity enough in the country to satisfy them in a practical way whenever inventors see a near prospect of reward.

inventors see a near prospect of reward.

To bring the question down to its lowest terms, there will be improvement when the people get tired of what they now endure and demand improvement. Probably the change will not come much before that time.

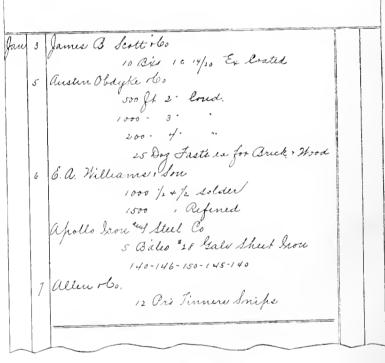

Fig. 9.-Receiving Book.

and harbor works in Maryland and Virginia; Capt. George Dewey, U. S. Navy; Mendes Cohen of Baltimore, expresident of the American Society of Civil Engineers, and J. Alexander Porter, civil engineer, of Savannah, Ga., to select the route of the Chesapeake and Delaware Ship Canal, in compliance with the terms of the last River and Harbor act. The board is instructed to examine and determine, from the aurveys heretofore made under the War Department, the most feasible route for the construction of the waterway to connect Chesapeake Bay and the Dela-

gregates about 25,000 tons, now being sheared and prepared for market. The two Service buildings have been allowed to remain standing, as they are needed by the Salvage Company for office purpose.

The Chief of the Bureau of Statistics, at Washington, reports that the total values of the exports of merchandise from the United States during the month of September, 1894, and during the nine months ended September 30, 1894, as compared with similar exports

The magnificent new terminal station of the Pennsylvania Railroad, at Broad

during the corresponding periods of last year, were as follows:

| 1894. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893. | 1893

formed and will drill a number of wells. The oil has been examined by experts at Indianapolis and pronounced to be of superior quality.

A promoter in California proposes to build an electric railway through the mountains 62 miles to the Yosemite Valley, and by utilizing the water power, furnish electric light and motors for all

is carried to the balloon by one of the three cables that keep it in place, and one lamp illuminates a space large enough to enable a considerable body of men to operate at night almost as easily as in broad daylight.

Garbage Disposat in St. Louis.

The Merz system of garbage disposal, which is satisfactorily operated in the city of St. Louis, Mo., by the St. Louis Sanitary Company, under a ten years' contract, is thus described: The wet garbage is placed in receivers, where it drains. It is then put into steam jacketed dryers, where it is constantly stirred for three hours. Transferred to retorts, it is saturated with naphtlm, which dissolves all the grease, and this is then distilled off. The residue is ground up fiae, placed in packs and sold for fertilizing purposes, bringing \$8 a ton. The grease, which is odorless, is sold also for \$8 a ton to a firm of soapmakers. Like all utilization processes, this has a vile smell, which is complained of by the people living five blocks from the works. The people in Detroit protested so strongly against it that the works were moved out of the city. The St. Louis plant is well out of the city. The city pays the company \$1.80 a ton up to 100 tons, and all over that is treated for nothing. The average amount is 180 tons a day.

A comprehensive investigation into the effect of machinery is labor is now being planned by the Bureau of Labor at Washington. This inquiry was

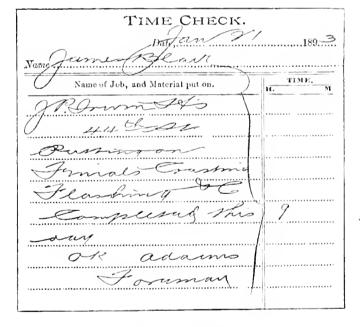

Fig. 7.1.-Time Check.

that region. It is argued that the road could be made to pay from the fact that about 4000 tourists visit the Yosemite every year, paying \$35 each for the stage ride.

Experiments are being made in Germany with a view to lighting fields of military operations by means of electric lamps suspended from captive balloons. These experiments are said to have been attended with considerable success, and the method is to be employed in the army maneuvers. The current

ordered by Congress, and will involve a study of the whole modern industrial system. The results cannot fail to be of great interest both to the employers and the workingmen of the country.

At the recent convention of the American Bankera' Association the Attorney-General of Maryland made the remarkable and gratifying attacment that for 60 years not a single regularly organized bank in that State had closed its doors and failed to pay its creditors dollar for dollar.

# RE

Sweeperettes.

so as to catch in the carpet. The A new line of carpet sweepers is now being put on the market by the Sweep-

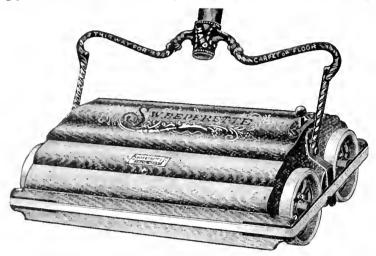

Fig. 1.-Sweeperette No. 4.

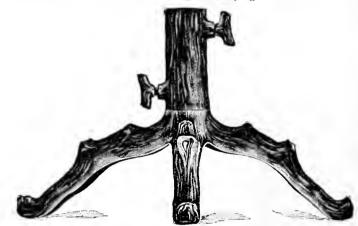

erette Company, Grand Rapids, Mich., and 76 Fifth avenue, New York. Two patterns are shown in the accompanying illustrations. That shown in Fig. 1 is made of selected birch with a light cherry finish, while the design of the box is referred to as presenting an artistic appearance. Fig. 2 shows a sweeperette with genuine mahogany veneer finely finished throughout. castings, wheels, bail and all parts exposed to the eye are well finished and nickel plated. The interior construc-tion and the material used are the same in all the various styles of sweeperettes. The handle is fastened in the socket by a flat strip of steel with an offset, which aprings over the lower inside portion of the socket, holding the handle rigidly in place. The handle can be placed in the socket or taken from it in a moment and without trouble. The pans are dumped one at a time by moving the metal ball at the top of the sweeperette forward or back, emptying the pans at a single dump, and without liability of spilling the dirt on the floor. The pans are doubled at the corners to insure

held in the sweeper in the most effective and simple manner. Braid designed to harmonize with the wood

adjustment of the brush is secured. On one side of the bail in raised letters is one side of the ball in raised letters is the following: "This way for a hard carpet or floor," and on the other side of the bail is: "This way for a soft carpet." The sweeper is to be used in the usual position, with the reading to-ward the operator, giving directions for the kind of surface upon which the sweeperette is used at the time. There is an ingenious arrangement which automatically raises the brush when it is to be used on a soft carpet, and lowers it for use on a hard carpet or floor. This adjustment, it is expisined, avoids the necessity of pressing the sweeper down and thus exhausting the operator's strength and tiring the back. The manufacturers claim that the sweeperette will sweep under a bed, table or chair, or will sweep a tile or marble floor, a feature which is peculiar to the sweeperette, and that the goods are made of the best materials and in the best possible manner.

#### Berlin Christmas Tree Holder.

Logan & Strobridge Iron Company, New Brighton, Pa., are offering the Christmas tree holder shown in the accompanying cut. The manufacturers

Berlin Christmas Tree Holder.

used in the box is put on for a furniture guard. This is secured in place and

has advantages, the makers consider,

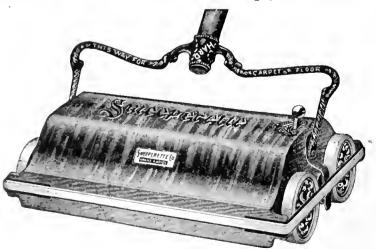

Fig. 2.—Sweeperette No. 6.

rtrength, and so adjusted, it is over rubber or other materiai for the remarked, that they work readlly and will not drop down at the corners and distinctive design, while with it an

refer to the holder as being handsome and unique, strong, substantial and nest in design. It is made with three sizes of holders which fit on the same feet-11, 21 and 3 inches in diameter. The set screw which fastens the tree has a range of a inch. The holders are finished in dark green and are packed one dozen in a case, assorted sizes.

#### Western Autograph Register.

The Illustration herewith shown is of an Autograph register, put on the mar-ket by the Western Autograph Com-pany, St. Louis, Mo. The register con-sists of a neat iron case, nickel plated, in which are independently mounted on spindles three rolls of paper, two of which are blank while the other is appropriately printed and numbered for the class of transactions for which the register is to be used. The strips of paper from these rolls are brought forward together over the writing table in the top of the register, being passed be-tween transfer ink papers in such a man-ner that whatever is written on the top strip is reproduced in fac-simile on each of the two strips undernesth. After the check is written a turn of the crank at the side draws the three strips forward simultaneously, two passing out of the register to be used in completing the trausaction, while the third is retained in the register, being rewound on the record core, making an inaccessible continuous record of all transactions. The two checks which have passed out of the register are torn off against a knife edge provided for the purpose, the original going to the purchaser while the duplicate is sent to the cashier. The register is referred to as being simple in construction, impossible to get out of order, and as being particularly adapted to the retail trade, doing away with the check book system which has been in use so long. It is also convenient, being attached to the counter, thus preventing the search for pencils, books, &c., to enter sales, &c. The manufacturers advise us that the register is giving the best of satisfaction to those using them.

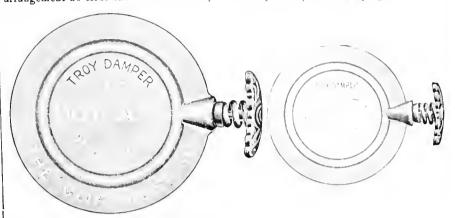

# Battery of Elevated Burton Coffee Urns.

The accompanying illustration shows a battery of elevated Burton coffee urns brought out by the Cincinnati Steel Range & Furnace Company, Cincinnati, Ohio. The hot water boiler or urn is elevated, as shown, the outlet or discharge pipes being on a level with the top of the coffee jars, allowing a free flow of hot water direct into the

water urn and this, it is pointed out, insures the jacket being filled with water of the same temperature as that which is placed in the coffee jars. The water urn is supplied with a measuring gauge to indicate the amount of water drawn into the coffee urns and by this arrangement no error can occur in mak-

#### New Pipe Damper.

The Troy Nickel Works of Troy, N. Y., have just placed upon the market a new damper, two varieties of which are shown in the accompanying illustrations. The damper is made of steel in such a way as to prevent warping. The

New Pipe Damper.

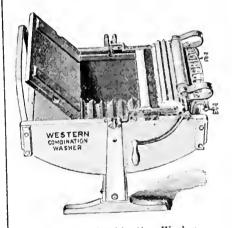

ing coffee. The urns are so arranged that either steam or gas may be used to heat them.

THE ENNIS SPECIALTY COMPANY, 311 River street, Troy, N. Y., issue a small catalogue of the goods they manufacture and handle, which include many

apring in the handle is strong, and the manufacturers claim it will keep the damper in whatever position it may be placed. One of the special features to which attention is directed is that one hole only is required in the stove pipe, and this can be quickly punched by the most inexperienced. The special features of the damper are the subject of letters patent now pending.

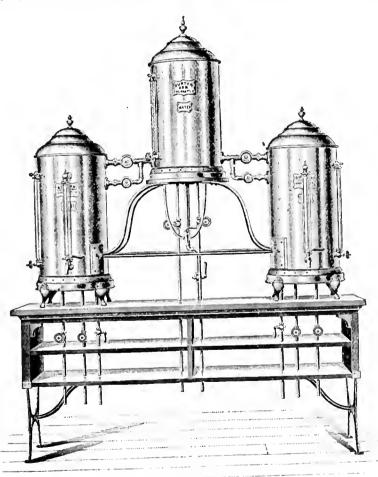

# The Western Combination Washer.

Horton Mfg. Company, Fort Wayne, Ind., are offering a washing machine, as herewith illustrated. The corrugated

The Western Combination Washer.

wood roller, which is shown in the cut as being awung on the top of the ma-chine, is described as revolving on its center when in use, and at the same time as swinging back and forth in a direction opposite to the motion of the box; also as adjusting itself vertically to any quantity of clothes in the washer. The point is made that this arrangemeut avoids the use of a pin wheel, which retards the motion of the water and of the clothes so necessary to quick work. It is explained that by a simple contrivance the machine is locked so that a wringer may be attached, as shown in the cut, and operated without tilting the washer. The manufacturers claim that the machine combines all the desirable features contained in other washera, and at the same time lessens the labor and the quantity of water required.

Battery of Elevated Burton Coffee Urns.

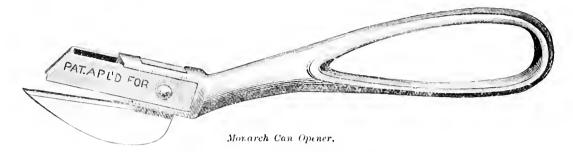

coffee jars. The boiler has an automatic filling device so arranged that the water urn cannot be over filled; it also has an inside crown to prevent the water from boiling over. Double connections are so arranged that either the coffee jars or the jackets surrounding the jars can be filled from the hot

specialties of interest to our readers. The table of contents gives a list of the articles, which are as follows: Electric ventilator, railroad dinner pails, dust pan, eake closets, bread jars, ice cream freezer, oil cans, fire pots, summer furnaces, tailor heaters and metallic skylights.

#### Monarch Can Opener.

The cut herewith shown represents a can opener offered by the Electric Letter Box Company, Meriden, Conn., and C.

He has purchased the house of the late William II. Hotaling, which will be fitted up as a store. A portion of the house will be extended to the street and a large plate glass window put in, made in an 8-inch size, and measure 51 luches when folded as in Fig. 2. The tool is full nickel plated, and, the manufacturers claim, is strong and durable, and that it can be carried in

F. Guyon Cempany, 97-99 Reade street, New York. The handle of the tool is of cast iron and the blade of tempered steel. The fulcrum also is steel and the blade and fulcrum parts are securely fastened to the handle by a strong rivet. The entire article is aluminum plated, which finish, it is stated, is entirely new. It resembles aluminum in appearance and, the manufacturers claim, will not turn smoky like nickel. These goods are put up in dozen lots on cardboard signs which are designed for display on counters or in windows.

#### Woodite Ware.

The Bronson Supply Company, 72 Beekman atreet, New York, as agents for F. W. Morse, Providence, R. I., have just commenced to introduce a new enameled ware called Woodite. The name is derived from the close resemblance in finish to the grain and color of wood. The enamel itself is mineral in character and not a lacquer or japan. The process requires several coatings, yet the covering of enamel is very thin. The ware, it is explained, is exmaking it one of the most attractive stores in the village. Mr. Ashley started in the hardware business a year ago and has built up a very gratifying trade.

#### The Bernard Folding Dividers.

The accompanying illustrations represent folding dividers put on the the pocket as safely and conveniently as a pecket rule.

THE CATALOGUE OF MICA manufactured by the Mica Mfg. Company, 89 John street, New York, shows a very interesting line of specialties of this material. In the announcement to the trade it is stated that the mica

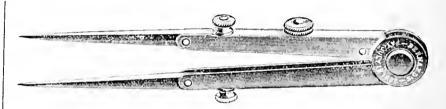

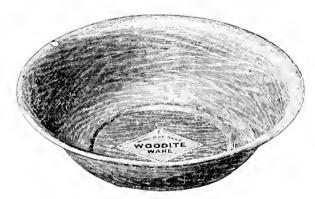

Fig. 1.-The Bernard Folding Dividers.

market by the William Schollhorn Company, New Haven, Conn., for whom Julius Berbecker & Co., 280 Broadway, New York, are agents. The points of the dividers are made of ciucible steel, finely tempered, and ar-

canopies are made of first quality, extra heavy mica, and are supplied with screw tops which make them stronger and more durable. Various shapes and forms of canopies are illustrated in the earlier pages of the book, showing their adaptation to globes, candles, lamp chimneys, &c. Mica protectors for shades are illustrated in numerous Mica chimneys for Argand burners are shown, also mica screens in various patterns. At the end is a pricelist of mica.

The American Mics Company of Kaneas City have been incorporated in Kansas, with a capital of \$750,000, to operate mica mines and build railways. The incorporators are Shelly Grover, August Isenberg, Jas. M. Poland and others, of Kansas City, Kan.

Ten carloads of refined lead from the works of the Balback Smelting & Refining Company, Newark, N. J., have been sent to Tacoma, Wash., for shipment to Yokohama by the steamer "Tacoma," sailing this week. The consignment aggregated 447,470 pounds, and is believed to be intended for the manufacture of lead water pipes for the

Woodite Wash Basin.

tremely tough and elastic, does not crack or chip from indentation and will not rust. It is not intended to withstand heat. The ware will be offered in the near future in a large variety of articles for household and kitchen use. Something like 18 months, we are told, have been spent in testing and experimenting, until the manufacturers believe it has been perfected. At present basins only, similar to those illustrated, are effered to the trade, but other lines will be ready later. The basins are will be ready later. The basins are made of IX tin and then enameled a black walnut color, although it is possible to produce various colors imitating different woods.

CHARLES ASHLEY of Port Ewen, N. Y., is about removing his hardware business to more commodious quarters. ranged for fine adjustment. The smaller thumb screws are for holding the points open, while one of the screws is connected with a spring which

Fig. 2.-The Bernard Dividers Folded.

allows the point to be moved for fine 1 adjustment. The larger thumb screw is for fastening the dividers open at any point desired. The dividers are as contraband of war.

new water works now being constructed at Yokohama. Some doubt is felt as to whether the lead may not be considered

# TIN PLATES.

Tin Plate Makers' Wages.

On Monday, October 29, the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., issued a notice to their idle employees to the effect that operations would be resumed at once. After stating that the wages of common labor will not be reduced the notice con-tinues: "The following reductions will he made on high priced labor, namely: Rollers on tin mill, 30 per cent.; doublers and heaters, 25 per cent. After these reductions, if the same weights are turned out as the average weights made during the last six months, men can still earn wages, a day of eight hours, as follows: Rolling, 30 gauge, 4700 pounds, at \$5.50 per tor, 2240 pounds, \$11.12; less 30 per cent. (\$3.34), \$7.78; less catchers' wages (\$1.75) pounds, \$11.12; less 30 per cent. (\$3.34), \$7.78; less catchers' wages (\$1.75) \$6.03; doubling, 30 gauge, 4700 pounds, at \$2.70. \$5.66; less 25 per cent. (\$1.42), \$4.24; heating, 30 gauge, 4700 pounds, at \$2.48, \$5.17; less 25 per cent. (\$1.29), \$3.88. It is our desire to retain all our old employees, but we shall engage new ones in place of those who are not satisfied with this action." The action of this firm in action." notifying their employees to resume work or forfeit their positions can be considered as the opening of hostilities between the Amalgamated Association and the Tinned Plate Manufacturers' Association of the United States. will be remembered that in September a conference was held in Pittsburgh between the above two organizations at which the manufacturers proposed a reduction of 30 per cent. in wages of rollers, 25 per cent. to heaters and about 20 per cent. to other tin house The reason advanced for these reductions in labor was the reduction in the duty on tin plate of 1 cent per pound, or \$20 per ton, which went into effect on October 1, 1894. The Amalgamated Association submitted the matter of the proposed reduction to their members and a vote was taken on it, resulting almost unanimously against accepting the reduction. No counter proposition was made by the workmen, and a shut down of the mills took place, only five or six concerns continuing in operation, these being principally lo-cated in the natural gas belt in Indi-ana. In this connection it should be noted that the tin plate concerns who continued in operation were given to understand by the Amalgamated Association that they would be allowed the benefit of any concessions that might be given to the other manufacturers.

Last week Wallace, Banfield & Co., Limited, of Pittsburgh, posted notices in their Irondale Rolling Mills, at Iron-dale, Ohio, a copy of which is as fol-

lows: "Owing to a decline of 1 cent per pound in the selling price of tin plate caused by a reduction of 1 cent per pound, \$20 per ton, in the new tariff duty, which took effect October 1, 1894, it is impossible to longer run the mills at former scale of wages. All persons are, therefore, hereby notified that all contracts, &c., will terminate Saturday, October 27, 1894. We invite all our present employees, on or

before Tuesday, October 30, to apply to the manager, Mr. Banfield, who will notify them of what, if any, changes have been made in their wages, and or refuse the same. The mill will start Monday, November 5, 1894."

The above two concerns are among

the largest manufacturers of the plate in this country, and their announcement that they propose to put their plants in operation at once, and without their old employees if necessary, will doubtless cause other concerns to take similar action in the near future. The outcome of the struggle between the tin plate makers and organized labor will be awaited with considerable interest. A report that a compromise would be agreed upon and a fight averted has been officially denied.

#### SCRAP.

Work is progressing rapidly on the buildings for the new National Tin Plate Works, at Anderson, Ind. It is claimed that the works will be ready for operation by January 1.

The Yspitty Tin Plate Works, Yspitty, Wales, will shortly reopen after a prolonged idleness. The works have been acquired by Sir John Jones Jenkins, a Welsh financial magnate, who will run them in conjunction with some local individuals.

A GRATIFYING TRIBUTE to the quality of the bright tin plate made in this country was recently paid by Ferdinand Kieckhefer, a member of the firm of Kieckhefer Bros. & Co., Milwaukee, Wis., one of the largest stamping concerns in the United States. Speaking of a cargo of 500,000 pounds of Welsh plate lately purchased by the company he said that they did not like to purchase tin abroad, as the grade is inferior to what is made in this country.

A TRAIN of 15 cars left Baltimore, Md., last week over the Pennsylvania Railroad for Milwaukee, laden with a shipment of 500,000 pounds of tin plates brought by the Atlantic Transport Line of steamers from Swansea,

THE CONTRACT for the construction of the mills for the newly formed Atlanta Tin Plate Company, Atlanta, Ind., has been given to the Lewis Foundry & Machioe Company of Pittsburgh. Work is progressing on the buildings at Atlanta, and will be pushed as rapidly as possible.

THE WELSH TIN PLATE WORKERS who recently went to Darfo, iu Italy, to operate a new tin plate works erected there, have been discharged and sent home again in consequence of their refusal to teach the natives.

THE LEECHBURG FOUNDRY & MA-CHINE COMPANY, Pittsburgh, Pa., have received an order from the Monongahela Tin Plate Company of that city for a Mesta patent pickling machine.

made from them are too badly rolled to admit of their being tin plated. Consequently they are forced to rely on England for their tin plates.

THE order for the machinery for their new plant at Anderson, Ind., has been given by the National Tin Plate Com-pany to the Totten & Hogg Iron and Steel Foundry Company of Pittsburgh. It will be a four-hot mill plant of the latest pattern.

IT IS REPORTED that a black plate mill will be built at Leechburg, Pa., a number of the leading citizens being interested and the necessary capital having been subscribed.

La Métallurgie, a French technical journal, gives the following information in regard to the tin plate manufactur-ing industry in Spain: "The manu-facture of tin plate was introduced into Spain by the Iberia Company, the works of which produce about 100,000 boxes per annum. Tin is made from the bars of the Biscay Company. total consumption of tin plate in Spain is estimated at 150,000 boxes per annum. A new firm, the Basconia Company, are erecting large works for the manufacture of this product. It is thought that two establishments will be sufficient for the requirements of the country." The last named concern is probably the works built by a Welsh firm who have just started into operation at Bilbao, in Northern Spain.

THE ABERCARNE IRON & TIN PLATE Works of Abercarne, South Wales, are to be put up to auction on November

IT IS NOTED in late British trade reports, as worthy of special mention, that orders for terne plates from the United States are again being received in some quantity in the British market. This is referred to as being a decided change for the better. For the past year or more the demand for Welsh terne plates in this country has been so limited, owing to the wide adoption throughout the country of the domestic product, that the imports of these plates from abroad had shrunk to very small proportions and would, doubtless, soon have ceased altogether but for the temporary stoppage of so many American works owing to the existing wage diapute and the consequent restriction in the supply of home made roofing plates.

THE PLANT of the Crescent Sheet & Tin Plate Company, Cleveland, Ohio, will, it is announced, be in full operation by April 1, 1895. The land on which the mill will be established is a tract of 6½ acres on Bessemer street, Cleveland, which the company have purchased at a cost of \$14,500. Contracts have been placed for hot and cold mill machinery and for four Corliss engines. The bulldings and equipment will cost about \$150,000. production of the works will be black and terne plates exclusively. The buildings, for which the contracts were let this week, will be of iron and brick. The works will give employment to about 250 men. The temporary offices

(Continued on Page 63.)

# PLUMBING and GAS FITTING.

### Public Conveniences.

The scarcity, in the large cities of the United States, of what are known abroad as public conveniences, occasions much well merited complaint. In a few of the public squares small houses may be found for use by men, but the number is entirely inadequate to the needs of the people. Through the suggestion of Piumbing Inspector W. T. Taggart of Pittsburgh, a keeper of a public house, where the local conditions were convenient, is about to throw open to public use a set of modern plumbing fixtures. This is a step that could be followed by others in that and other cities with advantage. In Paris and Marseilles there are a number of well equipped closets and stalls in charge of the municipality for use of the public. The cities also provide at frequent intervals along the streets small sheet iron houses for urinals. In London there is an increasing number of conveniences, which may be entered by going down a few steps to a well lighted apartment with a tile floor and fitted with the best sanitary appliances, in charge of an attendant, who for a small sum supplies toilet paper. The plumbers of large cities would be gratefully remembered by many if their associations would devote some of their energy to devising some system that would be acceptable and then laboring to bring it into use.

### A Tale of a Ram.

BA LOSSIT.

Allow me to note in the preamble of this veracious narrative, that while it is not a statement of dry facts, being about a water ram, yet it may prove to be a dry statement of facts in which there will be no attempt to pull the wool over the reader's eyes. In the so-called land of steady habits, which curious non-residents say means, fixed and permanent habits of sharp dealing formerly manifest in the merchandise of wooden nutmegs and horn gun flints, there is a property whose water supply is contingent upon the far from steady habits of a hydraulic ram. For a long time it was erratic in movement, sometimes working as freely as the proverbial jerks of a lamb's tail, and operating in a way that would be considered illbred in animate nature. The local knowledge and ingenuity was taxed to discover whether the fault lay in the ram or the water supply, much advice being given and many experiments tried. It may be said here that every one of the doctors declared that it ought to work after his prescription was tried, but after a few hours of showing what it could do, it would go on strike by keeping still. The matter was then laid before the hydrostatic wisdom of the country through the medium of The Metal Worker's Letter Box, resulting in various diagnoses and proposed remedies which at least furnished copy for that journal. Following the advice so kindly given, we ran it with a maximum and then a minimum aupply of water; made an air hole in the drive pipe and stopped the same, loaded the

valve with a dead weight and checked | it with a spring-both in turn discarded after trial-renewed the packing, tightened bolts, &c., &c. There was considerable knowledge gained by these precepts and practices toward the desired end of causing the ram to hoiat water as it should, and this knowledge together with his own "gumption" led the Boss Farmer to contrive something as follows: A short board has one end resting on the valve stem and the other is hinged to an upright. The horizontal hoard may be loaded to suit the water pressure and its advantage over a fixed weight or spring seems to be that it works more on the percussive principle. Any way, there is less "cussin" and more steady and sufficient butting than formerly. The improver will perhaps get honorable mention at some coming agricultural fair.

## TRAPS AND VENTS.

JOHN H. READ of Brooklyn, N. Y., well known to the plumbers who attend the National Conventions, is on the legislative ticket in his district.

THE CITIZENS of Milwaukee, Wis., have expressed their intention to support the Board of Health, who have met opposition from the Common Council in the enforcement of the local sanitary regulations.

J. B. GILHOOL. Carbondale, Pa., select councilman, is about making extensive improvements upon his South Main street residence and business place. A hot water heating plant has already been put in place in the basement. In the near future he expects to move his plumbers' shop to a building at the rear of the store and thus give increased space within his salesroom for the display of his atock of hardware. The building is to be completely transformed in appearance, the greatest change being in the front. The design calls for a handsome elevation of the most modern design with large plate glass windows in both stories.

FRANK McCAULEY has moved his plumbing shop to the rear of the Emley Building, corner of Market and Warren streets, Huntingdon, Ind.

The Members of the firm of Macdonald & Co., 296 Sixth avenue, New York, amicably arranged for the settlement of their affairs on the anniversary of their original partnership agreement. As a result the court entered an order on October 29, discharging the receiver, James Muir, who was the choice of the firm, and ordering him to turn over the material and tools to the new firm, Bryant & Crow. The old establishment will be closed, and all of the machinery and fixtures will be moved to the new showrooms and shop of Bryant & Crow, at 12 East Twenty third street. The firm are also to be congratulated on having secured the contract for the plumbing in the new 24 story building of the American Tract Society.

"THE SPRINGFIELD GAS MACUINE" la the title, printed in red ink, of a tasteful pamphlet issued by the Gilbert

& Barker Mfg. Company, Springfield, Mass., with New York office at 90 John street. The pamphlet, which is 7 x 6 inches in size, bound in red paper, describes very thoroughly the Springfield machine and makes the subject particularly attractive by means of illustrations showing the application of gas to cooking and hesting. At the end are a number of pages of testimonial letters which speak in high terms of this apparatus.

THE MASTER PLUMBERS of Somerville, Mass., have completed a permanent organization. The following officers have been elected: James F. Davlin, president; W. H. Snow, C. W. Cahalan, A. J. Smith, vice-presidents; P. J. O'Brier, secretary; W. F. Bennett, financial secretary; Thomas H. Naughton, treasurer. The organization is to be known as the Somerville Master Plumbers' Association. Meetings will be held in Eberle Hall the first and third Tuesdays in each month.

THE PLUMBING BOARD of Yonkers, N. Y., has issued certificates of competency to Michael Reagan of 40 Orchard atreet and Thomas J. Thornton of 470 West Thirtieth atreet, New York, they having passed satisfactory examinations.

Cummings & Stretton, plumbers, Woburn, Mass., have dissolved. They are succeeded by W. F. Cummings & Co. The new firm have taken spacious quarters at 419 Main street.

- J. L. LAWRENCE & Sons, Deckertown, N. J., have opened a branch plumbing and steam fitting shop in Unionville and in connection with the Water Works Company are prepared todo any kind of work in their line.
- C. E Coe, New Haven, Conn., formerly of Neumann & Coe, has opened a plumbing establishment in the basement at the corner of Howard avenue and Putnam street.

WILLIAM JONES, an old resident of Chelsea, Mass., died at his home in the Prattville district of that city last week. For many years he carried on the business of a practical plumber in Chelsea, and in his later years became a successful inventor of devices used in his craft.

RICHARD DONAGHY has moved his plumbing business to the atore on Eastern avenue, St. Johnsbury, Vt.

Beh & Tourtellotte are a new firm in the plumbing business at Middletown, Conn.

JOHN ADAMSON has opened a plumbing establishment at 40 Franklin street, Norwalk, Conn.

A. L. McGrath has opened a plumbing establishment at 37 Crescent avenue, Bridgeport, Conn.

The D. B. Hilton Company of 480 Clermont avenue, Brooklyn, N. Y., issue circulars relating to a new process for retinning bathtubs without removing or disturbing the plumbing or wood work. The process, as described in the circular, is said to require three costs of metal (being a liquid), the largest portion of which is pure tin, and is put on hot. It is further stated that it

thoroughly covers all leaks and is comparatively inexpensive. A number of references are appended to the circular from people in New York and Brooklyn for whom they have retinned bathtubs.

Du Bois & Darrow. 61 Gold street, New York, have conspicuously displayed in their showroom a sample board on which are arranged the pipe holders made by the Evory Mfg. Company of New York. These holders are made of cast iron, either plain or ornsmental in design and tinned or nickel plated as desired, and are used for holding lead pipe in position instead of the ordinary lead tacks which have to be soldered to the pipe. The holders are said to fasten the pipe much more securely and can be put in place in 60 seconds.

Young Pepper Davidson of the Knights of Tabasco is about to make a tour of New Jersey and Eastern Pennsylvania in the interest of the plumbing goods of the Meyer-Suiffen Mfg. Company of New York.

James K. Hamilton, a Sanitary Inspector of the Twenty-first Ward of Philadelphia, died on Tuesday at his residence, on East Everington avenue, Roxborough, Pa. Mr. Hamilton was 35 years of age and was born at Roxborough. He was formerly a member of the plumbing and heating firm of Struse & Hamilton of Manayunk, and was subsequently appointed a Sanitary Inspector, in which capacity he did a considerable amount of work in connection with the improved drainage of Manayunk, Roxborough and Wissahickon.

According to an item in a local paper a class in plumbing is to be started Monday, November 12, in connection with the Trades School, at Springfield, Mass. F. W. Tower, City Inspector of Plumbing, has been engaged as instructor, and in addition to the regular instruction, talks are to be given each evening on methods of laying out work. Persons wishing to join can secure information by addressing L. P. Strong, the superintendent.

In describing the characteristics of an up to date plumber in *The Metal Worker* of last week, through an error the wrong name was given for William L Whipple, 49 Manton avenue, Olneyville, R. I.

THE HENRY McShane Mfg. Company of Baltimore, Md., have secured 70 acres of land just beyond the eastern city limits, about 2 miles from the Maryland Steel Company's Works, at Sparrow's Point, and will erect a new plant. The buildings contemplated include a pipe foundry, a pattern shop, a brass foundry, bell foundry, finishing shop and power house. The company's product includes iron pipe, brass fittings for plumbers' and other uses, and bells. Construction work will begin early in 1895. About \$1,000,000 will be expended.

THE BOARD OF HEALTH OF Asbury Park, N. J., having refused to indorse the dry closet system for their schools are now confronted by a modification of it in the form of a doubtful latrine. The plumbers of the city are rendering the board excellent assistance in placing their knowledge of the disposal of sewage in a sanitary manner before the public.

Donaldson Brothers, steamship owners, are about to run a freight line of steamers between Boston and Bristol, England.

## Trade Notes.

W. R. DAUGHTRY, Opelika, Ala., is the inventor of the Cyclone Water Motor, for which he desires to make manufacturing arrangements. He claims many advantages for it, including simplicity and durability.

BEAMAN & SMITH, Providence, R. I., send us a copy of their No. 1 special pamphlet, descriptive of the class of work which can be accomplished with their No. 1 Horizontal Spindle Drilling and Boring Machine.

THE ADVERTISEMENT OF Bruce & Cook, 190 Water street, New York, which will be found elsewhere in this issue, calls attention to their extensive stock of Tin Plates. Reference is made to their bright charcoal and coke Tin Plates, of which they have a full assortment of sizes; also to their Roofing Plates, of which they present a list of names of between 20 and 30 different brands of various sizes and weights. Mention is likewise made of Solder and Russia Sheet Iron.

THE EXTENSIVE Tin and Japan Warc manufacturing plant formerly operated by the Geo. D. Winchell Mfg. Company, Cincinnati, Ohio, who failed about one year ago, has been purchased from the assignee by the well known firm of the F. H. Lawson Company, also of Cincinnati, Ohio. The new owners were to start up the plant on November 1, and increase the present facilities as necessity demands. To begin, over 100 men will be given employment. The establishment is well located, and is said to be one of the best equipped and largest of its kind in the West. The F. H. Lawson Company are well known to the trade, having been identified with the Tinners' Supply and Tinware business for many years past, and of late years as manufacturers. They are also known for their own brands of Tin Plate —Lawson and Old Process.

OUR READERS will be Interested in the system of exhaust ventilation shown in the cut in the advertisement of the Kernan Furnace Company, Utics, N. Y. It shows the Kernan system of heating by hot air furnaces and ventilating the different rooms by means of exhaust ducts.

J. P. Marsh & Co., 224 Washington street, Chicago, are in receipt of many orders for their Acme Automatic Air Valves, among which can be mentioned one from E. F. Keating, 75 John street, New York, for 112 dozen No. 6, with hest controlling attachment.

THE JOSEPH DIXON CRUCIDLE COM-PANY, Jersey City, N. J., issue their usual monthly calendar, calling incidental attention to Dixon's pencils. The card is backed with a blotter, making it convenient for desk use.

THE NEW HAMPSHIRE MICA MINING COMPANY, 7 Water street, Boston, Mass., distribute a price-list of Mica bearing date of October, 1894. The company make special prices on wet and dry ground Mics, ground Feldspar and Quartz. The mines of the concern are located in Newport and Claremont, N. Y.

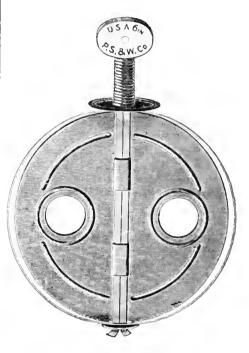

THE W. DEWEES WOOD COMPANY, McKeesport, Pa., manufacturers of patent planished sheet iron, have commenced the erection of a new iron building to take the place of an old frame one. The erection of this building gave rise to the report that some extensions were being made to the plant of this firm, which report is untrue.

The Canton Rolling Mill Company, Canton, Ohio, turned out 105 tons of finished Sheets in six days recently. The sverage output for their two-mill plant is 75 tons per week. The members of the above concern and most of the employees are Sheet mill workers who were formerly employed at Apollo, Pa., and Leechburg, Pa., but lost their positions by going on a strike.

THE ANTHONY WAYNE MFG. COM-PANY, Fort Wayne, Ind., have secured a ten year lease on a lot in St. Louis, Mo., 150 x 240 feet, and are overhauling their plant preparatory to removing to that city.

### The U. S. A. Stove Pipe Damper.

The Peck, Stow & Wilcox Company of Southington, Conn., have just brought out something new in the way of a stove pipe damper, an illustration of

The U. S. A. Stove Pipe Damper.

which is presented herewith. The device is constructed of wrought iron and steel, and is made under C. T. Redfield's patent. The makers state that it holds its place firmly in the pipe, and its position is always indicated by the wooden handle. The steel shaft pass ing through the damper forms, when locked down, a positive bearing on the plpe from outside to outside. Before locking the damper the pipe and spring are compressed, thus freeing the damper, so that it always works easily in the pipe and at right angles to the shaft. The circular shield on the outside of the pipe, between it and the handle, protects the wooden part from heating or burning off. The wooden handle is made of two disks, in which is imbedded, by pressure, the oval end of the steel shaft. The parts are then riveted together. The makers state that as the dampers are of sheet steel they can be readily changed in size to fit smaller pipe or that of irregular con-formation. The spring is said to be very elastic and not liable to set, as only the small metal shaft passes through it. It is protected from radiation by the shield and holds the damper firmly in any desired position.

# STOVE TRADE NOTES.

# The New England Stove Trade.

The comparison of the business of October with that of the month immediately preceding shows very little change in the volume of trade. In some branches there was an increase and in others a slight falling off. During September dealers generally laid in more or less light stocks and the continued mild weather has, combined with other and long standing adverse influences, prevented the unloading of these goods to any considerable extent. Retailers throughout New England appear to have plenty of jobbing work, but they report store trade as light. Of late the demand has been exceedingly erratic, indicating that hand-to-mouth buying is still in favor, but, on the whole, taking into consideration the temperature, the business of October may be characterized as hardly up to expectations in volume and only fairly satisfactory in other respects. There is a mild sort of clamor for lower prices, but this is generally estisfied by the substitution of inferior goods, if the low price is insisted upon. Collections from the larger centers are fairly prompt, but reports from the country districts are not so favorable.

One of the peculiar features of this season is that the demand for ranges seems to be larger than that for parlor stoves. This is to be accounted for in various ways-first, by reason of the warm weather, and again because of the competition of small furnaces and oil heating stoves. It appears that a gradual change is in progress, the tendency of which operates against the sale of higher grade parlor goods. In large cities and towns very few houses are erected without heating apparatus of some kind. This is especially true of the better class of dwellings, but it is likewise a fact that the modern tenement house is so equipped. The low prices at which good furnaces can be obtained leads to their being put in many old houses in the cities, and even out of the way places are attracted by the low cost of the heating systems. Among the poorer classes of the people the showy and elaborate oil parlor heaters are in considerable vogue, and going in many places where heretofore a parlor stove would have been bought. Furnaces are moving moderately.

While the demand suffers somewhat from the curtailment of building and the competition of hot water and steam, still most manufacturers in this territory are doing a fair amount of business, but no more than, if in fact quite as much

as, in September. Oil heating stoves are selling freely and the better goods in this line seem to be gaining on the poorer grades. The repair trade is irregular but quite active at present, and indications point to increased business as soon as weather conditions become favorable.

#### St. Louis Stove Trade.

But for the unfortunate spell of warm weather which set in about the 20th and continued until the 27th, the month of October would have been a remarkably heavy one. As it was, however, it has been very satisfactory, and with seasonable weather now prevailing a continuance of this demand is confidently anticipated. It is next to impossible to induce the retailer to anticipate his wants. Many of them carried over good sized stocks from last year and seem determined not to do the same thing this year, and, as a result, instead of orders of from 6 to 20 stoves of one kind being received, they run from one to five stoves, creating the impreasion that the dealer has the stove sold almost before he orders it from the This condition of affairs makes it particularly hard on the manufacturer, and the only satisfaction the manufacturer can derive from the situation is that nearly every other line is in the same shape. The demand at present runs largely to heating stoves. Some high-class goods are being ordered, but the major part of the trade are ordering medium class goods. The large number of gas and oil heating stoves which are now on the market is having its effect on the sale of heating stoves, especially the smaller size of heaters. The local foundries are all running full and are melting on an average of 100 tons of iron daily, and are thus enabled to keep their atock in good shape. In some lines they have run short, especially steel ranges, one concern having been compelled to strip their sample room to fill orders. As a rule, however, stocks are in good shape and orders are filled as they are re-

The gasoline manufacturers are already booking orders for next year, and while the season is yet very young sufficient sales have been made to indicate that next year's business in this line will be unusually heavy. Improvements and changes have been made where they seemed necessary, so that the line of 1895 gasoline stoves will be still nearer perfection.

The sale of sheet iron air tight heat-

ers has been very large, especially in the sections where wood is much used for fuel. The competition had caused more or less cutting on the prices of these stoves, and this fact is likely to cause some of the smaller manufacturers to cease making them after the season is over.

#### A Chat About Water Street.

BY JEEMS

The oldest inhabitant of this section cannot recall a time when there have been so many stores to rent in this vicinity as there are now. Fulton street, Front street and Pearl street have a number of stores to rent and many have stood idle for over a year. The easterly corner of Fulton and Water streets was, The easterly at one time, one of the best business locations in New York, and many a stove man was wishing to get it. The wood and hollow ware firm of Lockwood & Co. occupied it for many years and did a thriving business, but it has stood more or less idle for a long time. And Cort's so it is with many other stores. Cort's corner on Beekman street is almost deserted and, in fact, there is a real quiet taking possession of this once busy region. The diversion of the Brooklyn travel from the ferries to the Bridge is, perhaps, the prime cause of this change. Yet it does not account for all of it. Other causes are at work so far as the stove trade is concerned. Water street and stoves were as firmly connected together in the public mind as leather was with the Swamp, but while the Swamp is still so well-known for leather, outside of the stove trade Water street has disappeared from pubwater street has disappeared from public view. In fact, the masses know nothing of such a mart for stoves. In the old days the city housekeepers, as a rule, bossed the cooking, if they did not do it themselves, and the kitchen fairy that would dare to hint that she owned the kitchen would get the fire p— d— q—, you het. Consequently the getting of atoves and the using of them were very important affairs, and the housekeeper kept herself posted regarding them and made her pilgrimages to Water street to see the stoves if she wanted one, even if she did not buy there.

But all has changed, and is still changing. As city people began to spread out and started to build, many bought their own lots and built for themselves and selected their own ranges and furnaces; but that is done now almost exclusively by the architects or builders, who buy in quantities and the occupants of the houses use the srticles they find in them, consequently they never have to post themselves about buying them and have not the remotest idea where they do come from. larger Water atreet concerns ship most all their goods from the boat and all the big bustle and confusion that used to be there are simmering down; this, together with the absence of the people hustling for atores, makes it a comparatively atlll place except for a short time during the fall, and while the total volume of business is still large the life seems to have left, or is leaving, the trade there.

But after all it is only a part of the evolution of New York's business changes that is going on, but while more room and territory are demanded by many trades, it does not apparently apply to the stove trade—it has enough, as the vacant stores indicate.

Why, they don't even have any more prayer meetings down there. In Johnny Allen's and Kit Burns' time, when the original Parkhursters started to clean out the dives, they went at it boldly and openly in the daylight and got right down on their knees in Water street and prayed for all they knew how, and rooted out the dives. didn't fool much with Lexow business; no, and they wouldn't tolerate living pictures-that crowd wouldn't. Speaking about the Lexow Committee, there are two stove men on it, Geo. W. Bobertson of Southard, Robertson & Co., who used to live over in the old Eleventh Ward, New York, formerly known as "Stag Town," now "Jeru-salem," and Dan Brsdley, "Uncle salem," and Dan Bradley, "Uncle Dan," as he is familiarly known now. Dan used to lug bundles of bricks and castings over Catherine Ferry to Brooklyn, and do the stove pipe act around that town in a good and workmanlike manner. But he don't do it now. What the future will develop for the stove trade in New York, and especially for its continuance in Water street on its present basis, is a problem to be solved, but guess it will be continued

in some shape. One of the latest removals from Water street is of an old concern, who, while not identified with the selling of stoves there, are large buyers of them and belong to the fraternity. Holbrook, Merrill & Stetson of San Francisco, who have had an office with Munsell's people for many years, have moved to a new office in a Broadway sky scraper. The removal was rendered necessary owing to the large increase of Munsell's mica business, requiring all their room. Merrill's departure has somewhat interfered with a coterie of weather observers of which he was one. who usually took the aun and tested the humidity of the air several times a day; in short, kept the day moving in regular order. The day is like everything else-apt to go wrong unless it is 'tended to. It is remarkable to what extent habits control us. Charley Merrill had traveled the road so many years to that Water street office that after removing to Broadway for a while he turned into Water street every morning on his way from his Brooklyn home and marched up to the old office, and one morning nearly broke his neck stumbling over a case of mica before he realized where he was. He finally laid in with the "shineer" on the corner of Fulton street to head him off if he turned into Water street and also tipped the policeman to put him right if he saw him going wrong. Gus Brush, Merrill's right hand man, climbed up 13 or 14 stories in the new building a number of times before he thought about the elevator service, but is now quite used to the "lift," as the Englisher says. John Fraser, chief astronomer of that party, is considerably bothered by Merrill's removal, and so is Munsell. They say the sun is crooked, he don't rise as he should, and in fact the solar system has got out of gear and they can't straighten out things. About the size of it will be a new weather bureau will be started, nearer Broadway possibly. This taking the sun, seeing a man or discussing affairs used to be quite an observance among the old Inhabitants of Water street, but a chill has come over the custom and the sociable element is somewhat at a discount.

### New England Stove Notes.

A correspondent of The Metal Worker, who has just completed a business trip through the New England stove districts, reports the stove foundries in that section of the country as being on the whole in a very gratifying condition of activity. Manufacturers are experiencing a considerably better fall trade than they had looked for a few months ago. Most of the foundries are running full and their books, in nearly every case, show a material increase in orders over those of last season. In some instances the demand for goods for early delivery is above the capacity of the works and the manufacturers are hard pressed to fill the requirements of customers satisfactorily. The impression appears to prevail, however, that the improvement may not be a very lasting one, and no great enthusiasm is expressed as to the outlook for later in the year. Meanwhile the energies of the stovemen are being exercised to the utmost in "making hay while the sun shines.

Among the concerns specially mentioned by our correspondent are the Magee Furnsce Company of Boston, who report a very good fall trade in their stoves and ranges, with shipments running ahead of their capacity of manufacture. The Weir Stove Company, Taunton, Mass., are running full in their foundry and shipping many more goods than they had expected to be able to dispose of this fall. The Taunton Iron Works are reported to be in a similar condition of activity, and all the Taunton foundries appeared to be busy manufacturing and shipping goods.

The Dighton Furnace Company of North Dighton, the Somerset Company, Operative Foundry Company of Somerset and the Eagle Stove Foundry Company of Fall River were each fully occupied, and reported the demand for stoves and ranges to be very good, both from dealers and individual buyers. A peculisrity of the Fall River concern above referred to is that it is probably the only stove foundry entirely managed by a woman, who since the death of her father, the founder of the firm, has had complete control of all the departments of the works, which she is said to run most successfully.

The Richmond Stove Company, Norwich, Conn., are running their works to about two-thirds capacity, melting some 12 tons of iron a day and experiencing a very fair trade in heaters and boilers. The Stamford Foundry Company of Stamford are also busy, with good prospects shead.

The H. B. Smith Company, Westfield, Mass., are shipping many heaters and radiators in response to orders, and consider their fall trade as very satisfactory on the whole. The stove foundries at Providence, R. I., are also said to be all running and doing a very fair business at this time.

Taken altogether, our correspondent is of the opinion that the New England stove foundries are running fuller and receiving more encouragement than at any time in the last two years. At the same time prices are very low and business is done on so narrow a margin that the increase in its volume does not by

any means represent a corresponding increase in profits.

In connection with the stove trade, it is mentioned that the Eaton, Cole & Burnham Company of Bridgeport, Conn., makers of east fron fittings, valves, &c., are running their works to full capacity and melting about 27 tons of iron a day. They report their business to be about normal in volume, considerably better than that of last year, and fully equal to 1892.

In contrast to the stove trade work in the jobbing foundries in New England is reputed to be very slack. Those at Boston, Lynn and other points in Massachusetts, as well as the New Haven and Hartford foundries in Connecticut, are all spoken of as running on short time, with a lamentable scarcity of orders.

#### The Retort Soft Coal Heater.

The Marion Stove Company of Marion, Ind., present another illustration of success achieved through the manufacture of a single type of stove and making it as perfect as they know how. They only make the soft coal heater known as the Retort, but their trade extends all over the soft coal regions of the country. It is a stove which burns any kind of soft coal, and, it is said, cannot be made to smoke. Coking coal is burned without caking or clogging. In it soft coal is as easily handled as hard coal in a base burner. Fire has been kept in it for 96 hours. The coal is fed into a magazine, in which it is heated, but not burned, so that when it reaches the combustion chamber it is coked, and thus emits no smoke. The door of the combustion chamber can be opened without fear of emitting a cloud of smoke into the room. No damper is used in the pipe for controlling the draft, but the pipe is left with a clear passage at all times, the combustion being controlled by slides for the admission of air at the top of the stove. Very intelligent and sensible methods are followed in selling these stoves. Instead of blindly trusting to the experiments of consumers to find out for themselves how to burn their local coal the company ascertain the character of the coal and furnish directions how to use it to get satisfactory results, and thus find no failures and hear of no trouble. President F. J. Gould has made a valuable collection of analyses of the soft coal produced in all parts of the West and South, and his long experience when backed by this knowledge enables him to tell a consumer how to handle his local coal. changes are made in the interior of the stove in doing this, except that a fluted magazine is furnished for coking coal and a plain or smooth magazine for non-coking coal. That the company have a very high class of customers is shown by the fact that they passed through the panic of last year without losing a single penny on their Retort stove sales. Up to the present time only two sizes of this stove have been made, but the company are now bringing out three more sizes on the same principle, which will be smaller and somewhat cheaper, to meet the demand for cheaper goods.

Advices from Indianapolis are to the effect that owing to the improvement in general business and especially in the stove trade, the Indianapolia Stove Company of Indianapolis, Ind., have advanced the wages of their employees 5 per cent.

## Estate of A. Froelich,

289 Pearl street, New York, publish a catalogue of stove, range, heater and furnace repairs and stove dealers' supplies, which they make and handie. The publication is particularly neat and serviceable, bound in heavy red paper, provided with a loop in the corner for hanging up and is of convenient size, measuring 5 x 8 inches. In presenting the book to the trade the publishers call attention to the fact that all their castings are marked in full with the name of the stove, &c., to which they belong, thus rendering it an easy matter for any person to tell at a glance the full name of any repair which they manufacture. Their stock of water backs, they announce, embraces all those used in this market, and add that they are made from wood patterns and are thoroughly tested before leaving the foundry. In referring to their stock of stove dealers' supplies, they mention that it has been carefully selected, and embraces only such articles as are considered the best in the market. Directions for ordering repairs begin the book, then outlines of stoves, ranges and furnaces with accompanying text telling the names of the different parts, alt of which will prove of much service in ordering repairs. The catalogue of repairs proper covers 64 pages, the names of the stoves or beaters, as the case may be, being given alphabetically. The name of the manufacturer ically. is also given, and where further particulars are necessary to distinguish the repair foot notes tell what is required. The list of water backs alone covers A special repair notice is seven pages. to the effect that by arrangement with the manufacturers all repairs not listed in the catalogue and made by the concerns whose names are appended can be furnished in a few days. Then fol-lows a list of a number of prominent atove and furnace manufacturers. cellaneous repairs are noted after this; a number of illustrations of grates are shown; then atove leg reats, knobs, turn keys, ornaments, shakers, lifters, &c. Shovels are shown in large variety; brushes, cements, dampers, stove pipe rings, thimbles, eibows, stove pipe ventilators and chimney caps, registers, stove bolts, laundry stoves, mica, &c. A table of contents is printed at the end. Altogether it is an excellently arranged and serviceable catalogue which will be appreciated by the trade.

### Southern Stove Works,

of which Kiechle, Brentano & Oberderfer are proprietors, Evansville, Ind., have recently issued from the press a comprehensive catalogue of their specialties. The volume is made up of over 100 pages, tastefully arranged, carefully printed, profusely illustrated and bound in imitation leatherette covers, the side title being embossed in old gold letters. The frontispiece is a perspective of the building containing the main store rooms and offices of the company on Eighth avenue, running from Water to Ohio streets. In offering this volume to the trade the company call special attention to their new line of Our Leader ranges for wood; Our Gem Leader ranges for coal, and also for wood; the Royal Leader coal cooks, Star Leader wood cooks, Our Leader air tight soft coal heater, Our Leader Franklin stove, the Bess cannon stove, the Leader Oak coal and wood heaters, the Paragon box atove for wood, and the Clipper laundry stove. Owing to increasing business the company found it necessary to

increase their facilities, and have just completed buildings which give them double their former capacity. opening pages of the volume call attention to various matters of interest to the dealer, among which are directions for shipping goods, directions for operating stoves, telegraphic code, and directions for setting stoves. The various lines of goods shown are described in a way to enable the dealer to understand the important features of construction, while at the same time there is given the sizes in which the stoves are made, their weight, size of oven and list price. A portion of the work is devoted to hollow ware, tinware, elbows and miscellaneous goods. A feature which the trade does not fail to appreciate, especially when ordering repairs, and which is becoming common to the catalogues of leading stove manufacturers, are skeleton cuts of stoves, with all the plates numbered and referring to an explanatory table by which the dealer is enabled to designate by its proper name the part wanted.

### Gas and Stoves.

BY ATMOSPHERE.

There is a lot for the average man, particularly stove man, to learn about gas and stoves that will be profitable. Gas stoves for cooking are being used by the very rich and the very poor; by the former on account of comfort and convenience, and by the latter on account of both of these and economy. In the tenements of New York the poor use gas stoves, and some, having got beyond the hot plate stage, are using a better grade of stove. The fuel is not expensive, because the fire is lit or out in a second, and consequently a dinner can be cooked cheaper than with coal and without roasting the family. The hot plate is not to be underrated, for it is capable of good service.

A bright woman uses a two-burner hot plate to cook for a family of nine people, and, with a mutton stew and three vegetables, she served peach short cake as a dessert. A Beveridge cooked the atew and vegetables, and a sheet iron plate over one burner, with a tin pan turned over it for an oven, baked the short cake. Other women find the hot plate just as cheap and convenient as this woman, whose gas bill for three months for cooking and lighting was about \$10. She ran a fire in a coal range once a week for baking and laundry work, and she caiculates that by using gas her fuel bill is less than if coal had been used all the time. This accounts for a falling off in the sale of small coal ranges in summer, about which some of the dealers are growling.

The live atove and house furnishing goods man has a line of gas stoves and the cooking utensils that are used with them. Some of the big stove makers are using a gas stove in their kitchens, though they could have the best and handsomest coal range made if they wanted it. It would not be atrange to see a number of stove foundries with a line of gas stoves in their catalogues next year, for many of them sell less of their small goods and have got to melt less iron or fill in with something else. This is the time of the year for heating stoves and with gas radiators, gas logs, gas Franklins and other styles of gas heaters the trade in coal stoves is likely to suffer some. A gas stove cannot be beaten for heating an office, a bedroom, or any room where the fire is not in constant use. Coal is cheaper than gas to run continuously or even for

short periods, but it requires more attention, more labor and makes a lot of dirt, which the modern up to date folks will not stand.

Some say a gas stove with no fiue connections poliutes, vitiates and does other things to the air in a room that are a disadvantage; still they are used and in large numbers, and more are going to be used, which pleases the seller. They can be had with a chimney con-nection if wanted and the quantity of heat lost is not as great as with other methods of heating that also afford ven-It is said they dry the air tilation. in an apartment and artificial moisture is necessary, while others hoot at this idea and say the combustion of gas liberates enough moisture to saturate the air. Be this as it may, some highly esteemed gas experts aay that an urn filled with water can be used with a gas stove with comfort. Some people have found an urn of water to be an advan-tage on a coal stove and have been laughed at by others.

Hot air furnaces and hot water apparatus adapted for the use of gas only as a fuel are being atrongly pushed this year and show the disposition to avoid the labor and dirt that attend the use of coal as fuel. The buyers have not demurred at a probable increased cost of heating where the comfort and convenience can be afforded. It has been said that gas had seen its day when electricity commenced to attract attention, but it would seem that the "'possum' was only asleep and it is now making a run on the coal stove business that will make the foundrymen and retailers look around later to see what hit them if they haven't got an eye open now.

#### ODD PLATES.

THE PORTSMOUTH STOVE & RANGE COMPANY advise us under recent date of the death on October 21 of Will Stork, who for a number of years past has represented their interests on the road. Mr. Stork was at the time of his death in the prime of life, and was perhaps the best known salesman in the territory covered by him, having traveled over it for upward of 20 years. The company deeply feel his loss, and fully appreciate the fact that his place will be hard to fill.

RENEWED ACTIVITY is reported in the Canadian mica mines, near Beaver Lake, Province of Quebec.

F. V. STREETER, representing the S. M. Howes Company, 40 Union street, Boston, is one of the literary traveling salesmen on the New England circuit. Mr. Streeter goes around with a stove catalogue under one arm and a copy of Victor Hugo under the other. Some standard work beguites many a watting moment and the information absorbed is sometimes given out to the advantage of the dealer or perhaps to some benighted fellow traveler.

THE ANSHUTZ-BRADBERRY COMPANY, Pittsburgh, Pa., manufacturers of Tremont atoves and ranges, are directing the attention of the trade to their Tremont Oak parlor stove. This atove is referred to as containing all the latest improvements and is made in either cast or sheet steel body. Attention is also directed to their retort oak stove which will burn slack of any kind. The trade of this firm this aeason in their well-known Tremont furnaces has been the largest of any year since the furnace was put on the market and reports are constantly being received from customers expressing their entire satisfaction with

its operations. This firm are sending out to the trade a foot rule which can be folded up and carried in the pocket. It is intended as an advertisement and will doubtless be successful in fulfilling its mission.

THE KELSEY FURNACE COMPANY of Syracuse, N. Y., issue a phamphlet of 50 odd pages illustrating and describing the Kelsey furnace, which is referred to as the "greatest warm air generator ever produced." The heater is illustrated and described in the early pages of the pamphlet, while the great bulk of the matter consists of testimonial letters from those who have practically demonstrated the merits of the Kelsey furnace.

IT IS SAID that when the Sioux City Stove Works of Sioux City, Iowa, were transferred to the receiver, there were on hand some 5000 stoves of all kinds, with castings enough unmounted to make 2500 more. About one-half of the stoves have been sold and the disposal of the remainder is now in prog-Whether the castings will ever be assembled is unknown, says the Sioux City Journal, but it is probably the only way the receiver will ever realize anything like the full value of the metal. A gentleman formerly connected with the enterprise in speaking to a representative of the paper named about the stove plant expressed himself as follows: "It is a pity that an institution manufacturing such a finished product as that turned out formerly by the Sioux City Stove Works is forced to lie in idle-There are no better stoves manufactured anywhere, no better selling article, than this same Leeds product. But there is little hope of the resumption of the works. It is too big an institution to be successfully operated in Sioux City, and it is so arranged that it must be run full force or not It requires a force of at least at all. 1000 men when in full operation, and should an attempt be made to run it with a reduced number it would only result in loss, as the machinery could not be adjusted to a smaller output than it was originally built for. This is unfortunate. Perhaps if it were otherwise there might be some hope of a resumption, but as it is now the mel-ancholy fact remains that all there is to do is to close out the stock on hand, thus completing the demise of one of the finest manufacturing Institutions it was ever Sioux City's good fortune to

THE PENINSULAR STOVE COMPANY of Detrolt, Mich., are distributing to the trade a printed card as a reminder of their mail order department, together with an invitation to test its efficiency. The envelope sent to each customer contains five envelopes addressed to the Peninsular Stove Company for the purpose of sending in mail orders from time to time.

THE MANCHESTER STOVE COMPANY of Manchester, Ohio, have about completed their new factory building, which, it is stated, will be one of the largest in that section. Employment will be given to 150 men and boys.

A DISPATCH from Lorain, Ohio, to the Cleveland Leader states that the City Council recently voted to accept the proposition of the Cleveland creditors of the National Vapor Stove Company. Under its terms the city will quit claim Its lien of \$30,000 and give the creditors the works, they in turn agreeing to run them two years. The dispatch further states that there is a decided opposition to the act and arrange-

ments have been made to enjoin the Council from carrying out their intentions.

"Hano Me Ur" is the inscription upon a card which reaches us from A. Weiskittel & Son, Baltimore, Md. One side carries illustrations of the Fire King gas hetters, with brief descriptive particulars, a tac simile of the company's trade-mark and their name and address. On the other side we find a number of reasons why dealers should use gas for fuel. The manufacturers request those interested to write for a copy of their new catalogue showing a complete line of gas stoves and ranges.

CHARLES S. PRIZER of the Reading Stove Works, Reading, Pa., is reported in a dispatch from that place to have expressed the following views with regard to the business outlook: "The situation to-day is much better than this time a year ago. All indications point to a sound and steady improvement in business, although there is nothing to warrant an extraordinary increase of trade. This year there is a feeling of confidence and security throughout the country. We are constantly receiving orders from sections with which we did not do any business last year."

AN IMPORTANT NOTICE to the trade has been issued, to the effect that, on October 22, B. M. Nead and J. F. Ray. mond were appointed receivers for the Raymond & Campbell Mig. Company of Middletown, Pa. The receivers will continue the business of the company in all its branches, maintaining the high grade of the different lines of heating and cook stoves, steam and hot water boilers, and operating the machine and foundry department in a way to promptly meet all demands. It will be the aim of the receivers, by promptness in business and in efforts to maintain the reputation of the company for high grade goods, to merit a continuance of the patronage of the trade. The announcement also states that all accounts due the Rsymond & Campbell Mfg. Company are to be paid and made payable to the receivers by authority of the Court of Dauphin County.

THE CHICAGO GAS STOVE MFO. COMPANY have been incorporated at Chicago, Ill., with a capital stock of \$20,000. The incorporators include John S. Bindell, William Laemmer and Cynes Calconer, Jr.

Moore Brothers of Wichita, Kan., made their first cast of stoves on Wednesday, October 17. In the operation the workmen were so unfortunate as to set fire to the building, but with little damage.

THE CLARK STOVE COMPANY, Kansas Clty, Mo., are meeting with a very gratifying demand for the Clark steel range, which they manufacture. A feature of the range is a gasoline attachment, which can be easily taken off and replaced, enabling the atove to be used in summer with gasoline as a fuel and in winter with coal. We understand that the company expect to erect in the near future a large factory building.

THE CANFIELD STOVE COMPANY of Rondout, N. Y., make use of a number of verses in their advertisement in a local paper to call attention to the lines of stoves which they handle. In the list we notice Argand, Gold Coin and Red Cross stoves.

IN SPEAKING of the business situation George L. Farwell, president of the St. Paul Stove Works, St. Paul, Minn., said to a representative of a local paper:

"Collections are good and business is much better than was anticipated for the time of the year. We are doing half again as much as last year, and even more than two years ago. In North Dakota, especially, our lignite using stoves are in great demand. The outlook is flattering. There will be, I think, frequent orders for small lots—a safe and profitable method."

S. OBERMAYER COMPANY, with factories at Cincinnati, Ohio, Chicago, Ill., and Larsmer, Pa., arc distributing a folder relating to Ticeoleum pattern dressing. This is intended for use in connection with iron, brass, composition, metal and wood patterns, the claim being made that it will not gum up the patterns and will not allow the pattern to rust. Directions for using Ticeoleum are given together with prices.

THE MICHIGAN STOVE COMPANY disposed of a valuable piece of property last week. They sold the building at 8 to 12 Washington street, Chlcago, to John B. Drake, one of the owners of the Grand Pacific Hotel. The building is 811 x 120 fect, seven stories high, not including the basement, and was occupied by the Michigan Stove Company for several years in conducting their Chicago branch. They removed from it to Clinton street, between Van Buren and Harrison streets, to secure a more suitable location for conducting their business, renting the building at a very handsome rate to a furniture company. The investment in the building was very profitable. The company paid \$135,000 for it in 1885 and are now reported to have received \$300,000. This is the largest sale of real estate in Chicago for months.

#### SCRAP.

(Continued from page 57.)

of the Creacent Sheet & Tin Plate Company are at 312 Perry Payne Building, Cleveland. The officers of the concern are: President, H. P. Macintosh; vice-president, B. F. Arthur; secretary and treasurer, J. A. Matthewa; and superintendent, James Paton.

THE BEAVER TIN PLATE COMPANY have been organized and will erect a six-mill plant at New Lisbon, Ohlo. The main building will be of brick, three atories high and 180 x 120 feet superficial area. The contract calls for the completion of the building late in December and operations are expected to be commenced about February 15, 1895.

THE TIN PLATE WORKS of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., will, it is stated, resume operation at once, after an idleness of some weeks. It is announced that a sharp reduction will be made in wages, amounting to 25 per cent. in the case of the heaters and 30 per cent. in the rollers' wages.

THE LLANGENNECH TIN PLATE WORKS of Thomas William, at Llangennech, South Wales, will start up again shortly, after a prolonged term of idleness.

Said a member of one of the largest New York tin plate importing houses a day or two ago: "In my opinion the present is an excellent time for buying tin plates. Prices on the other side have sagged off again to nearly the lowest figures touched this year, and the Welsh makers appear to have lost the small advances they secured lately. This condition is not, however, likely

to continue long, as stocks of plates at British shipping points have been very materially reduced during the past menth, and stocks in this country are unusually small. Cargoes as they arrive go into consumption straight way, and but a very small proportion of imports go into stock. Meanwhile, although production in Wales is increasing to some extent, it is not doing so in proportion to the increased consumption both in this country and in other markets; and it is likely that there may be a general scarcity in some lines of plates before long. Indeed, such scarcity has been experienced here in respect of one or two well-known brands within the past week, and it still exists. No less than four brokers have been to my office this morning inquiring urgently for a certain largely used size and quality of charcoal tin, of which the market seems bare, but we had none to give them. And this has been the case with some other staple lines. These who buy plates now are, I think, likely to get their goods cheaper than they will be able to buy them again for some time to come.

THE A. GARRISON FOUNDRY COM-PANY of Pittsburgh shipped last week the balance of the equipment for the new sheet mills of the Pittsburgh Tin Plate Works, at New Kensington, Pa. This new plant is most complete in design and will be put in operation at an early date.

## The Indiana Gas Belt.

A representative of The Metal Worker last week enjoyed the privilege of a flying trip over a large part of the natural gas district of Indiana. It had been some two years since his previous visit to that section, which was made at a time of great prosperity and manufacturing activity, and there was consequently a keen desire to see how the district had fared under the wave of depression which rolled over the country in the intervening period. The comparison now to be made is by no means discreditable. The depression is rapidly losing its effect so far as this district is concerned. A pleasing bustle of reviving activity pervades the whole section. Here and there a manufacturing plant can be found that is running with a light force, but they are exceptions and in every case special reasons exist. New enterprises are springing up, some of which are of great extent and are calculated to bring increased prestige to the State and district.

#### Municipal Improvements,

Referring to the towns themselves, a few remarks will not be out of place. Those who have not visited these towns for two or three years will be interested in knowing that almost everywhere. excepting the very small towns, of course, municipal improvements have been made which contribute vastly to the comfort and healthfulness of citizena and vlaitora. Sewers have been laid, streets nicely paved, sidewalks improved and street car facilities wonderfully extended. The sewers have enabled sanitary plumbers to ply their vocation with much greater satisfaction. The visitor perceives this in the excellent toilet facilities now provided in the hotels of the district. The primitive arrangements of a few years since have been displaced, even in the small towns, by the same conveniences to be met with in good sized cities. Turning to the Improvements in street pav-

ing, the writer recalls an experience ln Anderson not very long since, when the streets were almost impassable in the spring on account of the deep mud. Now there are many miles of streets paved with brick, making the leading thoroughfares as fine and cleanly as can be found in any other city and wonderfully improving the appearance of the place. This work is being pushed still further, and the other gas belt towns are determined not to be outdone and are making corresponding improve-ments. This is a strong evidence of prosperity in itself, as a poverty stricken community may detest mud and filth but must endure them until the means are forthcoming to make the necessary changes. Electric street car lines abound and the service appears to be well patronized. Their accommodations are highly appreciated by those who have business with the manufacturing establishmeuts, as the utmost ingenuity seems to have been exercised in these Indiana towns in placing such institutions as far apart as possible. comprehensive scheme is now contemplated in this line, on which work may yet be started this year. It is to connect all the leading cities in the gas belt by an electric road, which will at the same time furnish street car service to the small towns intervening. Although the territory now is quite well supplied with steam roads, yet the passenger service is limited on each, and the trains are not always run at the most convenient time in the day for the traveling public. The interurban line will not only overcome this trouble but will undoubtedly prove an important factor in building up the small towns. brings up the question of the future of this section as a manufacturing district, its prosperity thus far having been based on natural gas.

#### The Future of the District.

Any one who will take the trouble to consider the geographical situation of this district cannot fail to be impressed by the fact that it is centrally located with respect to numerous great mar-The manufacturers of Indiana might be considered as too far west to catch much of the trade of the East, with so many competitors in the intervening territory, but nevertheless they enjoy a fair share of Eastern business. They are within easy reach of the large cities on Lake Erie, and close to Chicago and the Mississippi River cities, while they are specially well favored in their proximity to Louisville, one of the great gateways to the South and its growing trade. Numerous railroads traverse this section, several of the leading trunk lines of the country having built through it long before natural gas was regarded as a practicable fuel. Local roads and feeders of the trunk lines supply almost every nook and corner of the district with transporta-tion facilities.

The utmost care has been taken to husband the gas supply. The extravagance of other gas districts and the rapid exhaustion of the supply have been a warning to Indiana manufacturers, and they are heedful of the lesson. No indications are at present perceptible of a diminution in the supply of gas, and it is expected to hold out for years to come. If it should be exhausted, abundant supplies of high grade coal are near at band, as well as a great oll field, which has thus far merely been exploited to determine its extent, but has not been seriously drawn upon. Manufacturers and business men are therefore confident that

they will be able to permanently maintain any vantage gained through the powerful impetus of free gaseous fuel.

#### Inducements to Manufacturers.

One might suppose that by this time the peculiar advantages of the district would be relied upon for industrial growth. But inducements are still being offered to manufacturers to locate In this territory. Anderson has done a great deal in this line of late, a cash bonus being pald in addition to a free site and free natural gas. Other towns have also secured important factories, whose owners deem it desirable to obtain greater advantages in manufacturing cost in order to meet the low selling prices now ruling. Marion has been worsted in endeavoring to influence some of these new comers to locate there, because the town was without a fund from which to pay a cash bonus, and the citizens are now raising \$50,000 as a starter. They expect with this amount to be able to enter the race and accomplish important results in further building up their manufacturing industries and increasing their working population. The wisdom of this method of forcing the growth of towns has been often and severely criticised, but it nevertheless goes on and will be continued. It has undoubtedly worked well when managed by prudent business men who exercised scrupulous care in selecting the recipients of their favors. With all the ients of their favors. natural advantages offered in this district, it would by no means have attained anything like its present importance in manufactures if additional inducements had not been offered.

#### Tin Piate Works.

In writing of the natural gas district of Indiana the subject of tin plate works comes in the foreground, as so much progress has been made there in this line and further developments are to be expected in the near future.

The American Tin Plate Company, at Elwood, have the largest plant. works have been very successful, and until the controversy over wages came up as a result of the late tariff reduction they were run to their utmost capacity. The product of this estab-lishment has thus far been made wholly on orders for special sizes to meet the requirements of large consumers. This class of trade was preferred to the manufacture of standard sizes for job-A new mill, superb in all its bers. appointments, has just been built, but not yet put in operation. It is unusually heavy, to diminish the chance of breakages, and is expected to do fine work, but it will not be started until the wages question is settled. The company will then have ten hot mills, together with the necessary cold mills, shears, doublers, picklers and tinning pots to handle the entire output. present only two mills are in operation, and these are run merely to supply a few customers who depend solely upon the Elwood Works for their supply of tln plates. It is the opinion of President W. B. Leeds of this company that the manufacture of tin plates should be conducted separately from the manu-facture of merchant sheets in order to attain success. The discipline of a tin plate factory is necessarily much more rigid than that of a sheet mill. atage of the operation must be most carefully conducted in order to secure high quality in the finished tin plate, and quality must be the objective point to insure commercial success. The Elwood plates under his watchful care

have already attained a high reputa-

The Morewood Company's plant, at Gas Clty, is next in importance. have six hot mills, with foundations laid for two more mills which are shortly to be added. This plant is also run largely on orders for special sizes of tin plate. Thus far over 50 different sizes have been made. This would appear remarkable if the fact was not known that Morewood & Co., in Walcs, have considerably over 300 sizes passing through their books. The Gas City Works make three kinds of terne plate in addition to tin plate. One of these is hand dipped, having a very heavy is hand dipped, having a very heavy coating, another is finished with a mottled surface by the company's own process, and the third has a plain surface. The most rigorous methods are pursued in these works to secure the highest quality possible, thorough inspection following every step in the progress at the steel through step in the progress of the steel through the works. As an instance of the con-omy practiced in these works the fact may be mentioned that the dross from the tinning pots is collected and smelted in a special furnace, by which all the metal is saved except an almost infinit-esimal part. This plant was in full operation under an agreement with the workmen to take whatever wages might be agreed upon at other mills.

The Irondale Steel & Iron Company's plant, at Middletown, is the third fully equipped mill in the field. Up to the past week this mill has been running on black plates only, under a contract taken some time since. Two hot mill were in use. Four more mills are now being added, together with the necessary auxiliaries, and they will probably be ready for operation during the coming month. The tinning house is completed and some of the pots are in place, which are probably turning out tin plate by this time. This plant has been very substantially constructed, the mill building being of steel covered with corrugated roofing and siding, while the tinning house is built of brick and iron, the entire works thus being fire proof. The plant is well arbeing fire proof. The plant is well arranged, all material constantly passing forward until it reaches the shipping department. It is located on the Richmond division of the Panhaudle Railroad, from which tracks run into the mill. The company have carefully guarded their interests in the matter of fuel by leasing gas rights in the surrounding territory for a long distance.

New black plate mills and tinning plants are in course of erection at Atlanta, Montpelier and Anderson, but it will be several months before any of these are ready to roll. A new plant is talked of at Elwocd, and one is mentioned in connection with Alexandria.

The tin plate industry has called into existence also a class of manufacturers to furnish tinning machinery. The Elwood Iron Works at Elwood, Ford & Donnelly at Kokomo, and the Anderson Foundry & Machine Company at Anderson are all engaged in the business of making tinning pots and rolls, pickling machines, annealing boxes, floor plates, &c. All of them seem to have considerable business of this character.

The general freight agent of the Pennsylvania Railroad system west of Pittsburgh states that the freight traffic on his lines is steadily increasing, and the demand for empty cars is becoming so urgent that there are hardly any available on the system at present.

# TRADE REPORT.

## Metal Market.

Pig Tin .- Prices in the wholesale market have dropped again during the week, and not a little Tin has changed hands, both for prompt and later delivery at the lower rates. There has not been as much business this week as there was last on speculative or other account. Evidently many jobbers and count. Evidently many jooders and large consumers who purchased liberally at about 15 50¢ have enough stock to meet pressing wants and something to spare. It any event they do not figure as liberal buyers at the present time and values have little support aside from what comes through covering of short sales or speculative manipulation. The market, in fact, still appears to suffer from the weight of abuormal heavy supply, due chiefly to the syndicate attracting supplies from primary points and incidentally getting more than average supply into the hands of jobbers and consumers. Late in the week the market stillened somewhat, but closed tame. For small lots of Straits Pig jobbers' prices remain at about 174¢ % lb, Bars being about 1¢ % lb above that figure.

Copper.—No change of importance has taken place. Business is moderate, since consumers are being supplied to a great extent through deliveries on old contracts. There is no pressure to sell, but enough stock is offered to keep prices rather easy, the ruling rate for small quantities of Lake Ingot being  $10\frac{1}{2}\phi \approx 1$ b.

Sheet Copper.—The business passing in Sheet and other manufactured Copper is almost wholly confined to comparatively small lots for present needs. Very little has been done in the way of contracts of any magnitude for either spot or future delivery. Inquiry is fair and prices on their old level. Small jobbing lots of Sheet Copper are quoted on a net basis of 15¢ ? lb.

Pig Lead.—Business during the week has not exceeded very moderate proportions. The current demand is light. Consumers' views of prices usually fall about  $0.10\phi$  below those held by sellers, consequently buving has been tame. Prices for small lots of American Pig from store are rather weaker and are now quoted at  $3\frac{1}{2}\phi$  @  $3\frac{3}{2}\phi$   $\frac{3}{12}$  lb.

Lead Pipe and Sheet. — Business does not expand to any appreciable extent, but is, if anything, rather quieter than it was last week. Such orders as are being filled are mainly for small retail lots for current use. Nor does the immediate outlook appear promising, either for better prices or more trade. Reference is made in another column to the reduction in manufacturers' prices on Tin Lined Pipe, &c., in this market. Sheet Lead remains at the former list price of 61¢, and Lead Pipe at 5½¢, with 20 % discount.

Spelter.—Transactions here are on a moderate scale, and the demand continues light. For small lots of Western jobbers ask 41¢ ? lb. Special brands bring about the usual premium.

Antimony.—Offerings have been free and sufficient to carry wholesale prices aomewhat lower. Small retail lots, however, are unchanged at last week's quotations.

Nickel.—Quotations for small lots are about  $42\phi$   $\tilde{t}^{\beta}$  lb.

Tin Plate, - Very little business has been done in the way of heavy orders for either prompt or future deliverles, but numerous purchases of moderate sized lots of Plates have in the aggregate made up a very fair volume of business. It has not, however, been quite up to the standard of the past few The bad weather experienced in the earlier portion of the week appears to have reduced the demand for Roofing Plates to some extent. Buying is still for the most part limited to moderate quantities for present consumption, and notwithstanding the recent reductions in prices large consumers seem to be utterly indifferent in the matter of laying in stocks. The consumptive demand is nevertheless large enough to absorb almost all the shipments of Plates as they arrive. Stocks of imported Plates do not increase at all, and in some lines there is a decided shortage, particularly la special sizes of Charcoal Prices are somewhat irregular, Tins. and while higher in the case of certain scarce brands, lean on the whole in buyers' favor. The output of domestic Plates is still restricted by the continued idleness of many of the American works, owing to the unsettled wage dispute. The market for American Ternes is good and stocks of these Plates on hand are not excessive.

A special London cable dispatch of October 31 to The Iron Age reports on the British Tin Plate market as follows: Tin Plate market has been dull and prices are weak, owing to increased production. Forward business is restricted by lowness of buyers' offers. Light weights are much cheaper. Swansea quotations are as follows:

Bessemer Cokes, IC	/ @
J. B. Steel Cokes, IC	
Charcoals, IC	/ up.

Sheet Iron.—The demand for both Black and Galvanized Sheets, while hardly up to its recent proportions, is still sufficiently large to keep the mills busy and the prices firm at former quotations. For small jobbing quantities of No. 27 Common Iron the ruling quotation in this market is 2 65¢, and for R. G. Cleaned 3¢. Galvanized Irou in small lots is quoted at 75 and 5% @ 75 and 10 % off.

# Chicago Report.

Scrap.—The demand for Old Material is fair. Cast Scrap is in specially good demand. Dealers quote the following list of buying prices, Chicago delivery:

delivery.	Per net		Per lb
No. 1 Wrought Scrap	87	00.5	
Machinery Cast	'	1 (///

#### CONDITION OF THE

# Hardware Trade.

IN THE hand-to-mouth manner which has become so universal of late a good many goods are going out steadily, but there seems little disposition on the part of either retailers or jobbers to order beyond their immediate requirements. This state of things will naturally continue until prices

have plainly reached bottom.

Advices from Chicago. — October has been a good mouth for Shelf Hardware. Orders were not large, but have continued to come in very freely. The country trade have shown no disposition to anticipate requirements, but the demand from their customers has been sufficiently steady to compel the constant sorting up of stocks. The end of the month compares very favorably with the beginning, and taking the entire period a distinct gain is reported in the volume of business over that of September and very much in excess of that of October last year. Trade would have been still better recently if the weather had been more in accordance with the time of the year, but the temperature has been high and there has been little use for stoves or heating apparatus, and consequently stove furniture and trimmings have been comparatively neglected. Trade in Tinware and Stamped Ware is hampered by difficulty in getting shipments from factories. The impending tariff changes caused fewer goods to be made during the summer and fall, while retailers also held back their orders, so that jobbers are now in hot water trying to supply the strong demand. The same remarks can be made with regard to Tin Plate. Stocks in Chicago are being drawn upon heavily to supply deficiencies at other points in the West. Jobbers have latterly been in receipt of carload orders for Tin Plate, which is something quite unusual. Heavy Hardware is in fair condition, the trade of the mouth being a little larger than in September, but prices on all goods carried in this line are now cut so close that the increased volume is not reflected in augmented dollars and cents.

#### Notes on Prices.

Wire Nails.—If prices were more aettled, the market for Wire Nails would be in a very satisfactory condition. Inculries are numerous and the amount of sales considerable. We have been requested by several members of the Wire Nail Association to contradict the report which has obtained currency in the trade that the association have adopted the Baackes card.

Advices from Chicago.—The altuation is quite perplexing in the matter of quotations. The standard mills are endeavoring to hold up their price for shipments to Western points, but others are making considerably lower rates and thus demoralize the market. It is understood, however, that the low quotations made are invariably for spot cash, which is not specially tempting to those who place orders expecting to draw out in small quantities as they feel inclined to make specifications. Jobbers are quoting small lots from stock at \$1.10, but report that trade recently has not been very active.

Cut Nails.—The market for Cut Nails is quite as strong as at our last writing. While the demand is good, there is active competition for desirable orders. Small lots from store in New York are quoted \$1 to \$1.05, with the usual average.

Advices from Chicago.— Manufacturers report that orders are coming in just as they have been for some weeks, in small quantities, yet with sufficient frequency to keep the local works well employed. Small lots are selling at \$1 from stock.

Barb Wire. — There is little present delivery and the interest in the trade centers in the efforts of manufacturers to secure orders for future delivery. The market is represented by the following quotations on Four-Point Galvanized in carload lots, at the points named: Pittshurgh, \$1.95 to \$2; Cleveland, \$2 to \$2.05; Cincinnati, Allentown, Chicago and New York, \$2.10 to \$2.15.

Advices from Chicago.—Inducements are being made by some of the manufacturers to stimulate the placing of orders for spring delivery. These inducements are not slways in the matter of price, but extend to the enlargement of credits and the dating of bills a considerable distance ahead. It is not believed that this effort has met with much success, as merchants are not yet inclined to load up with goods even if they seem to be cheap. They have had considerable experience of this kind within the past three years, to their regret. The demand for early delivery has been a little better the past week or two owing to the extremely pleasant weather, which enables outdoor work to be proaecuted, and jobbers are also benefited by the increased movement. Small lots of Galvanized from stock continue to be quoted at \$2.25.

Towel Ralls.—The Reversible Polished Brass Towel Rails put on the market by Robert Ferguson, 51 Mercer street, New York, are sold to the trade at \$55 per gross, subject to a discount of 50 per cent.

The Lined and Block Tin Pipe.— Eastern manufacturers have reduced the prices on Tin Lined Pipe to 12½¢ and on Block Tin Pipe to 30¢ † lb. The discount remains unchanged namely, 20 ¢.

The lighting of churches, halls and large rooms has been made a specialty

by I. P. Frink of 551 Pearl street, New York. His Reflectors have been made to use either electricity or gas or both, and have been used, among other placea, in Moody's Auditorium, Northfield, Mass.; First Presbyterian Church, Pine Bluff, Ark.; Sanger Hall, Newark, N. J.; Catholic Church of St. John the Baptist, Brooklyn, N. Y.; Methodist Episcopal Church of Jacksonville, Ill.; Church of St. Francis Xavier, Little Falls, Mlnn.; Presbyterian Church of Vancouver, B. C., and Hasbrouck Institute, Jersey City, N. J.

THE ALBERENE STONE COMPANY, 219 Lake street, Chicago, are to furnish 16 laundry tubs for the new flat building at Groveland Terrace and Fourth avenue.

### Examination of Plumbers in England.

Recognizing the necessity for a higher technical training for the members of the plumbers' craft in these days of sanitary science, the City and Guilds of London Institute established a few years ago a system of plumbers' examinations in England, which has evidently been appreciated by the trade, judging by the recently published returns of the institute. shown therein the number of candidates for the certificate of the institute has increased remarkably in the past five years. The figures given are as follows: 1890, 569 candidates; 1891, 684; 1892, 825; 1893, 988, and this year the number has risen to 1253, showing an increase of 265, the largest yet reached. Of these 1253 candidates 652 have passed the required examination, 192 in the honors grade. At the practical examination, which is optional and sufficiently rigorous to demonstrate a high degree of skill in the candidate who passes, 450 candidates presented themselves this year, against 293 last year, and of these 202 satisfied the examiners. Of the 202, 168 also succeeded in the written examination and received the certificate of the Institute. Owing to the large increase in the number of candidates arrangements were made for the practical examination to be held in 44 centers outside of London as against 29 centers in the previous year; and to avoid any failure in the results of the examination, in consequence of a difference in the quality of the material provided for the candidates, all the material, consisting of sheet lead, pipes and solder, was forwarded from London to each center of examination. At each center a local examiner was appointed to superintend and report upon the work of the candidates and at the close of the examination all the work performed was returned to London to be passed upon by

the chief examiner. The amount of material used in this year's examination was 13 tons 12 hundredweight.

Steam Pipe Coverings.

some recent experiments have shown that under ordinary conditions with steam of 80 pounds pressure, 100 feet of naked 2-inch steam pipe will, in the course of a year of 300 days of ten hours each, condense water that has a coal equivalent of 7.7 tons. This, on the exceedingly conservative basis of \$2 per ton for coal, amounts to \$15.40 per year. Further experiments with various types of pipe covering showed that with the best of those tested there could be brought about a saving of no less than \$12.76 upon the length of pipe above specified. The conclusion is evident that good business policy warrants the covering of all exposed steam pipes.

### The Galvanized Iron Trade.

The cheapness of galvanized iron is wonderfully widening its consumption. As it can now be had at as low a price per pound as black sheets of the same thickness were sold only a year or two since, it is being used for almost everything exposed to the danger of rust. Several factors have contributed to the reduction in price, but the most prominent has been the increase in the capacity of the sheet mills of the country and in the number of galvanizing plants. Dnring the past two or three months the anomaly has been witnessed of these works being crowded to their utmost limit of production with only a slight hardening of prices, so slight as to be scarcely worth considering. In ordinary times such a condition of activity would have caused a very stiff advance, and the consumer who had not supplied all his wants for the time would have paid roundly for permitting himself to run short. Perhaps manufacturers were restrained from pushing up prices by restrained from pushing up prices by the fear that the heavy consumption was only short-lived and that there-fore an advance could not be sustained. But the fact that the demand continned for a considerable period, with general business dragging, is a warning to consumers to buy early another year and cover their requirements as far in advance as they can. If not, they will stand in danger of a considerable squeeze should they be forced to buy during the hight of the busy season.

United States Labor Commissioner Carroll D. Wright has lately presented some intereating figures showing the changes that have taken place in the wages of labor in the past half century, which exhibit a remarkable improvement in the condition of the wage earner during that period. He shows that wages were much higher and the cost of living materially lower in 1892 than they were 50 years before. Thus laborers in a New York brewery

received 62½ cents a day in 1840, 84 cents a day in 1860, \$1.30 a day in 1866, and from \$1.50 to \$2 a day in 1891. Carpenters earned from \$1.25 to \$1.62 per day of ten hours in 1840, about the same ln 1860, and from \$3 to \$3.25 per day of eight hours in 1891. Wheelwrights received \$1.25 per day in 1840, the same in 1860, \$2 in 1866, and \$2.50 in 1891. Cotton weavers were paid 62 cents per day in 1840, only 54½ cents in 1860, 85 cents to 90 cents in 1866, and \$1.05 in 1891. Wool spinners received something under \$1 per day in 1840, \$1.05 in 1891.

## The Moral Effect of a Technical Education.

The technical school, says The Iron Age, can scarcely be regarded as a teacher of morals pure and simple, but its influence for good is deep and lasting upon the integrity, sincerity and truthfulness of its students. It is not in human nature to pursue a course of three or four years in such studies as mathematics and the sciences without absorbing some of the spirit of exactness and completeness which governs in every deduction, every theory and every law. The pupil is taught that certain causes must produce certain effects, that in nature there is no actual loss, no return without the requisite expenditure of force or of matter. uisite expenditure of force or of matter. Nature is perfectly honest, there is no trickery, no uncertainty; physical and chemical action must be in accord with nature's laws. We may or may not know them as yet, but there is system, certainly everywhere.

The absolute truthfulness of mathematics, the transformation of work

The absolute truthfulness of mathematics, the transformation of work into heat, and even the mysteries of light and electricity continually lead the student into paths of exactness and train him in accuracy of statement and action. His after life, as engineer, as chemist, as electrician, must of necessity be governed and controlled by the habits thus formed. He feels that his reputation and character depend upon the accuracy of his statements regarding his work. He is chary about expressing opinions that have no substantial foundation. He becomes just in his judgment; it is second nature to him to look at both sides of a question, and he always desires to take an unprejudiced view of the case. In point of fact he frequently becomes so candid and so impartial as to assure his failure as a salesman, and to his credit be it said that he very seldom possesses the qualifications necessary to success where negotiations must be carried on with "boodle aldermen" and stubborn committeemen who yield only to the persuasiveness of the almighty dollar; upon them words of reason and logical argument are worse than wasted.

That the above is a faithful pen picture of all technical graduates can hardly be claimed, but that the influence of his studies may be seen in the later life of any man, and that, other things being equal, he is more sincere, more honest and more just than he would have been had he not pursued a technical course, cannot be questioned.

# THE LETTER BOX.

### Sheet Metal Launch.

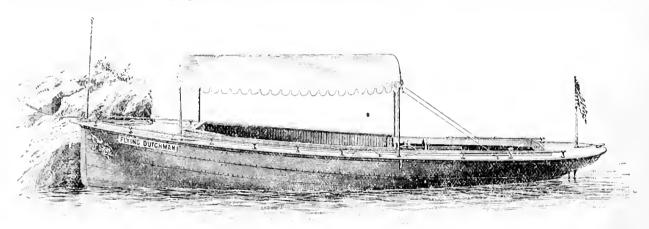

From Louis Giclas, Washington, D. C.—I like the Letter Box, but would rather read it than write for it. However, if every one followed this idea there would be nothing to priut, so I send you my contribution. I built a steel launch last winter in my spare

which is formed of angle steel. The sheathing is fastened to the ribs with cleata riveted on each side, as shown in Fig. 3. By referring to Fig. 2 the construction will be understood. There a section is shown through the keel with its covering and the additional strip on the bottom. Where the keel covering joins the sheathing it is nailed

ignite the charge. The boat will easily run 7 miles an hour. I worked 40 days in building the "Flying Dutchman," and I had about that amount of pleasure with it this season.

### Capacity of Flaring Vessels.

From C. A. M., Scranton, Pa.—Please publish in The Metal Worker a method

Sheet Metal Launch.-Fig. 1.-General View.

hours, and after running it all the season I am very well satisfied with it, so much so that I think many in the trade will be interested in it. I send you a photograph and a sketch which will give a good idea of it. In Fig. 1 a general view of the launch is shown, and ln Fig. 2 there is a sectional view showing the construction, Fig. 3 illustrating the method of fastening the sheathing to the ribs. The length of the launch is 21 feet by 4 feet 6 inchea beam and 2 feet 6 inches depth smidships. The draft is 10 inches at the bow and 19 inches aft. The ribs are \(\frac{6}{2}\)-inch T

and soldered. The clests are also indicated and likewise the method of fastening the ribs and angle steel gunwale. The ribs do not follow the side but cut across the oak timber. The cleats, which are  $\frac{\pi}{4}$  inch wide and  $2\frac{\pi}{2}$  inches long before being bent, are made of No. 20 galvanized steel and put astraddle of the ribs and riveted on each side, as in Fig. 3. The seams of the shesthing are riveted  $1\frac{\pi}{4}$  inches apart and soldered on the outside, making a perfectly tight shell of No. 20 galvanized steel. I have air compartments for buoyancy, and as the motor

of finding the number of gallons that a flaring vessel will hold; also knowing the circumference and the contents of the vessel, to find the hight? For instance, I want to make a 2-gallon measure, with top and bottom diameters of 6 and 8 inches, respectively. How will I find the hight?

Answer.—The rule for finding the contents of a flaring vessel is to add together the squares of the two diam-

Fig. 3.—Detail of Fastening.

eters and the product of the two dismeters and multiply the sum by one-third the perpendicular hight, and that in turn by 0.7854. The result will be the contents in cubic inches. To find the cspacity in gallons divide this by 231. This is in answer to our correspondent's first inquiry and from it we have deduced a second rule for finding the hight when the two diameters and the capacity are known. Multiply the capacity in gallons by 45,000 and divide it by 51 times the sum of the squares of the upper and lower diameters and of the product of the two diameters. To illustrate this by solving the problem that our correspondent has forwarded, we have to read as follows: Hight equals 45,000, multiplied by 2, which is the capacity in gallons, and divide this by 51 times 36, which is the square of 6,

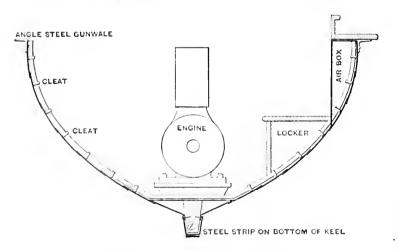

Fig. 2.—Cross Section through Boat.

steel set 12 inches apart. The atem and stern post are of white oak, as is also the keel. The sheathing is put on lap stresk in widths of 5, 6 and 7 inches, and is hammered to the proper curve. The ribs have no holes in them except at the keel and at the gunwale strip,

and all the machinery only weighs 375 pounds it is not a difficult task for it to float. The position of the air compartments is indicated in the sectional view, Fig. 2. The boat is run by a 2 horse power gasoline vapor engine, which employs an electric spark to

the smaller diameter, added to 64, which is the square of the larger diameter, added to 48, which is the product of the two diameters. The sum of these three is 148. Therefore we have, the hight equals 45,000 times 2, or 90,000, divided by 51 times 148, or 7548. Making the division, the answer will be found to be 11.92. Our correspondent will see, therefore, that 12 inches for the hight of his vessel is very little out of the way.

### An Unsatisfactory Furnace.

From "T. O. M.," Adams, N. Y.—
Noting the inquiry of "C. F." and the comment upon it in The Metal Worker of October 20, would say that having had an experience of 20 years in the furnace business, I think it is probable that the reason the furnace does not work is given in your last suggestion, that the air already in the room must be got out before the heated air can enter. It is very likely that some of the rooms are better heated than others because there is an escape of air from the room corresponding to the amount of hot air that enters through the register. Connection with the cold air box in the hall as suggested will help, provided the rooms all connect with the hall and the doors are kept open, otherwise only the hall will be benefited. Only by some sure way of ventilating can the furnace be made to give good results.

From E. F. J., Baldwin, Kan.—I took up my Metal Worker of October 20, and noticed in the Letter Box the trouble reported by "C. F.," and as I have been there I know how to feel for him. According to the plan, the dining room is No. 1, but in the state ment it is mentioned as No. 3. Which is right? "C. F." faile to state why he put a cold air duct away around to the west, when he could have taken it from the north. He says that the furnace is large enough and that the draft is good, which is half the way to success in any furnace job. In seeking for the trouble I looked first at the air supply and think there is some fault. The supply for ordinary short work is sufficient, but the turn, although not a direct angle, is sufficient to cause a considerable check to the force of the supply. Second, I think it should be supply. one-third larger at least. As the furnace is set now it would be some trouble to change everything, and un der the circumstances I would lower the furnace so as to give at least twothirds more pitch to the pipes. I would take a 12-inch cold air pipe from the hall, near the front door, and also from the dining room in some convenient place and return to the furnace, fixing a shield to prevent the cold air from coming up to the pipe from the main air supply. The job should then give fair results, but it would work better if he had used 12 inch pipes for Nos. 1, 2, 3 and 6, and a 10 inch pipe for the hall. It might seem queer to some to have a 10 inch pipe in the hall for hot air and a 12-inch pipe for cold air, but I am calculating that the parlor door will be open a good share of the time to the hall. On account of the length of pipe No. 4 I would make it 10 inches also. I think it is not good policy to use less than 12-inch pipes on the first floor living rooms. I trust that my suggestions may prove of some help.

Note.—An error occurred in statement of "C. F.," as printed, and instead of reading No. 3, it should read No. 1

### Strength of Pipes.

From D. F. J., Charlestown, Mass.—Will The Metal Worker please inform me how to ascertain the pressure that can be safely carried by lead, brass, iron and cast iron pipe? I would like to have some rule for making a calculation that I can use as a guide to the strength of pipes. What rule could I use for calculating the pressure at different points on a soil pipe, 100 feet in hight, that is filled with water, and would the same rule apply for all sizes of soil pipe? How many square linches of internal surface are there in a cylinder 24 inches in diameter and 42 inches long?

Answer.—It is strange that no tables exist in the handbooks giving the information sought by this correspondent. In The Metal Worker, February 28, 1891, this omission was commented upon in reference to copper pipes. The following table is issued by Tatham Brothers, New York, giving pressures under which their lead pipe may be used with safety, though a much higher pressure would be necessary to burst it:

Table Showing the Weight of Lead Pipe Which Should be Used for a Given Head of Water.

ımber all.	per ich.	Cali	Caliber and weight per foot in pounds.										
Head or number of feet fall.	Pressure square in	Letter.	3% inch.	½ inch.	% inch.	34 inch.	1 inch.	] 13,4 inch.					
30 50 75 100 150 200	15 25 38 50 75 100	D C B A AA AAA	10 oz 12 oz. 1 114 116 134	3/4 1 11/4 13/4 2 3	1 11/2 2 21/4 23/4 31/2	114 134 214 8 316 494	2 216 314 4 434 6	21/2 3 33/4 43/4 53/4					

We learn from one manufacturer of brass pipe that they have no table of the atrength of brass pipe and no knowledge of such a table being in existence, but pipe to stand a stated pressure is made when ordered. The American Tube Works, Boston, in their circulars guarantee brase pipe of iron pipe sizes to stand a hydraulic pressure of 1000 pounds to the square inch, and show a sample that is said to have been burst by a pressure of 3500 pounds. tables issued by the makers of iron pipe state that 1-inch pipe and smaller will carry a pressure of 300 and 11-inch pipe and larger will stand a pressure of 500 pounds to the square inch. For cast iron soil pipe no pressure is guaranteed unless "tested" pipe is specially ordered. This is due to the liability of a core to shift in the mold and make one part of the pipe thicker than another and to the probability of sand holes, though an opinion seems to prevail that extra heavy soil pipe will carry a presaure of 50 pounds readily. Extra heavy soil pipe has been sold by the Monitor Iron Works, New York, that has been

tested up to 100 pounds pressure and in some cases as high as 200 pounds. An advanced price is charged to cover the loss from bursting and the labor of making the test. A pressure of 500 pounds has been withstood for experiment by selected extra heavy soil pipe. The following rule for calculating the bursting pressure of pipes of different metals is based on their tensile strength: It is well never to earry a pressure over onehalf and it is better not to exceed onequarter of the bursting pressure for regular use. Multiply the tensile strenth of the metal per square inch by the thickness of the wall of the pipe in inches and divide the result by the diameter in inches, and the result will be the bursting pressure. Then divide the bursting pressure by four, and the result will be the pressure that may be safely carried. A safe estimate of the tensile strength of lead as used in pipes is 2000 pounds; of brass, 23,500 pounds; of wrought iron, or more correctly speaking, steel, 50,-000 pounds, and of east iron, 18,000 pounds. The strength of 4 inch cast iron soil pipe would be calculated thus, assuming the walls to be 1 inch thick:  $18,000 \times \frac{1}{4} = 1125$ , which divided by

4, the factor of safety, gives 2811 pounds. Stacks of soil pipe 210 feet high have stood the water test without leaks, and in a stack 256 feet high only a few pieces had to be removed owing to sand holes. The condition of the iron when poured and the position of the core in the mold play a very important part in the atrength of soil pipe; consequently, unless the pipe has been tested, it will be unsafe to rely on any calculation. The pressure in square inches exerted by water on a pipe of any size at any point is found by multiplying the number of feet between the given point and the top of the water column by 0.434, or a thumb rule le that a column of water increases in pressure per square inch 1 pound for each additional foot in hight, and to divide the hight of the column by 2 gives the pressure in pounds. By the thumb rule the pressure on the soil pipe mentioned, 100 feet, would be 50 pounds and the exact pressure would be 43.4 pounds.

The surface of the cylinder is calculated by multiplying its length by its circumference. The circumference is found by multiplying the diameter by 3.1416. To answer our correspondent's last question, therefore: 24 × 3.1416 = 75.3984 × 42 = 3166.7328 square inches of internal surface in the cylinder.

Water Front Hinders Baking.

From S. & S., Massachusetts—We have lately placed a water front in a No. 8 range and connected it with a 40 gallon boller in a room just over the kitchen. Our customer now complains that the range will not bake nor can they get up fire enough to do any work

with. Will some reader kindly advise us what is the best remedy to apply to this case. Would a coil do the work better and allow the oven to be properly heated? The fire box is as large as found in any ordinary range having a water front connected with a boller of the size mentioned and the range has always worked satisfactorily heretofore.

Note.—We trust our readers will respond to this appeal which is made to them. A diagram accompanied this letter, but as the piping was in no way responsible for the trouble it has not been reproduced.

## Circumference of a Stove Coilar.

From C. A. M., Scranton, Pa.—Please tell me through The Metal Worker how to find the circumference of an oval such as a stove collar, 6 inches long and 3½ inches wide; also publish pattern for flaring furnace pipe elbow.

Answer .- The oval of a stove collar is not an exactly definite shape, but for the purpose it may be considered as two semicircles at the end, connected by atraight lines. To find, therefore, the length of the stove collar, we must add together twice the semicircle at the end, which is equivalent to the circumference of a 31 inch circle, and add to this twice the horizontal distance. This horizontal distance will be equal to the difference between 6 inches and the two radii at the ends of the oval, which together will be 31 inches, so the flat part is 21 inches. Double that is 5 inches, and added to the circumference of a 31inch circle, which is obtained by multiplying  $3\frac{1}{3}$  by 3.1416, or 11 inches, the result will be 16 inches.

In answer to our correspondent's inquiry about the pattern of a flaring furnace pipe elbow, we would say that this is a problem that has been treated in "The Metal Worker Pattern Book," in one way or another, and as that may meet his requirements, we would refer him to Section 516, page 137, and Section 117, page 129, of that work. If these cases do not meet our correspondent's wishes, we would be glad to have him communicate with us again.

### Some Kitchen Boiler Questions.

Hrom E. R. B., Lexington, Ky.—We have an argument in our shop regarding the heating of an ordinary 52-gallon range boiler with a pipe coil, and would like the opinion of The Metel Worker and its readers. The questions are: 1. The surface exposed to the fire being the same in square feet, which will heat the water the quicker, 1-inch or 1½-inch pipe, the 1-inch pipe not taking up so much space and leaving more fire room? 2. What difficulty, if any, would be found in a range boiler connected directly with city pressure as regards rapidity of heating? Last, in piping a boiler one of our men ran the pipe that returns from the water back so that it was connected both at the side of the boiler and at the hot water service pipe at the top of the boiler, claiming that it would heat the water quicker and that hotter water could be drawn from the

boiler than in the usual way before the entire quantity was heated.

Answer. - In answer to the first question would say, that all conditions being equal it is probable that the 1-inch pipe would heat the boiler quicker than the larger pipe, as there would be a smaller quantity of water brought in contact with the heating surface in the same length of time than would be the case with the larger pipe, consequently it could not pass through the pipe without being thoroughly heated. answer to the second question, pressure adds no difficulty to the heating of water, although it is a well-known fact that under a low pressure, or atmospheric pressure, water boils at a temperature of 212° at the sea level, but on a higher level, where the atmospherie pressure is reduced, water will boil at a lower temperature, and water under pressure requires a higher temperature to be brought to a boiling point. The boiling point in these different cases varies and may have led to the conclusion that the pressure interferes with the heating of the water. In reference to the third question, this method of piping the boiler was discussed in The Metal Worker in the apring of 1893, and the correspondence will be found in our book called "Kitchen Boiler Connections," With this method of piping and a boiler full of cold water, the water that is heated by the water back is discharged directly into the hot water service pipe at a higher temperature than if it entered the boiler at the side and passed through the body of cold water before reaching the service pipe. Some plumbers use a stop cock on the pipe leading to the side connection to the boiler between the branch that leads to the pipe of the boiler and the boiler.

### A Cracked Bell.

From C. E. M., West Branch, Iowa.—
I would like to hear from the readers of The Letter Box of The Metal Worker if they have had any experience in mending cracked bells. We have a 34-inch bell that is cracked up about 8 inches, and when hit with a hammer it seems to ring clear enough, but when struck with the clapper it sounds cracked. It is a stationary bell, bolted to a frame, with an iron plate between the bell and wood. Would any benefit arise from sawing up the crack with a hack saw?

### An Improperly Shaped Flue.

From C. H., Ohio.—I should like to learn through the columns of The Metal Worker of a remedy for the following trouble: I have a steam boiler connected by means of a 12-inch smoke pipe with a chimney which is triangular in shape, the triangle being about 2 feet on each side, which forms very sharp corners. The chimney is about 75 feet high and it does not seem to draw very well. When the feed door is opened the smoke puffs out even when the direct draft of the boiler is open. I would like to know if a satisfactory draft would be established by using a 12 inch pipe made of No. 20 gaivanized iron to run up the chimney to a point about 1

foot above the top. Would such an arrangement give the desired draft? I would like to hear from my fellow tinners and plumbers on this question.

### Norton Brothers' New Factory.

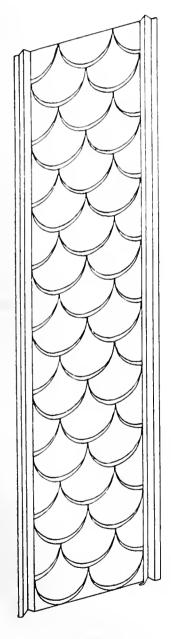

Norton Bros. of Maywood, Ill., dedicated their new tin can factory on the evening of the 1st inst. This factory has been built to take the place of the one on River street, Chicago, which was burned on February 19. It will be used for the manufacture of all kinds of tin packages, plain and decorated, and of any size or shape. The building is a brick structure, two stories high and 250 feet square, erected almost without regard to expense so as to embody the most perfect labor saving devices and at the same time provide the workmen with the highest comforts and conveniences. It is pronounced one of the finest factories now in existence by those competent to express an expert opinion. The dedication of the building was made a gala occasion for the employees and residents of the vicinity. A short programme of exercises was prepared, as follows: Tender of the building by the architect, F. R. Schock; building by the architect, F. R. Schock; acceptance by the president, O. W. Norton; "Maywood of the Past," Harrison P. Nichols; "Maywood of the Present," Gen. Wm. Sooy-Smith; "Maywood of the Future," H. F. Frink; "Retrospective and Prospective," Edwin Norton; "Our Health, Our Wealth and Our Happiness," Samuel Fox an employee. In his ad-Samuel Fox, an employee. In his address Edwin Norton referred to the fact that in the quarter of a century of the firm's existence as manufacturers they had never had a strike. He also stated that in the months of July, August and September the tin plate factory connected with this plant had turned out over 9,000,000 pounds of the finest quality of tin plate. As an evidence of the kindly feelings of the employees toward their employers, Mr. Fox at the conclusion of his remarks presented a testimonial of esteem signed by the employees and engrossed on parchment in the works. Dancing followed, after which a generous collation was served. The chronology of this company is as follows: 1868, business established in Toledo, Ohlo, as and engrossed E. Norton; 1870, firm changed to Norton & Fancher; 1871, removed to Chicago, office and factory at 63 and 65 South Canal street; 1873, opened office at 10 State street, firm changed to Norton Brothers; 1874, removed office and factory to 44 and 46 River street; 1885, opened factory at Maywood; 1890, in-corporated under style of Norton Brothers, commenced manufacture of tin plate; 1892, built present tin house and each weight foundry; 1894, River street factory destroyed by fire February 19, opened offices in Masonic Temple, February 20; opened warehouse, corner Sixteenth and Johnson atreets, April 1; opened new factory at Maywood, November 1. The directors of the company are Oliver W. Norton, Edwin Norton, Henry M. Norton, Horatio N. Norton, Lawrence A. Norton, Henry F. Akin and W. L. Gifford. The officers are as follows: Oliver W. Norton, president; Edwin Norton, vice-president; W. L. Gifford, secretary, and O. P. Swift, treasurer.

Improvements to the water works aystem of Minneapolis, estimated to cost over \$1,000,000, are recommended by the City Engineer, and will probably be undertaken.

## ROOFING AND CORNICE.

### Bischoff's New Roofing.

The illustration herewith given shows a new style of roofing which has been placed on the market by Fred. F. Bischoff of Libertyville, Ill. This roofing is pressed in sheets 1 foot 9 inches wide by 8 feet long, with a lock joint on each side which will do away with

Bischoff's New Roofing.

the standing seam and hammering. With the new machinery which Mr. Bischoff has recently placed he is able to sell this ornamental style of roofing as cheap, if not cheaper, than plain roofing. A new departure in the sheet metal line, also just brought out, is a metallic coffin. He has also just issued a new ceiling catalogue containing 118 designs.

### FLASHINGS.

J. K. Smith, Waterbury, Conn., has the contract for putting a slate roof on the new German Lutheran Curch at Torrington.

A CERTIFICATE of increase of their capital stock from \$200,000 to \$450,000 has been filed with the Sceretary of State of New York by the T. New Roofing & Mfg. Company of New York City.

THE CAPITOL CITY ROOFING COMPANY of Hartford, Conn. have just completed the roofing of the bulldings of the Sterling Silver Works, at Glastonbury, and have been awarded the contract for recovering the buildings of the Hartford Electric Light Company. One of their biggest contracts this season was for the roofing of the grand stard and two barns at the Charter Oak Driving Park.

Among the contracts recently taken by J. C. McFarland, 2511-2519 State street, Chicago, can be mentloned the following: Akron red Spanlsh tile roofing and trimmings for the residence of Robert D. Sheppard, Evanston, Ill.; copper work and slate roofing for C. & N. W. railroad depot, Marsha'town, Iowa; copper, zinc and galvanized iron work with Ohlo red Spanish tile roofing for residence of F. R. Chandler, Lake Geneva, Wis.; Akron red Spanlsh shingle tile roofing, with tile trimmings and copper work, for residence of E. M. Higgins, Edgewater, Ill.; interior copper work for Post Office at Charleston, S. C.; galvanized iron work and slate roofing for new depot of C. & N. W. Railroad at Belleplaine, Iowa; copper and slate work for the new Post Office at Burlington, Iowa.

C. B. RICKERT, 194 Clark street, Chicago, has the contract for the copper work, skylights and elste roofing for the City Hall, Milwaukee, Wis.

At Amsterdam, Holland, will be held next year an international exhibition of hotel arrangements and accommodations for travelers. Among the features of the exhibition will be an "electric restaurant," without attendants, where visitors will be served automatically with a complete dinner on pressing an electric button.

The Census Bureau has lately promulgated a bulletin on the manufactures of the United States, which contains some very interesting information as to their condition at the late census. The document gives statistics of 67 industries, each turning out a yearly product of \$30,000,000 or over, included in which are the iron and steel, cotton, wool, lumber, oll, leather, flour and grain, and other leading industries. Of these 67 industries 287,501 establishments reported, or 80.89 per cent. of the total number in the United States. These establishments represent an agregate invested capital of \$5,249,139,842, or 45 per cent. of the total capital for all kinds of industries. In them are employed 3,730,557 persons, receiving

\$1,811,186,882 in wages, or 79.17 per cent. of the employees and 79.34 per cent. of the wages of all industries. The cost of materials used was \$4,273,402,066, or 82.84 per cent. of the total cost of materials for all industries. The value of product is shown as \$7,618,836,200, or 81.31 per cent. of the total of all manufactured products in the United States in 1890.

A dispatch from Panama to the New York Herald says that President Bonnardel has ordered an active resumption of work on the canal in behalf of the new Panama Canal Company.

General Flagler, Chief of the Bureau of Ordnance, in his annual report states that carriages for modern guns have been already constructed at the Watertown arsenal. These include 42 inch gun lift and non-disappearing carriages, and 8-inch non-disappearing carriages, while there are at present being built barbette carriages for 10-inch guns and estimates have been made for disappearing carriages for 10-inch guns. The arsenal is now equipped for producing large castings, such as the platform plates used for mounting guns at the proving ground at Sandy Hook and other special massive castings requiring high tensile strength. The output from the arsenal of sea coast guns of regulation pattern during the year was 11 8-inch, 11 10-inch and six 12-inch. In addition, one 10-inch wire wound Crozier gun has been completed and work is in progress on seven 12-inch mortars. With the additional machinery already installed the output per annum will be, as anticipated, 12 8-inch, 15 10-inch and 15 12-inch guns.

October's fire lesses in the United States and Canada, as compiled by the Journal of Commerce, amounted to \$8, 186,700—an unusually low figure, and the smallest of any one month in the past three years, excepting that of September, 1892, which was just under \$8,000,000. The loss in October, 1893, was \$11,014,700, and that in October, 1892, \$13,350,000. The losses for the first ten months of 1894 are \$25,000,000 lighter than those for the first ten months of 1893. This marked dimunition is hailed with satisfaction by the fire underwriters, as promising to aid in repairing the depleted surpluses of the insurance companies, after their disastrous experiences of last year.

A press dispatch from New Lisbon, Ohlo, reports that while Newton, Johnson & Co. were slaking an oil well in Union Township, Carroll County, that State, the drill passed through a vein of lead several feet in thickness 45 feet below the surface. Directly beneath the lead was found a vein of zinc 14 feet thick. It is said the lead assays 65 per cent. and the zinc 70 per cent. There is said to be great excitement in the locality where the find was made, and preparations are being made to mine the minerals.

## STEAM AND HOT WATER.

## Crude Gas For Steam Generating Purposes.

A correspondent of an English journal says: Gas can be used with any chimney, and by the use of gas it is impossible to make smoke. I have lately seen some boilers in London which have been worked with gas the last seven years and have paid 78 per cent. per annum on the outlay; and I hear gas is used at some paper mills in Kent with equally good results. Yet

steam for the heating of public buildings, and to supply private consumers in stores, residences, &c.

## A Novel Hot Blast Heating Plant.

The machine shop of the Fuel Gas & Mfg. Company of Brinton, Pa., has been provided with a hot blast heating system embodying several novel and interesting features, particularly in the

engine. The wheel inside the fan casing is 71 inches in diameter by 33\frac{1}{2} inches wide. At 340 revolutions per minute the fan will displace 48,360 cubic feet of air.

The entire hot air piping is carried clear up to the roof trusses and thence is brought down, with outlets on accord story, into the first story. This is an unusual application, and the piping would have been distributed equally on each floor but for the presence of so much machinery and shafting. As in-

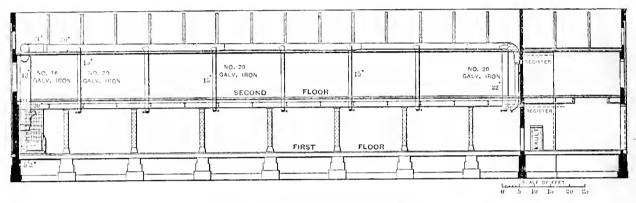

Fig. 1.-Longitudinal Sectional Elevation.

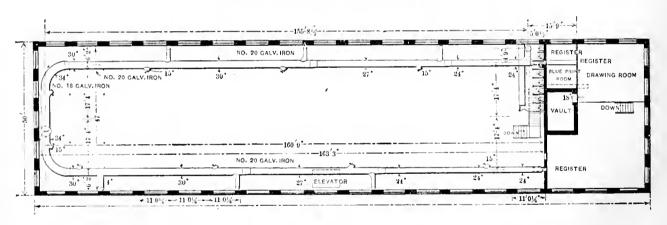

Fig. 2,-Plan.

A NOVEL HOT BLAST HEATING PLANT.

in both these cases the plant is out of date and does not give anything like the good results that may be obtained from a more modern installation with proper combustion chambers and arrangements for glving the gas a sufficient quantity of hot air. The novel plant is also less costly than the old, and would doubtless be used at any new place. The present plant cost £350 per pair of boilers and evaporates 9.11 pounds of water with the gas from 1 pound of fine slack. The modern plant would cost only £300 and evaporate 12 pounds of water with gas from 1 pound of the same slack.

A MOVEMENT is on foot in Circleville, Ohio, looking to the construction by a private company of a steam heating plant for the purpose of supplying

arrangement of the hot air piping. The designs for this system were made by Julian Kennedy of Pittsburgh and the Buffalo Forge Company of Buffalo, N. Y., built and guaranteed the plant. Fig. 1 is a longitudinal sectional elevavation of the building, Fig. 2 a plan view and Fig. 3 a transverse section. The hot blast apparatus is shown at the extreme left in Fig. 1. The building is 50 feet wide by 200 feet  $2\frac{1}{2}$  inches long, the machine shop proper being 155 feet  $8\frac{1}{2}$  inches long, the offices occupying the remaining portlon. The drawings show the arrangement of the plping and also give the thickness and diameter of the several sections.

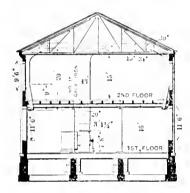

The heating apparatus consists of a 100-inch Buffalo fan and a 4000 feet capacity heater, the fan being driven by a 6½ x 8 inch direct attached upright

dicated in Figs. 1 and 3, the uptake from the heater is 43 inches in diameter. At the top this branches to each side, along which extends, on the roof truesee, a galvanized iron pipe, which is 30 inches in diameter where it joins the branch, and 24 inches in diameter at the other end. In these two lines of pipe are openings for heating the second story, and from them descend pipes for heating the first story, as shown in Figs. 2 and 3.

The temperature guaranteed on this plant was 65°, from zero outside, the calculation being to use exhaust steam from the main engine in the day time and the exhaust steam from the fan engine at night, together with live steam when necessary. Except during the coldest weather the exhaust steam from the fan engine is sufficient to heat

the building above the freezing point at night. Outside of the repairs, there is practically no cost, with the exception of the live steam used for running the fan engine, which is a very small matter. Part of the air is taken from the factory and part from outside, most of the air being used over and over again as a matter of economy. There being comparatively few people in the building, per cubic foot of space, the air is not vitiated to a great extent by respiration. In a factory using more power it would be possible to do the heating in the severest weather with exhaust ateam alone and taking all the sir from outside the building.

The condensation in one of these heaters is from three to five times as great as in the same amount of direct heating, either running around the building in the form of 1-inch pipe, or per square foot of direct radiation. Of course, by drawing the air by the action of the fan direct from the outside and

A Novel Hot Blast Heating Plant.—Fig. 3.—Transverse Section.

passing nothing but cold air over the coils a greater amount of steam is con densed than when taking the air from the inside. If there is no other use for the exhaust steam, however, then the amount condensed does not enter for consideration to any great extent.

We may add that under favorable conditions the larger part of the piping employed in the building just described could have been dispensed with. In many plants of this character, the apparatus would be placed near the offices, and a stand pipe would be run through the center of the building to the different floors, and this, with the office connections, would complete the layout. The cost of installing a plant of this character, exclusive of the galvanized iron work, is in the neighborhood of \$1250.

### An Old Steam Fitter.

The following is an extract from a Boston paper in reference to an old steam fitter, John L. Drew, 55 Blossom street, Chelses, Mass. Mr. Drew is 66 years old, and was born in Tuftonboro, N. H., June 12, 1828. On being asked about house heating, Mr. Drew said:

"Oh, we didn't have any house heating until about war times. It was a very expensive undertaking for a man to heat his house by steam then, and precious few had steam in their houses, I can tell you. A job of heating a nice house then cost about \$800 or \$900, and the same work or better can be done today for \$350, and there will not be the waste of steam, either. We merely put in an ordinary upright boiler, and let her

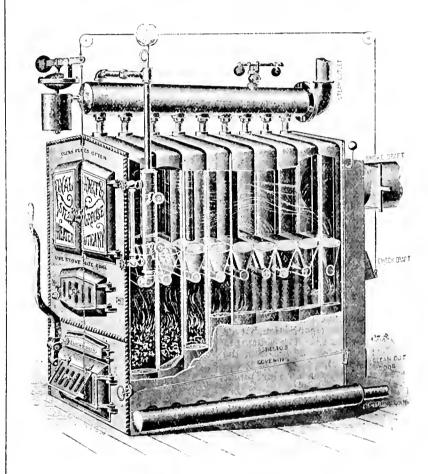

go for all the steam she was worth sometimes. I heat my house here by steam. I have in the boiler only about 1 pound of steam ordinarily. You see, it did not require nearly the amount of steam to heat buildings that was used for the purpose. Reducing valves have regulated that completely. There were no radiators then, and as a substitute in the way of something to prevent the pipes from marring the effect of the whole room a cast iron screen was placed around the coils of pipe and the coils gilded. If we wanted, too, a marble top could be placed on the screen."

When Mr. Drew first went to work at steam fitting there were no solid die plates for cutting threads in the pipe. Inch pipe and above had to be cut with a diamond point chisel. One who knows anything about the work can easily in-

a day, and a helper then got \$1 a day. The pay for a journeyman now is about \$3.50 a day and his helper gets \$1.75.

### The New Large Royal Heater.

We illustrate herewith a new steam and hot water heater recently invented and patented by W. M. Mackay, manager of the steam and hot water department of Hart & Crouse of New York, Utica and Chiesgo, and which is soon to be placed upon the market by the above firm under the name of the Royal heater. It is intended to be made in larger sizes than the present Royal heaters. In external appearance it is similar in construction, but the greater width and larger grate area enables the placing of the internal flues through which the heated gases travel different

The New Large Royal Heater.

agine the smount of work and time that meant.

"And then," said Mr. Drew, "i inch to inch i's and I's were of composition metal. Above that measure pipe was cast iron. But all their threads were cut with lathes, and it took about as long to cut one thread then as it does to cut six now."

Mr. Drew went into business for himself in 1867. The firm was Perham & Drew, and they had a shop at 62 Sudburv street. They were partners until 1870. Then he went into partnership with Isasc Coffin until 1890, when Mr. Drew sold out his interest and since then has been taking jobs for himself or working for other firms.

"I don't like to give up the work," he says. "There is a fascination about it for me, and I am active and love to work. Why should I stop?"

When he began at steam fitting a

When he began at steam fitting a journeyman fitter thought he was getting good wages when he was paid \$2

from their present constructions, as will be seen by referring to the cut. It is sectional in form, with screwed joints. The water legs of each section form their own portion of the base. The grate is an improved form of rocking grate. There is a slicing door immediately above the ash pit door which enables the slicing of all points of the grates. It has a large feed door which enables the birning of all kinds and sizes of fuel and a large clean out door which permits of cleaning all the flue surfaces quickly while the heater is in use heating the building. The heater contains a large amount of fire surface, so arranged, it is claimed, as to be perfectly self cleaning. The heated gases in combustion leave the fire box at the rest, traveling forward in a flue formed through the center of the sections against the vertical tubes to within a short distance of the front, when they are diverted into two flues, one on each side of the center flue. The gases

traveling back through these flues to the smoke connection at the back of the heater, which is fitted with movable diaphragms, compels the gases to travel to the bottom of the smoke chamber before passing upward to the smoke flue. These diaphragms being movable can be folded back, shortening the fire travel, and, it is pointed out, admit of the operating of the heater admit of the operating of the heater successfully with a poor draft or with soft coal as fuel. There is a clean cut door and bevel check draft fitted on this rear smoke box. The sections of the heater are connected together by means of screwed joints connected with manifolds on the outside of the heater, and the outside surface of the heater is covered with asbestos cement, preventing the radiation of heat into the basement. The heater is provided with a direct draft, which, when operated, allows the gases to pass directly from the fire box to the smoke outlet without having passed over the flue surfaces of the heater. It is also provided with a dust flue worked by a damper rod running to the front of the heater, which can be operated when shaking the grate, preventing the ashes eacaping in the boiler room. The size shown has a 32-inch width of grate and varies in length from 30 to 66 inches and is rated to carry 1100 to 3000 square feet of net steam radiation and from 2000 to 5000 square feet of net hot water radiation, exclusive of mains. The apparatus, as shown, is arranged as a steam heater, but it is also being constructed as a hot water heater. The aize, as shown, is completed and has been thoroughly tested; the results obtained, we are informed, far exceeding the manufacturers' expectations.

### HEATING NOTES.

The reception office and sample rooms of the Liebrandt & McDowell Stove Company, 123 North Second atreet, Philadelphia, Pa., are heated by one of their Home combination hot air and hot water heaters. The radlator in the effice is 80 feet distant from the heater, and the pipe leading to it can only be run with the minimum pitch, yet it is thoroughly heated.

THE UNITED STATES HEATER COMPANY were obliged to refuse orders for Mascot heaters a few weeks ago on account of the unexpectedly large sale of these bollers and the excessive demand upon their factory. We are advised that they have now made arrangements for outside foundry accommodations which enable them to fill Mascot orders again without interfering with prompt delivery of Capitol and Hecla heaters.

WE ARE INDEBTED to M. Mahony, Troy, N. Y., for one of his convenient monthly calendars for November. It is a card of proper size for desk use, and bears a modest reference to the Mahony boiler for steam and hot water heating.

GEO. A. JENCKS of the Union Steam & Gas Pipe Company, Pawtucket, R. I., called at *The Metal Worker* office during his visit to New York. The company are busy with a number of heating contracts.

James A. Hardino, 210 Water street, and Fred. P. Smith, 160 Flith avenue, New York, have been appointed as the Press Committee of the American Society of Heating and Ventilating Engineers.

THE USE of a ham boiler as an expansion tank on a hot water heating

system inspires confidence in the steam fitter's ability to overcome emergencies.

Fox & May, 521 Grand avenue, Milwaukee, Wia., have added to their plumbing business a department for steam and hot water heating and ventilating. They have accured the aervices of J. T. Ryan, who is well known in Milwaukee as an expert heating engineer, and have also secured the Morgan boiler for Wisconsin. They report the following contracts in progress of construction: Five atores and office buildings in Waukesha, Wis., together with the Hadfield House at the same place; in Milwaukee, the Honsrigheisen Flats. They are also fitting up James Sawyer's residence with two Morgan hot water boilers.

James A. Hardino of the Boynton Furnace Company, 209 Water afreet, New York, has returned from a business and pleasure trip to New England.

W. H. HILL of the American Radiator Company, 92 Centre atreet, New York, was one of the guesta at *The Metal Worker* office this week.

THE CITY HALL AND COURT HOUSE COMMISSION of St. Louis have decided to close the building up tight and by means of a small boiler and a coil of pipes force hot air into the portions of the building where plastering is being done or remains undried. There is plastering enough on the walls to entail a loss of \$5000 if not kept from the frost. A small engine and an air fan will be used, together with a system of pipes, which will carry the hot air to any part of the building, but not necessarily heat the whole. This system will keep the temperature at about 50° and enable work to be carried on all winter. The cost of this temporary heating is only \$700.

THE VALVES of the Mackay Mfg. Company, 66 James atreet, Newark, N. J., will be used on the heating plant in the St. George Episcopal Church, at Flushing, N. Y.

One of the applications of electricity, as described in the St. Louis Globe-Democrat, is to the sealing of cans of fruit and preserved meats. A conductive layer is formed on the lid of the can, and a metal coating is deposited by the ordinary methods of electroplating. The process is being applied to the sealing of bottles of wine, beer and chemicals with a metallic coating or capsule.

A number of second hand stove and iron dealers of Hamilton, Ont., lately petitioned the City Council, asking that a license fee of \$100 be imposed on peddlers who go from door to door peddling and purchasing stoves and iron. The petition was laid on the table indefinitely, the chairman remarking that if the second hand men considered that their business was suffering there was nothing to prevent them from going from door to door with horses and wagons, too.

At the recent labor convention in Indianapolis it was proposed by the delegates representing the iron and brass workers of the United States to establish for their trades, in all the large cities, a central union of which all the various metal trade unions will be members. The idea is to make a sort of clearing house for the various iron and metal industries, where they may be brought into contact and through which they may take joint action on any question.

### Canadian Mica Mines.

The Empire of Toronto, Canada, says that the Baumgartens of London and Washington, who are the largest opcrators in mica in the world, have just succeeded, between purchasing and bonding, in obtaining control of all the best known mica properties in Canada at a high price. The speculators declare that Canada has the finest white mica to be found anywhere. The Canadian Mica Company of London, England, of whom II. Baumgarten is president, already owned two mines of amber mica up the Gatineau, two in Frontenac, one near Murray Bay, one at Tadousac 200 miles below Quebec, and an asbestos mine at East Broughton, near Quebec. In addition to these the syndicate have acquired a series of mines situate near Murray Bay, 15 miles inland from the St. Lawrence, and others at Beaver Lake, near the mouth of the Saguenay. Some 200 men are employed at the mines, and this number will be largely increased next year when electric plants have been introduced. The company propose to double the output of the mines and profess to have a market for all the mica they can produce, provided it is of good quality and size. The mineral is to be drawn on sleighs to Quebec, 100 or more miles, during the winter season when the St. Law-rence River is frozen over. The Mining Review, it should, however, be mentioned, cautions in vestors about trusting the reports as to the great profits from mica mining.

### New Publications.

THE SANITARY ARRANGEMENT OF DWELL-ING HOUSES. By A. J. Wallis-Tayler, C. E. Size, 7½ x 5 inches; 196 pages. Published by Crosby, Lockwood & Co., London,

The book begins with some hints on the selection of a site for a residence, and then briefly outlines the plumbing system required for a sanitary system. The explanation of different manufactured articles used in house plumbing then takes up the remaining pages, giving illustrations of intercepting traps, fresh air inlets, various soil pipe joints, methods of testing different atyles of water closets, latrines and earth closets, gully traps, grease traps, flush tanks and ventilators. An appendix contains the Public Health act of London of 1875 and of 1891, the Model By-Laws and the Metropolis Water act of 1871. The book also contains a well arranged index.

A patent has been granted to August Shwaag, Berlin, Germany, for an improved method of tinning iron castings. The process consists essentially in coating the iron castings electrolytically with an alloy of iron and nickel or an alloy of iron and cobalt, and then covering the surface with tin. It is claimed that by this preliminary treatment the coating adheres exceedingly well.

Thomas A. Edison has sent to a New Jersey traction company a box of what he calls Ogden magnetic sand, which he believes will prove highly useful for trolley cars by rendering perfect electrical connection through snow and ice and preventing all alipping of the wheels in snowy weather. The sand is from Edison's mine at Ogden, N. J., where he is teeting his magnetic ore separator.

# PLUMBING and GAS FITTING.

## Philadelphia Master Plumbers' Association.

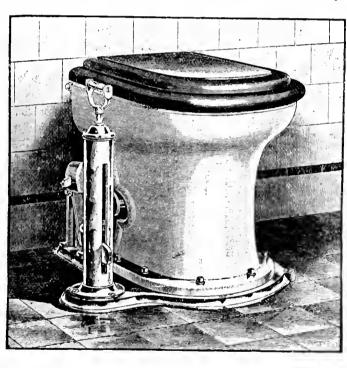

The members of this association are already making preparations for entertaining the delegates to the convention of the National Association of Master Plumbers to be held in the Quaker City next June. As a basis for operations. a Finance Committee was appointed at the October meeting composed of George F. Uber, chairman; Wm. S. Clark, Wm. Harkness, John E Eyanson, John Gormley, Saml. W. Barnes, Wm. McCoach, Wm. 11 Doyle, Wm. L. Owens, A. M. Hicks, Wm Calhoun, G. Wallace Smith, and F. P. Brown. These gentlemen are well fitted to take charge of the business end of the proceedings, and their appointment augurs well for the success of the meeting.

that the thirteenth convention shall, if possible, outshine previous conventions, or at any rate equal the best of them.

The ill luck attaching to the number 13 will be dispensed with for this occasion, and, like the 13 original States, the thirteenth convention of the National Association will not be lacking in solidity. From this time forward the association will be actively engaged in formulating and carrying out plans for the entertainment of the delegates and their lady friends on such a scale as to make their visit to the City of Brotherly Love one long to be remembered.

### Columbia Ship Closet.

The subject of our illustration is the Columbia ship closet made by McCam-

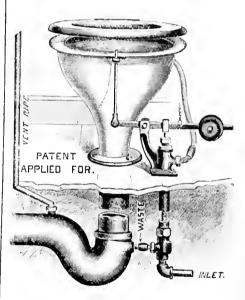

The Columbia Ship Closet.

At a meeting of the association held on Thursday evening last it was arranged that a souvenir book containing a complete history and description of the city of Philadelphia should be published by the association, and a committee composed of John Gormley, chairman; Samuel Barnes, Wm. Harkness, Chas. L. Parmalec and Wm. L. Owens was appointed to carry out the arrangement. The members of the association have shown by their early action that the proverbial "sleepinesa" of Philadelphia is a myth as far as her plumbers are concerned, and the future will prove that they are very much wide awake. It has been determined

bridge Company, Limited, 523-527 Cherry atreet, Philadelphia, Pa. This closet is in operation on the United States cruisers "Columbia" and "Minneapolis," and has been selected for the International Navigation Company's steamers "St. Louis" and "St. Paul," now being completed by W. Cramp & Son Steamship and Engine Building Company of Philadelphia. The closet is constructed with a view to securing for ships what is so highly appreciated in modern house plumbing—a water closet without wood inclosure. The supply and outlet fittings are located at the back and while perfectly accessible are concealed from view by a pedestal flushing rim bowl to which is securely hinged a hardwood seat and cover, the whole being mounted on a cast iron

base, which admits of the closet being firmly fastened to the floor. Water is supplied to the bowl and refilling chamber in the back of the bowl through a 1½-inch valve, Insuring not only a thorough flushing of the closet, but an abundant refill to the bowl after each operation. The bowl is conveniently located and is held in position by a brasa cylinder, which also guides the valve lever and weights. One of the features of the Columbia closet is that

A Frost Proof Valve.

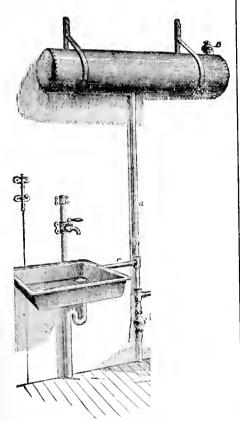

It is made of vitreous earthen ware, which is said to be not only proof against crazing, but to be perfectly non-absorbent and of the same material all the way through.

### A Frost Proof Valve.

A feature of the illustration presented herewith is the frost proof valve made by Casler & Hastings, 360 Seneca street, Buffalo, N. Y. The valve is designed for use in connection with water closets, urinals or any water fixture that is exposed and liable to be frozen. As will be seen in the Illustration, valve is connected with the water closet and by means of a lever which may be operated with a chain or red flushes the water closet when epened. The valve proper is located below the fixtures with which it is connected and as low as possible, in order to avoid exposure to freezing temperature. In operation, on opening the lever, a anpply of water finds its way to the closet or fixture, and when the weight of the ball on the lever closes the valve the water in the pipe above the valve wastes into the drain pipe that is used in connection with the fixture. All of the werking parts are said to be well constructed and of durable material, so that there is nothing to get out of order. Circulars giving an enlarged sectional view of the working parts of the valve, with a full description and prices, can be supplied by the manufacturers.

### Water Without Pumping.

With a city water supply it often happens that the pressure is not great chough at all times to force the water To do away with to the upper floors. the labor and expense of pumping, a device, illustrated in the accompanying engraving, is employed. It will be seen that it consists of an ordinary kitchen boiler of a size adapted to the require. ments of the house, and may be suspended from the ceiling or can be placed in the attic where it is concealed from view. In such cases it may rest on the ceiling joists. The check valve shown by A is placed below all the fixtures or The check valve shown branches from the main upright pipe.
The highest point of the boiler is tapped for a a inch pipe and the Kelly water vent B is screwed in. A safety pipe, furthermore, is carried to a point over the sink to guard against the possible leakage of the vent. When the pressure is strong the storage tank is filled and the water can be drawn from

Water without Pumping.

the pipe direct, leaving the tank full to supply water at times when the pressure la low. The water then comes down from the storage tank to the fixtures. The manufacturers, Thomas Kelly & Brothers, 124 Franklin street, Chicago, Il., sell a check valve and air vent, and the plumber making use of the arrangement may obtain his boilers where he desires. Both the air vent and the check valve have a rubber ball inside and a sharp raised seat to prevent particles from lodging between the seat and the ball. It will be observed that there is but one pipe, as the water comes up to the boiler and returns to the faucet by the same pipe.

WE ARE INDEBTED to the Journeymen Plumbers' Local Union No. 7, Albany, N. Y., for an invitation to attend their second grand ball at Union Hall, on Monday evening, November 19. The committee in charge of the enter-

tainment are John J. Gervin, chairman; Myron Cook, John Baker, James J. Culter and William M. Walsh.

### Kitchen Boiler Connections.

The reception given to "Kitchen Boiler Connections" by the trade has already made the issue of a second cdltion necessary, though the first edition only made its appearance in August. It has been complimented by the press and pronounced excellent by the trade, who have secured it as a handbook for the shop. Being taken from the in-quiries for information in the Letter Box of The Metal Worker it deals with actual experience, and the correspondence used has been selected with a view to treat clearly and simply the principles governing the operation of a water back and a boiler. The letters have been arranged so that step by step the reader would advance from the simple connection to the more complex, with a thorough understanding of the principles that must be observed to make the job work properly. To this informs. tion is added an Invaluable collection of the methods used in overcoming the troubles that have arisen from the im proper arrangement of the piping and of supplying hot water in many different ways. Some of the troubles for which remedies have been offered are noisy boilers, steam at faucet, insufficient heating of water, inefficient circulating pipes and many others. So many difficult problems are seldom presented in the experience of one man, and they have been explained by some of the foremost plumbers of the country. By no means the least interesting feature of the book are the chapters on heating rooms from the kitchen boiler, showing different methods of doing it, and on heating rooms by means of radiators connected with coils in heating stoves and furnaces. General rules are given for determining the size of the radiator necessary and the size of the coll required, which if used with discretion will be found safe in practice. The book has sold in all sections of the United States, Canada and Great Brltain.

### School Closets.

There is nothing in which the people should take a deeper interest than in the provision of convenient sanitary appliances for the use of their children at school and only such arrangements as are of unquestionable excellence should be selected. It is too true that there is a disposition to charge all public officials with extravagance in the expenditure of public money and the result has frequently been a demand for some cheap makeshift which in the end is costly. It is quits probable that this search in the name of economy has brought into the market many sanitary apparatus more or less defective in principle or construction.

The plumber is the true economist when he insists that nothing shall be used but the least expensive form of closet that is first class in principle and operation and yet for this advice he is denounced as mercenary. It has been urged that water closets cannot be used where there are no sewers, which shows the great mistake that cities make in not providing a system of sewers at the same time the streets are opened for laying the pipes for water. A cesspool is not to be generally recommended, but with vigilant care and frequent cleaning aud disinfection its evils may be a most nullified.

Where a cesspool is used, instead of being at the back part of the play grounds out of the reach of the public eye and a possible menace to the children, it should be located under the sidewalk at the front of the school so that it may be filled in at the first possible opportunity for connecting the drainage system with a sewer.

By installing a proper system of plumbing in a school the first step is taken for cering for the health of the children. If a cesspool is the only alternative as a receptacle for the discharge of the drainage system the expense and vigilance necessary to keep it in a proper condition of cleanliness will be an incentive to seek some better method of finally disposing of the sewage. If located in the street, as is the case with thousands of residences in cities where the system of sewers has not extended, any neglect that permits it to become offensive will bring prompt complaint to the Board of Health, which is usually clothed with authority to abate any nuisance that is a menace to the public health.

### TRAPS AND VENTS.

THE MECHANICS' SUPPLY COMPANY, 96 St. Peter street, Quebec, issue a circular showing in illustration their exhibit of plumbing and steam fitting supplies at the Agricultural and Industrial Exhibition of the Province of Quebec, held in September, 1894

GEORGE J. DEHN, successor to Dehn & Slutz, Iron Mountain, Mich., has several good plumbing contracts on hand, and advises us that business during the fall was excellent, no with standing the hard times in the iron region.

THE PLUMBING ESTABLISHMENT OF Clark & Sons, at Indianapolis, Ind., was destroyed by fire last week.

A PROMISING young plumber who was out of work this summer took in some of the county fairs profitably, as the following from a local paper implies: "The wonderful young peanut vender was a whole circus by himself. His yawp could he heard 18 miles, and when his mouth was open, which it was most of the time, his head was more than half off." It is said that he sold 36 hushels of peanuts in three days.

F. C. HEALY, La Crosse, Wis., has sold his plumbing stock to George J. Egge.

E. R. HALL, Waverly, N. Y., a plumber formerly with E. D. Mixer, has opened a plumbing shop.

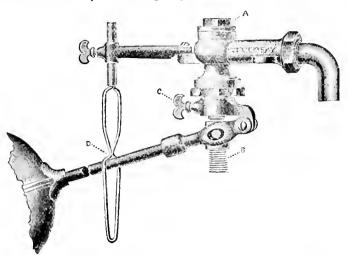

L S. Boardman, formerly of Parkersburg, W. Va., and later a resident of Huntington, has returned to Parkersburg and opened a plumbing and gas fitting establishment in the Academy of Music Building, 505 Juliana street.

A MEETING of the master plumbers of Springfield, Masa., was held last week at Cooley's Hotel and plans for the quarterly meeting of the Master Plumbers' Association of the State, which is to be held in Springfield, November 14, were informally discussed. A large delegation of local plumbers, also several from Northampton and Worcester, were present. The meeting of the State Association will be held in Graves' Hall, commencing at 10 o'clock, and will last through the afternoon and evening. At that time the plumbers will make their headquarters at Hotel Russell.

THE COMMISSIONERS of the District of Columbia last week gave a hearing to a delegation from the Master Plumbers' Association of Washington, D. C.,

consisting of James Nolan, J. R. Quinter, James Cunningham and Edmund Mallet, Jr. They urged several changes in the regulations. They requested the commissioners to pass some regulation which would prevent foreign

been formed, with a capital stock of \$10,000, for the purpose of manufacturing, buying and selling metal plates for floor and ceiling and steam fitters and plumbers' specialties. The company will occupy the factories recently

The Novelty Ball Cock.-Fig. 1.-Showing Quick Closing Top Supply.

labor from coming into the city, and after obtaining a license do a single piece of work and then return to their homes.

M THE QUESTION of a sewer system is being agitated in Windsor Locks, Conn. The town was empowered by the Legislature in 1893 to construct sewers, but the business depression has delayed the matter. A town meeting is soon to be held to consider the matter, and there is a prospect that the work will be commenced at no distant day.

Carlisle & Fisher have opened a plumbing shop at West Franklin street, Hagerstown, Md.

DENNISON & VEASEY, plumbers. have started a shop at the corner of Wyandotte and McDougall streets, Windsor, Conn.

James H. Doyle has moved his plumbing shop to 437 Third street, Red Wing, Minn.

THE SMITH ENGINEERING COMPANY have been incorporated at Macon, Ga, to do a general plumbing business, with a capital of \$50,000. The incorporators are J. W. Cabaniss, B. L. Jones and others.

JOHN H. READ, Brooklyn, N. Y., will be qualified to pass on the plumbing laws that will be presented to the legislature at Albany this winter, having been elected a member of the House and being a past master in the art.

THE PFAU MFG. COMPANY have been incorporated at Cincinnsti, Ohio, to manufacture water closets, &c., with capital of \$35,000. The incorporators are: Charles Pfau, Edward G. Pfau, Louisa Pfau, Harry Beeching and Alfred Becching.

MICHAEL W. COLLINS and THOMAS F. FALLON, two Boston, Mass., plumbers, have been elected to the State Legislature.

It is the purpose of the 40 or 50 journeymen plumbers in Erie, Pa., to take up the subject of sanitary engineering. After rooms are secured scientific journals, trade papers, and sketches of improved systems will be secured, and possibly lectures will be arranged for.

A NEW JOINT STOCK ASSOCIATION, under the name of the Beston & Bradley Company, Southington, Conn., have

occupied by the Connecticut Motor Company in Plantsville.

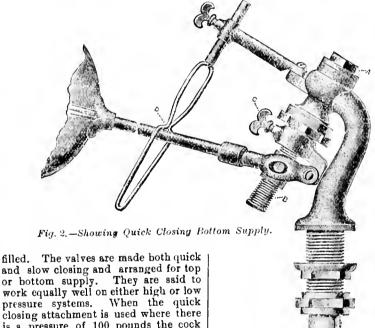

### The Novelty Ball Cock.

Peck Bros. & Co., New Haven, Conn., are just putting on the market the Novelty ball cock, shown in the Illustrations herewith. They claim it successfully avoids the disagreeable noise that attends the closing of the valve when the flushing tank of a closet is being re-

the tank valve or rub against the sides of the tank. Weighted floats, weighing not less than 28 ounces or more than 30 ounces, should be used with the quick closing cocks. The valve packing can be renewed by removing the cap A. Circulars showing all styles of this cock and giving full description can be supplied at any of the offices of the company.

### Sanitary Plumbing.

The papers read before the recent Sanitary Congress in Liverpool, says the Engineering Magazine, and the discussions these elicited, again bring the dangers to health and life through the spread of infection by sewers to public attention. There can remain no doubt in the minds of intelligent and well informed men that to avoid such dangers the whole system of house drainage should be constructed from beginning to end in accordance with the most advanced principles and methods of sanitary plumbing and sewer construction. People with small means hesitate when sanitary plumbing is named, because, in the popular mind, this term is thought to mean also expensive plumbing. newspapers describe the gorgeous appliances and fittings going into some millionaire's houses in glowing language, and speak of this sort of thing as sanftary plumbing; and the msn of small means gets the idea that sanitation is an sccompaniment of splendid living only possible to the wealthy. This is a great mistake. Sanitary plumbing means nothing more than plain plumbing done on sound principles, the practical appli-cation of which need cost very little

and slow closing and arranged for top or bottom supply. They are said to work equally well on either high or low pressure systems. When the quick closing attachment is used where there is a pressure of 100 pounds the cock will run a full stream until the tank is nearly filled, and it is claimed the tank will be filled in 15 seconds. Fig. 1 shows the quick closing cock with a top supply and Fig. 2 shows the cock with bottom supply. In adjusting the cocks the hight of the water in the tank is regulated by screwing the overflow tube B to the right or left, as may be necessary. After securing the cock to the tank and adjusting the float to the hight of the water required, the quick closing spring is adjusted so that the float rod will pass through the contracted neck of spring D and is securely fastened by the thumb screw. The float should be so arranged as not to interfere with

more, either in msterial or labor, than a defective job. It will cost the plumber who does it something more than the common, inferior sort of plumbing. It will demand more brains, knowledge and skill. The leading plumbers in this country have acquired the leading knowledge and skill, and are prepared to do their work as perfectly as the present state of the art will permit; and if fancy work be not demanded, will do it in sanitary respects as well for the man of limited means as it can be done for a millionaire.

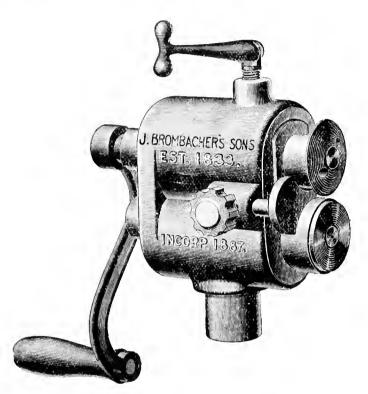

### Exectsion Incased Burring Machine.

In the accompanying illustration we show a general view of the new Excelsior incased burring machine, put on the market by Jacob Brombacher's Sons, 30 Cliff street, New York. The particular feature of the machine is that the case is cast in one piece and is of

slight spring of the lever. The machine can also be used for either burring or turning by substituting corresponding faces.

### Spring Vise Jaws for Tubing.

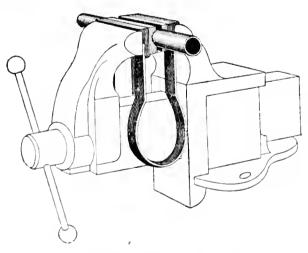

The Newark Machine Tool Works, Newark, N. J., are offering spring vise

Excelsior Incased Burring Machine.

exceptional strength. All the parts are perfectly interchangeable, and the gauge is described as simple in construction and very durable. The crank screw is made with a swivel handle, so as to always keep it clear of the work. It does not bear on the front box of the upper spindle, but on the middle of a spring steel lever, which is connected

jaws for tubing, as shown in the accompanying cut. The device is described as having jaws made of the best vulcanized fiber, securely fastened to pieces of the best malleable iron which have shoulders to catch on the jaws of the vise, and as being held together by a spring connection. When the vise is loosened to take out or to shift the

Spring Vise Jaws for Tubing.

to the frame at one end and rests on the front box with the other. The important advantages gained by this construction, to which the manufacturers allude, are that only half the number of turns are needed on the crank screw to clear the work, and that any undue strain on the machine, such as the roll passing over seams, is neutralized by a work, the spring causes the jaws to open, following the motion of the vise. It is stated that the paper jaws nearly encircle the tubing, holding it so firmly that it cannot slip, and avoiding all danger of distorting the tube, or marring the finish of the surface. The grooves are made in the jaws to suit any required diameter up to and in-

cluding 1½ inches. The device is designed for holding tubing or any cylindrical piece which is too delicate or too highly finished to be held in a pipe vise, and is made with jaws of the following lengths: 3, 3½, 4, 4½, 5 and 6 inches.

### Storage Battery Locomotive.

Norton Bros. of Maywood, Iil., are using in their tin plate factory an electric locomotive deriving its propelling power from a storage battery. The locomotive displaces hand labor in pulling small cars loaded with tin plate from one part of the factory to another. The plant consists of a number of detached buildings, and the magnitude of the operations compelled the adoption of some sort of mechanical power in transferring the heavy material between the several departments. A storage battery locomotive was decided to be the best adapted to the peculiar requirements of the work, and the firm of Pierce & Richardson, Manhattan Building, Chicago, prepared the design\* and supervised the installation, the battery being the work of Frederick L. Merrill. It is stated that the locomotive has worked so satisfactorily that Norton Bros. contempiate the addition of others.

The locomotive is built of wood, but strongly constructed. It is 5 feet in length, 30 inches in width and 44 inches in hight. Its weight is about 5000 pounds, and its four wheels are 20 inches in hight. The battery consists of 24 chloride ceils, and is piaced in the upper portion of the locomotive under cover. The motor is mounted on a McGuire truck, and develops 4 horse-power at 50 volts but is capable of running up to 6 horse-power at 80 volts. The locomotive has pulled five cars weighing over 8000 pounds on a track not in the best condition. The cells of the battery have been found to endure jarring or bumping satisfactorily. The battery is charged on the premises from a generator which is also used for supplying power to motors running machines in various portions of the plant. A wire is run from the generator to a number of points along the track, at which the battery can be charged whenever the locomotive is standing, thus keeping its efficiency constant.

The Columbia Zinc Works, Marion, Ind., of which James Latourette is proprietor, are in fuil operation manufacturing spelter for the general trade, and turning out about three carloads per week, which is principally shipped to consumers east of Marion. The ore is brought from Missouri. Silicate ore has been used hitherto, but an additional furnace has just been completed which will run on jack ore or blende. The new furnace consists of 16 kilns, arranged with eight on each side, and provided with three stacks, of which one is in the center and the others are at the ends. The furnace is 60 feet long, 19 feet high and 12 feet wide, and is expected to add considerably to the output of the works. The product is sold almost entirely for galvanizing purposes.

Some time since a leading merchant in Africa, who is an extensive purchaser of hardware, visited this country. Incidentally the low price of American bar iron was brought to his attention. The result has been that a trial order for bar iron for export to Africa is about to be given out.

### HEATING & PLUMBING.

### NEW WORK AND CONTRACTS.

BIDS will be received at the office of the City Clerk of Taunton, Mass., for the heating and ventilating plants for the County Street School House up to November 12 and for the Berkley Street School House up to November 19.

E. BAGGOT, 169-171 Adams street, Chicago, has the contract for the plumbing, gas fitting and aewerage in the two houses of Mrs. H. G. Woodward, Grand boulevard.

CLARK & JACOBS, Danielsonville, Conn., have the contract for plumbing the Phenix Hall Building.

SCHENERLEIN & BRO, Wheeling, W. Va., have the contract for placing a furnace and heating apparatus Methodist church in Davis, W. Va. They also have the contract for roofing the residence of Surveyor Bell, in West Liberty. William Schenerlein has just returned from Elkins, where he was superintending a job.

H. S. THOMPSON, 211 Randolph atreet, Chicago, has finished the plumbing in the flat building of Frank Euchent, Jackson boulevard.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until November 9, for a low temperature hot water heating apparatus for the surgeons' residence, United States Marine Hospital, Detroit, Mich. Drawings and specifi-cations may be had from the office of the Supervising Architect, Washington, or from the Superintendent, at Detroit.

THE BAKER & SMITH COMPANY, 193-197 Van Buren street, Chicago, are to install a hot water heating plant in the residence of Mrs. M. R. Brush, Michigan avenue and Forty-fourth street.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until November 30, for work including the plumbing of the United States Custom House and Post Office Building at St. Albans, Vt. Drawings and specifications may be had from the cifice of the Supervising Architect, Washington, or from the SuperIntendent, at St. Albans.

J. H. KENNEDY of Ware, Mass., ia doing the plumbing in Holden's new block, at Palmer.

THE WESTERN STEAM & HOT WATER HEATING COMPANY, 67 West Washing ton street, Chicago, report the following contracts for steam heating: Threeatory flat building of Mrs. Joseph Asron, 547 Robey street; three-story flat building of Thomas O'Connor, 51 Whipple street; three-story flat building of Wm. Fisher, 321 Chicago avenue; two-story flat building of W. S. Jones, 1589 Lexington avenue.

THE CONTRACT for placing the steam heating apparatus in the Riverside Hotel, Waterford, N. Y., has been given to Robert Pinkerton of Green Island.

JOHN GILLIE, Kingston, N. Y., has received the contract to equip the hotel of George Cole, at Pine Hill, with plumbing apparatus.

FOSTER & GLIDDEN, 53 Dearborn atreet, Chicago, are to place a Farquhar warm air furnace in the residence of Robert Airey, Morgan Park, Ill.

Pa., to furnish new heaters for the Lutheran church.

OPTENBERG & POTT, Sheboygan, Wis., have the contract for furnishing the heating and ventilating apparatus for the new public building.

- T. C. Joy & Co., 82 Lake street, Chicago, have shipped two carloads of Orient radiators for the Jesuits' Church, Milwaukee, Wis.
- P. B. CARY & Co., Dunkirk, N. Y., the contractors for the new system of plumbing at the Academy, have begun work under the supervision of Inspector Mann. Twelve new closets are to be put in, with slate urinals, and the broken tile in the drains under the floor are to be taken out and replaced with east iron pipea.

THE KIDDER MACHINE COMPANY, Franklin, N. H., have completed the ateam heating plant in Young's Hotel.

A. C. HICKEY, 69 South Canal street, Chicago, has a large contract of sewerage work for the Chicago Dock Company, at Twelfth street.

TRUE & BLANCHARD, Newport, Vt., have the contract to put the heating apparatus into the Court House.

HARLOW & BAILEY, Plymouth, Mass., have installed a Richmond steam heater in the Leyden Hall Building.

THE AMERICAN RADIATOR COMPANY, 111-113 Lake atreet, Chicago, are to furnish four carloads of radiators for the 14-story Reliance Building, Washington and State streets.

A. A. SANBORN of Boston, Mass., who installed the heating apparatus at the Fairhaven Town Hall, the Millicent Library and the Rogers School, has been awarded the contract to furnish heating apparatus for the new almshouse in Fairhaven, Mass. Wood, Brightman & Co. of Fairhaven have been awarded the plumbing contract on the comp building. on the same building.

THE CHICAGO HEATING COMPANY, 40 North Clark street, Chicago, are to place a Hecla ateam heater in the residence of J. M. Vial, La Grange, Ill.

TRACY BROTHERS, Ballaton Spa, N. Y., have been awarded the contract for a large amount of plumbing at Round Lake.

E. C. STOUGHTON, Thomaston, Conn., is to build a residence to be heated by hot air or hot water and to have modern plumbing.

THE S. WILKS MFG. COMPANY, 113-123 Clinton street, Chicago, are to furnish a Wilka heater for hot water heating in the residence of C. B. Shourds, Forty-fifth atreet.

THE EPISCOPAL SOCIETY, at Naugatuck, Conn., are to build a rectory to be heated by steam or hot water and to have a system of plumbing.

GEORGE E. DOWNE, president of the GEORGE E. Downe, president of the Ideal Boiler Company, 96 Dearborn street, Chicago, made a flying trip to St. Louts recently, and while he was there the Model Heating Company of that city closed a contract to heat 19 houses, in all of which the Ideal hot water heaters will be used.

T. P. TERRY & Son, Ansonia, Conn., have the contract for the plumbing and ateam heating in a \$10,000 house being erected at Naugatuck by R. S. Woodford.

A. B. WILKINSON, West Haven, THE CONTRACT has been let to the Johnson Machine Company, Uniontown, house of DeWitt Bradley.

THE FULLER & WARREN COMPANY, 147-149 Lake street, Chlcago, are to place a warm air furnace in the Nor-wegian Methodist Episcopal Church, Kedzie avenue.

CURTISS & PIRRPORT, New Haven, Conn., will do the plumbing in the new house of Geo. G. Powning. The heating contract has not been awarded.

- F. WM. SCHNEIDER, New Haven, Conn., is bullding a new house to be heated by furnaces and to have a system of plumbing.
- J. H. Shaw is to build a new house, at New Haven, Conn.. that is to be heated by hot water and have a system of plumbing.
- T. W. CORBETT, New Haven, Conn., the contract for the plumbing in two houses being erected by Wm. Kirkwood.
- C. HERPICH, New Haven, Conn., will do the plumbing in the new house of C. E. Smith.

JOSEPH DUGDALE, East Norwalk, Conn., will do the heating and plumbing in the Childs residence, at New Canaan, and in the residence of Geo. W. Schlicting, at Darien.

D. H. KELLY, Derby, Conn., has the heating contracts for the houses of Mayor Sullivan and Commissioner Mc-Manus. Mr. Kelly has recently put a water motor in his shop for running his pipe machine, and according to report it is giving excellent satisfaction.

THE CLARK & WELLINGTON COMPANY, Bridgeport, Conn., have the contract for the heating plant for the twofamily house being erected by J. Sporgo.

E. BAGGOT, 169-171 Adams street, Chicago, has been awarded the con-tract for plumbing and sewerage in the stations of the Lake Street Elevated Railroad, at Lake street, Fifth avenue and Clark street.

GEO. M. COUCH, Hartford, Conn., has just completed the installation of a combination heating plant in the real-dence of Norman F. Allen and is doing a similar job for Dr. Alton, using a Howard combination heater in both.

A. WETZEL, Pittsburgh, Pa., is using a Howard combination hot alr and hot water heater in heating a fine residence for one of his customers.

J. H. DEVENEY, 2306 Cottage Grove avenue, Chicago, has the contract for plumbing, gas fitting and sewerage in the handsome residence of Leon Mandel, Michigan avenue and Thirty-fourth street. The Imperial porcelain baths, sinks and other plumbing specialties manufactured by the J. L. Mott Iron Works are to be used.

JOHN P. SCHAFFER, heating and ventilating engineer, 18 Wood street, Pittsburgh, Pa., has recently received a contract for the hot water heating for the new residence of J. L. Patty, Sewickley, Pa., and also for the new club house of the Edgeworth Club, Edgeworth, Pa. Mr. Schaffer also has the contract for the steam heating for 12 new dwelling houses on Beatty street, East End, Pittsburgh, Pa., and has East End, Pittsburgh, Pa., and has recently received contracts for hot air heating for nine dwellings on Fifth avenue, Oakland, Pittsburgh; for the Grace Lutheran Church, Mt. Troy; Holy Incense Episcopal church, Leechburgh, Pa., and St. Charles' Roman Catholic church, New Bethlehem, Pa. In all of the above work, the Novelty In all of the above work the Novelty heaters and furnaces, made by the

Abram Cox Stove Company, Philadelphia, Pa., are used exclusively.

DAVIS, WRIGHT & Co., Keene, N. II., have contracted to put a hot water heating apparatus into the house of Young Jones, South Lincoln street.

William A. Eiculer, 75 Twenty-second street, Chicago, is to do the plumbing, gas fitting and sewerage in the store building of E. Bergman, 79-81 Twenty-second street.

THE HEATING APPARATUS is being put in the new High School Building, at Vinalhaven, Maine, by the Worcester Steam Heating Company, Worcester, Mass.

Sands & Regan, 54 Fifth avenue, Chicago, have the contract for the plumbing, gas fitting and sewerage in the residence and flat building of Dr. James Lawles, Wabash avenue and Fifty-second street.

THE ALCOCK PLUMBING COMPANY, 102 Twenty-second street, Chicago, have the contract for plumbing, gas fitting and sewerage in the flat building of George Lyon, 5029 Calumet avenue.

John Glotzbach, 189 Washington atreet, Chicago, has the contract for the plumbing, gas fitting and sewerage in the six flat building of George F. Stoneham, Wentworth avenue and Sixtyninth street.

THE L. H. PRENTICE COMPANY, 203-205 Van Bureu street, Chicago, have the contract for the steam heating in the very fine residence of A. O. Slaughter, Drexel boulevard and Thirty-eighth street.

THE DAVIS-JOHNSON COMPANY, 45 Jackson street, Chicago, are to place the New Idea smoke consuming furnace in the following residences at Rogers Park: E. II. Garretson, Dr. A. E. Lowell, J. E. Rockwell, Dr. F. M. Burr.

THE TIME for opening the proposals for the low temperature hot water heating apparatus for the surgeon's residence at the United States Marine Hospital, Detroit, Mich., has been extended until November 20.

P. V. DWYER & Co., St. Paul, Minn., bid \$3400 and secured the contract for the system of closets for the Adams, Scheffer, Garfield and Jackson schools.

Among the contracts recently taken by J. C. McFarland, 2511-2519 State atreet, Chicago, can be mentioned the following: Celedon Terra Cotta Company's open shingle tile roofing for residence of Leon Mandel, Michigan avenue and Thirty-fourth street; same roofing and copper trimmings for the residence and stable of C. F. Unrath, West Monroe street; about 1600 squares of heavy corrugated iron roofing for two electric power houses, one each for the North and West Chicago atreet rail-ways.

THE ANDREW McCABE COMPANY, Newark, N. J., will erect two threestory \$10,000 houses that will be heated by hot air and provided with a system of plumbing.

SMART & WATSON, Carbondale, Ill., have contracted to put hot water heating apparatus into F. A. Prickett's house.

The Board of Trade in Washington, D. C., has pronounced in favor of encouraging manufacturing establishments to locate in the national capital.

### SCRAP.

MERCHANT & Co., Incorporated, issue circulars from their Chicago house, under date of November 1, giving special quotations on an extensive line of demestic and imported tin and terne plates. The price-list also deals with copper, galvanized iron, sheet zinc, solder, eave troughs and special sheet irons, as well as other metals. The back of the catalogue calls attention to their metal Spanish tiles. A separate circular issued by the same firm relates to rosin sized sheathing, the text being printed on a sample of the article.

Two black plate mills have been started up at the works of the Irondale Steel & Iron Company, Middletown, Ind., and are running satisfactorily. Two more mills will be put in operation next week, and two more, making six in all, early in December.

It has never been claimed that American tin plates were perfectiou, but it must be admitted that opinion has generally been favorable to them in comparison with the foreign article. To show that all the world is not of one mind, however, we quote from a note recently received from a Brooklyn correspondent who, referring to American tin plates, says that objections to them are that they are left too greasy, that the coating of tin is rolled nearly all off and that the steel plate is not as good or as satisfactory as the old fashioned iron plate.

FORD & DONNELLY, Kokemo, Ind., have contracted for a branch plant at Montpelier, Ind., for the manufacture of tin plate machinery and appliances, a line of business they have lately taken up. They are also reported as about to enlarge their foundry at Kokomo.

CHARLES BRAV, mechanical engineer of the Lloyd Booth Company, Youngstown, Ohio, has been elected president and general manager of the recently organized Beaver Tin Plate Company, now erecting a large plant at New Lisbon, Ohio. The company will employ between 300 and 400 men, and their works are expected to be in operation early next year.

GUMMEY, SPERING & Co., Philadel. phia, have in contemplation the rolling of the black plates used in their tin plate works. Nothing definite has as yet been arrived at, but it is understood that arrangements have been made for the development of the enterprise at no distant date. The firm state that their business for the month of October exceeded somewhat the amount of business done during the same month of last year. Their sales of sheet iron were very large, and orders for their brands of tin plates were numerous. Their continuous roofing tin is in active demand, and their Anti-Pinhole bright plates are increasing in popularity.

THE PHILADELPHIA TIN PLATE WORKS are putting on the market an extra heavy double coated roofing plate, which they are calling Trotter's American New Method. This plate is made by a new method and is claimed to be equal to any roofing plate on the market of home or foreign manufacture. The black stock used in its manufacture is the Siemens Martin steel plate made and used by the operators of the Melyn Tin Works, Neath, South Wales, for their well known Melyn brands of plates. The proprietors of the works, Nathan Trotter & Co., report a good business done during the month of October, and that

they are running the works at their full capacity, with a prospect of continuing at that rate for some time. They say that their goods find a ready market and sales are made entirely upon quality.

British Board of Trade returns for October show exports of tin and terne plates during the month amounting to 41,000 tons, against 27,000 tone in the corresponding month of 1893. October shipments to the United States exhibit a marked increase, being 24,000 tons, as compared with 17,670 tons in September, 1894, and 13,860 tons in October of last year. The exports of tin plates from Great Britain to the United States during the last three years were as follows:

1894	1893.	1892.
Ton	s. Tons.	Tons.
January 18,29	6 23,498	17,554
February ,13,4	13 20,190	22,268
March16,9		22,789
April		31,061
May	9t 26,988	23,799
June17,2	47 26,759	23,550
July17,86		24.750
August 19,1	25 15,784	24,221
September	72 13,789	22,535
October 24,0		19,901
November		20,634
December	14,031	23,417
Totals 178,9	66 255,583	276,479

A special cable disparch from London, dated November 8, informs us that the Welsh tin plate makers propose to reduce their workmen's wages 25 per cent. Unless a concession is made by the workmen it is said that several of the works will probably close down.

THE AVONDALE TIN PLATE WORES of H. T. Griffiths & Co., Pontnewydd, Wales, were started up this week. They are a small two-mill concern.

A. A. Thomson & Co., 213 Water street, New York, report a very satisfactory demand for their special brand of American terne plate, the Central, on which two pots are kept constantly running at their tin plate works, 546 West Sixteenth street.

LATE PRESS REPORTS mention a rumor that is current among tin plate men to the effect that arbitration may be invited in the wage scale dispute.

THE CHARTIERS IRON & STEEL COM-PANY, Pittsburgh, are among the iron making concerns which, it is rumored, will erect tin plate plants in the near future.

Russell Sage is credited with the statement that the Manhattan Elevated Railroad Company have caused plans to be drawn for a double decked road to be operated by electricity in New York The scheme is said to have been aubmitted to prominent engineers of the United States and Europe and pronounced feasible. "The upper structure," said Mr. Sage, "could be constructed of light steel and used for express trains. The uprights could be placed by the side of those now in use, and would not disfigure the streets. The frame work could be very light, much lighter than the present structure, because by the aubstitution of electricity there would be no necessity to use heavy locomotives."

Herbert Praed, president of the Temescal tin mining syndicate, has recently made a careful investigation of the property in the interests of the English stockholdera. He will advise, it is reported, the thorough prospecting of the mines for gold, as ore found in various places would, he believes, pay scientific working.

### Some Reminiscences.

FOSSIL.

About the time when several prominent men were killed near Washington, D. C., by the bursting of a great gun called the Peace-Maker on board the United States man-of-war "Princeton," the writer was on his way to the South, cslled there because of a merchant's conviction that an imported Yankee boy would, by reason of that "cuteness" then credited to New Englanders, make him a better clerk than one born on the soil. Those were slavery days, and among the memories that I have of them a prominent one is that it took some time to learn the business relations then existing between the slave and master.

When walking in my freshness about the town in which I was located I heard the to me familiar sound of a tinner's hammer, which led me to enter the shop for the purpose of comparing Northern and Southern ways of work-There was a stalwart negro there who appeared to be boss and all hands, who greeted me as a possible customer and in answer to inquiries said that he run the concern in the interest of his master and owner, who was the then Governor of the State and resided at the capital nearly 100 miles away. This chattel mechanic was a good coppersmith, as appeared from the liquor stills in process of construction. He was honest, faithful and skillful, with the wages of his board and clothes. Perhaps the fact that he was likely to be kept on was an additional compensatlon.

Another of my colored acquaintances was Dr. M-s Jake, who carried on the blacksmithing business as if he owned it instead of being himself owned. Jake was a man of verestile talents, noted as a good workman at his trade, having also reputation as a veterinaria, and said to excel his master in practical dentistry as a tooth puller. He was the fifer of the local military company, and marched in his uniform at the head of the white folks as proudly as if he also was a man and a citizen. The slave The slave coschman of a local manufacturer was another of like name, but called Big Jake by way of distinction. The reader will bear in mind that these human cattle rarely had family names. Big Jake's private (?) business was the kiln drying of lumber, which he conducted by his master's consent at off times. Jim, belonging to Colonel McC., was a good friend of mine who with other darkles and several dogs used to assist me in nocturnal possum hunts whenever I found time to spend a night at his master's plantation. The Colonel had a tannery operated by his slaves, and I have known him to send Jim with a six-horse wagon load of leather to a market many miles away, and Jim would return from his business trip faithfully bringing back such property as the cash received, the team and him-self. Could any hired agent do more? Adam was a barber, with the loqua-ciousness of his calling, and would tell

Adam was a barber, with the loquaciousness of his calling, and would tell tough yarns with the confidence of sincerity. Among other notables who had passed under his brush was the then living and famous Texas Sam Houston. Said Adam: "Marse Houston he come for a shave, and 'fore takin' de cheer he jest pulled out he's bowie knife, an' ses he: 'Now, Adam, be mitey keerful. If you dror any blood on my face I'll make an extra hole in you!" Well, I went right along with the shave, cause

I reckoned he's only jest rootin me, an' when 'twas done he say, 'All right, Adam. The scare didn't make yer hand shake!' 'Marse Houston,' ses I, 'I don't got no call ter shake. Fore de Lord, if you raised that knife to me I got plenty time to cut yer throat.'"

In these days of labor agitation I call to mind these and other black business men of my before the war acquaintance and compare them with the workers of to-day, making my mental comments.

### Fire King Oll Heater.

A new oil hester, an illustration of which is shown herewith, has been

The oll fount is made of heavy brass, nickel plated, while the drum is of Russia iron, and is so arranged as to tilt back for the purpose of lighting the burner. The top ornament of the stove is an urn of conventional design. From an inspection of the cut it will be seen that the base and middle rings are connected with arms or supports, which relieve the oil fount of all weight or strain. The fancy top of the heater is made to swing, so that cooking may be done if desired.

At a recent meeting of the Nebraska Banker's Association, held at Omaha, I. A. Ford, president of the State Irrigation Society, said that there are 10,-

Fire King Oil Heater.

placed upon the market by A. Weiskittel & Son of Baltimore, Md. The heater stands 37 inches in hight and has a diameter of drum of 8 inches. The circular wick is about 3 inches in diameter and the oil fount has a capacity for 1 gallon, the claim being made that this is sufficient to burn from 10 to 12 hours, heating a room about 15 fect square with 10-foot ceiling. The castings of the stove are of attractive design and finished in either nickel or brass plating, as may be preferred. The mica frame is set with jewels, adding materially to the finish of the stove.

000,000 acres of low lands in the State of Nebraska that might be irrigated at an expense of \$2 per acre, and over 10,000,000 acres of high lands that might be watered at a cost not exceeding \$4 per acre. The meeting adopted a resolution in favor of the State irrigation system.

In his annual report to the Secretary of the Interior, Governor Hughes of Arizons states that when the irrigation works now in progress in that Territory are completed 1,000,000 acres will be added to its cultivable area.

### THE RETAIL STORE.

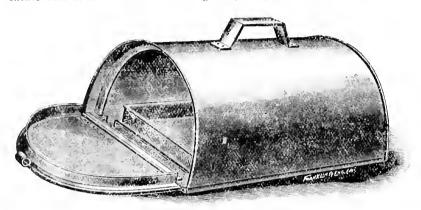

Your Partner's Son.

BY A PARTNER.

My partner had a son, a fellow ithout tact or "gumption," a failwithout tact or "gumption," a failure at school among boys of his own age, and yet without the sense to know that he was a failure. His father said to me: "I want to bring!

is to say he is paid a moderate salary and earns it.

When one member of a firm brings a son or other relative into the store he is taking unfair advantage of his partner, unless the young man is going into a department in charge of his father, where no one else will be annoyed by his failures.

The Champion Roaster .- Fig. 1.—General View of Roaster.

John here where I can make something out of him. He is doing no good at school and I want to have him where I can make him toe the scratch every time. There will be no charge for his work and I'll make him begin

at the bottom.

We are jobbers of Hardware with a good business. It has been my part to look after the running of the store more than it has my partner's. I felt that the burden of the boy's training was coming on me. I did not like the plan at all, yet it seemed unkind to object, and I thought if I had a boy I would probably want him in my owu

store.
So John came. He was a failure in himself and he made trouble with the others. He was pushed along into the order department long before he had shown any fitness as a packer and shipper, and he rarely got out an order but that he made a blunder.

His father was either too harsh with

him one day, so that we could not help but pity him, or passed over his blun-ders the next day as if they were of no

Fig. 2.-Longitudinat Section through Roaster.

consequence. He was with us two years before I finally insisted upon his being sent away, and those two years were as harmful to him as they were annoying to the rest of us.

He went to work for another house, had to do his work as it should be done, was advanced very slowly and is now a successful salesman on the road. That

The parent cannot, in the very nature of things, deal with his son as he does with other clerks, and the boy is rare who does not assume airs because he is the son of his father, rather than because he has proven himself to have ability.

A man cannot have one rule for his son and another rule for other clerks in the same department, consequently if

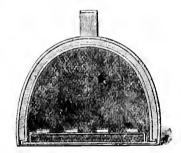

Fig. 3.—Cross Section through Rooster.

the boy is not up to the average demanded hitherto, the average is allowed to fall because of him.

Whether your partner shall bring his son into the store or not is a question that you should decide, not he. You have

you should decide, not he. You have been watching the boy and have made your estimate of his disposition and ability. If you see that his coming will not lower the discipline of the store, that he will not assume liberties because of his connection with one of the firm, you ought to suggest to your partner that you are willing the boy should be given a place.

It is a delicate question for you to answer if you wait for him to ask you if you would rather not have the boy: but it will cause vastly less trouble if you say, then and there, that you would rather not see the boy brought into the store, for if he is what you think it will make more trouble be-

tween you later.

Many partnerships are dissolved because of trouble growing out of partners' children. The sore spot having once started it rarely ever heals of itself, but grows larger until no physician can cure it.

If you agree with me thus far, how is it, supposing that it is you and not your partner who has the son? Are you sure that you are not imposing upon his good nature, and that you are not overlooking things in the young man because he is your son that you would not think of doing if he was Are you sure the boy is getting the training that would be his if in another store? Put yourself in your partner's place while you consider the situation, and then act.

### The Champion Roaster.

The accompanying illustrations show the Champion roaster, made by the Champion Roaster Company, Butte City, Mont., and for which the R E. Deitz Company, 60 Laight street, New York, are the Eastern agents. Fig. 1 shows the roaster complete, which is said to give excellent results, whether

Fig. 4.—Hot Air Cylinder.

used in connection with oil, gas or gasoline stoves, or used on the top of a coal stove, and which possesses special merit for use by camping parties, over a fire made from fuel of any character. Figs. 2 and 3 show sectional elevations, and Fig. 4 shows the hot air cylinder. By means of this hot air cylinder a circulation of air is maintained in the roaster, and the food is protected from any cooling influence that may affect the outer surface. Fig. 5 shows the grate used in the bottom of the roaster on which to place the food, thereby protecting it from direct contact with the hottest surface. It is said in use the noticest surface. It is said in doc the food cooked in the roaster requires no basting, and that it does equally excellent service in coooking game,

Fig. 5.—Grate Used'in Bottom of Roaster.

meat or fish. 'The roaster has been used with excellent satisfaction, both in private families and hotels, as well as by hunting, touring and fishing parties. It is made in three sizes, Nos. 1, 2 and 3, the respective dimensions of which are 8 x 10, 121 x 15 and 15 x 17 inches in width and length and special sizes are made to order. The Chicago office of the company is at Room 1425 Monadnock Block, Chicago.

### Riding Horse Tricycle.

The accompanying illustration shows a riding horse tricycle manufactured by the Quadruped Novelty Company, Canton, Ohio. The body is stamped in sheet metal and is mounted on rubber

between transfer ink papers in such a manner that whatever is writen on the top strip is reproduced in fac-simile on each of the two strips underneath. After the check is written a turn of the crank at the side draws the three stripe forward simultaneously,

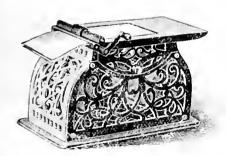

Riding Horse Tricycle.

tired wheels. The rider, seated in the saddle 2 feet from the ground, guides the tricycle by means of the reins and propels the vehicle as he would a bicycle, the legs of the horse responding to each revolution of the pedals, giving, it is claimed, an exact reproduction of the action of a horse in trotting. The horse is 36 inches high, neatly colored, with saddle, bridle, reins and neck collar, and has natural mane and tail. The tricycle is designed for the use of children from 3 to 10 years of age.

### Western Autograph Register.

The illustration herewith shown is of an Autograph register, put on the market by the Western Autograph Com-

Western Autograph Register.

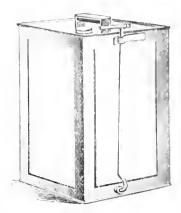

pany, St. Louis, Mo. The register consists of a neat iron case, nickel plated, in which are independently mounted on spindles three rolls of paper, two of which are blank while the other is appropriately printed and numbered for the class of transactions for which the register is to be used. The strips of paper from these rolls are brought forward together over the writing table in the top of the register, being passed

two passing out of the register to be used in completing the transaction, while the third is retained in the register, being rewound on the record core, making an inaccessible continuous record of all transactions. The two checks which have passed out of the register are torn off against a knife edge provided for the purpose, the original going to the purchaser while the duplicate is sent to the cashier. The register is referred to as being simple in construction, impossible to get out of order, and as being particularly adapted to the retail trade, doing away with the check book system which has been in use so long. It is also convenient, being attached to the counter, thus preventing the search for pencils, books, &c., to enter sales, &c. The manufacturers advise us that the register is glving the best of satisfaction to those using them.

### New Idea Oil and Gasoline Can.

An oil and gasoline can possessing a number of interesting features, so far as its construction is concerned, has recently been patented and placed on the market by A. F. Chable of 2827 Euclid avenue, Cleveland, Ohio. Fig. 1 of the illustrations represents a general view of the can, while Fig. 2 shows the manner in which the can may be emptied of its contents, as, for example, in filling lamps, stove tanks, &c. The emptying tube, which is the principal feature of the can, is formed of a single piece and is bent to the shape shown in Fig. 2. The position which the tube occupies at the side of the can is such as to bring the body portion of it close to the side, thus causing the tube to offer no obstruction as an attachment to the can. The lower inward bent portlon of the

tube is threaded, and is secured to the can by the use of a stuffing box. The latter is soldered in the can as near the bottom as possible, so that all the liquid

New Idea Oil and Gasoline Can.—Fig. 1.—General View of Can.

may be readily drawn off. As will be seen from an inspection of Fig. 1, the tube extends slightly above the top of the can, so that when in a raised position and out of use it effectually closes the can against discharge by reason of its length and position. When filling a vessel of any kind, it is only uccessary to release the tube at the top and lower it to a horizontal position, when the full pressure of the contents will be exerted and the liquid will be dis-

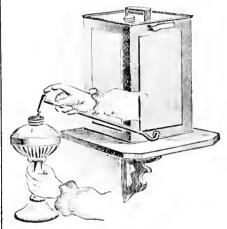

Fig. 2.—Manner of Emptying Can.

charged. When the vessel is filled, the flow is instantly stopped by restoring the tube to its upright position.

### MEMORANDA.

Adam Sharp of Sweetwater, Ill., has just opened a new hardware store at that place, and requests that copies of catalogues and price-lists from manufacturers and jobbers be sent to him.

MARK R. LEAVENWORTH, who was engaged in the stove business in Bridgeport, Conn., from 1869 to the present year, died on Thursday, November 1, aged 48 years.

THE FIRM of Wendorff & Uhls, 49 Broadway, Cleveland, Ohio, were dissolved by mutual consent. Louis Wendorff continues the business at the same location.

EUBANK & CLARK, Picdmont, Als., are adding stoves to their hardware business.

P. WALSH has opened a stove store and will do tinning and roofing business at Birmingham, Ala.

## STOVE TRADE NOTES.

### Southwestern Stove Manufacturers.

(By Telegraph.)

A meeting of the Southwestern stove manufacturers was held in the Southern Hotel, St. Louis, Mo., Wednesday and Thursday of this week, at which the following firms were represented:

Excelsior Mfg. Company, Buck's Stove & Range Company, Bridge & Beach Mfg. Company and Western Stove Mfg. Company of St. Louls, Mo.

Duffy-Trowbridge Stove Company, Hannibal, Mo.

Channon-Emery Stove Company, Comstock-Castle Stove Company, Thos. White Stove Company and Gem City Stove Company of Quincy, Ill.

Great Western Stove Works, Leavenworth, Kan.

Belleville Stove Works of Belleville, Ill.

Indianapolis Stove Company, Indianapolis, Ind.

Enterprise Stove Company of Vincennes, Ind.

H. Wetter Mfg. Company, Memphia, Tenn.

Phillips & Buttorff Mfg. Company, Nashville, Tenn.

Southern Stove Works and Indiana Stove Works of Evansville, Ind.

The meeting was called for the purpose of considering the outlook for 1895, and to perfect arrangements for furnishing to and obtaining from each stove manufacturer in the Southwest information as to the abuses that have existed in the slove trade, as to terms, freight allowances, &c., with a view to correcting same.

The question of moldera' wages was discussed, and while the molders are not looking for any advance now or in the immediate future, being satisfied to obtain steady employment, it was the expressed opinion of those present that the moldera would receive their share of any improvement which may take place. Prices were not touched on because it would be impossible, even if the manufacturers were so disposed, to enter into any agreement regarding prices in view of the laws which prevail in Missouri and Illinois.

Prices have been well maintained during the past season, and there was no just cause for complaint on this acore.

The meeting will probably result in the formation of a Southwestern association, which will hold meetings every 60 or 90 days, and which will in no wise corflict with the National Asso-

ciation, but will instead work in harmony with it.

The meeting adjourned Thursday evening to convene again at the call of the chair.

### The Western Stove Trade.

The tenor of advices from the atove and range manufacturers in Ohio, Indiana, Michigan and Kentucky are less uniform than for several weeks, and while there is still a confident tone the warm weather which has prevailed for a week or ten days accms to have curtailed the number of orders. some instances this has been of benefit, allowing the foundries to catch up with the accumulated business. Now, too, that there has been a decided lowering of temperature and a clearing of the political horizon, the lull experienced by some manufacturers will give place to the anticipated increase in the volume of business. Some foundries emphasize the point that it is necessary to produce at least ten per cent. more to reach the average sales in value of former years, caused principally by the reduction in prices of the manufactured goods, still the reduction in price of raw material causes but little change in the profits accured. There are other manufacturers, however, who have not reduced prices upon certain lines, preferring, as they express it, to improve the quality, thus giving the purchaser more for the same money.

But while some manufacturers make note of a falling off in the volume of trade there are others specially favored by location, who report that current orders are absorbing their entire output and that they are running full time and full force. Taken altogether, however, although the orders have not been kept up to the maximum, the volume of business not only compares favorably, but is in excess of that transacted during the corresponding weeks and months of last year.

One of our correspondents, commenting upon the lull resulting from the mild fall weather, predicts that "unless the winter is long and the cold severe there will likely be atocks of heating atoves left in the hands of manufacturers to carry over." Fortunstely the weather has already turned. That prices are low and competition strong seems to be evident from some of our advices, but such a state of affairs only contributes toward pushing manufacturers to give special care to workmanship and quality of the goods placed upon the market.

### The Blacker's Art.

BY G. R. APHITE.

In the fall season in our town there was always lots of orders left at the shop for a man to be sent to blacken a stove and put it up, and old Ike was a very popular artist. He had been brought up on "pure plumbago" and water which he mixed to the consistency of cream and carefully applied it to the entire surface of the stove. Then while it was drying to the proper condition he looked after the loose parts, lega, covers, centers, urns, &c. right moment to begin the shine was before the coating had lost all of its moisture, then with a broom the stove was touched up all over. After the shine had developed as far as possible with this broom a second longer and dry broom was brought into play. This was applied more leisurely, as it takes some breath and is not child's play to use a blacker's broom. Next came his brushes, and with one in each hand he went all over the stove and if the weather was not too damp a shine of some magnificence continued to grow. The final touches were put on with two dry brushes, which he was very careful to keep clean and dry. Ike left town and farmed for several years, but one Saturday afternoon he came to town and naturally visited his old friends. He found Dick, an old time devotee of the art, just putting the blacking on a big cooking stove, and after he got it covered about half their conversation became so interesting that they sat down, and pretty soon Ike noticed the blacking had dried, and said, "You'll have a fine time with that stove." put the blacking on the rest of the stove and conversed again till the stove was

Ike aaid, "You'll have a gray old shine there, and in old times the boss wouldn'tstsndthat," but Dick snswered, "You wait and see," and he polished up the driest part in a little less than no time to a brilliant black luster. Ike's eyes started out in smazement. He wanted to know what kind of blacking he used, how he mixed it and who put him on to the snap. Dick told him this was imported graphite from Ceylon, pulverlzed in a mill, then mixed with asphaltum varnish and a little oil of sassafras till it was as thick as a good stiff clay. In using it a chunk as big as an egg was dissolved in benzine and put on with a brush. The benzine was what made it dry so quickly, and he used deodorized so as to avoid the smell. The oil of sassafras was used to kill the smell of the asphaltum and benzine when the first fire was lighted

in the atove.

Ike absorbed it all and concluded to surprise the women folks at the farm, ao got from Dick a can of benzine and a big lump of the paste. Sunday morning he got up early and blackened the kitchen atove in fine style and was surprised to see how much easier it was to do it than with the old blacking. The women folks all voted Ike a true artist and wanted some of the blacking, so he explained all about it and then a fire was built.

The next week the women blacked that atove with a fire in It, and now Ike is in disgrace for putting up a job upon innocent women. As a brush well saturated was applied to the stove a quantity dropped in a hole broken in the lifter socket and so frightened the women that a correct account was never secured. They say it blowed the stove up and set the house afire, but they live in the same house and use the same stove yet, so that must be wrong. Nobody was hurt, and when Ike told Dick about it Dick said his old woman had a similar experience, though he had told her never to use it on a hot stove.

## The Abram Cox Stove Company,

Philadelphia, are sending out a new edition of "Our Furnace Book." This title in gilt letters appears on the salmon colored cover of a 72 page catalogue of Novelty furnace, heaters and ranges. On the upper corner, in red, are the words, "Successful heating upon common sense principles." On the lower corner, in green ink, is, "The compliments of the Abram Cox Stove Company," while their trade-mark and the addresses of their different offices, in text of the book is not only interesting reading, but is arranged in such a manner as to be very attractive. The first pages are devoted to the subject of heating and ventilation and followed by the Novelty furnace, which is the founder of the line, the Ideal furnace occupying the front position, after which follow Novelty A, Splendid Novelty, Success Novelty and Grand Novelty, accompanied by tables of their dimensions and approximate heating capacity. After these come the Ideal Novelty, as a combination heater for hot air and hot water, a sectional view showing the interior arrangement and other engravings showing the different forms of the hot water section used in this furnace. Following these is the Fireside, a very pretty open fire place heater, said to be adapted for all the different fuels and for natural gas. Next in the book is the Cuisine Novelty, a wrought steel French range, shown with single and double oven. This is followed by the Novelty Kitchener and the Model Novelty, the former being shown in many different forms. The Valley Novelty is a strictly portable range, set on feet and adapted for the use of a horizontal boiler. These are followed by several pages on "How to select and set a furnace," and a number of testimonials from those who have used the Novelty with satisfaction. The last page calls attention to the Novelty circulator and Novelty steam generator for hot water and steam heating.

### ODD PLATES.

Howard Sheppard of Isaac A. Sheppard & Co., Philadelphia, Ps., talked Paragon furnaces and Fidelity ranges with Wm. Kerby, manager of their New York house on Peck Slip, last Wednesday.

Mahood & Co., 14 North Second street, Philadelphia, Pa., report good sales on the Ladies' Delight oil heaters and that the Darby Square and Social Franklin heating stoves have become very popular with the trade.

SEVERAL ATTRACTIVE BOOKLETS are received from the Abram Cox Stove Company, Philadelphia. "Progress in

Heating" is the title of one eight-page pamphlet in dark green covers. back cover has an attractive half tone engraving of a residence which is heated by one of their apparatus. The book treats of heating with hot air furnaces and gives some information with reference to the size of hot air flues, construction of cold air pits and ducts and the necessity of the smoke flue having a good draft. "Combination Heating, Hot Air and Hot Water" is the title of another booklet setting forth the advantages of their Novelty combination apparatus. The text treats in an entertaining manner of the advantages of the combination system, the ventilation afforded by the hot air and the positive heat secured by hot water radiators. The last cover shows a very pretty residence, under which is the statement, "Heated by an Ideal Combination Heater." An eight page leaflet bearing the title, "Evidence," is an example of the advertising matter furnished to their customers. The opening page is the record of an action of the Novelty furnace before the Court of Public Opinion, signed by the clerk of the court "Ive Trydem." Several pages following are devoted to the testimony of the witnesses, which are letters expressing the satisfaction that has attended the use of the Novelty heating apparatus.

WM. THOMSON, 64 North Second street, Philadelphia, Pa., sheds Sunshine on all who visit him, both by his genial countenance and by the line of stoves and ranges which he runs.

Hansell & Belson, 144 North second street, Philadelphia, Pa., have a line of goods to meet all the requirements of the dealer in stoves for gas, oil and gasoline, as well as for coal, and all of the furniture to equip them. In addition, they carry everything in the supply line, blacking, bolts, mica, &c.

THE WEBB, STEPHENSON COMPANY, Nashville, Tenn., austained a loss of \$3000 by a fire in their stove store.

CHARLES FAWCETT, atove and hollow ware manufacturer, of Sackville, N. B., whose factory was destroyed by fire a short time ago, has rebuilt the works on a more extensive scale, doubling his former capacity.

NOTHING that has recently happened in the stove trade has attracted so much attention as the 5 per cent. advance in wages by the Indianapolis Stove Company of Indianapolis, Ind. It was first published as an ordinary item of news in the daily papers. But as it came during the hight of a political campaign, when one party was grasping at every item showing the least sign of an improvement in business, it was at once made the subject of editorial remarks in numberless dailies and weeklies all over the country. The name of the Indian-apolis Stove Company thus became at The name of the Indianone stroke almost a household word. The president of the company could not be accused of having made the advance merely for polltical effect, as he is a working member of the opposite party. If it was designed as an advertisement it could not have been sprung more shrewdly nor at a more opportune time.

F. M. BORDEN & BROTHER, Philadelphia, adorn the back of their envelopes with the words "Persistent Perseverance Provides Prosperity," using large initial letters and printing them in red ink. One of their New Jersey customers recently ordered some repairs and a stove, and as the shipment of the stove was delayed he tele-

graphed at their expense, "Please add 'Promptness' to the back of your envelope and ship stove." The telegram was the occasion of no little mirth on Second street, as it was freely shown to the stove trade.

AT THE RECENT Texas State Fair, held at Dallas, Texas, the Texas Farm and Ranch opened a baby show, at which the babies of farmers only were on exhibition, the city babies being cruelly excluded. There were all kinds of babies at the fair, however, as the following effusion will testify:

There were babies big and babies small, Babes that laugh and babes that squall, Babes with eyes of inidinght hine, Babes with eyes of dewy blue, Babes cooing, babes crylog, Babes kicking, babes crylog, Yet all so sweet, so dear, so pretty, That one thought, Oh what a pity, That of this cluster we've got to say, Which four will bear the awards away.

There were four prizes offered, the chief of which consisted of a Charter Oak stove made by the Excelsior Mfg. Company of St. Louis, Mo., and presented to the fortunate baby by the proprietors of the Texas Farm and Ranch. Miss Evelyn Harris of Richardson, Texas, was the prize winner who received the Charter Oak Stove. Sam Shannon, the Texas representative of the Excelsion Mfg. Company, while a single man, displayed such knowledge in bringing forward the fine points of the babies on exhibition, that many of his friends are of the opinion that the genial Sam was anxions to create a favorable impression on those fair daughters of Texas who were present.

THE WORLD'S BEST FURNACE COMPANY, 12 and 14 Washington avenue, North, Minneapolis, Minn., claim that the World's Best steel plate heater is the only furnace made with a low down radiator around the fire pot. It is said that this form of construction results in a great saving of fuel. The company issue a catalogue in which this warm air furnace is illustrated and described.

PRESS DISPATCHES from Lorain, Ohio, under late date are to the effect that the creditors of the National Vapor Stove Company, reference to which was made in these columns last week, have promised to organize at once and start the works after all legal complications have been settled. It is now expected that the plant will be in operation by January 1.

THE BELLAIRE STOVE COMPANY of Bellaire, Onlo, have just issued a new catalogue of their specialties, which is of such a nature as will interest dealers generally.

THE DETROIT STOVE WORKS OF Detroit, Mich., state that they are continually receiving a large number of inquiries from dealers who have not handled their goods neretofore. This leads the company to believe that the large amount of newspaper advertising of the Jewel line in the daily and weekly press of the country is accomplishing its purpose.

BLACK & GERMER of Eric, Pa., are meeting with a good demand for their leading specialties and are now running their works double turn.

THE JOSEPH BELL STOVE & RANGE COMPANY OF Muncie, Ind., write under recent date as follows: "Our Dandy Arlington and Family Arlington ateel range aecms to meet with special favor. We have improved the ornsmentation and finish as well as the constructive features of these steel ranges. We have also enlarged our assortment of goods

by the addition of lines of coal and wood cooks and stoves for natural gas, as well as high finish base heaters for soft coal."

L. B Jones, successor to the Security Gas & Vapor Stove Company, 108-110 South Commercial street, St. Louis, Mo., has issued a supplement relating to the Security gas atove, the text being largely made up of "information to those who contemplate purchasing a gas cook stove or range." The merits of the Security gas stove are set forth, while numerous testimonials which are presented show the favor with which the stove is regarded by the trade.

THE MAJESTIC RANGE in its various styles and sizes forms a prominent feature of the stove display made in the ware roems of Foster, Stevens & Co. of Grand Rapids, Mich. A short time ago the firm practically demonstrated the merits of this range before a large audience, which was present by special tuvitation. A Miss Foley performed the duties of chef, while numerous young ladies, daintily attired in white caps and aprons, served the guests with "golden coffee and steaming hot biscuits and butter," as a local paper de-The event was the subject scribes it. of a very flattering notice in the Grand Rapids Democrat, and the firm have reason to feel gratified at the success of the exhibition. We understand that daily receptions of this nature were given, at which large numbers were present.

WE ARE INDEBTED to Charles H. Andrews & Co., managers of the Boston, Mass., branch of the Resding Stove Works, for copies of some very prettily decorated cards, advertising Sunshine stoves and ranges, Othello and New Mayflower ranges, Torrid furnace and open fire grates. One side of each card is embellished with a colored design of a character which cannot fail to attract We likewise have from the same source a pamphlet relating to the Torrid steel plate warm air furnace, and presenting in addition to an illustrated description of the heater a long list of testimonial letters from those who have used it. There are also separate circulars relating to the Torrid furnace, the Royal Sunshine parlor stove and the Ideal Sunshine range, the latter being a new construction The ornamentation is rich and effective, the oven door carrying a panel supporting the name of the range. The Ideal Sunshine is made in five sizes and the usual modifications. The fire box is oval shaped and lined with fire brick or heavy cast iron sections, as may be preferred. The grate is of the most approved pattern, while the water front is made of special metal and has a large capacity for heating water. The range is also made for burning wood. There are, furthermore, price-lists of the Ideal Sunshine range and the Royal Sunshine surface burner, bearing date of October of the present year. Finally we have to acknowledge the receipt of a handsome entalogue issued by the Reading Stove Works and comprising over 240 pages of letter press, substantially bound in cloth cov-ETS.

LUTHER & LEDERHOS, 30 Cliff street, New York, are the assignces of a patent granted to Abner B. Hutchins of New York City for a gas stove possessing a number of interesting features. The heater consists of a sectional perforated casing, either conical or pyramidal in shape, closely surrounding a distributing chamber conforming in shape thereto and elevated above its floor. Between the lower horizontal wall of

the chamber and the base plate is a space which serves as a passage for the air and gas mixture when the device is The arrangement is such that in use. the mixture is evenly distributed to the burner holes in the casing. The gas is supplied to the stove by means of a pipe, from whence it passes to the mixing chamber, and from there to the burner, where it is distributed in a narrow sheet to the burner holes. By this arrangement of distributor it is claimed that the mixture can be ignited first directly above the base plate and again at the center and upper portion of the structure, while if it were not for the central distributor the mixture could only be lighted at the top.

The Dayton Mfg. Company, Dayton, Ohio, have issued an announcement to the vapor stove trade of the country, to the effect that they have purchased from the Covington Brass Mfg. Company of Covington, Ky., "all material, tools, machinery, patterns, &c., used in the manufacture of the Insurance gasoline stove." It is also stated that the company have entered into a contract by the terms of which they secure absolutely the exclusive right to manufacture the Insurance stove under all patents owned and controlled by the A. J. English Company of Cincinnati. The Dayton Mfg. Company will proceed immediately with the production of this stove "in the large way which is warranted by the present heavy demand for next season." The company expect soon to have ready all printed matter for the season of 1895, which will be distributed to the trade.

BRIDGEFORD & Co., Louisville, Ky., report that the improvement noted for September has continued during the month of October, although on account of the mild weather the demand for stoves has not been quite up to expections.

THE FOSTER STOVE COMPANY of Ironton, Ohio, advise us that dealers, generally, appear to be ordering to replenish their stock as sales are made.

THE HOME STOVE COMPANY of Indisnapolis are running their foundries full every day and have all the orders they can handle.

THE LEXINOTON FOUNDRY COMPANY of Lexington, Ky., have lately opened a retail department for the city trade which is consuming a large quantity of both cooking and heating stoves and ranges. In view of future prospects the company are now erecting a large wareroom, also a new building for storing patterns, &c. They believe that 1895 will bring a heavy demand for stoves in their line.

THE MILWAUKEE GAS STOVE COM-PANY of Milwaukee, Wis., issue a very pretty little catalogue of their Perfection gas radiators, heaters and parlor grates, for the season of 1894-95. gas grates are so constructed that very high efficiency is obtained by the pow erful radiation of a glowing asbestos back and by the circulation of air between Leated surfaces, while all products of combustion and impurities of the air pass up the chimney through a positive flue, easily controlled by a damper, providing perfect ventilation. A combination valve is used, which makes each grate adaptable at once for any kind of artificial as well as natural gas, or gas at any pressure. The gas connections are hidden and can be made when the grate is in place without removing a bolt. The design is ar-tistic, the effect of which is hight-

ened by a variety of beautiful finishes. The outward display of a name or number is avoided. The Perfection number is avoided. gas radiator is furnished with four, six or eight flues, and is intended for artificial gas only. These radiators are of highly ornamental design, and with the Perfection valve may be made to burn either a pure illuminating or a blue flame or a combination of both. Other gas heaters shown in the catalogue are three sizes of round heaters with asbestos fronts for natural or artificial gas; three sizes of round heaters with polished copper reflector fronts, for artificial gas only; a square reflector henter for artificial gas and a square asbestos heater for natural or artificial gas. The company issue a separate catalogue descriptive of their gas ranges and specialties.

Fred. S. Bolte & Co., stove merchants, 915 North Broadway, St. Louis, Mo., exhibit in one of their windows an aluminum stove. It is one of Moore's air tight heaters, made by the Joliet Stove Works of Joliet, Ili. The weight of the stove is but 60 pounds, whereas the same stove made in iron weighs 165 pounds. This is claimed to be the first stove ever made entirely of aluminum.

The plethors of money continues unabated. Saturday's statement of the New York banks showed, however, an increase in loans to the extent of \$1,-129,300, but deposits at the same time increased \$809,700. The banks now hold \$63,204,275 surplus reserve over the legal requirement; and, notwithstanding the recent action of the banks in reducing interest on out-of-town deposits, the flow of money from th interior appears to be unchecked.

Officials of the Pennsylvania Railroad Company have decided to increase its standard of weight of steel rails on its main line from 85 pounds to 100 pounds. On the recent tour of inspection this matter was given considerable attention, and the change was only deemed advisable after the matter had been thoroughly discussed. The change is to go into effect next year, and all new rails between Jersey City and Pitts-burgh will be of the new standard. The increase in weight is principally due to the heavier locomotives which the company have gradually been acquiring, besides the increase in speed. The 100 pound standard is a big jump from the weight rail used years ago. Then 56 pounds was considered heavy enough, but soon the weight was increased to 67, then to 75, and then to 85 pounds. The last weight has been the standard for several years, and to all appearance has met the requirements. A few years ago 100-pound rails were placed in various sections of the road for experimental purposes, and as they fulfilled all that was expected of them, it was decided to use this weight as the standard until further Besides increasing the weight there will be, in all probability, a change in the length of the rail. At present a 30-foot one is generally used, although in some places they are twice that length. The length of the majority of the new rails will be 60 feet. This is a saving of joints, thus giving a smoother surface.

It is calculated the Government expenditure for the month of October will exceed receipts by nearly \$10,000,000.

# TRADE REPORT.

### The Iron Market.

As the result of the elections, an improvement in business is expected by the majority of those who control large industrial operations. That feeling alone may go far toward bringing it about. In calmer mood the somewhat extravagant predictions now current may be withdrawn. But there is very good foundation for the hope of better times to come.

All doubt is now removed concerning any unwise legislation on the currency question, a fact which will tell a good deal with the timid holders of idle money. Then there is the further assurance that there will be no further hostile action on the tariff for a long time to come. With these perplexing questions out of the way capital may begin to look about for a chance to earn good interest instead of being chiefly concerned with the safety of the principal.

Many meritorious schemes have been lying dormant since the panic. The time seems to be approaching when some of them may be taken up. We heard lately of instances in which projects have had a hearing, which is a good deal more than was granted a month or two ago. It is clear that confidence is growing slowly, and it is the most important fruit of the elections that that process may be quickened in the near future.

Pig Iron.—Dealers in the Chicago district unite in reporting a very moderate volume of business. Inquiries are good, however, and trade is by no means ended for the fall season. Excellent orders are in prospect in local Coke Iron which will be closed within the coming ten days. Some Southern sales have recently been made in Chicago in sufficient quantities to indicate that a reasonable amount of business may still be expected in this locality by Southern makers. Prices on Southern Iron have been reduced with a view to increasing the trade in this class of Iron. Lake Superior Charcoal continues quiet. Quotations are given as follows for cash:

Lake Superior Charcoal	\$13.00 @	\$15.00
Local Coke Foundry, No. 1	10.25 @	11.00
Local Coke Foundry, No. 2	10.00 @	10.25
Local Coke Foundry, No. 3	9.50 @	10.00
Local Scotch	10.25 @	11.00
Obio Strong Softeners Ne. 1	13.00 @	13.50
Bouthern Silvery, No. 1	11.50 @	11.75
Southern Silvery, No. 2	11.25 @	11.50
Southern Coke, No. 2	10.25 @	10.50
Southern Coke, No. 3	9.75 @	10.25
Bouthern, No. 1, Soft	10.25 @	10.50
Southern, No. 2, Soft	9.75 @	10.25
Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15.50 @	16.00
Other Ohio Silvery	14.25 @	14.50

The tremendous production of Pig Iron in the Pittsburgh district during the past two or three mouths is beginning to tell and several Valley furnaces are piling Iron. It is understood that this is being done in preference to forcing their Iron on the market and thus pushing values down, and also for the reason that some furnacemen believe that prices of Pig about the first of the year will be better than they are now. A slightly better demand is noted for Foundry Iron, due to the fact that work among

the foundries is a little more plentiful. We quote the market as follows:

Advices from Cincinnati indicate that there has been only a jobbing demand for Pig Iron during the week, and it was scattered through that district, the North and to a very moderate extent the East. There have been bids made at lower prices for larger quantities, although not for any very large lot, which bids were declined by the Southern furnaces. That the market is quiet all admit, but there is no disposition apparent to accept lower prices. There is much complaint that ears in the South are so generally required for moving cotton that the movements of Pig Iron are restricted, but there is no urging to ship Pig Iron in this direction. There is no new factor in the consumptive side of the market, and dullness is the prominent feature all around. Quotations are as follows:

Southern Coke, No. 1	10.00 @	€10.25
Southern Coke, No. 2 Southern Coke, No. 3	8.75 0	9.00
Ohio Soft Stone Coal, No. 1 Ohio Soft Stone Coal, No. 2	14.50 @	15.00
Lake Superior Coke, No. 1 Lake Superior Coke, No. 2	12.00 a	12.50
Hanging Rock Charcoal, No. 1	16.00 a	16.50
Hanging Rock Charcoal, No. 2 Tennessee Charcoal, No. 1	13.00 @	13.50
Tennessee Charcoal, No. 2 Standard Southern Car Wheel	12.00 @	12.50
Lake Superior Car Wheel and		
Malleable	14.20 Q	14.75

Since our last report from St. Louis sales have not increased very ma terislly in that market. There are a number of inquiries in the market which if they result in sales will make a good showing. Consumers state that they are able to shade the market and continue to buy as their actual requirements demand. There is a gradual increase in the demand from all quarters, and while there is no great improvement anticipated until after the turn of the year a fairly satisfactory business seems assured for the next two months. We quote as follows for eash, f.o.b. cars St. Louis:

 Sonthern Coke, No. 1 Foundry
 \$10.75 \$2 \$11.00

 Southern Coke, No. 2 Foundry
 9.75 \$2 \$10.00

 Southern Coke, No. 3 Foundry
 9.50 \$2 \$9.75

 Southern Coke, No. 3 Foundry
 9.50 \$2 \$9.75

 Southern Car Wheel
 16.50 \$2 \$17.00

### Metal Market.

Pig Tin,—At the end of last week wholessle prices for Straits Tin were forced up for both prompt and future delivery. Since then a reaction has taken place to about the level of a week ago. Several hundred tons changed hands in the meantime, the bulk of it in the nature of closing out old deals. Otherwise there has been little to note in the market. Jobbers and consumers have purchased very conservatively and seem to be bothered little by the ups and downs of the speculative market, since with the strongest complexion put upon the statistical position it is found that there is not only enough Tin to go around, but some to spare. In fact, the visible supply is

still abnormally large and the records indicate that the deliveries latterly have swelled the "invisible" supply in no small degree. At the close of the week the market was unsettled. Jobbers' price for small lots of Straits Pig from store is about 17¢ P. Ib.

Copper.—The market remains in statu quo. There has been little or nothing more than mere routine business and of the most commonplace type, rarely involving more than small lots for immediate or early delivery. This class of orders has been filled at about the prices previously quoted—namely,  $10\frac{3}{4}$ ? B lb for Lake Ingot.

Sheet Copper.—Buying is at present very moderate and inquiry has been somewhat less in volume during the week under review. Prices remain at their former figures. Small jobbing lots of Sheet Copper are usually quoted on a net basis of 15¢ % lb.

Pig Lead.—There is perhaps a shade better tone to the market, but business here has been of moderate proportions and the demand only fair. The firmness would seem to be due chiefly to Western business that amounted to considerable in the aggregate. The price asked for small retail lots of American Pig is  $3\frac{1}{2}\phi$  @  $3\frac{5}{2}\phi$ .  $\widetilde{\psi}$  lb.

Lead Pipe and Sheet—The demand for manufactured Lead of all kinds in this market is described as extremely tame. Prices keep at their late low level. Sheet Lead and Lead Pipe are maintained at the regular list prices with 20 % off.

Spelter.—Business has been fair, and the demand is somewhat better, making upon the whole quite a firm market. For small parcels of Western jobbers ask about  $4\frac{1}{4}\phi$  ? Ib. Special brands bring the usual premium.

Antimony.—There has been some improvement in sales, but wholesale prices are still rather soft. Small lots go at 103\$ for Cookson's and 9\$\$ for Hallett's.

Tin Plate. — A somewhat quieter market was noted in the past week. Election interests have apparently interfered with business to some extent; but this disturbing cause being now out of the way, a brisker demand is looked for in the coming week. Deslings have been on a moderate scale and individual purchases are still confined to extremely conservative lines. Futures have been almost wholly neglected, notwithstanding the fact that Plates are now almost down to rock bottom in price. The supply of imported Plates bere has increased, and the assortment, especially of Ternes, is rather more liberal. The lines of Charcoal and Coke Tins in stock are, however, some-what broken, and certain descriptions, notably special sizes of Charcoal Wasters. are extremely searce. Consumption keeps pace very evenly with arrivals and receipts from domestic works. Imported Ternes are in fairly liberal supply. The recent wet weather has caused a material falling off in the demand for Roofing Plates. Prices show no radical change but incline to

weakness, in sympathy with their falling tendency on the other side.

A special London cable dispatch of November 7 to The Iron Age reports on the British Tin Plate market as follows: Tin Plate has been dull, and prices still show a declining tendency. A fair business was done at intervals, when makers met buyers' views. Cokes and Charcoals are nominally 3 pence lower. Ternes are about 6 pence down. Light weights continue to be in relatively best demand. Stocks at Swansea are now about 230,000 boxes. Swansea quotations are as follows:

Bessemer Cokes, IC	9	30 K	10,
Stemens Cokes, IC	10	0	10/3
J. B. Steel Cokes, IC			
Dean Ternes, 20 x 28			
Charcoals, IC	11	uı	Э.

Sheets is not as urgent as it was, but for prompt shipment mills and their agents are able to get very close to the highest prices recently ruling. The jobbing demand for Galvanized Sheets is quite active and prompt shipments are not easy to secure. Dealers complain that it is almost impossible to get orders filled by the mills within two or three weeks. Prices do not, however, give any indication of improvement. Small lots from store are quoted at 75 and 5 % @ 75 and 10 % off. For small retail quantities of No. 27 Common Black Iron 2.65 \$\phi\$ is about the ruling quotation in this market, and 3\$\phi\$ for R. G. cleaned.

### Chicago Report.

Scrap.—The market is not as active as it has been. Dealers quote the following list of buying prices, Chicago delivery:

acii. (cij.		
Per n	et ton.	Per Ib
No. 1 Wrought Scrap	\$7.00

### CONDITION OF THE

### Hardware Trade.

THE ATTENTION GIVEN to political matters during the past few weeks probably interfered somethe volume of business, what with which, notwithstanding, continues fair though not heavy. The steady, and in the aggregate large, consumption of goods which is constantly going on ealls for frequent replenishing of stocks. but merchants are very careful not to buy in excess of their immediate requirements. The year has shown a marked decline in the prices of so many goods and the market is still in so ground and the market is start that irregular and unsettled a state that they are not disposed to purchase Hardware which they may be called upon to carry until it can be replaced at lower figures. The near approach of the annual inventory also deters them from adding unnecessarily to their stock. A fair proportion of curtheir stock. A fair proportion of current business is for holiday and winter goods, but miscellaneous and heavy Hardware is also receiving its share of attention. In view of the result of the election an increase of confidence and an improvement in the tone of the market is anticipated.

Advices from Chicago.—The Shelf Hardware trade is in reasonably good condition. The demand is as good condition. The demand is as large as could be expected under the conditions which have been pre-vailing this year. The volume of business is much beyond that of last year at this time, although it is still considerably behind that of 1892. The month thus far shows indications of keeping up to the volume of business in October. Some jobbers are in receipt of good orders for seasonable goods, such as Stove Boards, Coal Hods and Stove Furniture, but others report that the very mild weather re-cently prevailing has considerably in-terfered with their trade in articles of this character. A cold snap is ardently desired, as it is expected to greatly increase the movement in this line. The demand for Tinware and House Furnishing Goods has expanded remarkably during the past two weeks. Factories are still in arrears on shipments. Orders are of the same character as heretofore, being made up almost entirely of broken packages but they make up in number what they lack in Ware report a steadily augmented trade. Sidney Shepard & Co. are greatly pleased with the success attending their new departure in this line.

### Notes on Prices.

Heavy Hardware is quiet.

Wire Nails.—There is little reason for complaint in regard to the volume of business, and some large orders and many smaller ones have been placed with manufacturers during the past week or two. In the matter of prices there is little new to be reported. Ninety five cents, f.o.b. at mill, for carload lots, is a general price, but it is frequently slightly shaded, and the price of 90 cents is being made on attractive orders.

Advices from Chicago. — Manufacturers' agenta report an improved volume of business. Inquiries are much larger and sales have been decidedly better. Orders are particularly good from localities which can be reached by water, but buyers from other sections are also taking more than for some little time. Factory prices are still irregular. Job-

bers quote small lots from stock a \$1.10.

Cut Nails.—The Cut Nail market is without important change. Small lots from store in New York are quoted at \$1 to \$1.05. The demand is fair and the tone of the market pretty steady.

Advices from Chicago.—The demand on manufacturers is still confined to earload lots, but they are received in sufficient number to keep the local works well employed. Outside manufacturers have recently made some efforts to take part of the trade in this locality, but owing to the fact that they seek orders for 1000 keg lots or more they have been unsuccessful. Jobbers continue to quote small lots at \$1 from stock.

Barb Wire.—The Barb Wire market is quiet, with few inquiries for immediate delivery. There is more or less negotiation going on in regard to orders for next season. The market is represented by the following quotations on Four-Point Galvanized in carload lots, at the points named: Pittsburgh, \$1.95 to \$2; Cleveland, \$2 to \$2.05; Cinclinati, Allentown, Chicago and New York, \$2.10 to \$2.15.

Advices from Chicago.—Business is quiet both with respect to orders for spring shipment and for fall delivery. Less effort is being made now to book orders for spring delivery by offering favorable terms of shipment. Manufacturers are evidently of the opinion that they will be able to control the trade more closely than in the past and appear disposed to wait for business in the natural way. Manufacturers and jobbers alike report light sales. Small lots of Gslvanized continue to be quoted at \$2.25 from stock and \$2.15 from factory. The Plain Wire trade is much better than that in Barb Wire. Manufacturing consumers are buying quite freely.

Glass .- The condition of the American Window Glass market shows little improvement since our report of last week, and quotations, it is reported, have been made which appear unnecessarily low. It is understood that prices have been made in the West at less than 90 per cent. discount for both single and double strength Glass in large lots. Such cases are probably the exception rather than the rule, as Pittsburgh and Eastern manufacturers, it is believed, are less ready to make concessions on quoted prices than they have been in the past. Although it is difficult to detect an improvement in this direction it is believed that prices, on an average over the country, are firmer, and that an improvement may be looked for.

Iron Rivets.—The American Screw Company, Atlas Tack Corporation and other manufacturers of Iron Rivets have adopted a revised list under date November 1, which is given in full in the following columns. It will be observed that there are a number of changes in list prices. The discounts announced by the manufacturers are as follows: Sixty five per cent. on Norway Iron Rivets, and 75 per cent. on Soft Steel or second quality Rivets. The American Screw Company issue a discount sheet under date November 1, in which they quote Rivets under the new list as follows.

Norway Rivets:	Per cent.

Parker Heater. - The Parker Portable Heater manufactured by the Charles Parker Company, Meriden, Charles Parker Company, Meriden, Conn., and 97 Chambers street, New York, an Illustrated description of which appeared In our last issue, is sold at a discount of 50 and 10 per cent. from the following list:

 No.
 3. Nickel Finish
 \$12,50

 4. Polished Nickel Plated
 17,70

 5.
 21 00

Christmas Tree Holder -The Berlin Christmas Tree Holder described in our last issue and put on the market by the Logan & Strobridge Iron Company, New Brighton, Pa., is sold to the trade at \$4 25 per dezen, net.

Bernard Folding Dividers. - The Bernard Dividers, illustrated in our last issue, are sold to the trade at \$11.50 per dozen, subject to a discount of 35 per cent. The Dividers are manufactured by the William Schollhorn Company of New Haven, Conn., for whom Julius Berbecker & Co., 280 Broadway, New York, are agents.

Woodlite Ware -The Bronson Supply Company, 72 Beekman street, New York, as agents for F. W. Morse, Providence, R. I., have just commenced to introduce a new enameled ware called Woodite, a description of which appeared in our issue, when an illustration of a Wash Basin was given, this being the only goods in this line which the company are at present prepared to supply. These Basins are sold to the trade at \$50 per gross, subject to a discount of 50 and 10 per cent.

Files.-The File market is in a condition very far from satisfactory, there being very active competition among some of the leading makers, and as a result prices are low and uneven.

Old Metals.-The market is dull, and prices, while rather firmer, are somewhat uneven. The following quotations represent about the prices now paid by dealers, New York delivery:

Heavy Copper
Light and Tinned Copper 10 15 614

### Trade Notes.

A NEW INDUSTRY is to be established in Columbus, Ohio, articles or incorporation having been filed by the Aluminum Letter & Sign Company to do business in that city. The capital stock is \$15,000, and the object is to manufacture Aluminum Letters, Figures and Signs and Castings of all kinds in which Aluminum forms an ingredient. The incorporators are James A. Irving, George W. Ochs, Charles M. King, A. P. Rusk and De Witt C. Jones.

EPPELSHEIMER & Co., 160-166 Bleecker street, New York, note a revival in their trade over last year. Bakers and confectioners are buying Cake Molds and Tinware and Molds for ices and confections. One of their newest Molds turns out a perfect "brownie" and is very popular, the fad being for "brownies" in everything just now.

E. T. BARNUM of Detroit, Mich., has issued his new fall supplement to his general catalogue; also a supplement devoted to Builders' Iron Work, and another supplement to his Fence catalogue, besides several minor ones. These catalogues have been sent to the trade in a number of foreign countries, as well as throughout the United States, and will, no doubt, be much appreciated.

H. A. & L. F. STEVENS, 529 West street, New York, are busy with holiday work in brass goods. They make a specialty of Piano and Banquet Lamp Work, and are preparing some elegant settings for lamps made of the celebrated American Rookwood Ware sent to them by a Chicago house.

W. J. Gordon, 218 New street, Philadelphia, reports a good demand for his new Automatic Power Seaming machine. Among recent shipments have been some to Milwaukee, Boston, New York, Brooklyn, Baltimore and Portland, Ore. He has just received an order for one from a firm in Newcastle, New South Wales, and will make shipment at the first opportunity via London or other European port.

H. C. BARRINGER and others of Baltimore, Md., have obtained a charter of incorporation for the Maryland Safety Light, Heat & Power Company, to manufacture appliances for lighting and heating buildings in Baltimore.

• In The Metal Worker of October 27 we stated that the Chapman Tin Mig. Company had removed to Newark, N. Y., from Clifton Springs. This statement, was an error. We learn from C. A. Chapman that for some time he has contemplated the possibility of leaving Clifton Springs, and has been receiving offers from different localities. He has not, however, made up his mind to move or decided upon any new place for his factory. He is open to offers and is still considering the whole question.

THE CAROLINA MICA COMPANY, Spruce Pine, N. C., invite attention to their regular standard Blue Ridge Mica, by means of circulars which they are distributing to the trade. They also call attention to the line of superior specked and spotted mica and to their line of Kaolin, Paper Clay, Tale and Bauxite. Price-lists of Mica which they are in a position to supply are included among the circulars which are being sent out.

THE SAYRE STAMPING COMPANY, Sayre, Pa., distribute circulars relating to the Uncle Sam dampers of their manufacture. These are made of malleable fron, the stem being pointed so that it may be driven through the pipe, and the damper plate being made of cold rolled steel, corrugated to prevent warping. The makers call particular attention to the lightness and strength of these dampers, and their desirability for heater pipes. The circular gives the list price of the various sizes, which run from 5 to 10 inches.

### News and Notes.

The Monde Economique, after careful investigation, estimates the world'a coffee production for the current year at 12,000,000 bags. As against this output, larger than that of any previous year, there is a consumption of only 10,500,000 bags.

It is calculated that the operators of the Schuylkill Valley, Pa., coal region will put out at least 1,250,000 tons of anthracite coal during the month of November. Of this amount, about 1,000,000 tons will be marketed by the Philadelphia & Reading Coal & Iron Company.

The coinage executed at United States mints during the month of October aggregated 4,044,360 pieces, of the value of \$4,152,700; of which 264,360 pieces were gold, of the value of \$2,911,800; 2,150.000 silver pieces, of the value of \$1,217,000; and 1,630,000 pieces of minor coin, of the value of \$23,000. Of the silver coined, \$600,000 were atandard ailver dollars.

Ignatius Donnelly figures out from the last census returns that in 1890, 9 per cent. of the population of the United States owned 71 per cent. of all its wealth. One-fifth of 1 per cent. of the people of this country owned \$12,000,000,000 of property, or about one-fifth of the whole property of the nation.

A new industry has been started in the San Joaquin Valley of California by Chicago tannera—namely, the cultivation of canaigre, a weed of the dock species containing a large amount of tannic acid. A large tract of land has been purchased on which the weed will be planted, and extensive works for preparing the acid will be built, at a cost of \$300,000. It is said that with the acid from this plant leather can be tanned better than by any other means.

The Canadian Lumberman calls for measures to preserve the forests of the Dominion from the unnecessary destruction and waste that is now going on in them as well as for a system of replanting in places where trees have been cut down for lumber.

The Railroad Gazette gives a list of accidents occurring on the railroads of the United States in September, which shows that there were 146 accidents, in which 50 persons were killed and 126 injured. Of those killed 30 were railroad employees, 5 were passengers and 15 trespassers. Of those injured 84 were employees, 32 passengers and 10 trespassers.

### It Is Reported-

Alabama.
That H. J. Hallack, Tinware, Stoves, &c., GADSDEN, has gone out of busi-

That G. O. Warren has succeeded D. E. Crocker in the Stove, Tinware and Honse Furnishing Goods business

at New Decatur.
That Mayberry & Watson Company are a new Hardware concern at Bir-MINGHAM.

That P. Walsh has just entered the Stove and Tinware business at BIR-MINGHAM.

That R. A. Posey, Hardware merchant, of Dadeville, has completed his new brick building and taken possession of it.

That Eubank & Clark, Hardware merchants, Piedmont, are adding Stoves to their assortment of goods.
That a new Tinware store has been opened at Utah by Thomas Carring-

That John P. Streety & Co. have opened a new Hardware store at HA-NEYVILLE.

Arkansas.

That the Hardware business of P. C. White & Co., BATESVILLE, is now being conducted by P. C. White under his own name.

That Reeves & Miller, Hardware, Stoves, &c., Cord, have dissolved. Nicholls & Miller will continue the business.

That J. P. and F. W. Maguess of Newark have sold their Hardware and Stove stock to W. A. Edwards, who will continue the business at the

former stand.
That J. E. Stevenson has succeeded to the Hardware business of J. H. Pace & Co., Maiden Rock.

### Colorado.

That William Rogerson of FLORENCE has disposed of his Hardware stock and fixtures to R. K. Warhnrst of Pueblo, who will continue the business at the old stand.

That the Hardware store at COLFAX conducted by Mrs. Joseph Tobias was slightly damaged by fire on the 25th ult. Loss, \$250.

Connecticut.

That S. F. Cadwell and W. F. Jones, Hartford, heretofore carrying on the Hardware business under the style of R. D. Hawley & Co., on November 1 changed the firm name to Cadwell & Jones.

Illinois.

Guillemont, formerly traveling salesman for Hibbard, Spencer, Bartlett & Co. of CHICAGO, has purchased a stock of Hardware at EL Paso, where he will open a new

That David Stiver will open a new

store at STOCKTON.
That O. A. Harrison, Hardware and Implements, Lovington, has sold

Idaho.

That N. C. Larsen of BELLVUE has opened a new store at SILVER CITY.

Indians.

That Hatfield & are Read a new firm at Washington. They will embark in the Hardware and building material business about December 1. Mr. Hatfield was formerly a member of the firm of Hatfield & Palmer, who were succeeded by J. A. Palmer & Son. The new firm expect to open up a stock of about \$10,000

That P. M. Jenks has bought the Hardware and Implement stock for-

merly owned by W. C. Gerner, BAR-NUM. Mr. Jenks was formerly an em-

ployee of Mr. Gerner.
That Isaac Odell has disposed of his

Hardware business at GILMORE.
That C. E. Danforth & Co. of HAM-

That C. E. Daintin to Color that the Foster, Bailey & Goodrich Company of Grinnell have decided to add Hardware to the other lines

they are handling.
That C. H. Thomas & Bro., will succeed Thomas & Dongherty in the Hardware business, at Creston, about January 1, 1895, E. N. Dougherty hav-ing sold his interest in the concern to

G. M. Thomas.
That Smith & Sauders, Implement merchants, South English, have sold out to Cheney & Sanders.

Kansas.

That the Union Hardware Company of ARKANSAS CITY have been organized with a capital of \$5000. The directors are J. G. Finley, J. S. Short, R. J. Rankin, S. H. Hamilton and Robert Godson.

That D. C. Kennedy, Hardware dealer, Andover, has sold out.

Kentucky.

That the Hardware store of John T. Miller, at Lexington, has been sold to J. Frank Vanderen and J. Scott. Mr. Miller has conducted the store for the past 42 years with conspicuous success and has retired from active business. Mr. Vanderen, one of his successors, has for the past eight years been a traveling salesman in the employ of the Simmons Hardware Company of Sr. Laus. Mr. Scott is a well-known St. Louis. Mr. Scott is a well-known local business man.

That R. A. Callender has sold out his Hardware business at Glencoe.

### Filtration of Drinking Water.

Some time since we noted in these columns the investigations being carried on with relation to the best means of economically purifying the water supply of communities. A recent paper entitled "Sand Filtration of Water, with Special Reference to Recent Results Obtained at Lawrence, Mass.," and presented before the American Public Health Association at its monthly meeting, records some very interesting and pertinent facts. It is practically an outline of the work being conducted by the Massachusetts State Board of Health, which has now been in progress for severel years and may be regarded as investigations upon nature's ways of working, with a view to their more economical and advantageous application to the problems in actual practice. For the past year the city of Lawrence has itself had in operation a large sand filter for the purification of its water supply. This is about 2.5 acres in area and contains sand of an average depth of about 4.5 feet. The filter is situated by the side of the Merrimac River and separated from it by an embankment. Its surface is 2 feet below low water in the river. The water is allowed to flow onto the filter about 16 hours per day. From beneath the filter it passes by under drains to a collecting conduit and thence to the pump. About 2,000,-000 gallons per acre pass through in 24 hours. Daily analyses of the water have been made to determine the bacteria present, both at the river before the water passes through the filter and also at the filter, the reservoir, the City Hall and the experiment station. The results show that the filter normally removed 98.3 per cent. of the bacteria from the water. The results obtained with other filters at the experimental station during an extended period are almost identical, being 98.54 per cent.

It is obvious that all this labor is heing expended with a definite purpose in view-that is, to ascertain to what extent the contamination of drinking water by disease germs can be practically prevented. How well the work has succeeded can best be shown by the results in the city of Lawrence. During the five years previous to the use of the filter the average annual death rate from typhoid fever in Lawrence was 1.27 per 1000 inhabitants. The population of Lawrence is 50,000, and this average rate is equivalent to 63 deaths per year. During the past year there have been 26 deaths from typhoid fever, a reduction of 60 per cent. Furthermore, it has been learned that of the 26 who died 12 were operatives in the mills, each of whom was known to have drunk unfiltered and polluted canal water, which is used in the factories at the sinks for washing. What these results mean may be still better comprehended by a knowledge of the fact that the sewage of Lowell enters this same river 9 miles above the Lawrence filter, and that during the past winter there was a severe epidemic of typhoid fever in the former city. It is thus found to be practicable to protect the consumers of infected water supply by means of sand filtration, a result that must stand as of the utmost importance in the sanitary condition of a city.

### Franklin Trade School Delayed.

The establishment of the Franklin Trade School in Boston hangs fire. Some doubt appears to exist as to whether the trustees of the fund left to the city of Boston by Benjamin Franklin a century ago for the benefit of the young mechanics of the city can be legally used to found a trade school. It will be remembered that this fund, which has grown during the interval of 100 years from the time of the testator's death, from \$1,000 to \$131,000, was voted by the trustees to be applied to this purpose. These trustees comprise, under the terms of Franklin's will, the pastors of three of the oldest Boston ehurches and the Selectinen of the city. The successors of the latter have been considered to be the Board of Aldermen, and as such they have served on the board of trustees. But the Selectmen were the executive of the town, while the Aldermen are the legislators; and the Mayor, being the executive, is by some considered the proper representative of the city on the board of trustees. The present Mayor of Boston appears to favor some other disposition of the money than the establishment of a trade

school. Hence the matter was referred for advice to the corporation counsel. and the scheme has been left in abeyance for the past year. The corporation counsel now gives it as his opinion that the trustees could not legally establish an endowment fund to carry on the school with the money that is left after erecting the necessary buildings and equipping them with machinery, &c. His advice, however, is not regarded as sound, and it is thought probable that a friendly suit will be brought to determine the exact status of the trustees and their powers and prerogatives. A strong feeling is said to exist in Boston in favor of the utilization of the Franklin Fund for the purposes of a trade school, as being an object more directly in line with the distinguished donor's well-known ideas than any other of the alternative schemes that were proposed. The usefulness of such a school to the city of Boston, and its benefit to the class Franklin desired to aid, is beyond question.

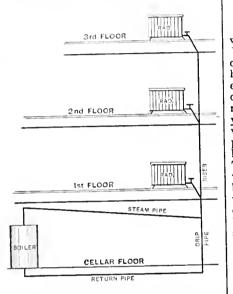

### Drawback Payments.

The Bureau of Statistics has just issued a statement prepared by the Commissioner of Customs which gives the amount of drawbacks of duties paid on exported articles manufactured from imported materials. It appears that the sums so paid were \$4,911,189.54 in the fiscal year 1891. \$3,410,736.88 in 1892, \$3,390,977.14 in 1893 and \$4,303,-976.05 in 1894. In the first year mentioned sugar drawbacks figured up to \$2.717,298.62. In 1892 these dropped to \$239,458.37 and have since become insignificant. This leaves us the really important item, that of tin plate, on which the drawback payments were \$1,418,496.15 in 1891, \$2,342,983.74 in 1892, \$2,650,792.55 in 1893 and \$3,523,-094.35 in 1894. These figures are interesting as showing how large a quantity of the tin plate imported into this country goes out again. Of course, the bulk of the material is used for making cans for the export oil trade, the Standard Oil Company being the chief beneficiary. The total imports of tin plate in the fiscal year 1893 were 628,425,902 pounds. Of this, 1,219,357 pounds was reexported, while 121,708,890 pounds was sent out under the drawback arrangement, thus leaving 505,497,655 for domestic consumption. In 1894 the imports fell off to 451,160,026 pounds; the re-exports dropped to 716,461 pounds, but the drawback exports rose to 161,757,907 pounds, so that the quantity taken by our markets of foreign plate declined to 291,585,658 pounds, a shrinkage of over 200,000,000 pounds in one year, due, of course, chiefly to the general depression of business.

# THE LETTER BOX.

## Dispute About Radiator Connections.

From W. W. K.—Please print the following inquiry in The Metal Worker, with the request that the practical steam fitters answer the question: I send herewith two diagrams, in both of which the boiler and radiators are placed in exactly the same position, the only difference being that in Fig. 1 the

Dispute About Radiator Connections.— Fig. 1.—Y-Connections to Radiators.

radiators are connected with the main riser by means of Y-joints and the return or drip pipe is carried down immediately below the water line at the boller. In Fig. 2 the radiators are con-

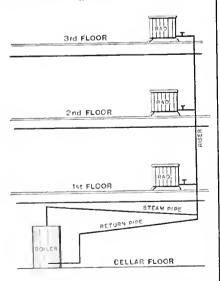

Fig. 2.-T-Connections to Radiators.

nected with the riser by means of T-joints and the return or drip pipe is carried overhead to within a few feet of the boiler and then dropped into it. The question is, which is the best method? No doubt either will work, but which will give the driest steam in the

radiators and the most freedom from water hammer? I should be glad to have answers from master steam fitters or practical workmen.

Note.—We present our correspondent's inquiry without comment, and trust that some of our readers who have had practical experience in such matters will favor him with an answer.

#### Concerning a Ram.

From Progress. - Why did "Fossil," who wrote about a ram in The Metal Worker of November 3, adopt such a crude back century idea as a "hinged board" (loaded or unloaded) in these elastic times? Tell him he can save his cussin' by using a common atationery rubber band placed around under the yoke and up over the stop pin in the valve stem of the ram. It will then palpitate readily and not dance around like a small boy with a burnt thumb. The trouble with the valve stopping, where the necessary connections have been properly made and the supply of water is sufficient, is that the rotating of the valve seats itself so that the water left between the surface of the valve and valve seat makes a union. Try two pieces of window glass or a piece of paper, wet and use as the boys make a sucker, and the effect will be apparent. "Fossil" reached the result desired, but not in the best way. An English writer has said that "of all the apparatus made by man the hydraulic ram is the most mulish and unexplainable." Is he correct? There are no effects without cause and natural laws are unvarying.

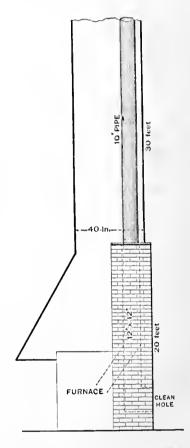

### A Plumber's Experience.

From G. F. S., Washington, D. C.-As a curiosity in plumbing I will tell you an experience that may serve others in trouble of the same kind. A person here complained for some time of a very noisy and rattling boiler in his kitchen and to my knowledge called in five different plumbers, but none could find the cause, as everything appeared cor-rect in the setting of the boiler. When my turn came I could see nothing wrong, but I reasoned that the boiler would only echo the noise from some-where else. The water back in the range being the only portion of the apparatus that was concealed I took it out, but found nothing in its appearance to excite suspicion. I did not like to give the problem up, however, so I took the water back to the shop to clean it and discover if anything was the matter. found the water back had been tapped on the top and had two brass boller spuds screwed in which I took out with considerable trouble. To my surprise I found a little tube from one of them, the plumber who had made the connection to the boiler having joined the hot water pipe to the spud where the tube was instead of to the other one, thus forming a trap. I changed the connections end for end and reconnected it and all went smoothly. The tube is of

no one ever thought of it. The best part of the story is to come. When I wanted my pay the house owner said that I had done nothing worth talking of, as I used no material and but little time, adding that plumbers are all robbers, &c.

### An improperly Shaped Flue.

From W. B. G, Philadelphia.—In The Metal Worker of November 10 you publish a letter from "C. H.," Ohio, who seeks a remedy for a badly constructed chimney. Perhaps a recent experience of the writer's will prove of

An Improperty Shaped Flue.—Plan Followed by "W. B. G."

service to him in curing the evit. Having occasion to build a smelting furnace I placed it under an iron hood, which hood terminated about 20 feet from the ground in a round sheet iron stack 40 inches in diameter. The hood was fastened against a brick wall, in which was built a chimney with a 12-inch square flue in it. The inside of this flue was carefully plastered up, and into it, about 6 feet from the ground, the flue from the furnace entered. This chimney ended at the base of the 40-inch stack. The stack was open at its base where it joined the hood, and the idea was that it would act as a draft from the chimney, and also draw off all escaping fumes from the furnace. When this job was completed and the fire started the furnace would not draw, and as we required a smelting heat it was practically useless. To remedy the

trouble I had cast a plate with a collar | on it and a 10 inch hole. This was placed on top of the chimney over the I then put 30 feet of heavy 10. flue. inch sheet iron pipe on top of this plate, and securely fastened it to the side of the 40 inch stack, having it end just flush with the top of the stack. This proved to be just what was needed. The furnace now draws with a roar, and I find no trouble in obtaining a smelting If "C. H." will run his 12 inch heat. If "C. H." will run his 12 inch pipe flush with the top of his chimney his trouble will be most likely ended. He will find that 1 lineh good black iron or sheet steel will last longer for this purpose than galvanized iron. The gases from the fuel seem to act on galvanized iron and eat it all up. I have used both, and find black iron well coated with tar lasts longest for stacks tof any kind. With this letter I send a sketch showing the chimney which I constructed.

### Pumping Water Horizontally.

From E. R. B, Lexington, Ky — What is the limit, if any, that water can be pumped in a horizoneal direction, the size of the pipe being such as to practically destroy the friction, the pump to have lift of 15 or 20 feet?

Answer .- The motion of water in pipes involves friction which cannot be destroyed, although it may be overcome by gravity or pressure in long lines. There is practically no limit to the length possible for a pipe to be laid with the friction destroyed. If there is velocity, no matter how small, there is friction, and as friction and force are opposite exponents in the problem of flowing water, a few figures as to their relation will be in line with the subject. The ratio of friction for a given velocity is inversely as the diameter of the pipe and for a given size of pipe nearly as the square of the velocity. Thus the head required to move water in a 6-inch pipe at the rate of 2 feet per second, delivering 231 cubic feet per minute. will be but 0.4 loot for the first 100 feet; 0.8 foot for 200 feet and 4 for 1000 feet in length, rising to 21 feet per mile. In a 12-inch pipe the friction will be one-half the above and the volume increased four times. On the other hand, if the volume of flow is to be increased with a 6-inch pipe, say to twice the velocity as in the case above stated, or 4 feet per second, the friction head will be as the square of the increase or four times, which equals 84 feet head per mile of 6-inch pipe. In this manner, knowing the head (hydrostatic pressure) that can be maintained and the quantity of water to be delivered a certain distance, the size of pipe can be computed, or with a given size of pipe the quantity can be computed for any pressure head.

### Why Do Tin Strainers Act So?

From A. B. M., Canton, Ohio.—I would like to know why it is that perforated tin used as a coffee strainer makes the coffee blue black?

The new Anglo-Japanese treaty throws open the whole of Japan to British trade and industry. Hitherto

foreign trade has been confined entirely to a limited number of treaty ports, and foreign merchants have been hampered in their business by many vexatious restrictions.

### Our Human Machines.

The comfort of workmen is a matter to which a great deal more attention could be given than it at present receives. It is true, says The Iron Age, that the question is not wholly neglected when new factories are built or old ones are remodeled. Here and there employers can be found with hearts big enough to consider that the health and comfort of their working people are worthy subjects for their careful contemplation, and purse strings are loosened a little more to enable improvements to be made directly for the benefit of the man at the bench, lathe or rolls. But these instances are altogether too rare. When a new mill or factory is being designed, the highest talent will be employed and the utmost pains taken to secure the best type of building for the purpose. Foundations will be most carefully looked after, the character of the building will be very elaborately studied so as to provide safeguards against possible disast-r from overloading or damage by fire, and the arrangement of the machinery will take the most anxious thought. In these days of small margins labor saving devices will be studied in every direction, and the highest development of human ingenuity will be called into play to reduce loss of time in every direction, as well as to secure expansion of output. All these details, and more, receive anxious attention, but the best machine after all, the human machine, is too frequently left to shift for itself, with no special care. The human machine, while it is capable of withstanding very rough treatment with no immediately perceptible ill effects really needs better care than any other part of the machinery in the shop. It needs ventilation, protection as far as possible from drafts and overheating, proper warmth in winter, facilities for promoting cleanliness, and sanitary comforts. The greater part by far of a workman's waking hours is given to his employer, and there is no doubt that this part of his life could be made much more pleasant than it now is. Perhaps if this part of the factory machinery were more carefully looked after the other part of the machinery might be found to work better also. Even if this is not the case there is nevertheless a duty resting upon the employer to do his best in this respect.

Occupations innumerable can be found in which the workmen cannot be made comfortable while performing their tasks. It would be impracticable to attempt it. Yet, even in these cases the works would be less uninviting if a man were given an opportunity to wash up before he left the place to go home. It would be still better if he were also furnished with a locker in

which to keep some slight change of clothing and thus present a somewhat tidy appearance when on his way to and from work. Smutty faces and grimy hands and soiled clothing are not badges of dishonor, but they might be left at the gates of a rolling mill or the mouth of a mine or the door of a factory without detracting from the standing of a workman, but adding very much to his self respect and to the pleasure and esteem of his waiting family. In the matter of sanitary conveniences especially too little care is exercised. Horses are stabled with as much regard for their comfort as is paid to workmen in this respect. When a mill or other manufacturing establishment is erected at a cost of thousands of dollars or hundreds of thousands, it seems pitiful that a few hundred dollars could not be spared to provide sanitary conveniences of a comfortable and cleanly character. In these days water closets and the requisite plumbing work are not costly, underground drainage can be easily arranged, and water for flushing is always available from the supply tanks. Why should the most primitive methods still be found in use, creating disgust whenever a resort to them is necessary, and perhaps injuring the health of those who are obliged to work in their vicinity? The employer to-day, more than at any time in the past history of the world, can affirmatively answer the question, " Am I my brother's keeper?" He is, and it is incumbent on him to treat that brother as well as possible.

This seems to be an excellent field for the exercise of practical philanthropy. A fine library building in a manufacturing town is a most desirable institution. It is well to attempt to lead the minds of workingmen and their families beyond the mere contemplation of their surroundings, and give them an opportunity to enlarge their powers and breathe the atmosphere of something else than a material life, but the library building should follow the establishment of good wash rooms and toilet rooms at the works. There is where the care of a workingman should begin, in the promotion of his comfort and in ministration to his absolute personal necessities. The endowment of institutions of this character should precede the endowment of a library by

The Turkish Government has granted a concession for the opening up of a recently discovered deposit of manganese ore near Caradja, in the province of Aldin, Turkey. The deposit is said to have an area of 900 acres.

The cotton spinning industry is reported as making great strides in Japan in recent years. In 1887 there were in existence 24 mills, with 130,000 spindles, and in 1893 there were 43 mills, with 385,265 spindles. Manual labor being very cheap, the manufacturers are able to meet all outside competition, and the foreign imports of cotton goods are falling off materially every year.

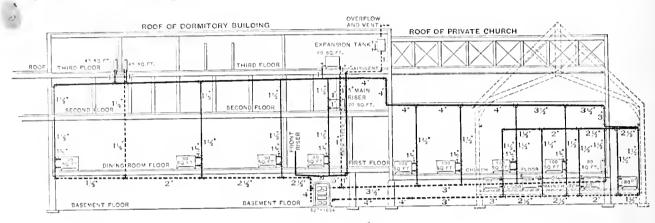

# STEAM AND HOT WATER.

### Heating the Rosary Hill Convent.

The heating plant installed in the Rosary Hill Convent, at Sherman Park, N. Y., by Albert Cryer & Co., 85 Centre street, New York, is interesting from

the 5 inch riser on the back wall of the building is shown. At the ceiling of the second floor, a plan of which is shown in Fig. 3, the 5 inch riser sep arates into two branches, a 3 inch branch running toward the dormitory with a fall toward the extreme end. A plan of

duced to 2 inch, to a point where a 1-inch connection is taken to another radiator in the dining room on the first floor. The main continues 2 inches until the end of the dormitory is reached, where it is reduced to 1½ inches and drops to a radiator in the

Heating the Rosary Hill Convent .- Fig. 1. - Sectional Elevation.

the different levels on which the radiators are located, some of which are very nearly on a level with the boiler itself. A No. 327 12-section Richmond boiler is used for the work, which carries about 2500 feet of direct radiation in addition to the piping, which is not covered, except the returns under the churches.

the third floor is not given, as it is similar to the plan of the second floor of the dormitory. A 1 inch connection is taken off to a radiator in the third floor and continues 3 inches in size until two 1½-inch connections are taken off, one to a radiator on the third floor and the other running over to the corridor,

MAIN RISER BACK

extreme end of the dining room, after which it drops to the return shown in Fig. 2. The return is 1½ inches in size until it reaches the return from the first dining room radiator, when it is increased to 2 lnches, and after receiving the second radiator increased to 2½ inches, and receiving the return from

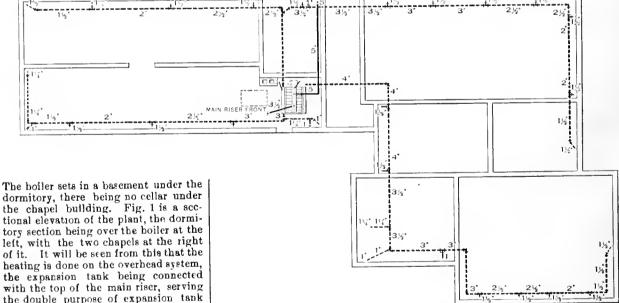

Fig. 2.—Plan of Basement and Chapel Foundations.

tory section being over the hoiler at the left, with the two chapels at the right of it. It will be seen from this that the heating is done on the overhead system, the expansion tank being connected with the top of the main riser, serving the double purpose of expansion tank and air vent. Fig. 2 shows a plan of the basement with a 5 inch riser running from the back of the heater to the back wall of the dormitory building and a 81 lnch flow main running to the front wall of the building. shows the system of return mains. There being no basement under the chapels and the floors of the chapels being on different levels the return mains are wrapped with layers of asbestos paper, halr felt, bullding paper and then covered with canvas. In Fig. 2 only

connecting with a radiator and dropping into a radiator below in the passage on the first floor, a plan of which is shown in Fig. 4. The main is then reduced 2½ inches and continues to a point where a 1½ inch connection is taken to a radiator in the dining room on the first floor, after which the main is re-

the last radiator continues 2½ inches in size until it meets the branch return from the chapel building. The 4 inch branch from the 5-inch main riser continues over to the end of the dormitory building, where it makes a drop of several feet to the ceiling of the private chapel. The celling of the private

chapel is arched, being 33 feet in hight at the center and about 23 feet in hight on the sides. This main continues 4 inches in size until four 1½ councertons have been taken to four radiators in the private chapel, after which it reduces to 3½ inches, which size it continues to a point where it drops down to a level of the ceiling in the main church, two 1½ inch connections having been taken

dormitory. It then merges into a 5-inch return and runs to the boiler. The 3½-inch flow main, which is taken from the front of the boiler rises to the ceiling of the second floor and is divided into two 2½ inch branches, one running along the dormitory until a 1½ inch connection is taken to the radiator in the chapter room on the first floor. It continues 2½ inches in size until a second

connection is taken to a radiator in the same room. At this connection it is reduced to 1½ inches until a 1 inch connection is taken to a radiator in the hall. The main then continues the same size until a 1 inch connection is taken to a radiator in room 1 on the first floor, after which it is reduced to 1½ inches and runs to a radiator in room 2 on the first floor. The return from this system

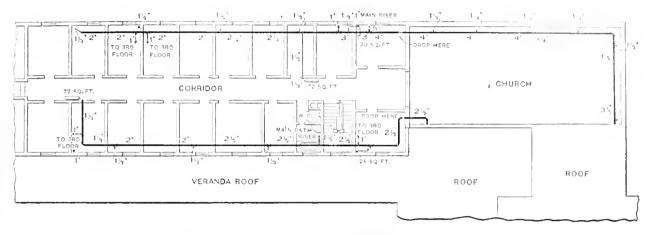

Fig. 3.-Plan of Second Floor, with Mains at Ceiling.

from it to radiators in the private chapel. The ceiling in the main church is 31 feet in hight in the center and 20 feet at the sides. After having made the drop the main is 3 inches in size, a 1½-inch connection being taken off to a radiator in a room between the private chapel and the main church. The main then continues 3 inches in

connection is taken to the radiator in the chapter room, after which it is reduced to 2 inches and continues to the last radiator in the chapter room. After this connection the main continues along the ceiling to a radiator in the far end of the corridor on the second floor, the return dropping down to the basement and returns, as is shown in Fig.

commences with the radiator in the end of the main church at the right of the entrance and is  $1\frac{1}{2}$  inches in size up to the first radiator, and on receiving the connection from it is increased to 2 inches until the second radiator is reached, when it is increased to  $2\frac{1}{2}$  inches, and continues until the fourth radiator is connected with it, when it is

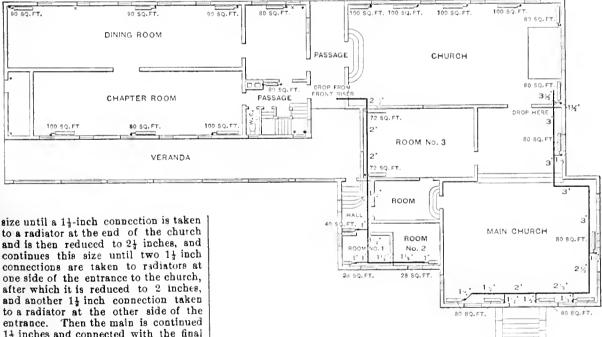

Fig. 4.—Plan of First Floor.

size until a 13-line counterion is stack to a radiator at the end of the church and is then reduced to 2½ inches, and continues this size until two 1½ inch connections are taken to radiators at one side of the entrance to the church, after which it is reduced to 2 inches, and another 1½ inch connection taken to a radiator at the other side of the entrance. Then the main is continued 1½ inches and connected with the final radiator on this branch. The returns for the radiators in this section of the building are divided, a 1½ inch return being taken from the radiator in the room between the chapel and church and continues until the return from the first radiator in the chapel is received, when it is increased to 2 inches in size, and after receiving the second radiators when it is increased to 3 inches until connections from the first two radiators when it is increased to 3 inches until connections from the last two radiators are received, when it is increased to 3½ inches in size until it reaches the branch return from the

2. The other  $2\frac{1}{3}$  inch branch runs toward the chapei buildings, a 1-inch connection being taken to a small radiator on the second floor. The main continues this size until the point where it enters the chapel building, where a drop of several feet is made. After reaching a line level with the ceiling in the chapel it passes through the wall and a connection is taken to a radiator in room 3 on the first floor. Here it is reduced to 2 inches in size and a second

increased to 3 inches. It continues this size, receiving the connection from the radiator in room 2, and on receiving the return from the radiator in room 1 is increased to 3½ inches in size, receiving the return connection from the radiator in the hall and is then increased to 4 inches, receiving the connections from the two radiators in room 3, after which it returns to the boiler with an independent connection. The return from the radiator on the second floor in the

small room at the right of the hall and from the radiator in the room above it on the third floor are connected with the return from the front of the dormitory. The ceilings in the dormitory are 12, 10 and 9 feet in hight on the first, second and third floors respectively. Under test this plant shows a rapid circulation and a temperature at the returns such as is considered an evidence of a well constructed job.

### HEATING NOTES.

Col. W. C. Mowry of Norwieh, Conn., has proved that he is not alone popular in the heating trade by being elected Secretary of the State of Connecticut by a plurality of something like 15,000. Col. Mowry assumes office on January 1.

THE SPRINGFIELD COIL BOILER COMPANY, 48 Hampden street, Springfield, Mass., have had their shop running full time in turning out their coil boiler for house heating.

THE PHILLIPS MFG. COMPANY, Spring field, Mass., are equipped for supplying wrought iron pipe of all sizes cut to lengths. They have recently erected the piping in the power house of the Springfield Street Railway Company, using no ells, but making all turns with large sweeping bends in the pipe, which was of the extra heavy grade.

B. Mallory, representing the stove department, and T. J. Douglas, representing the steam and hot water department of the Richmond Stove Company, Norwich, Conn., were traveling Weatern Massachusetts together this week.

SHUMWAY & RILEY, Northampton, Mass., have erected a number of steam heating plants this year on the circuit system, using the Richmond hoilers, all of which have proved satisfactory during the recent cold spell which covered western Massachusetts with snow.

SIAS & STEWART, Springfield, Mass., can refer to many steam and hot water plants of their construction that have been tested satisfactorily. They are a pushing young business house.

THE NEW YORK EXHAUST AND BLOWER PIPE COMPANY, Hartford, Conn., have just completed an exhaust system for handling shavings for the West Norfolk Lumber Company, at West Norfolk, Va. They fitted the factory of the Pope Mfg. Company, Hartford, Conn., with an exhaust system for removing the dust from the polishing wheels in their nickel plating shop and are arranging systems in the factories of Strauss Bros. and the H. E. Taylor Company, New York. They do a large business in the sheet iron work for indirect heating systems and fan systems.

THOMAS M. HARTLEY, a hot water expert from the Howard Furnace Company, New York, was a visitor at the Cowles-Couch Company, Hartford, Conn., this week.

THE MUNCIE ARCHITECTURAL IRON WORKS of Muncie, ind., are reported by the local papers to be very actively at work making radiators, among other cast iron products.

A LONDON CABLE DISPATCH of November 14 advises us that owing to the prevailing lowness of prices several Welsh tin plate works have been shut down.

### SCRAP.

THE FRANK-KNEELAND MACHINE COMPANY, Pittsburgh, Pa., are busy on tin plate machinery for Goldsmith & Lowenberg's new tin plate mill, at New Kensington, Pa., consisting of hot and cold mills, doubling shears, squaring shears, &c. The firm have also booked orders for the machinery for the Crescent Sheet & Tin Plate Company of Cleveland, Ohio.

The falling off in the value of the and terne plates imported into the United States during the first nine months of this year, prior to the change of duty, was very marked. According to the official Treasury records the total value of these plates on which duty was paid under the old scale up to September 30 was \$8,662,376, as compared with \$13,366,229 in the same period of last year.

A PRESS DISPATCH from Youngatown, Ohio, states that a firm in Wheeling, W. Va., has been figuring for some time with the Lloyd Booth Company of Youngstown about putting in a tin mill in the former city. Definite action was delayed pending the result of the recent elections. A few days ago the Youngstown firm received a telegram from the Wheeling people saying they would be ready to close the contract for the building of the plant within a few days.

THE TIN PLATE PLANT of the Muerer Bros., 575 577 Flushing avenue, Brooklyn, has been maintained in full operation up to the present time. A very gratifying demand is reported for their high grade American roofing plates, which is sufficient to absorb their product as fast as it is put out. The firm contemplate some important improvements in their tin plate department in the near future.

THE MORLAIS TIN PLATE WORKS at Llangennech, Wales, have recently passed under new ownership and are being enlarged and improved.

IT IS REPORTED that Stratton & Terstegge of Louisville, Ky., contemplate the erection of a tin plate plant in that city

Nothing further has been heard of any definite action by the Welsh tin plate manufacturers toward reducing the wages of their workmen. A largely attended meeting of the Manufacturers Association was held at Swansea a short time ago to consider the matter, but it is understood that decision in the question was postponed to another meeting to be called later. Strong opposition is expected from the workmen, and it is considered highly probable that a number of the works may be obliged to shut down if the reduction is enforced. The Welsh manufacturers claim that higher prices cannot be asked for tin plates if the American competition is to be met, and that existing prices offer little or no profit. The only way they can see out of the difficulty is by lowering the cost of production, and this can only be done by a reduction in the wage scale.

In Answer to the report that the Chartiers Iron & Steel Company, Limited, of Pittsburgh, manufacturers of fine sheet Iron and sheet steel, and whose works are located at Carnegie, Allegheny County, Pa., would erect a tin plate plant in the near future, we are officially advised that the statement is untrue. It is suggested that the report was gotten up for the purpose of booming some of the street car lines which are now under way in the direction of Carnegie.

As ALREADY NOTED in these columns, the Beaver Tin Plate Company have been organized at New Lisbon, Ohio, and are now engaged in the erection of a tin plate plant at that place. The main or mill building will be 200 x 100 feet in size and will be of iron. The tin house will be 60 x 184 feet and will be built of brick; the annealing house will be 70 x 80 feet and will be built of iron, while the boiler house will be 45 x 60 feet and will also be of iron. The boiler house will have a capacity of 600 horsepower. The foundations are now being put down for a six mill train of hot rolls, though only four will be put in at present. The foundations for the cold rolls of four mills have already been completed. The engine to drive the hot mills will be 32 x 60 inches, and for driving the cold mills 26 x 48 inches, and both will be of the Corliss type. Electrical cranes will be installed, one of 12 tons capacity in the main building and one of 5 tons capacity in the annealing and tin house. The entire piant will be equipped with the most modern and labor saving machinery of the highest clasa. The work of construction is being pushed as rapidly as possible, and the new concern expect to be in the market early in the coming year. Charles W. Bray, formerly accretary of the Lloyd Booth Company, Youngs-town, Ohio, is president of the Beaver Tin Plate Company.

It is stated that a company of Pittsburgh capitalists have about closed a deal for the purchase of a site in New Kensington, Pa., on which a tin plate plant will be erected. It is stated this new plant will be about one-half the size of the one now under erection by Goldsmith, Lowenberg & Co. of that place.

On Tuesday, the 13th inst., operations were resumed at the plant of the United States Iron & Tin Plate Mig. Company, Demmler, Pa., with non-union men. The start is said to have been successful, a large number of skilled workmen having been obtained from Pittsburgh, Beaver Falls, Braddock and other places. The men are being cared for in a hotel owned by the firm and located near the works. Be-fore the end of this week additional departments of the plant are expected to be put in operation. A start has also been made with non-union men at the tin plate plant of Wallace, Banfield & Co., Limited, at Irondale, Ohio. The resumption of work at these two plants with non-union men is the entering wedge of what promises to be a very bitter fight between the Amalgamated Association and the firms composing the Tinned Plate Manufacturers' Association.

THE ANDERSON FOUNDRY & MACHINE COMPANY, Anderson, Ind., whose leading product has hitherto been brick and tile machinery, have made a new departure. They have secured the services of an expert in the manufacture of tinning machinery and are now prepared to take contracts for equipping tinning plants. They will manufacture the Thomas & White pot, tinning rolls, pickling machines, annealing boxes, floor plates, &c. They have already taken some contracts for tinning outfits. Last week they cast their first pot. The company have also decided to build engines up to 40 horse-power, as they find this necessary in competing for trade. For some years past they have manufactured a steam boiler for house heating which has had a good local patronage.

## ROOFING AND GORNIGE.

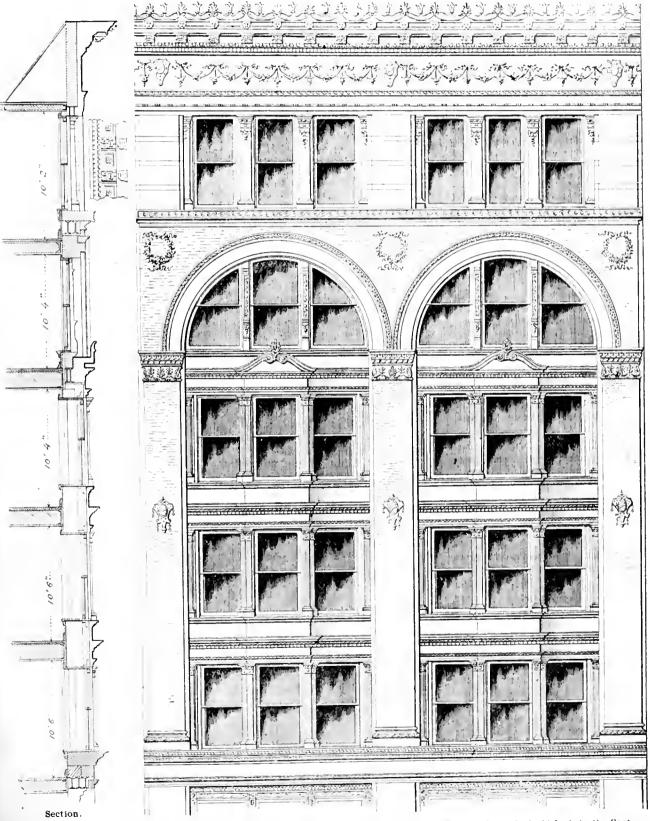

struction.

The employment of sheet metal in the fronts of buildings designed for busi- | ment of structures in many of the cities

Sheet Metal in Building Con-struction.

ness as well as dwelling purposes has grown so rapidly during the past few years as to form at the present time a marked feature of the external treat-

of the country. This in reasing use is due, no doubt, in some measure to the fact that sheet metal permits of ready ornamentation at comparatively small cost, and also constitutes in itself a light

Front Elevation of Business Block on East Houston Street, New York City. -Scale, 1/2 Inch to the Foot. Sheet Metal in Building Construction.-George H. Griebel, Architect, New York City.

form of construction, while at the same time giving bold and massive effects to the completed work. A striking example of work involving the use of copper and galvanized iron in the manner mentioned is found in a bullding now rapidly approaching completion on East Houston street, New York City. The front of the structure, which is seven stories in hight, is divided above the accound floor by a brick pilaster into two triple window bays, the exterior of the bays being covered with 20ounce copper. The object in view has been to produce rich and massive effects with a light form of construction and in this the concern doing the work, Borkel & Debevoise of 42 44 East Houston street, New York City, have been very successful. The illustrations which we print herewith represent the front of the structure above the second story, while the section shows the profiles of the copper work at the various stories, together with the appearance of the soffit of the cornice. Inspection of the front elevation shows the pilasters dividing the windows of each bay to be fluted, while the cornice of the windows at the different stories is enriched in a pleasing manner. As stated above, the two bays extend upward for a distance of three stories, and are topped with broken pediments. The story immedi-ately above the bays is finished in the form of two semicircular arches, which carry the weight of the upper story. The copper is fastened to an iron frame work which is moored to a rough brick backing. The whole treatment of the front is harmonious, giving to the building a rich and substantial appearance. The architect of the structure is George H. Griebel, of 247 West One Hundred and Twenty-fifth street, New York, who prepared the plans for Emil Unger.

## The Pattern Cutting Class at the Pratt Institute.

As previously noted in these columns, the new evening class in sheet metal pattern cutting, in connection with the trade school of the Pratt Institute. Brooklyn, N. Y., commenced its session on September 24 with a limited number of pupils, but with every prospect before it of a career of great usefulness. Several applicants for admission to the class who were accepted did not, however, materialize at the last moment. This fact is to be regretted, as it tends to discourage the authorities of the school, who have taken great pains to provide a much-needed course of trade instruction. The candidates who have joined the class, however, are reported to be making extremely satisfactory progress. They evince great interest in their work, are regular and attentive, and promise to make a good showing at the end of the term. Probably the existing hard times and the recent dearth of employment in the building trades precluded more young men from taking advantage of this opportunity of instruction in sheet metal pattern cutting, and it is expected that the next session will make a more favorable showing in point of numbers. At present the class is being instructed in a special course of pattern drawing by Louis Roulllion, the mechanical drawing instructor of the Department

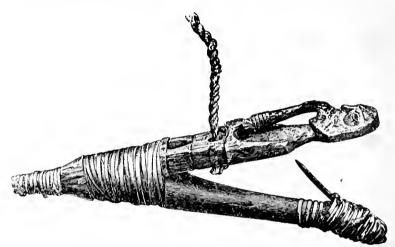

of Science and Technology of the institute. Mr. Rouillion intends to keep the pupils at this work for the first term of three months, after which arrangements will be made for a more specific course of instruction in connection with practical sheet metal work. The director of the department, Professor Richards, has consented to receive applications from any young men in the trade who have already a good knowledge of mechanical drawing and who desire to join the class at the beginning of its second term on January 2, 1895. Such candidates would, however, if accepted, be expected to satisfy the instructors that their knowledge of pattern drawing is at least equal to that of the pupils who have gone through the preliminary course at the institute.

Both Professor Richards and Instructor Rouillion express themselves as highly pleased with "The Metal Worker The management of this company is now in the hands of B. H. Gedge, who was for years connected with the American Wire Nail Company in an active capacity and who brings to the new concern the advantage of his experience in assisting to build up a great institution from a small beginning.

FERRIS BROS., South Manchester, Conn., have been awarded the contract to put the tin roof on the new building of the Manchester Electric Tramway Company, which is to be used as a car house, repair shops and office. The work will require about 3 tons of M. F. tin and 500 pounds of solder.

### Aboriginal Curio.

The primitive Fish Hook here represented is one made and used by the Aleut Indians in Alaska for catching halibut. It is constructed of two pieces of wood, properly shaped and fastened with a withe, apparently made of some kind of willow or reed, split flat. The iron

Alaskan Fish Hook, About One-third Size.

Pattern Book," to which they say they are indebted for valuable help in regard to the course of instruction they are mapping out for the new class.

### FLASHINGS.

N. S. Beebe, Springfield, Mass., makes a specialty of sheet metal work for buildings, the cornices, fronts and windows of many buildings in and near Springfield being samples of the work designed and produced in his shop.

ATWATER & McCABE, Springfield, Mass., show some very handsome sheet metal work in the copper window fronts of the new Y. M. C. A. Building.

THE PORTER IRON ROOFING COMPANY, Anderson, Ind., have quite recently completed a plant for the manufacture of iron and steel sheet roofing and siding. Their products comprise standard crimped roofing, center crimp roofing and siding, corrugated sheets, round and angle ridge cap, standing seam roofing, roll and cap roofing, weather boarding, &c. The plant is equipped with the latest improved machinery for the manufacture of roofing and siding. Power is furnished by a gas engine, which does its work satisfactorily and very economically. The factory is located near the belt railroad which runs around the city, and the company are now putting in their own track to enable them to make direct rail shipments and save cartage.

hook, something like a pointed Wrought Nail, is also secured with a withe. On this hook the bait is placed, and in trying to get it the fish is caught. Passing through the center is a rope about 36 inch in diameter, made of twisted withes, fastened underneath swivel-like, so as to turn freely. When in use the hook maintaius a horizontal position. The suggestive action shown in the rude carving in putting the hand to the mouth may be based on actual results in the augler's experience, indicating that with the hook and the hand the mouth is filled. The greatest dimensions of the hook are 1134 x 5 inches. This interesting curio, temporarily in the possession of Henry C. Squires, 20 Cortlaudt street, New York, is the property of Rev. Dr. John C. Bliss of New York, who brought it from Sitka two years ago.

Work on the new battleships "Indiana" and "Massachusetts," at Cramp's shipyard, Philadelphia, is progressing rapidly. In two days of last work the workmen placed in position seven of the heavy 40 ton 18 inch side armor plates of the "Indiana;" 12 of the 20 plates are now in position, 6 more are ready for placing and only 2 remain to be shipped from Bethlehem. The barbettea of the vessel are almost completed. The work on the "Indiana's" armor is regarded by the contractors as being remarkably rapid and satisfactory. The "Massachusetts" is nearly ready for her builder's trial.

### The Everclean Stone Filter.

A filter for which special merita are claimed is being manufactured by the Stifel-O'Neil Home Comfort Company, St. Louis, Mo. A general view of the No. 1 filter to shown in Fig. 1. This filter has a capacity for furnishing all the water for a large family, for drinking, cooking and even laundry work. Fig. 2 shows a sectional view of the No. 3 Everclean filter, which is the smallest the manufacturers make, having a ca-pacity only sufficient for the kitchen and dining room needs of a small family. The general principle of the two filters is the same, and by referring to the sectional view its operation will be understood. A is the supply pipe through which water is admitted to B, through which it is carried to the cylinder C, from whence it is driven by the pressure through the stone E into the channel F, and thence up into the chamber G. it p sees through the hose connection H to a bucket or other receptacle that may be provided for it. When the stone E becomes coated with mud the depression of a hand lever opens the Fuller ball cock at J, and at the same time admits the city pressure through another Fuller ball cock at L into the top of the cylinder M. The

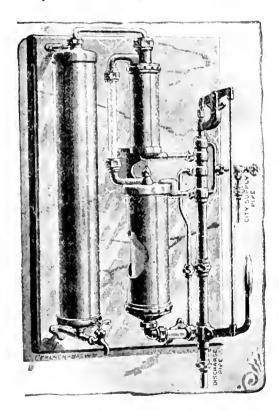

ment, intimate that there is as yet little or no opening for the importation of machinery into Chins. The Chinese have not yet been convinced of the utility of adopting any modern labor saving machinery. Perhaps one of the effects of the present war may be the enlightening of the celestial mind and the opening up of China in this respect.

### News and Notes.

The estimates of the Naval Ordnance Bureau for the coming year call for an expenditure of nearly \$7,000,000, of which \$5,237.670 is for the armament of vessels already authorized, and \$25,000 for arming and equipping the naval militia.

The railroads in Indiana, Illinois and Ohio are said to be experiencing great difficulty in filling the demand for freight cars, more especially stock and coal cars. The demand from shippers is referred to as showing an extraordinary increase since election.

The combined manufacturers of Cincinnati and its neighborhood have issued a general call for a convention in that city on January 22, 1895, to form a National Manufacturers' Associ

The Everclean Stone Filter.-Fig. 1.-General View of No. 1 Everclean Stone Filter.

water thus admitted forces the piston downward, driving the water in G through the channel F and out through the stone E into the annular space D, carrying with it the mud, which falls with the water down through the ball cock J into the waste. When the lever is raised again the waste cock at J is closed and the filtered water again is driven up through the channel F into the cylinder G, forcing the piston ahead of it until it reaches the top of the stroke. When this is done the outlet H is opened and the filtered water has free passage to the reservoir.

Recent reports from the British Consul at Chefoo, China, to his Govern-

ation. The purposes of the proposed organization, which is to be of a non-political character, will be to secure wholesome legislation for the encouragement of manufacturing and to stimulote favorable trade relations with foreign countries.

Texas cotton growers have decided not to sow any more than one-half this year's acreage of cotton next season, owing to the present low selling price of cotton, which, they claim, is from 1 to 2 cents a pound below the cost of production.

Superintendent Hannan of the New York State Department of Public Works, has ordered that the Erie,

Champiain, Black River, Oswego and Caynga and Seneca canala be closed for the season on Friday, November 30, at midnight, unless sooner closed by ice.

The second attempt to carry out a speed trial of the new United States torpedo boat "Ericsson" was defeated on Monday by another breakdown in her machinery just after she had started on her trial trip. The eccentric strap of the port engine broke while under full headway. Professional opinion tends to the belief that the "Ericsson's"

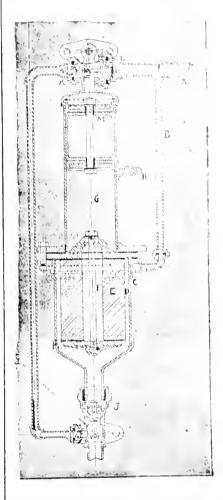

Fig. 2.—Sectional View of No 3 Filter.

castings are too light for high speed in rough weather. This, however, is no fault of the builders, they having been made according to the Government specifications.

The Ottoman Minister of War has decided that in Inture Mauser and Martini-Henry rifles will be manufactured in the workshops of the Government arsenal at Constantinople, instead of being obtained from abroad. To this end the workshops are being fitted with the necessary plant. Special laboratories are also being constructed for the manufacture of a smokeless powder invented by a Turkiah officer.

An order in council has been issued by the Canadian Government amending the regulations governing the payment of drawbecks on duties on articles entering into the construction of goods manufactured in the Dominion for export. Hereafter 99 per cent. of the duty paid will be refunded instead of 90 per cent. The change will place Canadian manufacturers in an extremely favorable position to compete in foreign markets with the manufactured products of other countries.

# THE TIN SHOP.

## Pattern of Can Top Having One Side Vertical.

From J. A. J. Knoxville, Tenn.—Will The Metal Worker give a correct method for obtaining the pattern of a can top having one side vertical? In the aecompanying sketch A B C D represents the elevation of article, E F G H the plan of base, and E J K L the plan of opening in the top.

Answer. - In Fig. 1 is shown a reproduction of our correspondent's sketch. Fig. 2 shows another drawing of the same form, somewhat larger, with which is also shown the method of deriving the patterns. Since the top and the base of the can top are both circular and are parallel, the shape of which the pattern is required becomes a frus tum of a scalene cone, and lines drawn upon its surface from any set of points assumed in the circumference of its base to its apex will divide the circumference of the top into similar and proportionate spaces. Therefore, the first step is to extend the lines of the aides B A and C D until they meet at M, the apex. Next divide the plan of

ELEVATION

F

PLAN

Pattern of Can Top Having One Side Verticat — Fig. 1.—Plan and Elevation of Article for which Pattern is Required.

toward the apex M, cutting the line of the top B C, all as shown. With M as center describe ares from each of the points in the base line A D, and extend them indefinitely in the direction of O. In the same manner draw ares from the traced through these points, as N Q O, will be the bottom of the pattern. From the points in the line N Q O draw lines cutting the arcs of corresponding number previously drawn from B C; then a line traced through these points

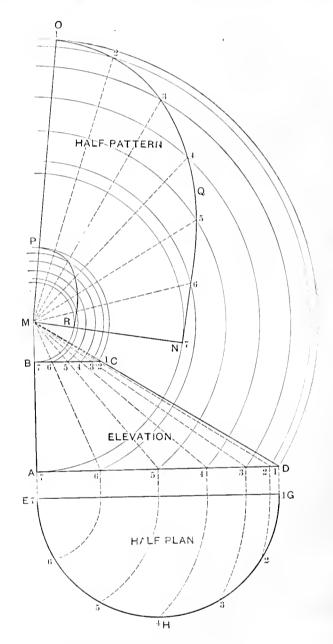

Fig. 2.—Method of Obtaining Pattern.

the base, one half of which, E H G, only is shown, into any convenient number of equal spaces, as shown by the small figures. As it is necessary to ascertain the distance from each of these points to the apex of the cone the simplest method of accomplishing this is as follows: From E as a center, with E 6, E 5, E 4, &c., as radil, describe ares cutting E G. Carry lines vertically from each of the points in E G, cutting the base line A D; thence carry them

points of intersection in B C, as shown. From the apex M draw any line to intersect the arc from A or 7 of the base line, as M N, which will form one side of the pattern, corresponding to B A of the elevation. Set the dividers to the space E6, used in dividing the plan of the base, and starting from N step from arc to arc, thus laying out the stretchout of the base E H G, and at the same time locating each point at its proper distance from the spex M. A line

of intersection will be the top of the pattern, and PRNQO will be one-half the required pattern.

Victor de la Cordova, a New York exporter, has been held by the Federal Grand Jury in \$25,000 bail for placing cartridges among barrels of tallow shipped in the Ward Line steamer "Yumurri" for Havans. It is said that the Ward Line owners attribute the diaasters to their other vessels during the past year to a similar source.

#### Howard Hot Alr Blast Furnace.

To meet the growing demand for a furnace that will efficiently burn soft coal, the Howard Furnace Company, Syracuse, N. Y., have lately patented

understood and the arrows show the course of the air as it rises through them to the fuel and combustion chamber. The special feature of this ar rangement is the provision it makes for heating the air to a high degree, which is one of the essential conditions

Howard Hot Air Blast furnace.

and put on the market the Howard hot air blast furnace, a transparent view of which is presented in the accompanying illustration. The difficulty in burning soft coal is to so proportion and so distribute the air that the coal will be perfectly consumed and no heavy smoke formed. To accomplish this desirable result the hot air blast, as they term it, has been patented. The device consists of a sort of skeleton fire pot, arranged within the fire pot of

Fig. 1.—Perspective.

of smoke prevention. The attachment is not in any way complicated and, what the trade will appreciate, it is so made that the whole or part of it can

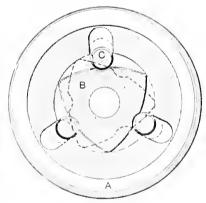

Fig. 2,-Cross Section.

THE TRIMO NIPPLE HOLDER

the furnace and made of segments connected with vertical grooved sections that extend to the sah pit of the furnace. These vertical grooves form shallow channels between the fire box proper and the supplementary lining through which the air rises above the fuel. By referring to the illustration the position of these channels will be

be placed in the fire pot of the furnace through the feed door without disarranging the furnace proper. Another feature of the hot air blast to which the manufacturers allude is the ease of regulating the supply of air under the control of one damper. In summing up the merits of the Howard hot air blast the manufacturers refer to them as followed.

cutter the greater the grip on the nlpple, as the tendency is to move the rolla toward the outer ends of the cam.

Application is to be made to the Dominion Parliament to incorporate a company to build a trans-Canadian railway from Quebec to Fort Simpson on the Pacific Coast.

lows: Heated air is Introduced to the fire and a sufficient supply of oxygen admitted, a powerful refrigerating influence avoided and a more rapid mixture obtained, the result being that the smoke is reduced to a minimum and the heat of the coal utilized more thoroughly. The furnace is made with diameter of tire pot ranging from 18 to 30 Inches, and estimated heating capacity of from 5000 to 60,000 cubic feet. The Howard Furnace Company have issued a descriptive and illustrated eircular of this new furnace, which deserves more than casual mention, be-cause it presents the merits of the system in a perfectly clear and concise way. The pamphlet was apparently written by one who thoroughly understood the theory of combustion and has explained it in a way to appeal to the intelligent and practical man.

#### The Trimo Nipple Holder.

The Trimo nipple holder, made by the Trimont Mfg. Company of Roxbury, Mass., will hold nipples to cut either right or left hand threads. It holds the pipe firmly and releases instantly when reversing the die. It is adapted for either vise or machine use, and the nlpple can be placed or removed without stopping the machine. The collar of this holder is suitable to fit the sleeve of the stock for the size pipe it is intended to hold, thus insuring a straight threaded nipple. When used in a machine the collar surrounds and fits the outside of the thread already cut and the rolls lock on the inside of the pipe, making the hold firm and true.

The construction of the holder will be understood from the engravings, Fig. 1 being a perspective view, Fig. 2 a section through the gripping mechanism and Fig. 3 a perspective view with parts broken away. On the outer end of the shank is formed the triangular cam B. In longitudinal recesses formed in the body are the locking rolls C, which are pressed against the cam faces by aprings. The nipple is introduced between the collar A and these rolls. It is evident that when the collar is moved so that the cam occupies the position indicated by the dotted lines, the three rolls will be forced outward against the inside of the nipple, which will be held firmly between the rolls and collar. Moving the cam in the opposite direction will permit cutting the opposite thread. The greater the strain of

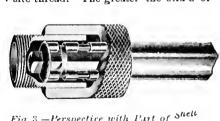

Fig. 3.—Perspective with Part of Shell Broken Away.

# PLUMBING and GAS FITTING.

Evening Classes at the New York Trade School.

The work of the evening classes at the New York Trade School is progressing very satisfactorily. Considering the depressed condition of the building trades in this section during the past year, the number of candidates presented for enrollment in the various classes on October 15, the opening night of the fourteenth season of the school, is considered encouraging. Naturally, with the distressing lack of employment which so many mechanics have experienced of late, the applications for instruction have not been so numerous as they were last year.

The evening plumbing class, which last season was somewhat overcrowded, having 143 pupils, is this year composed of 103 young men, and this proportion of decrease is about the rule in all the other classes. The falling off ia most marked, not among the beginners, but among the apprentices and younger journeymen who are already working at their trades. The total number of pupils under instruction in all the evening classes is 228. This includes the plumbing, carpentry, blacksmithing, stonecutting, bricklaying and plastering, house and fresco painting, and the printing classes. About 90 applications have been received up to date for the day plumbing class. Probably a few more names will be added to the list before the opening of this class on Monday, December 3.

A good deal of interest appears to have been aroused in connection with the two new classes which will be inaugurated this winter-namely, those in tinsmithing, roofing and cornice work, and in steam and hot water heating. Numerous inquiries have been received by the trade achool officials in regard to them, and it is hoped that they will be enabled to start up these useful branches of instruction with a goodly number of candidates. Applications for admission to them should be transmitted as soon as possible to the New York Trade School, First avenue, Sixty seventh and Sixty-eighth atreets, New York City.

#### Plumbing Class at the Pratt institute,

The trade school classes of the Pratt Institute, Brooklyn, are fully as well attended this season as they were last year. The plumbing class in particular is manned to its fullest capacity. Had the accommodation for pupils been conaiderably larger there would have been

no difficulty in utilizing it, a number | of applications for admission having been refused owing to lack of space. The present plumbing class is composed in part of second term pupils, who are going through a more advanced course of instruction than the beginners, and who will, if successful, be awarded the certificate of the institute at the close of the current season. A new feature is a course of weekly lectures in the higher branches of scientific plumbing which are being given by Instructor John Todd to the second-year pupils.

#### Cleaning Solder.

BY OLIVER TWIST.

This is something that I believe is not understood as well as it should be by the plumbers of to-day. There are certainly a large number who do not understand it at all, especially in country towns, where they have largely to depend upon their own resources for their

knowledge of the trade.

Among the many difficulties the country plumbers have to meet, this one of cleaning solder has bothered them not a little. They mixed their first lot of solder with great care—just so much of tin and just twice that much of lead-and they have started out to learn the art of wiping joints. They once had the opportunity of seeing a man who knew how to do it well and they watched him. My? how nicely that solder worked, to be sure. How bright it was. How smooth. How it could be moved and molded into shape, just like so much butter. They went home and tried it. It worked nicely for a while, How it could be although they burned their fingers oc-casionally. But wait awhile. What can be the matter with the solder? "It seems to set and cool about as fast as I can pour it on the pipe, and when I go to move it to get it into shape, off it falls in chunks; not adhesive at all, no ductility. It cools quite a white color, works like sawdust." "Well," you say, "if it cools so quickly, the metal can't be hot enough." "Yes it seems hotter in the pot than it was be-fore." Then comes the question: "How

It is when they have come to this  $\epsilon x$ perience that many a boy has laid down the ladle with disgust, and has become completely discouraged. Cheer up boys, there is a way out of the difficulty. Let me see if I can lead you to it. You may have spoilt your solder by overheating it. Some foreign aubatance may have got into it. You may have caused it by dipping brass couplings, &c., into the pot, in order to tin them (Don't do this on any account; tin all your brass work with a copper bolt, or soldering iron, as some prefer to call it.) It is liable to occur when wiping on brass couplings, ferrules, soldering nip-ples, &c. The reason is that brass is an alloy of zinc and copper, and the solder readily mixes with zloc, and a very small portion of zinc is sufficient to cause the lead and tin to crystallize and

separate. Now for the cure. solder must be made extra hot, almost twice the heat it should be if it was all right. Plumbers' solder melts at 440°, to clean it we want to raise it to 800°. What for? Because zinc melts at 773°. and we want to bring it to the surface. so that we may akim it off. Don't make it red hot in the daylight, or you will have reached a temperature of about 1100° and you will spoil it. Throw in a lump of sulphur, which by mixing with the zinc will help it to float. Stir up the whole thing well, and akim off the top, which will be a mixture of lead oxide, putty powder, sulphur and zinc. Then when it has cooled down to about the working point stir in lots of tallow and a little roain, which will take the aulphur out of the metal. Then after adding a little tin to pay for what we have loat by overheating the metal, it

will be ready for use again.

Another way to obtain the same result would be to granulate the solder by pounding it. When it reaches the cooling point it will break up as fine as sawduat. Then put it into some dish or other and cover it with spirits of salts, and allow it to stand over night. Then after remelting and adding a little tin it will be all right. Your solder may not be zincky, but burnt through inattention. If it becomes overheated do not atir it, but allow it to cool down to working heat, when the addition of a little tin will cure it. If you consider that tin forms putty powder at 428° and lead oxidizes at 612°, the two together at 440°, what do you think will become of it if you make it red hot in the day time—about 700° hotter than it should be? No wonder if it will not work right. Do not add fine solder or atrap solder to your metal unless you are sure of what it is made of. Solder that you buy is often adulterated with antimony, bismuth, &c., which gives it a bright appearance and makes it look good. It will form teats on the bottom of the joint in spite of you. You need to be very careful what you put into the pot if you would have good work. Don't melt zinc in the pot or ladle at all, as it is very troublesome to get rid of. Now make a note of this table.

#### English and American Plumbing.

Between the work of the American plumbers and the English workmen in the same line, says the Plumber and Decorator, there are a great many radical differences; in fact, the plumbing business in Great Britain and America is carried on upon entirely different lines. On this side of the water the plumber habitually does roofing, makes pipea and flishings, usea lead wastes, makes lead fixtures, is usually a gas fitter and very generally does decorating work. To a huilder he is very frequently a general utility man.

It is very rare to find an American plumber in the roofing business. In

fact, the two lines are usually as separate and distinct, in all except the smaller shops and these with questionable characters, as the dry goods trade and the grocery trade would be. As far as England is concerned the union of the two trades was a very natural one, because in the early days the lead roof was one of the most common coverings for buildings, and the plumber being a lead worker found quite as much to do on the roofs as with either parts of the drainage of a house. In fact, it seems that the plumber's original business was that of the sheet lead worker, and consequently he was really more of a roofer than anything else, and being a roofer flashings were part of his work.

The use of the outside waste and vent pipes is something that it is very difficult for the American plumber to understand. In such work open joints or their equivalents are necessary for taking up expansion and contraction. The fact that the winters are comparatively mild prevents the wholesale destruction of the plumbing which would take place in that country with a similar con-struction. The outside position of the pipes renders them less liable to destruc-tion by vermin than if they were placed within the building. The fact, how-ever, remains that the winters are frequently severe enough to produce frost, and at such times it is difficult to see how a lead system on the exterior wall of a house could be operated without instant destruction or, at least, stop-page. All the English authorities on plumbing, while speaking of the inside work and recommending it, fall back on the outside work as the style which, after all, seems best suited to the demanda of the people. The English plumber still does a great deal of lead work which in America has been superseded by materials obtained from the manufacturers ready for use.

Lead trap making is, in America, a thing of the past. Even the bottle trap is now a commercial article, and there is nothing remaining that needs to be made in the shop. Service boxes and drip trays are no longer made of lead, so that the modern American plumber has little to do in general plumbing work beyond bending and fitting pipe and making safes. In the better class of work even safe making is disappearing and water tight floors are taking its place. It is not an unheard of thing to hind first class jobs in that country where not 5 pounds of lead have been employed on the whole of the plumbing

work.

In Americs, as in England, gas fitting is recognized, and has been for many years a legitimate part of the plumber's business. In England the union of gas fitting and plumbing seems to go back to the very beginning of the art of conducting gas pipes, and the continued use of the so-called "composition" pipe, which is a bendable pipe like lead, makes it a very proper branch of the trade. In America, on the other hand, the plumber has taken to the use of iron, brass and other hard metal pipes to such an extent that he has to have his shop fitted with most of the tools for handling wrought iron pipe. Hence he naturally combines gas fitting with wrought iron pipe work as a proper, legitimate branch of his business.

On the other side of the water there is a constant advance in the styles and manufacture of plumbing goods of all kinds. There is nothing used by the plumber, from a joint for lead pipe to a complete set of bathroom fixtures, that he cannot buy ready made. The work

is becoming more and more a trade in which science and the ability to set up ready made fixtures and ready jointed pipe is more essential than skill in working lead. The schemes of plumbing and drainage made uccessary by their tremendous buildings are of a character to call for scientific knowledge of the highest class, but the manual skill needed beyond that of making a perfect screw or calked joint does not seem to be called for. Job after job of fine plumbing work is turned out, and the master plumber will tell you that he did not use a pound of lead. It requires very little thought, therefore, to see that the tendency of the plumbing work in the United States is dia metrically opposite to that of Great Britain, and it remains to be seen whether in the future the lines of advancement are to be still further diverging or in common.

## Springfield, Mass., Trade School.

A trade school has been started at Springfield, Mass., as a department of the Christian Industrial and Technical School, founded by the Rev. David Allen Reed. This department is under the superintendency of L. P. Strong, and comprises classes in five different trades, in which instruction is given by competent master workmen. The class in wood carving is taught by J. Desoe and has six pupils. There are six pupils in the carpentry class, taught by Chas. McGregory. In the bricklaying there are seven pupils under the charge of Lewis Hunt, and Frank Steel has six pupils in a sign painting class. Our New England readers have an opportunity of receiving instruction in plumbing from F. M. Tower, the Plumbing Inspector of Springfield, and this class already has 14 scholars, about half being helpers in the local plumbing shops. Some increase in attendance is expected at the plumbing lectures, which have been prepared with some care, and are said to be exhaustive in their treatment of the practice and theory of plumbing. The tuition fee for the classes is \$15, except the plumbing class, which is \$14. The classes opened on Monday night, and will run three nights a week until April. This is the first year for this school, and every effort will be made to advance the pupils, so that in future the school will have a larger attendance, and if possible support a day class, for which some demand has been found.

#### TRAPS AND VENTS.

A NEW PROJECT for the sanitation of the sewers of the city of Mexico calls for the building of some 25 windmills in different parts of the city at a cost of \$25,000. These windmills will rotate paddle wheels in the sewers and quicken the current to 1 meter a second.

A CERTAIN MR TUER, who resides in London, has been much agitated over the question of odors in a nearby district, and under date of October 16 of this year he sent the following announcement respecting the had smells to one of our foreign contemporaries: "Whereas some evil disposed stinks,

emanating at irregular intervals from the Lord knows where, intrude themselves into the nostrils of the unfortunate devils whom business daily calls together in Leadenhall street and its neighborhood. And whereas the writer hereof and his neighbors are often sickened unto death thereby, information, in writing only, as to the responsible concocter of these villainous stinks will be received by Messrs, Carr and Martin, solicitors, 11 and 12 Great Tower street, E. C., or of the may aging director of the Leadenhall Press, Limited, 50 L. adenhall street, E. C.

John M. Thompson and WM H. Allen, who have conducted a plumbing and tinsmithing business, at Washington, Pa., under the firm name of Thompson & Allen, have dissolved partnership. Mr. Thompson will continue business at the old stand.

COLLMAN & WESCOTT, Fair Haven, Vt., quarriers and manufacturers of slate. are offering a line of wash trays in three regular sizes and any shape or slze as ordered. They state that these tubs are made of the very best quality of slate obtainable, and are grooved and put tegether with bolts and insoluble cement.

The following story comes all the way from Haverhill, Mass. Scene: Stove and plumbing establishment. Exter agricultural looking individual who wants somebody sent out of town to put a faucet in a pipe. A plumber with full kit is started off and arriving finds that the job needing attention is putting a new damper in a stove pipe. Exit plumber disgusted. Bill, \$8.

THE WHITAKER SUPPLY COMPANY, Kokomo, Ind., a concern manufacturing plumbers' brass goods, have, after long litigation, shaken off a receivership and, it is reported, are doing a fair business.

THE MASTER PLUMBERS' ASSOCIATIONS of Connecticut, are arranging a State Association with the view of urging the passage of a plumbers' law. The journeymen plumbers will be asked to join the Masters' Association in getting the bill through the Legislature.

IT IS REPORTED that the plumbers of Minneapolis, Minn., will continue to work at old wages, owing to scarcity of work.

The Master Plumbers of Mont-Real and Vicinity evidently mean ousiness. At their last general meeting a decision was reached to apply to the Parliament of the Province of Quebco for an act of incorporation. Legislation, a Canadian correspondent informs us, costs money in Canada as well as in the United States, and the amount necessary, \$350, was subscribed instanter. The Master Plumbers' Association of Montreal and Vicinity show by this liberal action that they intend to continue in existence.

SMALL BROTHERS are erecting a building on Broadway, Everett, Mass., to be used as a plumbing shop.

F. A. McCaulay, Huntington, Ind., has purchased the plumbing stock formerly owned by Buchanan & McCaulay and will continue the plumbing business at the corner of Market and Warren streets.

THE FAIR HAVEN MARBLE & MARBLEIZED SLATE COMPANY, Fair Haven, Vt., publish an illustrated circular of some of the slate goods of their manufacture. One of them relates to kitchen sinks and shows sinks in different styles.

Attention is also directed to laundry tubs, marbleized state shelves, slate washstand tops and white marble work; likewise slatestone, tile floors and wall slates. Illustrations are given, together with tables of sizes and price-lists and descriptions of the goods.

GRORGE BOOTH, the inventor of the weil-known Steel Clad bathtub and the president of the Steel Bath Mfg. Company, Detroit, Mich., recently had a disagreesble experience, due to the overzealous action of a United States Marshal anxious to enforce the law against foreign labor. Mr. Booth is also the head of a manufactory of tubs at Toronto, Canada. While on a recent visit to Detrott, as he was about to leave his hotel late Saturday night, ho was accosted by a United States Marshal who politely invited him to the Commissioner's office. On striving there it appeared that the transaction was a case of arrest on a charge of importing foreign labor, and had Mr. Booth been a poor man or unable to procure bail he would have been put in the common jail to await trial. Bail was promptly furnished, however, but numerous witnessses had to be procured and lawyers paid. In introducing and establishing the new industry in the United States Mr. Booth had found it desirable to bring an expert mechanic with him to set up the requisite machinery, but as this is permitted under the act he was released after considerable delay without having the matter brought to trial.

SMITH STANNARD, 17 Harrison avenue, Springfield, Mass., makes a fine display of gas and electric lighting fixtures, and has an attractive line of wood mantels, art tile grates, fire dogs and fire place furnishings.

Donahue Bros., 9 Pynchon street, Springfield, Mass., have a well kept sample room showing a Faultless and an All Right boiler, a line of modern closets and an enameled iron and steel clad bath. They have been busy all through the year, and are now engaged in completing some heating and plumbing contracts.

THE NEW ENGLAND PLUMBING COMPANY occupy three floors of a large building at 91 and 93 Dwight street, Springfield, Mass. They carry a large line of soil pipe and fittings, lead and fron pipe, gas and atesm fitters' supplies, hesides a line of sanitary earthenware in closets and lavatories. In their ahowroom they display French and Roman enameled iron baths and a variety of fine plumbing fixtures.

W. S. Werster of Cszenovia, N. Y., has started in the plumbing business, at Montgomery, Als.

OLIVER & HOWLAND, 17 Hampden atreet, Springfield, Mass., are plumbers with a shop equipped for pipe cutting and threading by machinery. They also have a well arranged office and give personal attention to the details of their business.

- II. O. Sprague & Son, Westfield, Mass., carry a large stock of pipe and fittings and have machinery for cutting and threading pipe up to 8 inches in dismeter. They do a general plumbing business, and have a large sheet iron shop where they turn out some fine cornice work. They use both the Economy and Bay State furnaces in their heating contracts besides doing steam and hot water work in which Mills, Mercer and Cottage boilers are used.
- S. W. & A. B. LEE, Northampton, Mass., do a plumbing, tinning and heating business, and carry a large line of

brass supplies. They have a steam pipe cutting plant and use steam from the same boiler for heating their store, in which they display a fine variety of stores.

THE ALRERENE STONE COMPANY, 219 Lake street, Chicago, are 10 turnish laundry sinks for the 24-flst building of M. Press, Wabash avenue and Fortyfourth street.

A BOSTON DAILY PAPER gives an account of one whom they describe as the oldest plumber now in service at the trade. This honorable title refers to John E. McVey, 201 Broadway, South Boston, Mass., who is a little more than 66 years old and has been a plumber for 50 years. Mr. McVey began to learn the plumbing trade on May 11, 1844, which was before Boston had a wster supply, and when he hegan work the plumbers made most of their own material, lead pipe being made from sheet lead, and traps, bends, &c., being home manufactured. In addition to plumbing Mr. McVey helped to put in many of the first hot water boilers. He is a very much traveled plumber, having been nearly around the world and in 56 English cities, in many of which he worked. In Manchester, England, in 1859, he plumbed the house of Lord Macbeth in the American style. For two years he worked in Cubs putting in gas works. He also worked on plumbing at the Capitol at Washington and did plumbing for President Millard Filimore. He tella an interesting story of Chicago, where he worked in 1857, of an offer made him of 6 acres of land on Michigan avenue for \$75, which he didn't take, as he thought it was an outrageous figure to pay. Mr. MeV served in the army from 1861 to 1865. Mr. McVey

EAMES & LEE, Northsmpton, Mass., are plumbers who believe in organization rather than demoralization. They also do a large tinning and heating business in hot air, hot water and steam.

FRANK S. DIBBLE, Northampton, Mass., is about again, after a slight illness, looking after his plumbing and tinning business.

WHITCOMB, KIRKHAM & HAZEN, Springheid, Mass., make a fine display of stoves and ranges in addition to doing plumbing, ateam heating and sheet metal work.

- H. M. BREWSTER of the Stebbins Mfg. Co., Brightwood, Mass., visited the trade in New York this week in the interest of their line of bibbs, basin cocks, &c.
- F. L. CRAM of the Perfection Clean Out Company, Haverhill, Mass., was showing his soil pipe specialties to the plumbers of Springfield, Mass., on Wednesday.
- F. P. Hype talked tin plate and plumbers' supplies to the plumbers of Eastern Massachusetts this week in the interest of C. S. Mersick & Co., New Haven, Conn.

The L. Wolff Mfo Company, 93 West Lake street, Chicago, have just issued Supplement No. 3 to their Catalogne B, advance edition. The supplement consists of 32 pages of the same general style as the catalogue, being printed equally well and beautifully illustrated. It treats mainly of Wolff's wash out water closet ranges, enameled iron layatories and urinal stalls. The fixtures shown are especially well adapted to Government work and public buildings, schools, &c. The closet ranges are shown with and without par-

titions between the seats. The partitions are made of galvanized cast iron. Double ranges, with a row of seats on each side, are made with galvanized cast iron partitions and backs. In these ranges the sests are all hinged with heavy brass hinges and are made of cabinet finished cherry. The wash down pipes are made of perforated brass, the flush pipes are galvanized and the tanks are automatic and copper lined. The sec-The sectional lavatories are made in two sizes, and include fine enameled iron combined slabs and bowls with oval basin, patent overflow and improved overflow strainer, soap cup and two nickel plated Doherty self closing faucets for each slab. These lavatories are furnished either with bronzed iron brackets or bronzed iron legs. An entirely new feature, not heretofore at-tempted in enameled ware, is the shape of the basin, the arrangement of the soap cup, which drains into the basin, and the general design of the slab, which has a raised edge similar to countersunk marble slabs. Another design is shown with square basins. Another form of lavatory is a cast iron sectional wash sink having three sections. Single lavatories are shown in a number of styles. Urinsl stalls comprise marble stalls and slate stalls in various sizes and styles. The remainder of the catslogue treats of traps and fittings.

THE STEHBINS MIG. COMPANY, Brightwood, Mass., are finding a good sale for their Stebbins Special brass goods, which are warrented. They make a varied line of compression bibbs and faucets, and claim special merits for their self closing basin cock. Their works are conveniently located on the railroad and a visit to their foundry, core shop, machine shop, polishing and plating departments conveys an impression of careful workmanship and reliable goods.

THE HOGAN MFG. COMPANY, Hartford, Conn., sre marketing a new water closet flush tank, which is noiseless and works under all pressures of water.

C. HERPICH New Haven, Conn., is erecting a block on Congress avenue, near Ward street, in which he will fit up a store for his plumbing and stove business.

THE PLUMBING FIRM of Beh & Tourtelotte, Middletown, Conn., have dissolved.

The Birkery Mfg. Company, Hartford, Conn., have been running full time this year and the popularity of their high pressure bail cock has made it necessary to increase their force for the last two weeks. Their ball cocks are said to have given the best satisfaction in cities where a high water pressure is carried, and where the varying pressure that results from pumping stations is met. These cocks are made as large as 3 inches for the inlet and discharge and work with so little power that an extra large float is unnecessary.

The Government crop report for the month of November makes the average yield of corn, per acre, 19.7 bushels, which is about 1½ bushels above the yield estimated under the figures for October. This is the lowest yield in 13 years—that of 1881 standing at 18.6 bushels per acre. Last year the average yield was 22.5 bushels, on a much larger acreage. The cotton returns show an improvement as compared with those of last month, 191.7 pounds per acre being the indicated average yield for the entire cotton beit.

### HEATING & PLUMBING.

#### NEW WORK AND CONTRACTS.

LYNCH & RICHARDSON, Middleton, N. H., have been awarded the contract for heating the new Town Building and will use for the purpose two Gurney steam boilers.

THE BANGOR HOSPITAL will be equipped with a one-pipe system of steam heating by Babb, Witham & Kelley, Bangor, Maine.

AMONG the contracts recently taken by the Hub Plumbing, Heating & Stove Company, Clinton, Mass., are the heating for the Bergman Pharmacy, William G. Wilder's residence, L. H. Felton's residence at Bolton; heating and plumbing in the McIntyre Block, heating and plumbing in the Deitzman Block and the Primary School Building in Northborough; also a residence in Northborough and a wind mill plant in Boyleston.

THE BAKER & SMITH COMPANY, 193-197 Van Buren street, Chicago, are to place an Ideal hot water boiler and necessary radiation for heating the residence of Thomas Nicholson, 3344 Ver non avenue.

THE PAWTUCKET STEAM & GAS PIPE COMPANY, Pawtucket, R. I., are heating the new State Armory, Pawtucket, and the new Town Hall, at Cumberland, and a number of other buildings, using several carloads of Exeter ornsmental radiators.

PLANS have been prepared for a new block for F. L Leighton & Co., hardware dealers, Wallington, Conn., which will have a tin roof and be heated with steam.

P. F. CONNELLY, New Haven, Conn., is doing the plumbing in a new house being built on Arch street.

THE FOSKETT & BISHOP COMPANY, New Haven, Conn., have many large contracts on hand, among them being the equipment of F. M. Brown & Co.'s entire building with automatic sprinklers. They are also changing the heating system at the Candee Rubber Works.

M. J. Daly, Waterbury, Conn., is putting a Hopson & Chapin heating system in George M. Woodruff's house, Litchfield. He has also been awarded the contract for heating F. B. Rice's new building, at Waterbury.

METZ BROTHERS, 107 Twenty-second street, Chicago, are to install a hot water heating plant in the residence of J. F. Menson, 712 Washington boulevard.

F. COOGESHALL, Providence, R. I., is installing the heating apparatus in the new First Methodist Episcopal Church, at Pawtucket; in Mrs. Hartshorn's large residence, at Newport, and several other residences, using Exeter sectional boilers and radiators.

EDWARD S. HANKS, 58 Harrison avenue, Springfield, Mass., makes a specialty of plumbing work, and in addition to fitting some large business blocks with the upper floors as apartment houses, he has done the work in 15 fine residences and 50 of a less pretentious character.

W. M. COOLIDGE, 88 Plymouth place, Chicago, has the contract for the plumbing, gas fitting and sewerage in the Post Office Building at Cedar Rapids, Iowa.

The Phillips Meg. Company, Springfield, Mass., have the following contracts in course of completion: They are doing \$10,000 worth of plumbing and heating in the new Park Block, at Westfield, using exhaust steam. They used two Mills steam boilers in the Y. M. C. A. Building and are using horizontal tubular steam boilers in the parish house of the Memorial Church and in Worthy's Hotel.

J. B. FARNSWORTH has secured the contract to do the plumbing on Albert E. Leighton's new house on Leighton avenue, Clinton, Mass.

A CONTRACT to heat with hot water the new Roman Catholic Theological Seminary, on Quinpool road, Hallfax, N. S., has been awarded Power & Co. The sum involved exceeds \$4000.

THE THEO. JACOBS COMPANY, 72-74 Market street, Chicago, are to place a not water heating plant in the residence of Wm Best, 4320 Drexel boulevard.

GEO. L. WINTER, Southbridge, Mass., has been awarded the contract for heating the new engine house at Globe Village and will put in one of the Gurney steam heaters, for which he has taken the agency.

The contract for the steam and plumbing work of Bell Bros.' new overall factory has been awarded to Mullen Bros., Dubuque, Iowa.

A STEAM HEATING PLANT is to be installed in the new apartment house being built for J. W. Hallahan at Twelfth and Walnut streets, Philadelphia. A steam heating plant is also to be put up in the church at Twenty seventh and Wharton streets. Vallee Bros. & Co. are also to have a steam heating plant introduced in the five-story building 617-619 Arch street

THE ALCOCK PLUMBING COMPANY, 102 Twenty-second street, Chicago, are to do the plumbing, gas fitting and sewerage in the residence of C. E. Peterson, 4929 Cottage Grove avenue.

SETMAN BHOS, proprietors of the American House, have placed a contract with Howe Bros. of Canton for heating the house with steam. The system to be used is the Pease Economy all steam heating system.

A NEW STEAM HEATING PLANT, to cost about \$10,000, is to be introduced into the Bartram House, at Thirty third and Woodland avenue, Philadelphia, Pa. A. Segal of 305 Drexel Building is the contractor. Another heating plant is to be installed in the parish building of the Church of the Incarnation, at Broad and Jefferson streets, by Contractor Frank R. Watson.

WORKMEN are now engaged in putting steam pipes in the D., L. & W. round house at Binghamton, N. Y. The round house has 12 plts, and in each of these ten pipes will be arranged along the sides. The pipes will be attached to the car heater on the locomotive. In all there will be over 7000 feet in use.

- J H. DEVENEY, 2306 Cottage Grove avenue, Chicago, has the contract for the plumbing, gas fitting and sewerage in the residence of J. Rosenberg, Michigan avenue near Thirty eighth atreet.
- J. B. FARNSWORTH, Clinton, Mass., has received the contract to furnish the plumbing for the State Industrial School's new building at Lancaster.
- M. H. Haves, Lee, Mass., is putting steam heating apparatus in the Gleaner Block.

E. Baggor, 169-171 Adams streets Chicago, has secured the contract for the plumbing, gas fitting and sewerage in the residence of K. A. Sprague, 2636 Prairie avenue.

The John Davis Company, 69-79 Michigan street, Chicago, are to furnish a steam heating plant for the new Court House and jail at Waukegan. Ill. The Champlon Iron Works of Keuton, Ohio, do the iron work.

Punyis & Rockway, 215 Fifth avenue, Chicago, have the contract for steam heating in the Eagle Grove Syndicate Building, Eagle Grove, lowa.

J. J. Wade & Son, 276 Dearborn street, Chicago, have the contract for the plumbing, gas fitting and sewerage in the Horse and Carriage Repository, Wabash avenue and Sixteenth street. The Wade system of sewerage will be used.

THE HEATING AND PLUMBING CONTRACTS that the John B. Smith Company, Lewiston, Maine, have on hand include work on the Masonic Temple, Augusta; two residences at Brunswick, two residences at Lisbon Falls and other houses at Sabattus, and the Doyle Block and the People's Savings Bank, Lewiston.

RUFE BROTHERS Doylestown, Pa., are engaged in furnishing St John's Catholic Church, at Manayunk, with ateam heating apparatus.

C. W. TALCOTT, Woonsocket, R. I., is heating a large school house, using Exeter radiators. J. F. Mulvey of the same place is heating the Park Avenue School, using Exeter radiators. Among other places where these radiators have recently been used are the Odd Fellows' Block and the Somersworth Hotel, Somersworth, N. H., and the school house at Saco, Maine. The last contracts were taken by Willard E. Paul of Portsmouth, N. H.

ADOLPH SEGAL has taken out a permit for putting a steam heating plant to cost \$10,000 in the Bartram apartment house, Philadelphia.

THE BOARD OF SUPERVISORS of San Francisco have approved the system of ventilated flush closets presented by Walter Morgan & Co., for use at the Douglass School Building.

DWYER & Co., St. Paul, Minn., were awarded the contract for the plumbing and flush closets in the Garfield, Scheffer, Jackson and Adams schools of that city.

MEYER BROTHERS, 4146 Cottage Grove avenue, Chicago, have the contract for warm air heating in the residence of M. Rose, 6500 Drexel boulevard.

James Ahern. Hartford, Conn., has the contract for plumbing and gas fiting in the armory of the First Regiment of the Connecticut State militia. He is doing the plumbing and installing a Pequot hot water heater in the new residence of Amos Whitney.

THE BOSWORTH HEATING & SUPPLY COMPANY, Hartford, Conn., recently completed the heating plant in the factory building of the Atwood Faience Company, at Parkville, Conn.

Thomas Oakes, Hartford, Conn., is installing a hot water heating plant, using a Volunteer boiler, in the residence of Alex. Watson, and is doing the plumbing in several new houses in the city.

THE COWLES COUCH COMPANY, Hartford, Conn., are using a Howard heater in the residence of Isaac Bragaw, and are doing the plumbing in a six-tenement block for Mrs. A. Allen.

## Melting Tin Plate Scrap in a Cupola.\*

BY DR. EDWARD KIRK.

Tin plate scrap is melted in the ordinary foundry cupola the same as cast iron scrap, but more fuel is required to melt it. The best results are obtained with 1 pound of coke to from 3 to 4 pounds of scrap and a mild or light blast. Various ways of preparing the scrap for charging, such as hammering or pressing it into ingots and forming it into compact balls, have been tried. but as good results are obtained by charging it in bulk, and it is generally added in this way. The charges are made of about the same weight as charges of iron in a cupola of similar size, but more fuel is added. The scrap when first put in the cupola is very bulky and takes up a good deal of room, but when heated it settles down into a compact mass, and takes up very little more space than a charge of cast iron scrap. Tin plate scrap settles rapidly, but melts slower than cast iron scrap or pig.

Numerous attempts have been made to recover the tin deposited upon the iron by heating the scrap in various ways to a temperature at which tin melts, but the coating of tin is so light it will not flow from the iron. All such attempts to recover it have proved failures. The iron, or rather steel, which is coated with tin is a very soft and tough material, but when melted the tin alloys with it, and the metal produced is very hard and brittle. The molten metal from this scrap has very little life, chills rapidly in the apout, ladlea or molds, must be at a white heat when drawn from the cupols, and must be poured as quickly as possible. not melted extremely hot the metal expands or swells in cooling to so great an extent as to tear a sand mold to pieces or break an iron mold where it cannot escape. When the metal is melted very hot this expansion does not take place to so great an extent, and a sand or iron mold may be used for any work into which it is to he cast.

The molten metal is more susceptible to the effect of moisture than iron, and is instantly thrown out of a mold when sand is worked too wet and cannot be made to lay in it. The sand must, therefore, be worked as dry as possible. The metal is very hard and brittle and only fit for sash and other weights, and even these when light and long must be handled with care to avoid breaking. The weights when rough cannot be chipped or filed smooth and sash weights made of this metal are generally sold at a less price than tron weights, for when rough they wear out the wooden box in which they are hung very quickly, and builders dislike to use them. A foundryman who recently had a contract from the Government for a number of weights of several tons each, to be used for holding buoys in the ocean, made them from tin plate scrap. When cast they were so rough that he remarked it was a good thing they were to be sunk in the mud under the ocean, for they were not fit to be

In a number of experiments I made in melting this acrap I found I could produce a gray metal from it about as hard as No. 3 pig iron, by melting it with a large per cent. of fuel and a very light blast. But the metal was very rotten and had little if any more strength than when white. I tried a number of experiments to increase Its strength, but in none of them did I succeed to any Melting it very hot and running it into piga and remelting the pig improved the strength in some degree, but this was expensive and the results did not justify the expense. I also made a number of tests to learn the amount of metal lost in melting this scrap, and found with a light or proper amount of blast to do good melting there was practically no loss. With a strong blast the loss was heavier, and in one heat, with a very heavy blast, I lost 10 per cent. of the metal charged. The metal from this heat was a little stronger and also a little harder, which was probably due to oxidation of the tin and iron by the strong blast before melting. In melting old roofing tln, rusted scrap and old cans the loss in melting varied from 10 to 25 per cent., which was probably due to rust, paint and solder used in putting the work together.

Tin acts as a flux when melted with iron and renders it more fusible. Scrap from which the tin has been removed by acids to recover the tin or by the process employed in the manufacture of chloride of tin is more difficult to melt in a cupola than when covered with tin, and more fuel and time are required to melt it, but a better grade of iron is produced from it. Scrap of this sort should be melted soon after the tin is removed from it, for it rusts very quickly, and when rusted to any extent produces nothing but slag when melted.

Scrap sheet iron is more difficult to melt than tinned acrap and is seldom melted in a cupola, for better prices are paid for it by rolling mills than foundrymen can afford to offer.

Galvanized sheet iron scrap cannot be melted at all in a cupola in large quantitica, for the zinc used in galvanizing it, acting like the zinc solution used in the Babcock fire extinguishers, cools the fire in the cupola to a marked degree. When melting tinned scrap any galvanized acrap that has been mixed with it must be carefully picked out, for even in small quantities it lowers the heat in a cupola to such an extent that the metal from the tinned acrap cannot be used, and must be poured in the pig bed if it runs from the cupola at all. There are a number of waya of doctoring the metal from tin plate acrap when it melta or flows badly by the use of gas and oil, retort carbon, &c., but they do not improve the quality of the metal to any extent, and it is very doubtful if they increase its melting or flowing properties.

A cupola of any suitable size can be employed for melting tin plate scrap and an entire heat of the scrap may be melted alone or it may be mixed with cast iron acrap or pig and melted, or again, it may be melted alone directly after a heat of iron. It is a common practice in many small foundries to melt this acrap in the cupola for sash and other weights directly after melting a heat of iron for soft castings. An extra heavy charge of fuel is placed upon the last charge of iron to check the melting for a few minutes by preventing the scrap settling into the melting zone and the soft iron is all melted and drawn off before the scrap begins to come down. In melting long heats of this scrap it is necessary to flux the cupola with limeatone or shells in sufficient quantitles to produce a fluid lag. The flux should be put in on the

first charge of acrap in very small cupolas and on the second or third charge in large cupolas, and on each charge through the heat after. The slag hole through the heat after. should be placed at the lowest point consistent with the amount of molten metal to be collected in the cupola at one time, and opened as soon as the first charge of scrap, upon which flux is placed, has melted. The slag hole may be opened and closed from time to time, but it is better not to make the hole too large and leave it open through The flow of slag then reguthe heat. lates itself and there is no danger of it running into the tuyeres. In melting a few hundredweight of this acrap in a cupola, after melting a small heat of iron, it is not necessary to charge flux in sufficient quantities to produce a fluid alag to be tapped, unless the cupola is very small and shows signs of bunging up. In this case flux must be charged with the iron and slag tapped early in the heat, to keep the cupola in condition to melt the acrap after the iron is melted.

When constructing a cupola expressly for melting tin plate scrap the charging door or opening should be placed about 6 inches above the scaffold floor so the acrap may be dumped in from a barrow and save handling it a second time with forks. The charging door should be much larger than in a cupola of the same diameter for melting iron and should be not less than 3 or 4 feet aquare in any case, and for cupolas of very large inside diameter the opening should be equal to one half or threefifths the diameter of the shell and 4 or 5 feet high. The hight of the door above the bottom depends upon the diameter of the cupols. In large cupolaa it should be placed 18 or 20 feet above the bottom and in smaller cupolas as high as posible without danger of the stock hanging up in the cupola before settling into the melting zone. The lining material must be carefully selected, for a poor fire brick will not last at the melting zone through one long heat; in fact, none of the fire brick lasts very long at this point and it is generally necessary to put in a few new ones after each heat. High silicon brick is said to lest better then any other is said to last better than any other brick, but some of the native stone linings which I have described last longer in melting this scrap than any of the fire brick and they are generally used for lining cupolas for this work. coat of melting tin plate acrap in a cupola is from \$1 to \$2 per ton more than the coat of melting iron. The amount of profit in melting this acrap for weights, &c. depends, like all other foundry business, upon the location and size of the plant and the management of the business, but at the present time, even under favorable circumstances, the profits are small.

#### Barker's Chimney Top Ventilator.

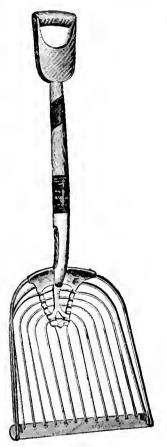

In The Metal Worker of October 27 we published in reply to a correspondent a method of cutting the patterns of a chimney top. We have since learned that the chimney top illustasted is Barker's chimney top ventilator, patented October 28, 1879, and that G. E. Barker, St. Lawrence, S. Dak., and H. W. Barker, 7820 Wallace street, Chicago, Ill., issue licenses to manufacture under royalty. When the article was published we were unaware that the device was controlled by patents. We take pleasure now in correcting the omission.

# THE RETAIL STORE.

#### Improved Wire Scoop,

The cut here shown represents a scoop manufactured by the Cleveland Lock Company, Cleveland, Ohio. It is explained that the secop is of unusually large size; that it has a socket in which the handle fits; that it is made entirely without rivets, of spring steel stock, making a light, rigid and strong tool; that it is finely galvanized and attractively finished. The manufact-

Improved Wire Scoop.

urers state that the scoop has an absolutely safe edge, and that It may be used by grocers and shippers for handling apples, pears, oranges, peaches, &c., without danger of bruising or injuring the fruit. The scoop is recommended by the makers for use by fish dealers to handle fish rapidly; and when provided with a long D handle for ice men, for removing slush ice when gathering the ice crop.

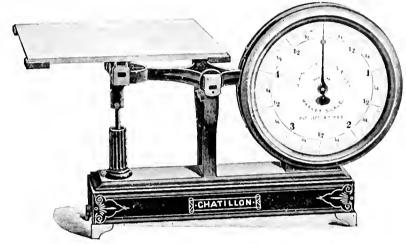

#### Even Balance Market Scale.

John Chatillon & Sons, 85-93 Cliff street, New York, have just put on the market an even balance scale, as here shown. This is introduced as an exceptionally sensitive counter scale, designed largely for market uses. One of its prime characteristics consists in its being fitted with agate bearings, as fine watches are ruby jeweled, to reduce friction and minimize wear. The double dial is 8 inches in diameter, with 10-inch nickeled sash, and so arranged that the pointer can be seen equally well

by both buyer and seller. The scale has a marble plate 11 inches square, the extreme length of the scale being 23 inches. The body of the seale is finished in maroon and decorated. The scale can be obtained with dlals indi-

Market Scale with Agate Bearings.

cating 5, 10, 20 and 40 pounds at one revolution, by  $\frac{1}{3}$ , 1, 2 and 4 ounces respectively, at a uniform price.

#### Streeter's Sensible Ash Sifter.

The illustrations here given arc of an ash sifter offered by N. R. Strecter & Co., Groton, N. Y.; New York office, W. H. Jacobus, 90 Chambers atreet. In operation the ashes are emptled into the hopper, the lid closed and the ratchet bar drawn. It is explained that in a moment the coal will be found in a drawer at the bottom perfectly separated from the sahes, and that the ashes are retained in the hopper at the top of the sieve and are allowed to go through the sifter at the will of the operator. The manufacturers state that as the coal and ashes both run to closed receptacles

Fig. 1.-Streeter's Sensible Ash Sifter.

there is no dust. The sifter will be made in both wood and steel, but the manufacturers state that only steel ones are at present ready for market. It is claimed that the steel sifter will last as long as the stove or range from which it gets its supply of ashes.

Thomas, will deal in hardware, stoves, tinware and house furnishing goods.

J. T. Dame has succeeded the firm of Dame & Francis in the stove and tinware business, at Salem, Va.

WM. M. ASHLEY, 27 Harrison avenuc, is introducing in Springfield, Mass., the

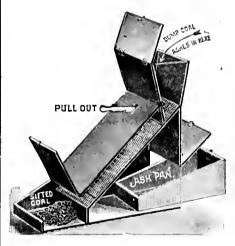

Fig. 2.-Sectional View of Ash Sifter.

new scorch proof asbestos cooking utensils of the Crown Specialty Company, 69 Beekman street, New York. The utensils are made of heavy tin, with an outer covering of copper and an asbestos lining between, which is said to be proof against scorching or burning. A sample is exhibited cut in two parts vertically, showing the construction.

Sprague & Moore, Westfield, Mass., are adding hardware and paints to their stove, heating and plumbing business. Their new store shows no little taste in the display of the goods.

#### Motor Cycles.

The Motor bicycle, shown in Fig. 1, and the Victoria cycle, shown in Fig. 2, are being introduced by the Motor Cycle Company, Cleveland, Ohio. The drlving mechanism of the former con-

It is an impossibility to run the machine until the passenger has taken his position in the saddle. The speed is varied at will by turning the throttle valve, and the machine stopped by closing the valve.

machine stopped by closing the valve.

Considered as a whole, the bicycle is designed and constructed with a

gines will outlast the best make of

bicycles.

The Victoria Motor cycle was built to supply a demand which a two-wheeled machine would not reach, and to take the place of a horse and carriage, seating two or three persons, side by side.

Fig. 1.—Motor Bicycle.

sists of two hot air engines—one on either side of the rear wheel—the crank connection being clearly indicated in the engraving, and the general arrangement being similar to a locomotive. The can in front of the operator carries the oil, which is conveyed through the frame of the machine to the cylinders of the engines, where it is mixed with air. Being

view to making it unusually strong and adapted to meet the requirements of all classes of riders and convenient to operate. The front wheels are 24 inches in diameter and the rear ones 22 inches, with 4 inch pneumatic tires, having a non-puncturing strip between the inner and outer cover. The surface presented to the ground when the machine is in operation is

The machine is low and casily entered-The machine is easily controlled, and any person of ordinary intelligence can run it. There is no expense except when in actual use, and which is but a few cents per day. Each machine is guaranteed by the manufacturers for one year. Arrangements are being made for space at the New York and Chicago bicycle exhibits, where it is understood

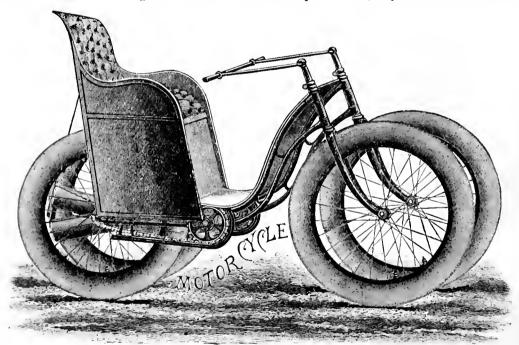

Fig. 2.- Victoria Motor Cycle.

ignited it expands the air and forces the pistons forward. Ordinarily, in engines of this type, a fly wheel is necessary to equal the load; in this case the passenger takes the place of the fly wheel, or, in other words, the velocity of the cycle and the passenger combined pull the engines over the center and compress the charge behind the piston.

about 5 inches in width, giving surface sufficient so that the machine can be ridden over mud, sand, dust, and over rough roads. It may be propelled by foot power if desired. The manufacturers claim that the machine may be run at any speed from 1 to 30 miles an hour, that it will climb hills, run against heavy winds, and that the en-

there will be machines, so that any on wishing to try them may do so.

Thomas Ellison, the well-known statistician of Liverpool is of the opinion that prices have certainly reached bottom the world over, and that their increase from now on will be sure and gradual.

Combination Heater and Cook Stove.

Edward Miller & Co., 10 and 12 College place, New York, are introducing

heater is designed for oil, having a font with a capacity of 4 quarts, to burn 12 hours. The extreme hight as a heater, with the drum, shown in Fig. 2 in posi-

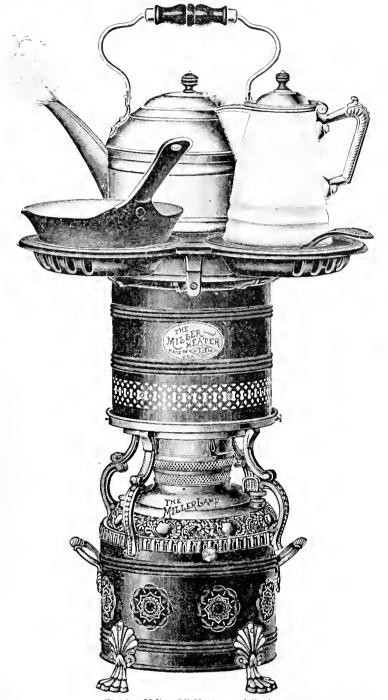

Fig. 1.-Miller Oil Heater and Cooker.

Fig. 2.—Sheet Iron Drum for Heater.

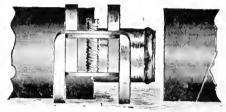

their Combination heather and cook stove, as shown in Figs. 1 and 2. This

tion, is 30½ inches and spread of feet 11¼ inches. The holder and drum are of Russia iron, with nickeled lamp and trimminga. For cooking the drum is removed and the cast iron extension top with three holes can be quickly placed in position. For roasting and baking Nos. 2 and 3 ovens are furnished. The point is made that all the weight of the cylinders and utensils reats solidly on the font and not on the burner. Each lamp is supplied with an extra flame spreader for illuminating purposes when not used as a heater.

THE E. E. SOUTHER IRON COMPANY, St. Louis, Mo., have just completed and are now ready to place on the market a new ash can. The can is made of heavy galvanized iron, hexagon shaped and corrugated. It is claimed by the manufacturers that it is impossible to dent this can by the roughest kind of usage, and that it is practically indestructible.

## Double Clinch Hose Band and Mender.

Clayton & Lambert Mfg. Company, Ypsilanti, Mich., are offering the hose band and mender illustrated in the accompanying cut. It consists of a mender tube of seamless brass, which is placed inside the hose, and a double metallic band with a brass set serew. One band and one tube is required for mending a hose. It is explained that the brass tube is easily inserted, giving a full opening for the water to flow through, and that it does not rust. The screw is attached to the band so as not to become detached, and the band can be removed and replaced as many times as desired. The screw, it is stated, is never set by rust, and that it is never detached or lost. It is pointed out that the owner can mend his own hose, and that a knife and screw driver are the only tools required for the operation. The manufacturers claim that the mender is water tight, durable, light, strong and easily put on, and that it may also be satisfactorily used for attaching couplings, nozzies and other The menders and bands hose fixtures.

Double Clinch Hose Band and Mender.

are made in  $\frac{1}{2}$ ,  $\frac{3}{4}$ , 1,  $1\frac{1}{4}$  and  $1\frac{1}{2}$  inch aizes. A sample and prices will be sent free by the manufacturers to inquirers.

#### Selling Stoves.

We have a sort of notion, says an English journal, that lronmongers don't push the stove business quite as well as they might do, and as indeed they ought to do. In regard to this subject we would venture to make one or two suggestions for the consideration of our readers. First and most important is the question of sdvertising. Stoves do not seem to be advertised to any great extent by ironmongers, as where any attempt is made in this direction the announcements are usually of the barest and most unsatisfactory kind conceivable. A mere statement that "we supply all the latest designs in stoves, grates, &c., la not enough to win business, and if the fact is worth announc-ing at all we make bold to suggest that it ought to be done in a more attractive manner. There's nothing on earth essier, and it is a marvel to us that more of our friends have not looked at the question in this light. Our idea is that when an ironmonger has made up his mind as so what stoves he intends to push, he should at once write and ask the manufacturers to loan him electros of a few nice designs. With these he should be able to get out an attractive circular which will show likely customers the sort of thing they can purchase at his shop. . . . Ironpurchase at his shop. . . . Iron-mongers should also make a special show of stoves, &c., and invite customers to inspect the very latest improvements. Enterprise pays in these times, and those who are not willing to go ahead will soon find themselves quite out of the running. As each season comes round the goods specially suited to it should be pushed with energy. Now is the season for stoves, and we hope our readers will determine to make the most of it.

#### Ideal Furnace Damper Clips.

Stover Mfg. Company, Freeport, Ill., are offering two styles of furnace damper clips, as here shown. The circular line is designed to represent the damper blade usually supplied by the tinner, which in the extension clip, Fig. 1, is riveted to leaves at opposite sides, and when completed is placed in the pipe in a similar manner to any

The manufacturers remark that the use of two leaves and two bearings is peculiar to the damper clips made by them, and that they have advantages over clips with but one bearing.

#### A Stove Day.

BY POINTER.

Reading the articles on "A Cooking arnival" and "A Thankagiving Carnival

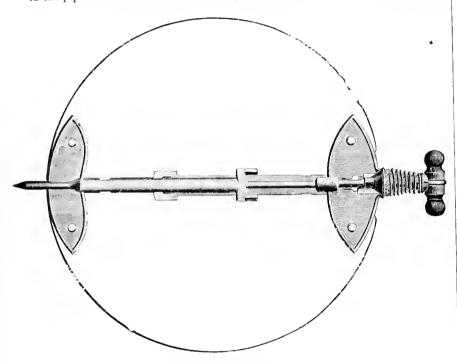

Fig. 1.-Ideal Extension Furnace Damper Clip No. 1.

ordinary stove pipe damper. It is explained that the extension feature permits of using one size clip for different sizes of dampers from 8 to 12 inches, at the same time retaining the rigid feature of a bar joining the two leaves of the clip together, and thus preventing the heat warping the blade out of shape. It is pointed out that two bearings are employed for properly supporting the damper in the pipe and that it is held in any desired position by the

Window" suggested to me that the stove dealers could be benefited by a stove day. Of course, every live dealer makes some show at the beginning of the season and then the attractions are bought and the sample rooms not being taken care of in the rush, a stove store is apt to be anything but inviting. In consequence the old shopkeepers hang

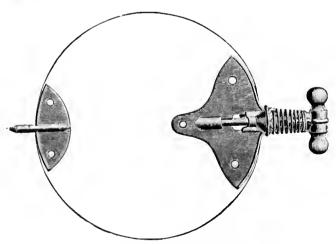

Fig. 2.-Ideal Furnace Damper Clip No. 2.

friction caused by the pressure of the apring on the collar which bears against the pipe. It is stated that the handle is easily and quickly removed and that the sharp point of the cllp is used for making holes in the pipe for the spindle to reat ln. The clip shown in Fig. 2 is similar to the one described, but it has no bar to join the two leaves together.

of the stock detract from the attractiveness of stoves that sold readily when the line was full. Toward the last of October it would be a good idea to arrange for a stove day, the sole object of which would be to get rid of old stock and to sell more of leading lines. The stoves, if possible, should be arranged opposite each other, one line having a muslin

streamer suspended over it, "The Good Old Fashioned Kind," and over the other "The Very Latest Up to Date."
Placards on the old stagers like "Tried and True," "Good as Gold," "Sure to Bake," "Easy on Fuel." "Heats Like Fire," printed on butchers' wrapping paper in red ink, would sort of freshen up the old soldiers.

Then you waut a salesman who don't know what the price is, but who is up on science and the comic almanac to make the people glad they came, and to make them want the stoves so badly that they must have them. The new stock will largely do its own placardstock will largely do its own placarding and talking, with the aid of the lithographs and clreulars sent with them. When you have planned what you intend to do, hang a whole sheet of stove pipe iron out in front of your place for a banner and fringe it with pie plates and cake tins riveted around the edgea. Have painted on it in big white letters, "We Celebrate Stove Day November 22. Our Show Will be Gay." Take that banner in as soon as the day is over. To make it a success an extra man may be needed to get things ready, to hang up the atreamer, to suspend your mottoes from it over the stoves. Some of the boys will be glad to earn a half dollar and have some fun driving around town in your business wagon with a transparency announcing your celebration and attracting attention by pounding on an old wash boiler with a atick and rattling sheets of iron and tin. Everything goes in these days but the old "chestnuts" and this is the season to market them.

THE ROCHESTER STAMPING WORKS, Rochester, N. Y., issue a catalogue for 1894-5 of the high grade specialties of their manufacture. The publication is an oblong pamphlet of small size, but contains within its covers much intereating information relating to copper and other sheet metal goods which they make. The first section concerns tea and range kettles, of which many different styles and sizes are illustrated and briefly described. Full tables of sizes and prices accompany the illustra-tions. The next division relates to tions. The next division relates to coffee and sauce pots, urns, chafing dishes, &c. Among the miscellaneous goods are cuspldors, water pails, oil and gasoline cans, dinner pails, elbows, &c. Wash boilers, trimmings, &c., are similarly described and illustrated at the end of the pamphlet.

At the third annual meeting of the Foundrymen's Association, held in Philadelphia November 7, the following officers were elected for the ensuing year: President, Francis Schumann; vice-president, P. D. Wanner; treasurer, Josiah Thompson; secretary, Howard Evans. Executive Committee, Walter Wood, chairman; Thos. Glover, Stanley G. Flagg, J., E. E. Brown and William Sauter.

The citizens of Niles, Ohio, are making a strong effort to attract new indus-tries to their town. The Board of Trade of Niles have acquired considerable land in the outskirts of the town, and are offering free sites to manufacturers, several of whom are said to consider the matter favorably.

The Texas Cotton Palace, at Waco, Texas, was formally opened on November 8.

# STOVE TRADE NOTES.

The Chicago Stove Trade.

The gasoline atove trade is again expanding. The tendency for some time had been toward concentration, and the business seemed to be drifting ateadily but surely into the hands of a very few large concerns who had gained special prominence in this line. But the field has been deemed sufficiently inviting to induce fresh ventures of capital, and the coming season will see several new concerns asking for a share of the vapor stove business. The smaller manufacturers are also arranging to take a more prominent position by increasing their facilities and enlarging their lines. Milwaukee is now attracting much attention by reason of the enterprise exhibited by Cresm City manufacturers. Our advertising columns last week and this week bear witness that a patent controversy of some importance has come up which will be of considerable interest to the makers of process stoves. Whatever the result of the controversy may be, Milwaukee will undoubtedly figure much more prominently in the vapor stove trade during the coming year than ever before.

The range trade has been quite a feature of fall husiness in this locality. According to the statements of numerous managers the proportion of ranges sold has been considerably larger than usual. The spring has heretofore been considered the range season, but if the tendency now shown continues the fall will hereafter take the lead in this respect. The movement can be helped still more if merchanta generally will heed the suggestion recently made in these columns to make the Thanksgiving season prominent in the minds of their customers as a time for "booming" cooking appllances. The idea is so eminently appropriate that it must strike favorably every one connected with the stove and house furnishing trades. A Thankagiving dinner, to be well prepared, should be cooked with the very best appliances. While on the subject of ranges, the fact deserves to be mentioned that the trade in steel ranges has shown vigorous growth this season. The character of the demand for this class of goods is shown by a bit of information imparted to the writer a few days since, but not in confidence. A prominent Western steel range manufacturer, in apologizing for not more promptly filling an order, stated that he was over 600 ranges behind on deliveries on contracts then on his books. The manufacturers of cast ranges are not asleep on this matter, as

many of them have also entered the | steel range trade, and with quite satisfactory results They are making innovations in finish which are quite pleasing to a large class of buyers, especially the substitution of ornamental cast fronts for the conventioual plain front of the old French or wrought Iron range.

The trade in heating stoves naturally showed a decline during the mild weather prevailing in the latter part of October and running into this month. At this time of the year much depends on the character of the weather, and the heating stove trade drags if people are of the impression that they may be able to get along without making any further investments in heating apparatus. It is needless to say that the sharp drop in temperature throughout the Northwest during the past week was regarded as a promising advance in the direction of better stove weather. The stove repair trade continues large, with a heavier demand than usual for parts of antiquated patterns, indicating the great economy now being practiced in making even very old atoves fulfill their functions for another season if possible. The repair business is one that does not always receive adequate attention, especially at the hands of the smaller foundries. Complaint is frequently heard that customers are kept waiting for their repairs for a week or more, because the pieces have to be made, whereas the foundry should always have a stock on hand and fill the order immediately. The repair trade is aufficiently profitable to make it worth systematic attention.

### The Open Fire Place, Past and Present.-II.

Coal as a Fucl.

It was not until the diminution of timber became appreciable that the prejudice against the use of coal as a fuel was overcome—a prejudice so atrong that Sir Gilbert Blane records a case in the reign of Edward I: a person was tried, convicted and exea person was tried, convicted and executed for burning coal within the city of London." The prejudice would lead one to suppose that the old fire places, notwithstanding the testimony of Hebrard, did smoke; but while our ancestors could tolerate an atmosphere impregnated with the smoke from wood, they entirely objected to one charged with coal smoke, which, if present stall, would be present in greater volume. The more general use of coal as a fuel must necessarily have had much to do with the alteration in the construction of the fire place. In the early form of grates for coal fuel they were probably general purposes if constructed on

only a few bars of iron bent into a oblong or semicircular form, and fixed in the wall or recess or niche. A reference to one occurs in an inventory bearing the date 1603: "A cradell of iron for the chimnye to burn sea cole with." It was called sea coal from the fact of its being imported to Lon-don by sea. Next the introduction and development of cast iron work, which da'es about the seventeenth century, would give opportunites for a totally different treatment, and it is with the development of this latter treatment that we are most concerned at the present time. From time to time there have been numerous attempts to economize the waste heat from the open fire place, by various elaborate arrangements of pipes, flues, air chambers, and other contrivances, commencing with the attempt of Savot in a fire place at the Louvre, where an air chamber was constructed beneath the hearth, and at the back of recess, which communicated with the apartment through two round openings made in the frieze of the mantel piece, the air for this being taken from the chamber instead of from outside. In other respects the idea does not appear to differ from modern inventions; but to attempt to give a history, however brief, of all these inventions would, in itself, be aufficient to form the subject for a series of papera, and as most of them appear to have been as costly as they were ineffectual, I do not propose to make further mention of them, but instead confine myself to the open fire place pure and simple.

#### Kinds of Fire Place.

Of these there are three kinds still in use auitable for the combustion of coal fuel. These are the dog grate, the hob grate, and the ordinary grate. For picturesque effects perhaps the dog grate is capable of producing the beat results, being the nearest approach to the old open hearths; but its practical value is not equal to the ordinary grate, as it is more extravagant in combustion, not generous proportionately in its warming powers, liable to smoke under provocation, and, finally, it must be conceded that a fire place in this form must distribute more dust than one that is more controlled; therefore I would recommend generally that the dog grate be used in the entrance hall or other apartment where it would be no great hardship to dispense with a fire if necessary. Next comes the hob grate, which seems to have been a favorite in the eighteenth century, but I do not see anything to recommend it. It is necessarily more expensive in construction. It has to be fitted, and being made in a material that is not altogether auitable for fitting, it is either expensive or badly made. Secondly, like the dog grate, it consumes out of proportion to the work it accomplishes; and, lastly, it has a similar liability to smoke under certain conditions. Its practical advantages are its hobs—advantages that may be supplied to any ordinary grate by the addition of a trivet. The ordinary grate is undoubtedly the best for

proper lines; there is still room for economizing generated heat, as it is only a small percentage that is utilized, but many improvements have taken place within the last few years, although most of these improvements were advocated a century ago. The most sound and practical ideas are not proof against fashion and unpractical economy; thus it is that what appears to be new in the open fire place is but the development of principles advanced a hundred years In determining the construction of a fire place, the first essential is a fire brick back and side cheeks, with no metal there at all; secondly, to use as little metal work in the construction of the fire place as possible; and, lastly, the most suitable form. Great lessons in this direction were taught by Count Rumford, whose writings date from 1796 to 1802, but have recently been republished. Among other improvements he advo-cated the reduction of the chimney throat and fire clay backs and sides, but these appear to have been recommended earlier by "Gauger" (Cardinal de Poug-Rumford objected to the nac, 1713). circular covings on the ground that they produced eddies or currents, which would be liable to cause the chimney to smoke, and laid down new rules for determining the best form. He further accidentally discovered the advantage of the lean over back, which has only lately been revived and advocated by many manufacturers as an entirely modern and original idea, although Pridgin Teale, who deserves our warmest thanks for being the means of its general revival, in his lecture to the Architectural Association in 1886 gives an extract from Rumford's writings explaining the accidental discovery of the great advan-tage of this form of construction. This ides of the lesn over back was one of the chief features of the so called Stevens grate, the semicircular iron grate that we were so familiar with 20 or 30 years But these were manufactured in iron instead of fire brick, and the throat was beneath the lean over instead of above, thus preventing the greatest force of hest from playing upon it, allow-ing it to escape instead of retaining it. Various forms of this grate were generally in use until 20 years ago, and, of course, some survived much later, and are even now made in cheaper forms. It recommends itself much to builders, because it practically fixes itself; but while it is supposed to be built on the lines advocated by Count Rumford, nothing can have been farther from the spirit of his teachings. I think it well bere to give a few extracts from his valuable writings. He says: "It is quite certain that the quantity of heat which goes off, combined with the smoke, vapor and heated air, is much more considerable, perhaps three or four times greater at least, than that which is sent off from the fire in rays, and yet small as the quantity is of this radiant heat it is the only part of the heat generated in combustion of the fuel burned in an open fire place which is ever employed or which can be em-ployed in heating a room," and "as it s the radiated heat alone which can be employed in heating a room it becomes an object of much importance to determine how the greatest quantity of it may be generated from the combus-tion of fuel." I have accepted his doctrine without dissent, because my paper is upon the open fire place in its simplest form; but other writers have condemned the foregoing as being likely to discourage experiment and the development of ideas for utilizing other than radiant heat.

#### The Fire Basket.

His plan for the fire basket was the same as now used. He laid down the rule that the sides should be built at an angle of not more than 135° with the back-that is, 45° with the front. This enables nearly the whole of the heat radiated from the cheeks or sides to pass elear of the actual fire place, instead of radiating to and fro, as it would do in cases where the basket is built with right angles. The angle for the checks is improved by Mr. Teale, who gives the angles 120° with the back and 60° with the front. These angles enable The angle for the cheeks most of the rays to escape the jambs, but only just so, thus sending them more into the corners of the room; but it is only fair to Rumford to add that he said they were not to exceed 135°. He condemned all iron backs for the fire basket on account of the great heat conducting power of iron, which wastes the heat and cools the fire by conveying it through the brick work, and ultimately to the open air outside. In its atesd he advocated the use of fire brick, and this, until his accidental discovery of the advantages of the lean over back, he built in a vertical form, condemning all forms of backs which less away from the fire. He first wrote: "It frequently happens that the iron backs of grates are not vertical, but inclined backward. Where the grates are wide and can be fitted up with fire brick, the inclination of the back will be of little consequence, since by making the fire brick in the form of a wedge, the front may be made perfectly vertical, the iron being hid in the solid work of the fire place. If the grate be too shallow to admit of any diminution, it will be best to take away the iron back entirely and cause the vertical back of the fire place to serve as the back to the grate." He subsequently wrote, after having had to deal with a chimney with a very thin well in front that it and a very thin wall in front, that in order to reduce the fire at the throat he had inclined the back forward. "I was surthe back forward. "I was surprised to find upon lighting the fire that it appeared to give out more heat into the room than any fire place I had ever constructed. This effect was quite unexpected; but the cause of it was too obvious not to be immediately discovered. The flame rising from the fire broke against the part of the back which sloped over the fire, and this part of the back being soon very much heated, and in consequence of its being very hot, and when the fire burned very bright it was frequently red bot. threw off into the room a great deal of radiant heat. It is not possible that this oblique surface could have been heated red hot merely by the radiant heat projected by the burning fuel, for other parts of the fire place nearer the fire, and better situated for receiving the radiant heat, were never found to be so much heated, and hence it appears that the combined heat in the currents of smoke and hot vapor which rises from an open fire may be at least in part stopped in its passage up the chimney, changed into radiant heat, and afterward thrown into the room." In addition to the extra heat obtained from the lean over back, its influence must be beneficial in keeping the general atmosphere clear of gases and smoke, a very considerable percentage of which must be consumed in this way that otherwise would escape up the flue. The Norwich grates that caused so much notice, through the clerical correspondence in the Times, were undoubtedly a great improvement upon their immediate

contemporaneous predecessora and inasmuch as they were conclass. structed on principles which reduced the metal work and introduced more fire brick into the basket; but they had one great fault-they were all advocating a shallow grate from back to front, a formation that has many disadvantages. Rumford said, before he discovered his lean over back, that a proper depth was from 6 inches to 8 inches for middle sized rooms, and pointed out that where the fire place was made shallower than this it would be difficult to prevent the fire going out; even if the fire does not go out it will be apt to burn dead. Another objection to a shallow fire place is in such a case the fuel must necessarily be continually pressing against the fire bars, the result of which must be an untidy hearth, in consequence of ashes and cinders being forced through by this continual pressure; whereas if the fire place is deep, the fuel need not press against the bars at all, they being simply a guard or fender in case of dislodgment of fuel in combustion. For this reason I prefer to use a larger fire place than is advocated by others, and build the fires quite independent of the bars—in short, I think, the fire place would be much improved if constructed to do without the front bars altogether, thus giving an uninterrupted view of the fire, and the radiation would then also be unobstructed. Even with the most approved upright steel bars, with a moderate fire this obstruction or screen is not less than 25 per cent. of the surface of the fire.

#### Dr. Bartlet's Patent.

The best of the Norwich grates was Dr. Bartlet's patent, which had a depth of 61 inches at the base reduced by the shape of the bars to 41 inches at the top. This grate was recommended in these words: "These bars are so arranged that as the fuel descends it falls into freer space, by which means the fire is caused to keep alive and burning for a very considerable time without attention." This in itself was rather a severe criticism upon the so-called parson's grate. Dr. Bartlet's grate had also another advantage, the fire bars being vertical steel bars, instead of the then usual heavy horizontal bars, but the fire brick back of this grate, although well begun, was not carried out in the same spirit, because the back above the bars receded and formed an unnecessarily large opening to the throat of the flue. For a few years these grates were much in favor, and had many imitators all over the country. Manufacturers did not hesitate to copy the principles or the designs, which were mostly of Japanese origin. The fret or economizer seems origin. The fret or economizer seems to have become pretty general in one form or another about this time. The economizer is undoubtedly one of the chief improvements to the open fire place, supplying as it does a hot air chamber beneath the fuel, thus facilitating, and at the same time controlling, the combustion. Fire brick bottoms in a measure helped to do this, but not so effectually, and they have this disadvantage—the ashes have to remain in the grate or fall on to the hearth in view; with the economizer the hearth may be kept perfectly clean, but to insure this, in addition to the use of the economizer, it is necessary to fix the bottom grating or gridiron lower than the bottom bar of the grate front. This not only keeps the hearth free of cinders and ashes, but hides the dead and untidy part of a fire from view.

#### Cost of Stove Patterns.

BY I. OPEN.

The discussion of the cost of stove patterns, whether in the office or foundry, is apt to bring to light some things that are less disagreeable when kept shady. The sand heap of the biggest foundry dwindles to so and hill compared with the "heap" that is put into stove patterns and to reduce this "heap" to the ant hill proportion is a secret that some have not yet discoverd, or at least have not yet put into praetice. That the practice will not be followed widely by that class of foundrymen who lay up their treasure in other places than bank vaults is more than probable when the secret is disclosed by the relation of the following experience:

In making a business trip that kept the Atlantic ocean within a day's travel a hint was given that interesting informstion could be secured by stopping at the foundry of an enterprising firm. The foundry was not as big then as it is now. because it is said that the wicked shall flourish for a season. The boss was not in, but by some push and geniality a chat was started with a workman who seemed in authority and a trip about the foundry to show it off was made. One of the parts of a popular stove, all filed up and mounted on a new fallow board, called forth the remark that the stove that that piece belonged to must be a new one and a seller. The workman said it was, and the conversation brought the information that they were going to make it in three sizes.

Then the visitor masqueraded as a buyer from the tenement house district of New York on the lookout for a bargain in a small stove and would buy 500 if the price could be made right and the stove showed up right. The workman said he thought he could show him a stove if he would say nothing abroad at present, as the stove was not quite

ready for the market.

They adjourned to the pattern filers' domain and there another size was all filed up ready for the sand and set up previous to being taken apart and sent to the fallowboard man. Another size was partly filed up, and on expressing satisfaction the boss was hunted up and a net cash price was quoted on all sizes which was 20 per cent. lower than the inside price to big jobbers made by the house who put the stove on the market. The boss said that was as near as he could quote, but not to close a contract until he had got the stove running in the sand, as he would do better if he could, but must have the profit that he had calculated on in the price quoted. He was told that the small size was most in demand and the order would probably be divided 300, 150 and only 50 of the large size, at which he made no complaint.

Well, the stove came on the market, and as it had a patented feature which the original foundry made under a shop right, application was made to the patentee to protect them, but as there was no money in it for the patentee he respectfully declined. There was no design patent on the stove, and the pirate continued his piracy, at a small expense for patterns and no expense for advertising or introducing a well-known

and popular stove.

In another section sufficiently removed to prevent conspiracy, but at the same time a man deparated from his early training and filed up a stove that was having a fine run in his locality, and made trouble by selling it at a low price to dealers, who cut under the

price which rival dealers thereabouts got for the original of the counterfeit. This stove, however, was of striking contour and of plain style, yet was proteeted by a design patent, or copyright; so the blast was put on the pirate, which made him take water, but in order to remove further temptation bis counterfeit patterns were purchased for a nominal sum. He had experienced trouble in making some parts straight. and incurred a considerable loss, and these parts began to crack in a short o that orders for new parts came in. He could not supply them, and the wrath of his trade proved expensive and enduring. Verily, the wicked shall flourish for a season! So long as "buy chesp and sell dear" is practiced there will be enough people in this world who follow it to take the goods made from stolen patterns, though such goods are not freely bought by reputable tradesmen, particularly straight out stove dealers.

#### Robert Diven.

Robert Diven, one of the oldest stove men in New York and for nearly forty years connected with the J. L. Mott Iron Works, died on the 7th inst., 72 years of age. He had been more or less an invalid for a number of years, but kept at his post pretty ateadily, until finally he succumbed to his mala-With him passes away one of the old time characters of Water street. He was posted on all the tradition and ancient gossip of the street, and never seemed more pleased than when talking on these subjects. His knowledge of old New York and its people was very interesting. He used to live on Beekman street many years ago, in the old Hermance boarding house, the home of many men who have since become noted and wealthy both in the hardware and stove trade throughout the country. James de la Montanye of San Francisco lived there when he was in business in New York. Of late Diven has lived in the past, and never seemed tired of talking of it. Bob was always kindly disposed and charitable to all, and while he would indulge in emphatic expressions at times he quickly forgot them and never held malice. His funeral took place on Sunday af-ternoon from the old John Street Church, one of the venerable relics of down-town New York, and a very fitting place for the finality of one who had spent so much of his life near the sacred spot. The stove men were well represented at the services. Mr. Jordan L. Mott and a large number of his staff were present. The remains were interred in Greenwood.

'Man that is born of a woman hath but a short time to live, and is full of misery. He cometh up, and is cut down, like a flower; he fleeth as it were a shadow, and never continueth in one stay."

JEEMS.

#### ODD PLATES.

GRAFF & Co., 208 Water street, New York, have such faith in their Faultless furnace No. 70 that they offer to warm with it "all the dear brethren left out in the cold on election day." An examination of this monster heater is sufficient to convince the most skeptical that they would probably be successful in the undertaking if the opportunity were offered them.

A CIRCULAR illustrating the gas furnace made by the Pennsylvania Gas

Furnace Company of Buffalo, N. Y., reaches us, bearing the imprint of A. II. Dixon, 41-43 East Bleor street, Toronto, Canada. The merits of the heater are set forth in a way to convince the skeptical, tables being given showing the heating capacities and prices of the various sizes in which the furnace is manufactured. Mr. Dixon is the Canadian manager and states in the circular that it is the intention of the proprietors of the patent to dispose of provincial and county rights and also to manufacture the furnace in Canada.

J. H. Court & Son, 222 Water street, New York, with Brooklyn store at 41-51 Adams atreet, have presented to the Twenty-third Regiment's Fair, now being held at the new armory, corner Bedford and Atlantic avenues, Brooklyn, a sample of their very best work, in the shape of a No. 418 Cort gas range, with high shelf, canopy and water back, handsomely nickeled over all.

M. M. Gowdy, Springfield, Mass., reports a good demand for the Cole air tight heater, and is making some improvementa in its construction. The cover of the fuel chute is now hinged to turn back. Being made of planished iron and lined with No. 20 steel it is durable and a quick heater, adapted for the use of chips, cobs or wood.

THE CHICAGO & ERIE STOVE COM-PANY, Erie, Pa., are distributing itlustrated circulars of their Modern Helper and Quick Helper steel ranges. In reference to the former the makers state that while in shape it is similar to a steel range, it is heavier than an ordinary cast range, so they have combined many of the advantages of both cast and steel constructions in this four-hole range. The bottom oven plate is of steel supported by the automatic adjustable patent braces which have been so successfully employed in connection with their best steel ranges. The Modern Helper has an end broiling door, which can also be used as a feed door if desired. The quick oven is accured by means of the peculiar arrangement of plates already referred to. The drop door is well balanced and is fitted with a patent adjustable spring of the Alaska type. The Quick Helper is provided with heavy, atrong castings, end broiling door and oven constructed in the same manner as that described in connection with the Modern Helper.

THE SOMERSET STOVE FOUNDRY COMPANY of Someract, Mass., successors of the Boston Stove Foundry Company and the Someract Co-operative Foundry Company, favor us with a copy of the new catalogue which they have issued illustrating their lines of Somerset stoves and ranges. The Somerset Grand six-hole range is the leader and occupies the place of honor in the catalogue. The Wyoming, Somerset G, New Grecian, Matron, Somerset Jewel, Arion cian. and Harvest are the names under which other goods shown are offered the trade. The heaters occupy a number of pages, the place of honor being given to the New Somerset, a round sheet iron surface burner which embodies the modern features and which is offered the trade in three sizes. At the close of the catalogue is a notice to the effect that the company have "purchased the pat-ents embracing all improvements under Goodfellow's patents for the manufacture of the Nonpareil agitating fire and sifting grate. Also Goodfellow's nonpirate and non-warping fire grate." A feature of the catalogue is a list of stoves, ranges and heaters for which repairs can be furnished.

The Standard Lighting Company, Cleveland, Ohio, send us folders relating to their New Process oil heater. The manufacturers state that they use with this heater the mammoth globe linean-descent lamp with a special attachment or spreader, which, with the drum, can readily be removed. With the spreader changed and the glass chimney placed in position, the heater is converted into a 200 candle-power lamp. The oil fount is of brass, nickel trimmed, and the drum is of Russia iron, with ornamental top. The heater stands 28½ inches in hight, is 9 inches in diameter and weighs 13 pounds.

Joseph Huse & Son, Boston, Mass., are issuing a card on which is a bright new cent, with the statement: "You are a cent ahead, but you will be dollars ahead if you purchase your stove repairs from us."

A PRESS DISPATCH from Russell, Ky., announces the destruction by fire of the stove foundry of George Harbly & Sons, at that place. The loss is partly covered by insurance.

M. H. WILDER, Florence, Mass., of the Central Oilgas Stove Company, was a visitor at the New York office this week, and also made some visits among the New England trade. The new oil heater brought cut by them this year has proven a popular stove.

AT THE RECENT MEETING of the Southwestern Stove Manufacturers, held in St. Louis, the Ireland & Matthews Mfg. Company of Detroit, Mich., were represented by their Mr. Matthews. They had on exhibition a full line of urns, knobs, &c., which attracted considerable attention.

Among the Special Notices in our advertising columns this week is the announcement of a stove foundry business for sale that will interest the trade. The business has long been established and favorably known, and any one desiring to enter this field of industry would do  $w \in \mathbb{N}$  to inquire into the matter.

THE WROUGHT IRON RANGE COM-PANY, St. Louis, Mo., have secured the contract for the entire kitchen outfit for the new steamer "St. Louis," which was launched at Philadelphia on the 12th inst. The contract includes every article used in furnishing the kitchen from the large center range down to the commonest pewter fork. of the size of the contract and the immense amount of material which will be required can be obtained when it is remembered that the ateamer will have a carrying capacity of 1500 persons. The Wrought Iron Range Company are naturally proud of this contract, secured over 1000 miles from their factory, and in competition with the leading concerns of the country.

The following interesting item appeared in the issue of the Boston Daily Globe of Thursday, November 1: "A Globe stove, manufactured by the Central Oilgas Stove Company of Florence, Mass., has caused a ludicrous development in human nature. The stove is a magnificent heater, and it lights up the room beautifully, the round glass globe of this particular floor lamp heater giving forth a charming mellow light. The ground glass illuminator has the word 'Globe' cut in exquisite design. Now, the rich part of the story is the fact that some individuals actually refused to buy Globe stoves unless the word 'Globe' was obliterated from the illuminator. While they admire the illuminating influence of the Globe news-

paper, they do not care to have a distinctively Globe stove. They say their friends might think them Democrats. And this would be too bad."

THE GRAND RAPIDS VAPOR STOVE COMPANY of Grand Rapids, Mich., have about closed a deal for the purchase of the property on Mill street formerly occupied by the Grand Rapids Felt Boot Company. The purchasers are now occupying a building on lower Canal street. They have succeeded in building up such a large trade that the business has outgrown its present quarters and more room is needed. building upon the property purchased is five stories in hight and covers an area of 50 x 100 feet. The purchasers will at once build a japanning room in the rear of the building, 40 x 50 feet in dimensions, and they expect to be located in the new plant by January 1. The building is supplied with atcam and water power, but electric power will also be added to be used in cases of emergency. The stockholders of the company are Thomas Friant, Daniel McCoy, Felix Raniville. Thomas M. Peck, McGeorge Bundy, Joseph J. Tucker, Lois A. Giddings, F. A. Stone and R. A. Kenyon. Frank A. Stone is general business manager and B. P. Kenyou is superintendent of the company.

THE REPORT is in circulation that capitalists of Wausau, Wla., are contemplating the establishment of a stove works at Marathon City.

FRANK H. T. BARNOUR, vice-president of the Detrolt Stove Works, was married on the 8th inst. to Miss Elsie Mary Tower, daughter of O. S. Tower of Ionia, Mich.

THE MICHIGAN STOVE COMPANY are distributing among their patrons a "burglar proof purse" which is ingenlously constructed so as to afford no little amusement. The purse is of the frog mouth pattern, made of the best materials, and the uninitiated cannot open it when closed, nor shut it when open. On one side of the purse the company's Garland trade-mark is atamped in gilt with "compliments of Frederic W. Gardner" underneath.

H. M. CARY, 34 Portland street, Boston, agent for Sam S. Utter, paid a visit to New York this week, the principal reason being to consult with Sam concerning an order for a large lot of gas, oil and cook stoves.

THE EXCELSION MFG. COMPANY, St. Louis, Mo., are advising their friends to prepare for the holidays by purchasing the Toy Charter Oak stove, which, it is claimed, sells on sight and is a good advertisement for the dealer handling it. The Toy Charter Oak is a facsimile of the full size construction and is made with the same care and attention to details.

BUCK'S STOVE & RANGE COMPANY, St. Louis, Mo., are mailing to their friends in the trade a circular illustrating Buck's Royal air tight heater, adapted for using as a fuel any kind of coal or coke. The cast iron dome of the stove is made in one piece, the feed door is large, the air tight base is provided with capacious ash pan and the grate is of the basket pattern with cone center. The makers state that they have thoroughly tested this mode of construction and know it will prevent the fire pot frem burning out, and cause a better and cleaner combustion on account of the increased grate aurface. The heater is shown in general view and also with the casing removed.

THE IRELAND & MATTHEWS MFG-COMPANY of Detroit, Mich., are about increasing their manufacturing facilities by the addition of a building 40 x 100 feet in size and three stories in hight. The company expect the atructure to be ready for occupancy about January 1. The new structure will cost about \$12,000.

THE PHILLIPS & BUTTORFF MFO. COMPANY, Nashville, Tenn., state that there is no foundation whatever for the rumor recently current in the trade that they expected to take charge of the plant of the Harvest Stove Company at South Pittsburg, Tenn. The proposition has not even been considered and the rumor probably grew out of the fact of Mr. Buttorff's recent visit with the officers of the Tennessee Coal, Iron & Railroad Company to the various industries located at South Pittsburg.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., have just issued and are mailing to their friends in the trade a new edition of a special furnace catalogue, illustrating some of the constructions which constitute their product in this line, and covering both hot water and warm air heaters adapted for using various fuels. A written guarantee accompanies each furnace sold, and is emhodied in the company's furnace contract, as explained in the little pamphlet which they have issued. There is also given among the pages a long list of names of persons in various parts of the country who have used the company's goods.

### Trade Notes.

THE R. E. PARSONS COMPANY, Bridgeport, Conn., have added a department for the manufacture of Brass, Copper and Composition Castings to their establishment.

THE ST. LOUIS METAL & SUPPLY COMPANY, St. Louis, Mo., issue a leaflet of testimonial letters relating to Star Anti-Friction Metal which they manufacture.

THE ROME BRASS & COPPER COMPANY, Rome, N. Y., have just completed a two-story addition to their large mill. The company employ about 300 hands.

THE ROANOKE ROOFING & CORNICE COMPANY, Roanoke, Va., are about to add a car factory to their plant.

FRED. HARTMAN, 143 Wells atreet, Chicago, has a number of contracts for the gaivanized iron work used in connection with refrigerating machinery.

TELEGRAPHIC ADVICES from St. Louis, Mo., indicate that Tin Plates, Galvanized and Black Sheets, Corrugated Iron and House Furnishing Goods are enjoying a large measure of activity in that district at the present time. The demand is referred to as good and the aelling as heavy.

McKeesport Supply Company. McKeesport, Pa., manufacturers of and jobbers in Ferrotype Plates, Japanned Signs, Developing Trays, Panels, &c., Plumbers' and Gas Fitters' Supplies, Fenders and Coal Vases of iron and brass and Aluminum Wares, issue a circular under date of November 1, in which they announce that they have become an incorporated company, with George Russell, president; Wm. A. Cornelius, vice-president; Theo. Tonnele, treasurer, and Theo. M. Hopke, secretary. They state that they have enlarged their manufacturing facilities, and promise the best workmanship and prompt attention to all orders

placed with them. In addition to their usual line of goods they are prepared to undertake the manufacture of novelties and specialties in japanned or pressed ware, also small castings for ornamental purposes, &c.

F. J. BLAKE & Son, Hartford, Conn., sre building for a new chemical company some large Copper Stills and have a number of contracts for coppersmithing work. They also run a brass foundry.

THE FERRACUTE MACHINE COMPANY of Bridgeton, N. J., manufacturers of Presses, Dies and other Sheet Metal Tools, have recently received orders for three special inclined Embossing Presses for the Standard Caster & Wheel Company of New York, and have furnished previously to that company 12 of their other Presses for the manufacture of patent ball joint casters. Among recent shipments were six Presses with automatic disl feed attachment and  $\epsilon$ mbodying entire new features for accurate feeding to the Metal Rlm Rag Company of New York, and a Press for the General Electric Company of Schenectady, N. Y., which weighed about 20,000 pounds, and is capable of cutting out a blank 54 x 36 inches and will give a pressure of nearly 100 tons. They are also building two more Presses of the same general style for sheet metal work in Western factories.

AN ITEM going the rounds of the trade press during the past few weeks conveys the impression that the Anthony Wayne Mig. Company of Fort Wayne, Ind., in view of the plant being erected for them at St. Louis, Mo., would give up the former location. Recent advices from the company are to the effect that a branch factory has been established at St. Louis 50 x 125 feet, four stories, located on the corner of Msine and Sidney streets, which is now being equipped with the necessary machines a day. This step has been taken in order to be right in the center of the market, saving freights on lumber, also shipping machines from Fort Wayne, the St. Louis trade on the company's production averaging from 25,000 to 30,000 mschines annually, which amount, it is believed, can be doubled as soon as the new plant is in complete operation. The Fort Wayne plant will be operated as heretofore under the able supervision of A. C. F. Wichman.

The Plant of the Brilliant Steel & Iron Company, Brilliant, Ohio, which has been idle for some time, has been purchased by Joseph R. Jackson, formerly superintendent of the plant of the National Tube Works Company, McKeesport, Ps. It is stated that others are interested with Mr. Jackson in the purchase. It is the intention to make a number of improvements to the plant, and it will be equipped for the manufacture of Wrought Iron and Steel Pipe.

"Home Comfort Urns" is the title of a 16-page pamphlet which reaches us from the Wrought Iron Range Company of St. Louis, Mo. The Coffee and Tea Urns illustrated and described are made with a hot water compartment surrounding the inside cylinder, which is constructed with an enameled steel, atone or solid white porcelain jar. The hot water is siphoned from the hot water boiler into the Tea and Coffee Urns, which are made of any size or capacity required. A feature of the pamphlet is a price-list of the goods shown.

THE MILLETT CORE OVEN COMPANY, Brightwood, Mass., have a good selling

device in their patent portable Core Oven, which has been found very convenient in small foundries. Its dimensions are 36 x 36 x 48 inches in hight and doors open at different hights, to which shelves are attached for holding in the cores. When the door is opened so that the shelves are exposed, the opening is closed by an inside door. Four of the doors are 5 inches high and one 10 inches. The Ovens are also made for brick setting.

THE ARREST this week of a former senior partner of a well-known enameled ware importing house on a charge of undervaluation to the extent of \$100,000 has caused not a little stir in the trade. It is freely intimated by American manufacturers that cuameled goods have for years been systematically sent into this country under false valuation, and if this charge is true it is highly desirable that the practice be stopped.

IN THE NOTE in The Metal Worker November 10, referring to the Uncle Sam Dampers made by the Sayre Stamping Company, Sayre, Pa., it should have been clearly explained that the stem alone is of mslleable iron, while the damper plate is of steel.

On November 5 the last span of the bridge across the Ohio River, connecting Louisville, Ky., and Jeffersonville, Ind., was finished. The span was 550 feet in length, being one of three of the same length. One of the other spans is 210 feet, and the other two 340 feet, making six spans in all. The spproach ou the Indiana side is 4000 feet long. All of this is completed. The approach on the Kentucky side is to be 2600 feet long. The hight from low water to the coping of the bridge is 90 feet. The trusses are 84 feet high by 30 feet wide, single track, with footway on each side. The entire bridge, including approaches, is of ateel. The traveler, which handles the heavy material, is 105 feet high. The last span was completed entirely in 54 hours' time. The sub-structure will all be removed by the 15th of the present month, and the bridge proper completed will be turned over to the owners by the Phanix Iron Company, who built it. This bridge will be operated by a company, and several railroads are now figuring for the right to use it. The two most prominent projectors of this bridge, Dennis Long and Jacob Krieger of Louisville, both died before the bridge was more than started.

Industry of San Francisco says: "There is a good deal of difference between making the details of a war ship and assembling one. The Union Iron Works here is about the only place in the world where a ship is wholly produced in the works. The "Oregon," duced in the works. The "Oregon," for example, contains 120 steam engines, every one of which was made in the Union Iron Works, while the sister ship, constructed by the Cramp Company, at Philadelphis, contains 72 engines made by other firms. Not only this, nearly all the steam and water fittings, the whole of the hydraulic apparatus, and indeed nearly every detail of all the ships built here are produced in the works at the Potrero. Even the electric lighting plant was put in by the contractors, who purchased only the dynamos and other elcments that could not be produced by the resources of their own establishment. This is a very important fact in respect to the Union Iron Works, and indicates an ability of staff, plant and administration without parallel." The Busy Season and its Temptations.

19Y L. A. N.

The busy season of the heating trade, particularly of that part of it which is principally related to domestic heating appliances, has arrived. Business has been bad with this trade for so long that what this autumn may offer will be eagerly sought and competed for. That phase of competition and bane of trade, cutting prices, is under such circumstances likely to be excessively indulged in. Its effects upon the whole duiged in. Its effects upon the whole trade have often enough been pointed out. They are universally recognized as bad. Talk with almost any man in the business and he will both admit and lament the cvil. The chances are that within an hour after the conversation he will slice all the profit off an estimate to keep his neighbor over the way from getting the job at a cut price. It is only a question between these rivals of which can stand this sort of thing the longer. Mr. Longpurse can stand it for a greater time than Shortpurse, and he flatters himself that when Mr. Shortpurse has folded his tent and silently stolen away the field will be clear, prices can be restored and the money sunk in wiping out competition can be regained. Is this sure?

Shortpurse has gone out of businessperhaps has been employed as a salesman by Longpurse or some other dealer, and lives to regret that he had not atopped before he began business for himself. The interest on the money he has sunk in a foolish atruggle, would now gratefully eke out a salary not any too large for his needs and wishes. But Longpurse's bank account is not so full as it was, and this being known to some enterprising man, the latter sees an oppor-He rents Shortpurse's old tunity. store, fits it up nicely, stocks it with nice goods, and Longpurse finds he has got to divide the trade or begin to cut prices once more. Perhaps he can stand a second dose of this, but the years are rushing along and he is not getting rich. He has not even amassed a com-The time for inventories and balance sheets is approaching and he has well grounded fears that the end of the year will show that instead of any profit having been made, his capital has been further impaired. This does not make him happy or proud. would be better off, perhaps, if he also had folded his tent like Shortpurse. Sympathy for such men acems misplaced, for cutting prices below a fair margin of profit is not only the meanest, but the most dangerous kind of competition indulged in by any business man. If the trade cannot realize a reasonable average profit for all the men in it, its condition cannot be improved by lessening profits. The trouble is that there are too many in the business.

Grand Chief Arthur of the Brotherhood of Locomotive Engineers has voluntarily withdrawn his appeal from the injunction issued against him by Judge Taft on the application of the Toledo, Ann Arbor & North Michigan Railroad Company compelling him to rescind his order to the members of the brotherhood in the employ of the company to refuse to haul their cars, and restraining him from issuing any further order of a similar nature. This ends a long litigation in the matter of the famous Toledo & Ann Arbor boycott.

# TRADE REPORT.

## The Iron Market.

Those who entertained somewhat sanguine views as to the immediate effect of the result of the elections upon business have been disappointed. Buyers have not jumped into the market, and the volume of business has shown practically no increase. We have no doubt but what the removal of a possible source of danger has strengthened confidence. The feeling is better, but there are other considerations which outweigh that in shaping the near fut-

ure of the Iron trade.

We are now on the threshold of winter, which is usually dull in the Iron business, unless buyers think it wise to anticipate their apring requirements. It was not so many years ago that the Rail mills had on their books, as early as October 1, orders for 1,000,000 tons of Steel Rails, for delivery during the succeeding year. Until now the position is very different. Few rolling mills, foundries, car shops or builders have orders reaching much beyond the current year and the majority have gaps to fill for 1894. Buyers cannot be tempted. We know of instances in which very advantageous terms were offered, without leading to the slightest anticipation of requirements.

In the Wire trade the latest development is the rupture of the newly formed Barb Wire combination, while war goes on vigorously in the Wire Nail trade. In the Cut Nail trade gossip deals most with a sale of 5000 kegs to a cooperage company closely allied with the Sugar Trust.

The atarting of two of the leading Western Tin Plate mills on a non-union basis is a movement of much significance. It means that an effort is being made to drive the Amalgamated Association out of one of its last strongholds.

Birmingham advices indicate that the Japanese Cast Iron Pipe order is not definitely closed.

Plg Iron. - New York market continues dull, and there are no indications of an expanding demand. As yet there has been no serious talk as to contracts for standard Northern brands for next year. From New England come complaints of very low prices on Southern Iron, while Buffalo furnaces are unsettling matters along the lower Hudson by putting in sample lots at low prices. In the Cast Iron Pipe trade everything is very quiet. Some negotiations are on for apring delivery, but there does not seem any immediate chance that business will result therefrom. We quote standard brands \$12.25 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2; \$10.50 @ \$11 for No. 2 Plain, at tidewater. \$11 for No. 2 Plain, at tidewater. Southern Iron, same delivery, \$11.50 \$12 for No. 1; \$10.50 \$11.25 for No. 2; \$10.25 \$10.75 for No. 3; \$10.50 \$10.75 for No. 2 Soft, and \$10.75 \$11.75 \$10.75 \$ @ \$10.40.

A few enthusiasts in the Philadelphia market undertook to quote higher prices on Wednesday, but finding that orders were filled elsewhere, they soon reconsidered their action, and dropped back to the old figures, at which there is a good healthy demand. There is no particular reason for prices being higher except that they are too low for a reasonable margin of profit, but so long as there is a supply fully equal to the demand there is no reason why consumers should pay more money, as their margin is also much less than it ought to be. There is a little weakness in Bessemer Iron; other descriptions are steady at prices as last quoted for Philadelphia and equivalent points.

Advices from Chicago intimate that the past has been a very fair week in local Coke Iron in that market, and several important deals were closed. While important deals were closed. the lateness of the season would appear to be unfavorable to heavy business, there are good prospects of the demand continuing moderately active until the spring trade sets in. The most hopeful feeling prevails among both manufacturers and consumers. Prices of local Coke Iron, however, are not expected to advance for some little time, until general conditions show more im-provement. Quotations on local Coke Iron have been revised this week in order to bring them more closely in harmony with actual prices recently current. This is not to be taken as incurrent. This is not to be taken as in-dicating that values have receded during the week, but is done in order to make a better basis on which to show any advance which may be made to-ward a higher range of values. Lake Superior Charcoal is in somewhat better demand, which is perhaps owing to the fact that the large dealers are again giving some attention to this class of Iron, which they have long neglected. Quotations are given as follows for cash: 

The demand for Foundry Iron in the Pittsburgh dittrict is light and prices are weak. Quotations are given as follows:

While the volume of business in the Cincinnati district during the week has not been large, yet there have been some encouraging features, with a stronger undertone all around. Sales were slightly enlarged. There was a better jobbing trade and there were several sales of 500 to 600 tons. There were also reports of pretty large buying by Southern Iron Pipe works. supplied at previous prices, and the most that can be said is that the tendency seems to be upward. Quotations are as follows:

larger amounts, which, however, the furnaces refuse to entertain. Prices are as low as it is thought they can go, and it is the policy of the furnacemen to stock their Iron rather than shade the market any further. Many con-sumers are allowing their stocks to run down in view of the annual inventory, so that the market is likely to be quiet until the turn of the year. We quote as follows for cash, f.o.b. cars St. Louis:

. 9.75 @ 10.00 dry ...... 9.50 @ 9.75 Southern Car Wheel ...... 16.50 @ 17.00

### Metal Market.

Pig Tin.-Very little change in prices has taken place during the past week. Values in the wholesale market are down to a level that tends to check bearish operations, but low prices have failed to weaken live buying interests. In short, it is a lethargic market as far as speculation is concerned, and few trades have been made except on more or less peculiar terms as to options and delivery that have a tendency to mystify rather than instruct the outside buyer. That there is some motive in this can hardly be denied, and that it is a means to speculative ends goes without the saying. It is an unmistak-able fact, however, that purchasea by out of town dealers and by consumers have been only fair and that sales are atill being made outside at prices unusually close to those that go into general circulation as being net cash rates for spot stock. Jobbers' prices for amall lots of Straits Pig from store have been marked down to  $16\phi$  @  $16\frac{1}{2}\phi$ , and for Bars to  $17\phi$  @  $17\frac{1}{2}\phi$   $\frac{2}{12}$  lb.

Copper. -There is no decided change, but the market has a weaker appearance and buyers are extremely conservative, not only in placing orders for future delivery, but in purchasing against immediate wants. It would seem that little concern is centered The elections last week have had a upon the endeavors of producers to resalutary effect upon the market. The demand, however, has been pretty freely has been a good teacher and that consumers have settled down to the opinion that there will be enough Copper of all kinds to go around. For small retail parcels the price of 101¢ ? It still rules.

Sheet Copper.—Dealers report that the inquiry is only moderate and largely of an unsubstantial nature, being made merely for the purpose of testing the market. Large purehasers still hold aloof, and the business passing during the week has been almost wholly in small orders to fill current needs. Prices for Manufactured Copper of all kinds are unchanged. Small jobbing lots of Sheet Copper are usually quoted on a net basis of 15¢ ? lb.

Pig Lead.—Some efforts have been made to give the market more tone, and in that connection reports were sent out of large business having been effected, but the alleged business cannot be traced. As a matter of fact, several sellers have been offering large lots for both near and distant delivery, at prices that are about down to the recent lowest figures. The demand from the smaller consumers has been of a very ordinary character. American Pig in small lots from atore is still quoted at from  $3\frac{1}{4}\phi$  to  $3\frac{1}{2}\phi$   $\approx$  lb.

Speller.—Ordera in this quarter have fallen off, and Eastern consumers figure as very indifferent buyers at the moment. Galvanizers, who were liberal buyers in some quarters a short time ago, have also modified their offers, and upon the whole the support is less promising at the present time than it was a week or ten days ago. Prices are rather easier. For moderate jobbing parcels from store the ruling price ranges from  $4 \phi$  to  $4 \frac{1}{2} \phi$  P lb.

Antimony.—Nothing more than routine business has been transacted, and the demand is exceedingly commonplace. Quotations in small lots are unchanged from those presented in last week's report.

Nickel.—Prices are extremely variable, with the range of  $38\phi \oplus 45\phi$  quoted, according to quantity and delivery.

Tin Plate.-Very little change has taken place during the week, either in the character of business or in the demand. The substantial increase in ordera which some oversanguine individuals looked for as a result of the elections has not yet materialized. The demand is still confined, for the most part, to moderate lots for prompt or part, to moderate lots for prompt or near future delivery, and is rather be-low the average for this season of the year. Many of the large consumera place their orders direct, taking all ad-vantage that there may be in purchas-ing for future shipment, and they go about it indifferently. Supplies on about it indifferently. Supplies on spot have accumulated somewhat, and the assortment is rather better, but some special sizes and qualities of Plates are more or less scarce and the "hunting around" by brokers in the endeavor to secure these Plates still continues. Along with the confirmation of reports of quite liberal stocks at foreign producing points this serves to give a weaker tone to prices. Imports have been rather heavy in the last week or ten days, but they are fairly well met by the consumptive demand. A special London cable dispatch of November 14 to The Iron Age reports as follows in regard to the British Tin Plate market: Tin Plate has been dull and prices are easy. Buyers very uncertain and waiting. Transactions limited. Large shipments have been made, chiefly on former

orders. Stocks at shipping points estimated now at about 200,000 boxes, a reduction of 30,000 boxes the past week. Swansea quotations are as follows:

THE ARCHER & PANCOAST COMPANY were incorporated at Albany, N. Y., on November 14, to manufacture Lamps, Electrolicra and Gas Fixtures and Art Metal Work in New York City. The capital of the company is \$100,000, and the directors are Archer V. Pancoast, Chas. A. Cheever, Byron Traver, Wm. S. Fearing, John B. Summerfield and Samuel B. Lawrence of New York City. Henry T. Bragg of Yonkers; Gurdon S. Howe of Rosebank, S. I., and Ed. Cornell of Central Valley. Samuel B. Lawrence subscribes for \$99,600 of the capital stock.

THE NATIONAL SANITARY FURNACE COMPANY, Philadelphia, capitalized at \$50,000, were incorporated last week by the State Department for the manufacture of machines, furnaces and devices for the destroying of waste matter and garbage, d&pris and refuse matter and for the purpose of manufacturing Fer-

tilizers from the garbage and other refuse thus incinerated.

#### CONDITION OF THE

## Hardware Trade.

HE INTERRUPTION TO BUS-Three introductions to be since in the state of the public mind in political matters prior to the electron has been such reeded by a somewhat increased activity, orders the present week coming in a little more freely. There is a per-ceptible improvement in the feeling a little more freely. There is a perceptible improvement in the feeling that pervales the trade, and a confidence that more stable conditions will prevail which will serve as the basis for a gradual return to prosperity. The orders which are being received call for a good proportion of winter goods, this class of trade having been stimulated by the advent of cold weather, especially as a good many merchants, owing to the prevailing conservatism, had been more than usually late in making their purchases. There is also a fair demand for general Hardware, and on the whole the condition is better than a few weeks ago. The volume of business is not, however, on the whole up to the average, while it shows a decided improvement over last year. The tone of the market in the matter of prices is far from satisfactory, on many goods constations being weak and The tone of the market in the matter of prices is far from satisfactory, on many goods quotations being weak and irregular. The trade are, however, generally coming to accept the fact that prices on the whole are likely in future to rule low, owing to low prices of raw material mergased competition of raw material, increased competition among manufacturers and diminished among manufacturers and diminished cost of producing goods. Owing to these influences a return to former high prices is generally regarded as unlikely. At the same time there is no doubt that prices ruling on many lines of goods are exceedingly close, and, with a recovery in raw material and a fair increase in the demand, it is thought not unlikely the demand, it is thought not unlikely the demand, it is thought not unlikely that advances in some lines may be expected. Whether or not the bottom has been surely reached on goods in which marked declines have taken place during the past year or two is a question on which there is some difference of opinion. In this condition of things the trade are naturally purchasing with a good deal of conservatism, and it is difficult to obtain a line of goods in which there is any disposiof goods in which there is any disposi-tion on the part of careful buyers to place orders in excess of early requirements.

Advices from Chicago.—Shelf Hardware is doing fully as well as at any time this fall. The election excitement last week caused some little falling off in daily sales, but mail orders at the beginning of the present week are heavier than usual, which brings up the average. The conditions which have kept trade steady during the past two months still exist. Orders are small but frequent, showing that country merchants are being compelled to constantly replenish their stock. Staple goods are comparatively quiet, as is usual with the approach of winter. Seasonable goods have been in rather light demand, owing to the very mild weather. But the past week winter seems to have set in in earnest and a much stronger demand is now expected for all classes of these goods. Tinware and House Furnishing Goods have been in somewhat less demand than was reported last week, but on the whole this class of trade is doing considerably better than during the early fall months. The Heavy Hardware business has improved considerably. Inquiries are better and consumers now are talking more favorably of stocking up on staple goods.

### Notes on Prices.

Wire Nails.—The Wire Nail market continues in very much the condition referred to in our last report. The de mand is fair and some heavy orders have been placed, with some large shipments that buyers might have the advantage of water transportation. The market continues to be represented by the quotation of 95 cents, f.o.b. mill, for carload lots, with a 60-cent average, but this figure is shaded and on attractive orders 90 cents is obtainable.

Advices from Chicago.—Factory prices recently have settled down to the level of \$1, Chicago. This is due to the low rates made by water from Eastern points, which eatablished a delivery price that had to be met by manufacturers in interior localities. The large contracts which are usually placed for late shipment before the close of navigation were attractive, and the lowest rates were made to secure them. Several important transactions of this character took place during the past week. Now that the season of navigation is about over and shipments must be made by rail, there is an expectation that prices will be firmer. Jobbers are of this opinion as well as manufacturers. Small lots from atock are quoted at \$1.10.

Cut Nails.—There is a fair demand for Cut Nails, but the volume of business is not especially heavy. Small lots from store in New York are quoted at \$1 to \$1.05.

Advices from Chicago.—The volume of business last week, as reported by manufacturers, improved considerably over the average of the preceding weeks. Single orders are no larger, but continue to run to carload lots, with an occasional call for two carloads. Small lots from stock are quoted at \$1.

Barb Wire.—The Barb Wire marke is, as usual at this season, quiet so far as actual businesa is concerned, the demand being light and comparatively few orders being placed for next spring. In the matter of price the tone of the market is not quite so strong as it has been, owing in part to rumors of some disagreement among the manufacturers. In this condition of things some of the large trade are deferring placing their orders, awaiting developments. Quotations on Four-Point Galvanized in carload lots are as follows: Pittsburgh, \$1.90 to \$2.05; Cincinnati, Allentown, Chicago and New York, \$2.05 to \$2.15.

Advices from Chicago.—Not much business has recently been done in en-

Advices from Chicago.—Not much business has recently been done in entering new orders for spring delivery, so far as can be ascertained. Country merchants are making some inquiry for shipments beginning in January, but are not yet inclined to indicate how much their purchases will be. They are disposed to wait until they are thoroughly assured that prices have touched bottom. Such harmony exists among the Barb Wire manufacturers, however, that there is strong reason to believe that the present basis of values will be maintained. Orders for prompt delivery are now small, owing to the prevalence of winter weather throughout the Northwest. Trade continues in fair volume with Southwestern points, which, however, only take a small part of the output of this section. Jobbers quote amail lots of Galvanized at \$2.25 from stock, and \$2.10 to \$2.15 from factory.

Western Autograph Register.— This Register was illustrated in our last

issue. It is manufactured by the Western Autographic Register Company, 927 and 929 North Eleventh atreet, St. Louls. The register is sold at \$15 each.

Glass.-Prices of Glass have not gained atrength during the past week, though there is a noticeable improve-ment in demand. Additional factories are being put in operation and yet it is reported that stocks are not secumulating to any extent in manufacturers' hands. This would indicate that the production is being taken nearly as fast as the Glass is made. A fair local price for small lots is from 85 to 85 and 15 per cent. discount for single strength, and from 85 and 15 to 85 and 20 per cent. discount for double strength Glass. While importers quote 70 per cent. discount on foreign Glass, there is little doubt but that lower prices have been made, when brought into competition with American Glass. Demand for Plate Glass appears to be falling, with weaker prices. While there is considerable variation in prices New York and New England average quotations are probably 70 and 10 per cent. discount on sizes 5 feet and over and 75 and 10 per cent. discount for sizes 5 feet and under on the Eastern list. Upon the same basis Western prices are 70 and 10 and 5 per cent. discount on sizes over 10 feet and 70 per cent. discount on sizes 10 feet and less from the Western manufacturers' list.

Old Metals —There is a rather better demand for some descriptions of Scrap Iron. Other Old Metals are quiet. Prices paid by deslers in New York are about as follows:

Heavy Copper	<del></del>	TO A	₹
Light and Tinned Copper	39	Th 614	(4)

		od's Hardware stock,   warehouse	e in the rear of their store

### It Is Reported-

#### Alabama.

That Park Johnson & Co., SELMA, have dissolved.

#### Illinois.

That Benjamin Broughton and Frank Taylor of DE KALB are negotiating for the purchase of a Hardware stock at Lake View, Iowa.

#### Indiana.

That an accumulation of natural gas under the floor of James Galbreath's Hardware store, at Swazel, caused an explosion early on the morning of the 8th inst., that blew the front part of the building into the street.

That E. Sell of Kentland has sold his Hardware store at that point to Hugh Gainor of RAUB.

That J. F. McNear, Hardware merchant Country Count

chant, Columbia City, has gone out of

#### lowa.

That County Auditor C. M. Doxsee has purchased the H. J. Winkie Hard-

ware stock, at Algoma.

That F. J. & W. M. Anderson of
Mitchell County have purchased the Hardware stock of Davis & Zimmer-

man, Jefferson.
That W. C. Gerner, Hardware and Implements, Barnham, has sold out to

P. M. Jenks.
That Wilson & Nelson, Wirt, dealers
in Hardware and lumber, have sold out

That Hill & Haskett, Hardware dealers at Earlham, have sold out to W. M. Clark & Co., who have decided to add a line of turniture to their bus-

Kansas.
That Mr. Brill of Wamego has pur-

at NORTH TOPEKA.

#### Louisiana.

That the Southern Hardware Company, Monroe, have been incorporated, with I. Baer as president and S. Marx as secretary and treasurer. The capital stock is \$10,000.

#### Maine.

That Charles H. Clark, in the Hardware business at Kennebunk, has sold out to John W. Lord & Co.

#### Massachusetts.

That the Peirson Hardware Company, PITTSFIELD, are making extensive improvements in their store.

That W. W. Lydston, MERRIMAC,

has been succeeded by the Amesbury Hardware Company.

#### Michigan.

That Hnll & Co. have bought the Hardware stock of R. J. Clark, at Port HURON.

#### Minnesota.

That W. H. L. Donaldson of Preston has sold his Hardware stock to Kinsella & Rockwell of PLAINVIEW, Wabash County.
That Thomas Hall will soon open a

new Hardware store at St. CLAIR.

That Weinberg & Hagen have purchased the Hardware store of Nels Mikkelson, at New London.
That Hoppin Hardware Company,

DEXTER, are building an addition to the rear of their store 20 x 40 feet.
That Smith & Viesselman, FAIRMONT,

have purchased ground on which they will erect next spring a two story brick structure to accommodate their grow-

ing Hardware business.
That R. Rierson & Co., Hardware and Implements, Lyle, are making preparations to build a corrugated iron

store building.

#### Missourl.

That Chas. Morelock has bought out the business of Morclock & Son, KIRKS-

That W. R. Clark has purchased Mr. Lansche's interest in the Hardware firm of J. P. Lansche & Co., Troy. The business will hereafter be conducted under the style of Wright & Clark.

That Davis & Morrow, FAIRFAX,

have disposed of their business.

That the Ludlow Hardware firm of Phillips & Haley have disposed of their stock.

#### Nebraska.

That the firm of J. H. Stewart & Co., BLAIR, have been dissolved, E. A. Stewart retiring. The business will be continued by J. H. Stewart under his own name. This is the oldest Hardware house in BLAIR, having been established by the corby 70°s J. ware nouse in Blank, naving been established in 1869. In the early 70's J. H. Stewart began his apprenticeship in the business and early became a partner, and for many years past has been its managing head.

#### New Jersey.

That G. A. Myers & Co., wholesale and retail Hardware, PATERSON, have dissolved. George Christie succeeds.

#### New York.

That the store house of George Barr, Hardware merchant, OGDENSBURG, was destroyed by fire on the 4th inst. Loss, \$10,000.

That Thomas H. Parker, dealer in Stoves, BINGHAMTON, has sold out.

Ohlo. A. Fillmore, Hardware That W. A. Fillmore, Hardware merchant, Zanesville, has removed to new quarters.

#### Cost and Competition.

Au old tradesman remarked that competition would be less severe if actual cost was better known. The truth of the statement needs no defense, and it is quite probable that more would be gained by educating cut rate competitors than by fretting over lost contracts. A short time since prices were so demoralized in a certain locality that no dealer could see any light ahead. One, more aggressive than the others, sent word to all to meet at his place a set evening to discuss an important matter. He found a good attendance, and by means of his account slips he showed the cost for time and material, well inside of a safe business profit, required for several kinds of work which all were doing. By this method some were for the first time made aware that they were in error in the prices they thought they could afford to quote. The meeting brought mutual confidence and respect where distrust and bitter feelings had prevailed. A resolution was passed in which all agreed to look carefully into their work and charge a uniform advance for profit and to continue the practice for one month regardless of results, which were to be reported at the subsequent meeting. Now, the system of carefully calculating cost has been firmly established there and the methods of some which were imperfect have been remodeled. Competition still continues, but, as all have a good idea of the actual cost, it does not result in a loss. Furthermore. better work is being done and better material is being used than formerly.

Deposits from Water in Kitchen Boilers.

The deposits from water may be tron blesome in many places, and most people are at a loss to understand how they occur. All cold water absorbs

the atmosphere always contains a small percentage. When water thus charged with carbonic acid runs over lime or magnesia, or filters through earths containing these materials, it dissolves portions of them. When heated, the carbonic acid is driven off from the water: and as it is only by virtue of the presence of this acid that water can dissolve carbonates of lime or magnesia, these then resume the solid state, and, adhering to metallic surfaces. form a scale almost precisely as tartar forms upon neglected teeth. It follows that if water be first heated before being fed to boilers, or if by chemical means the carbonic acid can be expelled and time for the precipitation of earthy matters be allowed, the water will not thereafter form a mineral scale. While feed water heating is practicable for power boilers, it is not usually so for kitchen boilers or for heating boilers. In places where only a hard water supply is available, it is better to use such forms of boilers for each of these purposes as will admit of access to their interiors for cleaning. Some waters contain vegetable matter which forms a scale, or which, at least, mingles with the mineral scale. The latter is normally white or nearly so. If it be mixed with matter of vegetable origin it may have a dark color, often resembling chocolate. Recently a large quantity of this kind of scale was taken from a power boiler in New York which was fed by water pumped from the Hudson River.

Unreliable Industrial News.

In these times when the news printed in the daily press, and particularly that relating to industrial matters, is so highly colored one way or the other, according to the political beliefs of the papers in question, it is wise not to put too much faith in printed statements to the effect that this or that establishment has started up after a suspension of anywhere from three months to a year and will run to full capacity right along. Again, it is not always best to accept as truth the statement appearing almost daily, that on account of the resuit of the recent elections wages at a certain establishment have been advanced 10 per cent, or even more than that amount. Two cases that came up in Pittsburgh last week well illustrate the point in view. One was to the effect that a prominent bar iron concern had voluntarily increased wages of their puddlers 10 per cent., and the papers that train with the party that won such a victory recently took oceasion to make a great ado about it. The other was to the effect that a large tube con-

carbonic acid gas from air, of which f cern, whose plant had been entirely closed for six months, would resume at once, giving employment, some accounts stated, to 1000 men. The reaumption was attributed entirely, of course, to the recent elections. Investlgatlon proved, unfortunately, that the firm credited with giving their puddlers an advance of 10 per cent, knew nothing about it, and the item was what is commonly known as a "fake." The tube concern in question have been closed for some time, but have put on a few men to get out some special work, and whether they will continue to run in part or not, depends on their getting some orders, which, up to this time, they have not received. Only a short tlme ago a communication was received from a concern building rolling mill and tin plate machinery, requesting that no attention be paid to a statement that was being industriously circulated to the effect that they had received an order for the building of a tin pla'e mill, all on account of the "great victory." While it would be a very great pleasure to chronicle news of this kind, stripped of its polltical features, investigation proves too often that its only foundation is in the brains of some imaginative reporter.

New York City's Refuse.

In another part of this issue we print an abstract of the interesting report of the New York City Garbage Commission who have recently made an exhaustive inquiry into the systems of garbage disposal pursued in other cities, with the view to adopting the best practicable method in this city. The crying need of a change in the existing method of disposing of New York City's refuse by dumping the whole mass in the ocean has become so insistent as to forbid any further delay in the adoption of some better system, if the health of the community and the comfort and well-being of the neighboring seaside resorts are to be maintained. The question of filling up the harbor channels with the dumped garbage has became, too, quite a serious one; and this reason alone should be sufficient to move the city authorities to prompt action. If, as seems demonstrable, the city's refnse can be not only disposed of, but disposed of at a handsome profit through the medium of reduction works, the sooner such works are put in hand the better.

Under the new tariff law any dutiable article can be manufactured in bonded warehouses, instead of only the few allowed under the old tariff. The new allowed under the old tarlff. The new regulations governing bonded manufacturing warehouses have just been issued by the Treasury Department.

# THE LETTER BOX.

#### Corrosion of Iron Pipe.

From W. II. F., Washington Depot, Conn.—Please inform me through the columns of The Metal Worker which will corrode iron pipe the quickest, letting the water run continually, draining the pipe or letting the water stand in the pipe?

Note. - Our correspondent has not asked au easy question. Practice varies in the care of boilers in the summer in which the same problem is involved. Some engineers leave the boiler full of water, and others drain it completely. If a boiler or the piping be left full of boiled water it would probably corrode less than if left in any other way. Or if the piping be drained and dried and kept closed so that damp air will not pass through it will also not corrode. If ordinary water be left in it the air in solution will have a considerable effect in promoting rust. Boiled water, of course, is free from air and is therefore less corroding in its effect. This is a question, however, that can be discussed to advantage by the practical readers who have tried the several methods. We have no doubt that opinions will vary as to the plan to be followed.

#### Water Front Hinders Baking

From W. D. B., Southampton, N. Y.—Replying to the inquiry of "S. & S." of Massachusetts in The Metal Worker of November 10 regarding a water front for a No. 8 range, would say I believe the difficulty is caused by the water front not fitting into the fire box perfectly. Let your correspondents take some asbestos furnace cement and point up all the joints inside of the fire box and the pipe holes in the stove where the circulating pipes connect with the water back, making sure that they are perfectly tight. Then, if they will use nut coal in the range, I believe it will work as well as it has ever worked.

# Hanging Gutters on High Buildings.

From J. R. S.. West Fairview, Pa.— I should, and I know others would, like to know the best methods, or those usually followed, of hanging gutters on high buildings. There are barns in this locality that are 40 feet to the eaves, having slate roofs, with a fall of 8 inches to the foot, that are not provided with snow guards. The question is, how to hang gutters on these high buildings without the use of ladders, which requires very heavy work.

Note.—It is evident that the hanging of gutters on high buildings is attended with more or less difficulty. When a barn is being built, and scaffolding is

used, the tinner could take advantage of the circumstance by placing the gut. ter in position before the scaffolding was removed, thus avoiding the labor connected with the use of ladders. Cornicemen and painters often use a swinging staging for their work, but the method would hardly be applicable to hanging gutters on barns on account of the labor involved in securing the staging and changing its location in order to fasten the gutter. If there are any of our readers who have used a method for hanging gutters on high bulldings that is especially convenient, we should be pleased to have them inform our correspondent through the columns of The Metal Worker.

#### Sheet Metal Launch.

From W. C. B., Newark, N. Y.—I notice in The Metal Worker of November 10 an account of the sheet metal launch made by Louis Giclas, Washington, D. C. The picture pleases me very much, for I have been thinking strongly of building one for myself. If Mr. Giclas does not think me inquisitive, I should like to know what the engine cost and what make it is, and trust he will supply this information through The Metal Worker.

#### Cleaning Solder.

From W. D. V., Southampton, N. Y.—I have about 150 pounds of solder that I cannot use. It seems to have zinc in it and I have tried to burn it out with sulphur and eat it out with acid, but have been unsuccessful with both experiments. Ususlly I have had no difficulty in cleaning it with sulphur. Perhaps some other metal is mixed with it. I should be glad to have any suggestions as to a method of finding out what this metal is and also how to clean the solder.

#### Fossil on the Rampage.

From Fossil.-I regret that " Progwhose letter was published in The Metal Worker of November 17, did not give us his valued counsel earlier so that we could have tried a few gross of stationery rubber bands in our ram experiments. Judging by our experi-ence one would last several minutes. I have an impression that the waterways in a working valve are constructed to produce that rotary motion which "Progress" would check; also I fail to see the point of his "sucker" illustration. The sucker's action results from atmospheric pressure, but our valve was inclined to stay up rather than down, and needed a little help on the drop which neither a spring nor inert weight seemed to furnish. The hinged board has a rebound that does the business, and although it may be a "backcountry idea," it gets there just the

#### A Well Problem.

From C. F., Tennessee —I have a customer living on high ground whose well and elstern are about to give out. He comes to me to make him a tubular or driven well, and I don't know how. The well, or pump, will have to be from 80 to 100 feet in depth. I can easily have a hole bored from 8 to 18 inches in diameter down to the sand; but what shall I do next? The ordinary bored wells are common here, but this man wants a pump, with a point to the tube driven down in the sand. Please help me out.

Answer. - Our correspondent is not as precise as we could wish for a proper understanding of what is wanted. If the well now giving out is to be used a matter of only a few feet deeper will restore the water supply. This is a common trouble with wells throughout the country that have been dug in an ordinary or wet season, and become too low or entirely dry in a time of drought. The reinforcement of such wells is deacribed and fully illustrated in our issue of July 21, 1894. If our correspondent is to make a new well, then after the hole is bored with an open end tube to the desired depth and into the waterway to a depth sufficient for a permanent supply, a deep welt pump may be inserted, with its pump chamber within 10 feet of the hottom, the hottom acction made into a point and atrainer the same as for driven wells. The point and atrainer can be pressed down as far as possible below the bottom of the outside casing or tube, so as to give free access of water to the strainer. If this is not deep enough to clear the bottom of the outside tube with the strainer, the outside tube can be drawn up a little to give the necessary clearance. If very coarse gravel is met at the hottom in the waterway, no driving of the point will be needed. We think that this, with a perusal of our illustrated article on the reinforcement of deficient water supply in wells, will make the question clear to our correspondent and enable him to accomplish the work.

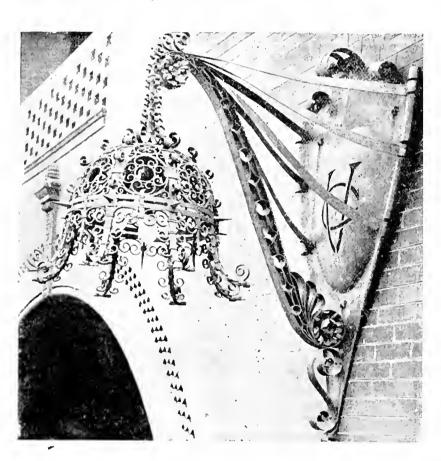

The returns of the United States Burcau of Statistics show a large increase in exports of domestic merchandise for the month of October as compared with September. The exports during October were \$82,291,250, against \$57,811,037 in September. The total exports during the ten months ending October 31, 1894, have been \$644,570,000, which is about \$28,000,000 less than the figures of the first ten months of 1893. The excess of exports over imports in the same period has been nearly \$97,000,000. This fact is regarded as providing a safeguard against any extensive loss through gold exports in the near future.

#### The Anthracite Situation.

Rumora have been very plentiful recently, says The Iron Age, concerning aharp cuts in prices of anthracite coal to the line trade. The circumstances are somewhat complex. When the bituminous coal strike occurred this summer the anthracite interest expected a sharp increase in the demand. This did not take place to the extent expected, the estimated increase in tonnage having been only about 1,000,000 tons. The anthracite interests were slow to recognize that the added demand was not as great as expected, and continued to mine large quantities. Production was not cut down sufficiently. When October arrived the sales agents reluctantly attempted to meet prevailing con-

rangement under which they receive 60 per cent. of the selling price of coal at tidewater, for their coal on cars at the mine, the coal being handled by the Lehigh Coal Company. As a minimum \$3.25 at tidewater for stove coal is fixed in the contract.

Now, by far the greater part of the coal mined by the individual operators goes to tidewater, although fully two-thirds of the authracite coal mined does not go in that direction. It will be readily understood that the leading rail road interests, with whom tonnage is the first consideration, may find it to their advantage to permit an overstocking of the tidewater markets and a corresponding decline in prices, because the coal mined by the individual operators must bear the greater part of the burden.

ELECTRIC HANGING LAMP.

dltions. One large interest agreed to the allotment made for that month and yet broke its pledges a few daya later. Another interest which was supposed to have given its adherence verbally fell back upon the ambiguous assent given to justify independent action. In the mean time tidewater prices crumbled away under the pressure to dispose of surplus product. At the same time the leading interests attempted to recoup by advancing prices to the line trade. This brought about the vigorous protest on the part of the individual operators of whose action so much is now printed in the newspapers.

It is estimated that about 30 per cent. of the total amount of anthracite coal produced is mined by individual operators, the majority of whom ship over the Lehigh Vailey Railroad. The largest of these individual operators are Cox Bros. & Co., who, however, have special arrangements with the railroads, because they haul their coal to tidewater with their own engines, cars and rain crews. The others have an ar-

Every one of the great coal roads has its line trade which it controls more or less completely. For that trade the company coals are reserved and the deliberate attempt has been made to make this line trade pay a higher price for the coal than is paid in tidewater markets. The injustice of such a proceeding, both to the individual operators and to the consumers along the line, is flagrant. It has led to the demand on the part of the individual operators upon the Lehigh Valley road to make prices to the line trade harmonize with those at tidewater. It has led to the report that Coxe Bros. & Co. will sell their coal on the basis of price f.o.b. mine.

So far as we can learn the struggle is one which will not very materially sffect the cost of production of iron by those manufacturers who largely use anthracite as a fuel.

"Technical instruction for butchers" is the latest development in trade education in England.

#### A Trick of the Trade.

ву в вміти.

The place where I worked was one of the kind that turned nothing away that came, and in the blacksmith shopthe boss held forth and was not very often laid out. A big steamboat used to run from our town every day lying there all night. One night she was away behind time and it was found that a nut on a 3 inch rod, connecting the engine with the walking beam, had split and the engineer was afraid it would not last till he landed. When he arrived there were no tools in our town to duplicate the nut and he was in a dilemma what to do, and didu't see how he could make his trip for a day or two. The boss heard of it and went to see the break, then told the engineer that if he would let him have that nut he would mend it so he could use it the next day, when it would be stronger than ever. The engineer didn't believe it and wanted an explanation, which the bess wouldn't give, and as the engineer had little to lose he concluded to let him try it, going to the shop to see the job done. A band was made of good iron that fitted the nut tight when white hot after the nut had been heated and closed. The band was driven down on the nut and cooled by a plunge in water and as the band was heavy the nut was stronger than ever before and rendered service for years

One day a traveling "jour" asked for a job, seeing that our shop was busy, but the boas did not want him. The "jour" stayed and talked and showed that he was a bright fellow, and the boss rather liked him; told him the history of his favorite pair of tongs; showed him how nice they worked and talked with him considerably. He asked the "jour" if he could weld three pieces of iron together in one weld at one heat without help. The "jour" said that was too much for him, and the boss said if he could have done that he would have hired him anyhow. The boss asked the "jour" to dinner, but he seemed embarassed at his inability to do the test job and would not go. When the boas came back from dinner he found his favorite center punch welded to the jaws of his favorite tongs, which were hanging over the horn of the anvil with the rivet cut out -three pieces of iron welded at one heat at one place without help. The boss cussed, then owned up beaten, and if he could have found the fellow he would have given him a job; but evidently the "jour" concluded that the boss would heat a welding heat should they meet, and got out of town as soon as possible.

#### Electric Hanging Lamp.

We here illustrate an electric hanging lamp made for the Union Club of St. Louis by the Ludlow Saylor Wire Company of that city. This lamp la made of wrought iron and given the Bower-Barff finish, which renders it absolutely rust proof. The design of the lamp was furnished by the architect, T. C. Link.

Taking silver—the heat conductor known—as 100, for the ratio in which heat passes through it, the other metals stand in comparison as follows: Copper, 73.6; gold, 53.2; brass, 23.6; zlnc, 19.0; tin, 14.5; iron, 11.0; atcel, 11.6; and lead, 8.5.

# PLUMBING and GAS FITTING.

## The Eastern Supply Association.

A meeting of the manufacturers of and dealers in plumbers supplies in New York and adjacent States was held on Tuesday and Wednesday, the 20th and 21st insts., at the Imperial Hotel, New York City, for the purpose of forming an association to take charge of all trade matters and to work in harmony on questions of importance in connection with the plumbers' supply trade. The new association was named the Eastern Supply Association. The following officers were elected: Presi-

bodies, which will determine all questions of importance affecting the trade in general.

#### A Novel Shower Bath.

The illustration herewith given shows a novelty in shower baths which has just been brought out by Thomas Kelly & Brothers, 124 Franklin street, Chicago. It consists of a perforated ½ inch pipe, formed into a circle 8½ inches in diameter, and connected with the bath cock by a piece of hose as usual. The temperature and pressure of the water are regulated by the combination bath

a thousand-dollar bond, but this, it is pointed out, will prevent many skilled but impecunious plumbers from doing work. The ordinance was amended to make the bond \$250, but even after this amendment the enforcement of the ordinance was indefinitely postponed.

# The Mosely Suction and Force Pump.

The Mosely Folding Bath Tub Company, 161 South Canal street, Chicago,

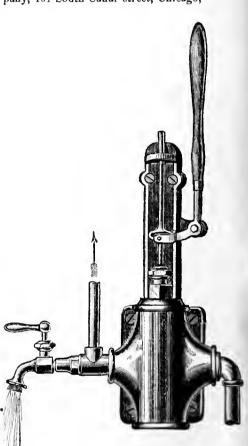

A Novel Shower Bath.

dent, John Reid of J. L. Mott Iron Works, New York City; vice president, B. T. Salter of Owen & Salter, Philadelphia; secretary, Edward W. Low of New York City; treasurer, B. Frank Hooper of Colwell Lead Company, New York City. A majority of the manufacturers and dealers have, it is stated, already joined the association, and it is expected that a still larger number will at once give in their adherence to it. The association embraces the States of New York, New Jersey, Connecticut, Pennsylvania, Maryland and the District of Columbia. The association, it is announced, will work in harmony with the two associations which have already been formed in the West and in the extreme Esst. A National Committee will be appointed, composed of three members of each of these three

cock and then turned off at the outlet cock, the side of the tub being broken away in the illustration to show the arrangement. The ring is then placed over the head and the water turned on and off by means of the single cock at will, without danger of being scalded with hot water or shocked with cold as is the case in using the ordinary shower. The arrangement here adopted avoids wetting the walls and tloor, which is a fault of the overhead shower bath, and it also enables a shower bath to be taken without wetting the head. The ring is made of brass and nickel plated.

THE LICENSINO OF PLUMBERS in Scattle, Wash., is occasioning some discussions in the Board of Aldermen of that city. It appears that the ordinance requires that every plumber should give

The Mosely Suction and Force Pump.

Ill., are offering the suction and force pump here shown. The pump has an iron enameled cylinder, with two chambers lined with block tin to prevent corrosion. The trimmings are of brass, with a wood handle, and the valves, it is explained, are easy of access. The pump is quadruple acting, with oscillating movement. It is pointed out that the action is easy and direct, with a short stroke, and that it has great efficiency for the energy expended. The makers state that the pump, style No. 1, with a 1½-inch auction and ½ inch discharge, has a capacity of 8 gallons per minute, a continuous stream, and that when used in connection with their heater and folding bathtub, either direct or to a supply tank, it is next in convenience to a city water service. It is further stated that the pump is well adapted to forcing water in buildings where the elevation is too great for the pressure from street mains, and also for fire protection.

#### The Simplex Lead Pipe Cutter.

The Simplex lead pipe cutter, which is herewith illustrated, is made with a blade of tempered steel, ground to a sharp point, with keen edges. The shape of the blade is indicated by a dotted line running across the pipe in The curved jaw of the frame the cut. extends around the pipe while the blade is moved up and down in the slides by the action of the binged levers between the handles. A slight pressure suffices to puncture the pipe, after which, in the progress of the cut, the blade cuts entirely from the inside outward, as it could not do otherwise owing to its shape. Thus the pipe is not crushed or bent and the ends do not need to be reformed or chamfered. Cutting by such a tool is vastly superior to sawing, as

The Simplex Lead Pipe Cutter.

there are no chips or shavings left in the pipe to injure valves or faucets. It is easily seen that the shape of this tool adapts it to work close to a wail or ceiling or near a corner. A small pipe can be cut with one hand. The weight of the tool is 13 pounds, and the length is 15 inches. It is offered for sale by the manufacturer, Robert D. Wardwell, 1359 West Jackson street, Chicago, or by dealers in plumbers' supplies.

#### TRAPS AND VENTS.,

JOHN TROLAND of Norwich, Conn., known to plumbers by the papers be has prepared for his State conventions, has a large snow shovel in his store bearing the following inscription in white chalk: "Only 75 cents; reduced from \$1 since election owing to the atorm.

THE VANDERMAN PLUMBING & HEAT-ING COMPANY, Willimantic, Conn., carry a large line of steam fitters' and plumbera' supplies, and have machinery for cutting and threading large pipe. They also have a well equipped machine shop for turning out the special tools in-vented by Wm. Vanderman. Their steel tool chests for plumbers and ateam fitters are growing in popularity and demand. Their pipe benders, asbestos gaskets, combination vises and pipe cutters have become standard goods and arc taxing the capacity of the plant. Another of Mr. Vanderman's productions that has met with special favor is his plumbers' estimate and list book. It is made in two sizes, for the pocket and for the office. They help the plumber to remember everything in his estimate, and furthermore give a record of all prices quoted for work. Those who have tried these books have duplicated their orders in some cases several times. A new catalogue is being sent out with illustrations and descriptions of these York Trade School, licensed plumber

goods that can be had on application. The Duplex steam and hot water heater made by the company has been used in the vicinity of Willimantic with results that have increased the sales this

A North of England plumber writes to a London contemporary as follows: "In a country district not far from here a gentleman has erected a house of ease close to a well frequented footpath through some fields near his residence. Inside is a large box of dry earth, and the following notice is put up in a conspicuous place: 'Gentle wayfarer, when vou have done kindly sprinkle some ashes over the faithful departed, and go your way in peace and thankfulness. There are very many places in this country where similar conveniences would be greatly appreciated, and if the sound sanitary advice given above were fol-lowed no nuisance need follow." This is rather unique.

BURGESS SOLDERING FURNACE COM-PANY, Columbus, Ohio, owing to the increased demand for the Gem soldering furnaces have been compelled to seck larger quarters, and for 30 days past have been busily engaged installing new machinery and fitting up their new shops, which are now about completed, enabling them to produce the goods both more rapidly and economically than ever before. A number of new styles have been added, so that they are now in position to meet nearly every requirement for a fire pot.

A TABLE given in a recent issue of the *Pioneer Press* of St. Paul shows the increase in the plumbing permits issued during the past six months as compared with those issued in the corresponding months of 1893. In round figures the month of June this year shows an inmonth of June this year abows an increase of \$1000 over last year; July, \$10,000; August. \$22,000; September, \$3000; October, \$3000, and November, up to the 8th, showed an increase over the whole month of November of last year of about \$3000.

W. B. Armistead is to remove his plumbing shop and feed store at the corner of Second avenue to South and Twelfth atreets, Fort Dodge, Iowa.

THE COMBINATION GAS MACHINE IS the subject of an advertising card sent out by the Detroit Heating & Lighting Company of Detroit, Mich. The back of the card gives a sectional view showing the tank arrangement and location as well as the apparatus in the basement of the house. Its merits are briefly re-

PLUMBING INSPECTOR DUNN has reported to the Board of Health of Kingston, N. Y., concerning the sanitary condition of the public schools of that city that the ventilating arrangements are entirely inadequate to afford a sufficient supply of fresh air.

WE LEARN from a Detroit local paper that the plumbing examiners have completed their work for the time being, Chairman Meathe saying that there are no more plumbers in the city to be examined. Altogether 150 plumbers have been examined, and all but about 20 have received certificates.

THERE has been a change in the plumbing firm of W. B. Davis & Co., Anderson, Ind., J. R. Rotherford and W. B. Davis having sold their interests to J. M. Maynard and J. M. Donnelly, J. L. Williamson still resists his place; the firm tains his place in the firm.

and gas fitter, Norwich, Conn.," is the card presented by the newest plumber In that city. He has a large showroom and ample shop space, and, better still, has enough work to keep him very busy.

F. llor-rail. has removed his plumb. ing shop to the Y. M. C. A. Building, New Britain, Conn.

J. J. FAY, Willimantic, Conn., is one of the busy plumbers of New England.

THE PLUMBING SUPPLY HOUSE OF Frank J. Knox, Hartford, Conn., was a busy place on Thursday of last week with new vitreous ware coming, iron pipe going out and plumbers supplies of every description being assembled for shipment. A good trade has been established by his efforts to please the plumbers.

THOMAS LANGDON, Hartford, Conn., has a fine custom trade in high grade plumbing that keeps his force busy. He finishes bathrooms with tile floors and walls, and fits them with enameled baths, handsome lavatories and closets. Remodeling old work is a specialty with him.

R. T. Allen, who for 14 years has been in Chicago, has gone to Bangor, Maine, and opened a plumbing store at 8 Franklin atreet.

GEORGE H. McCalmon has rented a store in Goodwin's Block, Biddeford, Maine, where he will carry a full line of plumbing goods. Mr. McCalmon is apoken of as one of the best plumbers in that ueighborhood.

PATENT CHAIN Вкоск'я WRENCH is illustrated and described in a circular issued by Curtia & Curtis, Bridgeport, Conn. The circular also gives a table of prices, dimensions, &c., of the five different sizes.

THE MASTER PLUMPERS of Neenah, Oshkosh, Fond du Lac, Green Bay, Marianette, Menominee, Oconto and Appleton held a meeting at the Sherman House, at Appleton, to discuss plans for the completion of a Wisconsin State organization. A committee was appointed to set forth the object of the association in a circular letter to the plumbers all over the state and summon them to a convention to be held sometime during the winter. One of the purposes of the organization will be the securing of the passage of a State law requiring the appointment of plumbling inspectors in cities and the examining and granting of licenses to plumbers.

THE STANDARD GAS COMPANY have been incorporated at Saco, Me, by L. E. Gatcomb, Albert Hartman and George B. Irish, to manufacture and deal in gas regulators, fixtures and meters.

THE AMERICAN PORCELAIN COM-PANY have been incorporated at New Brighton, Pa., by Thomas E. Marshall, Frank S. Reader, Thomas Craven and Willard S. Read, for the purpose of manufacturing sinks, wash trays and other articles made of clay.

THE WILLIAM VANDERMAN PLUMB-INO & HEATING COMPANY, Willimantic, Conn., publish an illustrated catalogue and price list of the various specialties of their manufacture. The front page of the catalogue presents a portrait of Mr. Vanderman, who is well known to the heating and plumbing trade through-The goods illustrated out the country. The goods illustrated and described include his expansible water closet connecter, combination compass and washer cutter, tool chests, pipe cutters, pipe benders, combination

vises, lead joint runners, radiator trucks, union elbow connecters, lead pipe holders, lead pipe former and sizer. &c. All the goods are illustrated, thoroughly described and prices given.

Chas. Thatcher & Co., Waterbury, Conn., are progressing finely with the work on Section 2 of the work of extending the water works system and increasing the water supply. Their contract calls for laying 3 miles of 36-inch cast iron water pipe and testing it under a pressure of 150 pounds to the square inch, which is equal to 80 tons on the plugs placed in the ends of the pipe. The greater part of the trenches have to be made in solid rock, and in some places the cuts are 30 feet deep. Air outlets and blow-offs are placed at all high points in the piping to prevent the pipes becoming air bound. The work will be completed shortly after the first of December.

A NOTABLE JOB of plumbing in these days is being done in the residence of T. M. Cox by S. E. Dibble of New Ifaven, Conn. In order to get a modern plumbing system in this house, which was built some years ago, without cutting the timbers so as to weaken them, 4-inch lead soil pipe is used to receive the discharge from the closets and other fixtures. In making the different necessary connections, more than a dozen joints have been made. The work is such as any plumber might be proud of, and a glass floor could be used with propriety to show it off.

Manufacturers of brass goods, such as bibbs, stops, cocks and valves, will find at the Steele & Johnson Mfg. Company, Waterbury, Conn. a large variety of brass washers, spring washers, small screws, and all the small parts that are made of brass and used in the construction of such goods. They make a specialty of this branch of brass work and are prepared to quote prices on application from the manufacturing and supply trade.

A NEW PLUMBING AND HEATING ESTABLISHMENT has been opened in the Opera House Block, Fulton, N. Y., by Buell Brothers.

GREEN & ALLEN is the name of a new plumbing firm who have begun business in the Jeffries Block, Janesville, Wis. They have fitted up a handsome store, displaying bathtubs, closets and lava tories, and at the rear is the workshop. The members of the new firm are F. E. Green and John Allen, who were formerly at Escanaba, Mich., where they had been in business for ten years.

THE S. WILKES MEG. COMPANY, 113-123 Clinton street, Chicago, have received an order for five hot water heaters for Denver, Col.

The Engineer mentions a new bronze that has lately been introduced in France, which, it is claimed, is much superior to manganese bronze or phosphor bronze. Roma, which is the name by which it is known, contains copper, phosphorus, tin, aluminum and manganese. It is a pale yellow, has a specific gravity of 8.5, and melts at a temperature of about 1000 C. As it does not corrode in sea water, and is not magnetic, it is preferable to steel for the hulls of steamers. It is said to have shown a strength of 24½ tons per square inch for castinge, 31 tons for forgings and 35 tons for rolled metal; all of which is certainly very extraordinary. Possibly the cost of it is so high as to prevent its extended use.

## HEATING & PLUMBING.

### NEW WORK AND CONTRACTS.

THE CITY COUNCIL of Milwaukee, Wis., has awarded the contract for a new steam heating plant in the City Hall to the Hernedeen Mfg. Company, Milwaukee, at \$11,000.

J. H. DUFFY, Portland, Me., is engaged on the plumbing work in the new Brown Block.

ALLEN & WARD, Athol, Mass., have the contract for putting in the heating apparatus in the new Pequoig House.

JOSEPH DUODALE, East Norwalk, Conn., has received the contract for the plumbing work in the house of Marvin Brothers.

II. HOTELING, Chicago, has completed the work of placing the steam heating plant in the Hotel Whitney at Columbus.

THE HARTFORD HEATER COMPANY, Hartford, Conn., make a specialty of hot water heating, using their Hartford and Little Gem hoilers. They have installed plants in the residences of W. L. Camp and A. L. Dickerman, and the Gilbert Home School, at Winsted; in the residences of C. M. Spencer and H. A. Phelps, at Windsor, and in the residences of Mrs. Gates, Hartford; H. O. Wilcox, Simsville. and two boilers for T. H. Woodruff, Thomaston.

THE CONTRACT for the plumbing, gas fitting and sewer work required in the school building at the corner of Collingwood and Nineteenth atrects. San Francisco, Cal., has been awarded to William F. Wilson.

R. S. Sholes, JR, Norwich, Conn., bas the contract for the plumbing in the saloon of W. Franklin, and will use three water closets and urinals.

J. R. BLATCHFORD, Kankakee, Ill., has the contract for heating the old portion of the County Poor House.

GEO. M. ELLIS, Norwich, Conn, will use Volunteer boilers in the following heating contracts which he has secured: The Sweedish Church and the residence of R. Higgins and the residence of Dr. Jennings, at Jewett City.

A. H. SQUIER & Co., Scranton, Pa., are using a Page safety sectional boiler in heating the Clarke Building in that city.

F. B. AIKEN has the contract for the plumbing in the Knowlton cottage on Church street, Elsworth, Me.

The STEAM HEATING CONTRACT for the new Scovill Memorial Library at Salisbury, Conn., has been let to the S. H. Beard Company, New Britain, Conn.

WM. BLEVINS, Hartford, Conn., is heating three greenhouses for A. L. Whiting, West Hartford, Conn., using the Caswell hot water heater. A. Thatcher combination heater is being set in the residence of J. S. Quinu, Hartford, and an Allen steam boiler is being placed in the residence of the Rev. John Conway, at Winchenden, Mass. He also has the contract for remodeling and extending the heating plant in the large dry goods store of C. Fox, Hartford, and the additional floors and extension that are being built to it.

LINDLEY & MEREDITH, Bennington, Vt., have the contract for heating the Bennington County Court House and Jail and are using two Volunteer steam boilers.

THE JOHN DAVIS COMPANY, 69-79 Michigan street, Chicago, are to install a steam heating plant in the Vulcan Iron Works, 86 North Clinton street.

Monaher & Breed, Norwich, Conn., are using a Springfield coil boiler for hot water in heating the residence of Wm. Matthews, at Greenville. They are using two All Right ateam boilers and 53 radiators in the Central Block, at Norwich.

A. B. SPROUL, New Haven, Conn., is using a Humber hot water boiler in the residence of J. Hemmingway, at Fairhaven.

THE WELLS-NEWTON-QUAY COM-PANY, Monadonck Block, Chicago, have the contract for the plumbing and steam heating in the New England Building, Cleveland, Ohio.

L D. SMITH. New London, Conn., is doing a fine job of plumbing in the residence of II. Lautller, erecting two lavatories, two baths and two closets, and is using a Pequot hot water boiler in heating the residence of Captain Hinkly.

THE HOPSON & CHAPIN MFG. COMPANY, New London, are installing Pequot boilers and hot water heating plants in the City Hospital at New London and in school buildings at Waterbury, Conn., and New Brunswick, N. J., and in a new bank building at the latter city. They will use their system of compound direct and indirect radiation.

GEO. L. ROOD, 79 Lake street, Chicago, has the contract for combination heating in the residence of M. Meeker, 125 Astor street.

NEWMAN & CRONIN, New London, Conn., are putting steam heating plants in the residences of E. A. Stedman and Giles Bishop.

MURRAY & MAHER, New London, Conn., are doing the plumbing in the residences of Perry Stone and F. Parmalee, and using Comfort ateam heaters in the residences of Miss Helloway and Dr. Blood. They are also doing the plumbing in the new City Hospital.

THE BAKER & SMITH COMPANY, 193-197 Van Buren street, Chicago, are to place a new steam boiler in the P. Hayden Estate Building, 49 Lake street.

L. MALLORY, New London, Conn., is remodeling the plumbing and installing a hot water heating plant in the residence of B. P. Leonard at Pequot.

The Vanderman Plumning & Heating Company, Wiffimantic, Conn., have completed the plumbing and are finishing the heating plant in the Normal School in their city. They have installed the Duplex hot water heater in the new residences of J. B. Lyons, G. K. Mason and John McDonough of Willimantic, and have installed the Duplex steam heaters in the residences of A. C. Scripture, Geo. Tiffany, W. H. Lutham, A. T. Fowler and Maitin Heverin, at Willimantic, and Addition Kingsbury, South Coventry. They have done the plumbing work in most of the above mentioned residences.

J. J. Wade & Son, 276 Dearborn street, Chicago, are to do the plumbing, gas fitting and sewerage in the residence of Thomas Mickolson, 3344 Vernon avenue.

ROBERT BROWN, Norwich. Conn., has the contract for using a Richmond

steam boiler for heating the residence of Captain E. Smith, and has heated the Dime Savings Bank with a Richmond hot water boiler. He is doing the plumbing in the residence of Geo. S. Palmer and in three houses for Morgan Williams.

E. BAGGOT, 169-171 Adams street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the residence of A. M. Reece, 4319 Drexel boulevard.

M. J. Dally, Waterbury, Conn., has secured the contract for heating the new building for the missionaries of La Salette.

OLDS & WEIPPLE, Hartford, Conn., are doing the plumbing work in the residence of James Clark. The house is to be heated by an H. B. Smith Company's Cottage hot water boiler.

THE HAWTHORNE HOUSE, Winthrop, Mass., is to be fitted with new heating apparatus.

GEORGE E. BENZHAF, New Canasn, Conn., has the contract for putting a new furnace in the New Canaan Club House.

PAUL R. PATTEN, Salem, Mass., has been awarded the contract for piping and steam heating the Harrington Building on Essex street.

T. F. AHEARN & Co, New Haven, Conn., have taken the contract to put in the gas fixtures, including the metal ceilings, in the new café, to be opened in William Kachrle's new building on Crown street.

SEALED PROPOSALS will be received by the Committe on Public Buildings of the Common Council of Newark, N. J., until November 26, for the plumbing and heating work for the proposed new Second Police Precinct Station House. Plans and specifications of the work may be examined at the office of Henry C. Klemm, 240 Market street.

M. F. O'LOUGHLIN, Pittsfield, Mass., has the contract for plumbing the Smith Block, at the corner of Depot and North streets

SEALED PROPOSALS will be received at the office of the Supervising Architect. Washington, D. C., until December 14, for work on the United States Post Office Building at Canton, Ohio, including the plumbing, fixtures and connections. Drawings and specifications may be had from the Supervising Architect, Washington, or of the Superintendent at Canton, Ohio.

NICHOLS & MURRAY, Somersworth, N. H, have begun the plumbing work in the Free Baptist Church.

Joseph Buckley, New Haven, Conn., has the contract for the plumbing in the new nine-story First National Bank Building, for which Albert L. Webster, New York, was the sanitary engineer. The fixtures will be nickel plated and the work of the exposed character from Peck Bros. & Co. There will be 33 Henly wash down closets, 83 Erie lavatories and 30 urinals used, besides laundry tube, slop sinks and baths. The Durham system of drainage will be used. The gas pipe will aggregate 2 miles in length.

The Foskett & Bishop Company, New Haven, Conn., are extending the heating plant of the Hotel Beechwood, Summit, N. J., the verandas being inclosed with glass and will be heated, making about 10,000 feet of hot water radiation in the job. They are install ing hot water heating plants in three

achools, at West Haven, Conn., and have the work well under way of installing a steam heating plast in the Hublnger Block, at New Haven.

J. T. Kay, Meriden, Conn, is installing the heating plant and doing the plumbing in the Curtis Home, using two Bigelow horizontal tubular boilers with 3500 feet of indirect and 1000 feet of direct radiation. He also has the contract for heating the Liberty Street School and will use a New Economizer boiler and 2000 feet of direct radiation.

THE PECK WILLIAMSON HEATING & VENTILATING COMPANY of Cincinnati have been awarded the contract for heating and ventilating and sanitary work in the High School at Perrysburg, Ohto.

F. J. WHEELER, Meriden, Conn., is using a Magee combination hot air and hot water heater in the residence of Dr. Wilson, and has the same apparatus in both his store and his residence.

GEO. W. MINOR, Waterbury, Conn., is installing a Hub hot water heater in the residence of F. W. Wightman, and is using a Hub combination hot air and hot water heater in the residence of Wm. Miller. He is doing the plumbing in the residences of M. Cairns, Peter Skehms and Chas. Kempke.

DUGAN BROTHERS have been awarded the contract for plumbing the new house for James L. Newcomb, at Albany. N. Y.

THE CHAS. THATCHER COMPANY, Waterbury, Conn., are installing Gurney hot water boilers in the residences of Fred Illy, at Naugatuck, and C. A. Jackson, and a house of Frank Boos, at Waterbury. They have the contract for a Hecla steam boiler for the Hopeville, and have used a Capital hot water boiler in the parish house of Father Trainor.

THE PECK WILLIAMSON HEATING & VENTILATING COMPANY, formerly known as Bennett & Peck of Cincin nati, Ohic, have been awarded the heating and ventilating contract for hoth the new school buildings at McKeesport, Pa., by the Board of Education.

JOHN GALVIN is doing the plumbing work in the new block on Elliott street, Brattleboro, Vt.

THE NEW HAVEN HEATING & PLUMBING COMPANY, New Haven, Conn., are installing heating plants in the High School Building and the Insane Asylum at Middletown, Conn., and in the new Scientific School and Chemical Laboratory at New Haven they are erecting a plant on the blower system. They have the contract for a similar plant for the new First National Bank Building, in which they will use a Babcock & Wilcox horizontal tubular boiler.

W. A. HECKMAN has been awarded the contract for putting the steam heater in the Lewis Briner School Building, Fourth and Elm streets, Reading, Pa., at a coat of \$890.

THE COWLES-COUCH COMPANY, Hartford, Conn., are putting in a No. 9 Howard combination heater in the residence of H. J. Maerehlein and a No. 7 in the residence of L. E. Baker, both of Hartford. They have also just finished putting into the residence of F. P. Tracy of Hartford a No. 17 Howard double radiator warm air furnace.

THE WESTERN STEAM AND HOT WATER HEATING COMPANY, 67 West Washington street, Chicago, are to place

a hot water heating plant in the flat building of William Smith, 757 South Kedzie avenue.

THE DAVIS JOHNSON COMPANY, 45 Jackson street, Chicago, have contracts for warm air heating in the following residences: M. E. Baldwin, 260 North Clark street; Mrs. M. E. Kuhn, Roscoe and Evanston avenues, V. C. Chase, 2486 Commercial avenue.

MEUTZ Bros., 107 Twenty-second street, Chicago, have the contract for hot water heating in the residence of Judge Caldwell, Indiana avenue and Forty-third street.

J. H. DEVENEY, 2306 Cottage Grove avenue, Chicago, is doing the plumbing, gas fitting and sewerage in the residence of E. Foreman, Michigan avenue, near Thirty eighth street.

FRANK P. SCHUSTER, 234 North Clark street, Chicago, has the contract for the plumbing in the residence of W. H. Winslow, Riverside, Ill.

THE ALCOCK PLUMBING COMPANY, 102 Twenty-second street, Chicago, are overhauling and placing new plumbing in the residence of M. B. Craft, 6320 Madison avenue.

SEALID PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., till December 11, for covering steam pipes in the Government buildings at Brooklyn, N. Y.: Bay City, Mich.; Denver, Col.; Hoboken, N. J.; Kalamszco, Mich.; Louisville, Ky.; New Bedford, Mass, and Rochester, N. Y.

#### Correspondence Schools.

We mentioned last month, says Industry of San Francisco, the receipt of a number of publications relating to the "Correspondence Schools," at Scranton, Pa. Among these, and of most interest, are a large number of letters, nearly 200, written by students in respect to their experience and opinions of the system. It is the most original agency for technical education that has ever been devised, capable of an extension that has no visible limit, and portends a time when we will not set off a few of the most fortunate for education, but educate all up to the limits required in the application of the skilled arts. Ose effect will be to raise the standard of the ordinary courses in technical colleges and schools, because medioerity can be attained at a tithe of the expense and in ways more congental to most students. The habit of writing out exercises is a good one, good in all kinds of mnemonic effort, and when to this is added the interest of a communication personally addressed, and the environment of a home, it is easy to discern the attraction of a correspondence system. Among the papers mentioned is one sheet of examples in hydraulics that, as a collection of educational problems, is the best we have ever seen. When a set achool book is done, and the plates made, there is an end, but in the present system a tentative course is possible. Change and improvement can go on continually; not only this, the problems submitted can be nicely graded to the requirement and capacity of the student, and can, by the facility for change, be made relevant to particular examples or practice.

The Delaware & Hudson Canal Company have given notice that the canal will close for the winter on December 1. The past season is said to have been a very unprofitable one.

# STEAM AND HOT WATER.

# A Disciple of Sherlock Holmes.

Feeling aure that the following from the Boston Globs of November 12 referred to the well-known heating engineer, John Demorest, who represents the Pease Furnace Company, a call was made at 228 Franklin street, and on interviewing Mr. Demorest he acknowledged that he was the man who, on discovering that he possessed a better umbrella than he was entitled to, returned ucarly a block through a drizzing rain to leave his address with the stamp clerk, hoping that the owner would make inquiries. Mr. Demorest is a good example of the reliable men engaged in the heating business. The following is the article from the Globe:

That the application of Dr. Conan Doyle's law of deduction and analysis is quite possible, furthermore that a certain electrical expert who is also a connoisseur in U. S. stamps claims that Sherlock Holmes, though deceased, had better wetch out for his laurels. The better watch out for his laurels. The stamp expert mentioned called at the wholesale window of the stamp department, Boston Post Office, Saturday, Nov. 10, leaned his most excellent umbrella in the corner, and, having invested liberally in the few remaining Columbian values, turned again to grasp his most excellent—ah, gone, you deduce what had occurred! Yes, gone and in its place a highly unsatisfactory substitute. Our hero immediately forgot the transit of Mercury, forgot his train, transit of Mercury, forgot his train, forgot all else save here was a chance for deduction. Not having the regulation 90 per cent. nicotine Sherlock Holmes pipe, he lighted a cigar of domestic manufacture, and consulted his watch with extraordinary minuteness, muttering: "If he is not here in one minute ing: "If he is not here in one minute and thirty-eight seconds we must reconstruct.

At this instant entered a man with an umbrella of the proper description, who was about to give his card to the stamp clerk, when the student of deduction passed a pasteboard to him, remarking: "I am the person you desire to exchange greetings with. The stranger promptly handed out this card:

JOHN D————, Engineer, 228 Franklin atreet, Boaton.

An exchange of umbrellas followed.

"As you are exactly 1 minute 35 seconds ahead of the time I expected to see you, you met an acquaintance near the post cflice, and you therefore did not have far to come back," remarked our trained observer. Instead of being struck down with amazement the gentleman quietly replied: "Exactly, and as I see you are a student of Doyle's law of analysis, I would be pleased to know your steps of reasoning that you should wait here for me."

b "It shall be as you desire. The umbrella in our hands being entirely unlike our own, except in color, would lead to the inference that the substitution was intentional rather than accidental; on the other hand, it is possible for an absent-minded man to make such

a mistake. It is also 'thinkable' (as Doyle puts it) that such a party should make the mistake, even though the transfer should be entirely to his credit. As regards the umbrella—first, there was one person sufficiently abstracted to fill the first part of the conditions, we may safely conclude that another person on a smaller errand might be engrossed to a degree capable of unconsciously filling the second part. It occurs to us also that a man who buys his stamps at the who'esale window would hardly stop to enrich himself in so unbecoming a manner, notwithstand-

Crane's Telescoping Floor Sleeves.

ing all umbrella jokes and the present inclemency of the weather. "When would the absent-minded

"When would the absent-minded man observe the m'stake?" "About 2 minutes and 30 seconds after putting up the umbrella?" "What would he do supposing our other inference to be correct." "He would come straight back here with it, therefore he would return in 5 minutes and 40 seconds at the latest. You came—I possess again my treasured umbrella."

# Crane's Telescoping Floor Sleeves.

The Crane Company, Chicago, have just put on the market a full line of sizes of teleacoping fire proof floor sleeves made of galvanized sheet iron. One of them is illustrated herewith. These sleeves are made with a neat cast iron flange on top and a cast iron thimble on the bottom. They are easily adjusted and have no screws, slots nor springs to get out of order. Their price is of course below that of a cast iron floor sleeve. The No. 3 size has an adjustment of 5 inches and the No. 4 size of 10 inches.

### HEATING NOTES.

Col. W. C. Mowry, Norwich, Conn., wears with grace his recently won honor of being elected Secretary of State, and sends heating apparatus to his customers with his usual promptness.

W. H. PAOE is preparing a flag pole 32 feet long from which to float a tlag over the works of the W. H. Page Boiler Cympany, at Norwich, Conn., on proper occasions, and is a little disappointed that he did not have it ready a little sooner.

GEO. M. ELLIS, Norwich, Conn., has a Volunteer boiler in his window, and inside he is arranging a platform and a nickel railing around a fine plumbing exhibit. An enameled bath, a handsome lavatory and an embossed water closet are to be shown with full nickel fixtures of the up-to-date pattern. Adjoining this display he has a high platform, under which sets a Volunteer boiler finished in white and gilt, and connected with radiators ornamented in different styles. During the past year Mr. Ellis has installed over 50 heating plants in which the Volunteer and All Right boilers have been used.

W. C. Higgins of the Richmond Stove Company has returned to Norwich, Conn., after an extended trip among the steam and het water customers of the company.

THE IRON CITY HEATING COMPANY, 610-12 Duquesne street, Pittsburgh, Pa., are a new agency for the Richmond and Victor steam and hot water apparatus, and are distributing a handsome catalogue among the residents of their city.

THE WILLIAM H. PAGE BOILER COMPANY, Norwich, Conn., issue advance sheets of their 1895 catalogue showing the improved forms of the well-known All Right and Volunteer bollers of their manufacture. Likewise there is a new sectional boiler illustrated that will be of interest to the trade. The cuts are finely executed, showing the construction of the apparatus to excellent advantage.

THE RINGEN STOVE COMPANY, St. Louis, Mo., favor us with a copy of their fall catalogue devoted to hot water heating. The catalogue contains a comprehensive explanation of their system of heating, and in addition shows photographs of some of the many houses heated by them. Prominent among them we notice the Convent of the Visitation, St. Louis, which is heated by nine No. 20 heaters, and has 27,000 square feet of radiation; the St. Joseph's Orphan Asylum, St. Louis, has 19,500 feet of radiation; St. Louis County Courthouse has 6,200 square feet of radiation, and Adolphus Busch's residence has 5,000 square feet of radiation. In addition to these the catalogue also contains a lengthy list of those using this system, and many testimonial letters are also shown. The catalogue is neatly printed on an excellent quality of paper

and should be in the hands of those who have in contemplation work of this character.

Some idea of the force exerted by water hammer is conveyed by some wrecked pipe fittings on exhibition in the shop of the Foskett & Bishop Company, at New Haven, Conn., who are making the repairs. They are 10 inch heavy flanged tees and ells that have withstood a steam pressure of 115 pounds under all conditions, and are supposed to have given way by their support settling and permitting an ac-

The New Haven Boiler Works, New Haven, Conn., are busy on an unfilled contract to make some side draft horizontal tubular boilers for John McCormack, Wallingford, Conn., which are used for heating buildings.

#### Heating Estimate Blank.

The following estimate blank used by Metz Brothers, 107 East Twenty-second street, Chicago, Ill., will interest the steam and hot water heating trade: lights for the new engine house, Aurora, Ill.

J. C. McFarland, 2511-2519 State atreet, Chicago, has the contract for the galvanized iron cornices and slate roofing on the new school building at Marinette, Wis.

A good preparation for preserving tools from susting is given by the Woodworker. It is made by slow melting together of six or eight parts of lard to one of resin, stirring until cool. This remains semi-fluid, ready for use, the

#### New Trade-Mark.

We illustrate herewith the trade-mark adopted by the Ringen Stove Company,

New Trade-Mark of Ringen Stove Company.

St. Louis, in their hot water and ateam heating departments. The design is attractive and aptly illustrates both systems of heating—steam and hot water.

#### FLASHINGS.

GOULD BROTHERS have bought out the Elmira Roofing Company, Elmira, N. Y., and will continue the business under the name of the Gould Roofing Company.

AT A RECENT MEETING of the stockholders of the Berger Mfg. Company, Canton, O, manufacturers of sheet metal roofing, siding and ceiling, the capital stock of the concern was increased from \$100,000 to \$250,000.

A. H. BUCKINGHAM, New Haven, Conn., has the contract for the sheet metal cornices, &c., for the new ninestory First National Bank Bullding in this city, and is also making the sheet iron work for the heating plant.

THE PEET & SCHUSTER COMPANY, Springfield, Ohio, were incorporated by C. A. Schuster, John II. Mumma, Charles Schuster, William Conklin and W. A. Scott. The capital stock is \$10,000 and the company are organized to manufacture roofing and architectural sheet metal work.

J. J. CCLVIN, 159 La Salle atreet, Chleago, is to furnish the copper cornices, bay windows, shingles and akyreain preventing rancidity and supplying an air tight film. Rubbed on a bright surface ever so thinly, it protects and preserves the polish effectually, and it can be wiped off nearly clean if desired, as from a knife blade, or it may be thinned with coal oil or benzine.

The Toronto Mineral Wool Company, Toronto, Canada, will move to Hamilton, Ont., as soon as the new smelting works, now building in that city, are in operation. The Mineral Wool Company use a large amount of slag in their business which they have hitherto imported from Clevelaud. This the amcilling works will be able to supply.

The Dolcoath Mine, one of the most famous copper and tin mines in Cornwall, England, is also one of the oldest, the date of its opening being so far back in the dim past as to be entirely unknown. Prior to 1788 the value of metal extracted from it is said to have been over \$10,000,000. Since the present company have worked the mine, the dividends amounted to over \$5,000,000. It gives employment to 1300 men.

# THE TIN SHOP.

# Pattern for Irregular Flaring Article.

From H. J. S., Appleton. Wis—I would like to have a method published in *The Metal Worker* for obtaining the pattern of the article shown by the inclosed sketch. Both openings are to be round, and ADF is to be a right angle.

Answer.—In Fig. 1 the side elevation of article is represented by A D F, the half profile of small end by A B C, and the half profile of large end by D E F. In the front elevation the diameter of small end II I K is shown to be 4 inches,

triangles will give the distances between the points in A C and D F as if measured on the finished article.

To obtain the triangles represented by solid lines in A D F proceed as follows: Draw any line, as L M in Fig. 2, and erect the perpendicular NO. From N on NO set off the lengths of solid lines in A D F, and from N on L M set off the lengths of corresponding lines in D T F E. Thus make N a' of diagram equal to a' 2, and connect a' b' 2. Make N b' of diagram equal to b' 3, and connect b' b' 3, &c. To

from A B C of profile. Also the stretchout of F D of pattern is derived from
F E D of profile. The lengths of solid
lines in pattern between points indicated
by small letters are derived from the hypotenuses of triangles in Fig. 2, and the
lengths of the dotted lines in pattern
are derived from the hypotenuses of triangles in Fig. 3. Then to develop the
pattern shape shown in Fig. 4, proceed
as follows: Draw any line, as A F, which
make equal to F A of the elevation.
From F, with a radius equal to F2 of the
profile, strike a small arc, as shown.
From A as center, with radius equal to

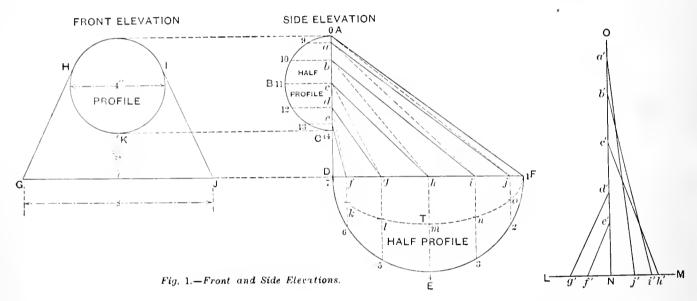

Fig. 2 — Diagram of Triangles Represented by Solid Lines in Elevation.

PATTERN FOR IRREGULAR FLARING ARTICLE.

that of the large end G J to be 8 inches, and the distance from G J to K is 2 inches. Then in Fig. 1, let A D F represent the side elevation of the article. Draw the semicircles A B C and D E F, representing the half profiles of openings. Divide the semicircles into the same number of equal parts, in the present instance six, and from the points thus obtained drop perpendiculars to A C and D F. Connect the points in A C with those in D F, as shown by the solid lines. Thus connect a j, b i, c h, &c. Also connect A j, a i, b h, &c., as shown by the dotted lines. From D F set off the length of similar lines in  $\Lambda$ BC. Thus make jo equal to a 9; in equal to b 10; h m equal to c 11, &c. The intention is to construct triangles the altitudes of which shall be equal to the lines in A D F, and their bases equal to the length of linea between D T F and DEF. The hypotenuses of these

obtain the triangles represented by the dotted lines in AFD proceed in a similar manner. Draw any line, as P Q in Fig. 3, and erect the perpendicular RS. From Ron RS set off the lengths of dotted lines in A F D, and from R on PQ set off the lengths of corresponding lines in D T F E. Thus make R A" of diagram equal to A j', R j'' of diagram equal to o 2, and connect A" j". Make Ra" of diagram equal to a i, R i'' of diagram equal to n 3, and connect a" i", &c. The last dotted line to be shown would be from point e in the top to D of basc. To do this, set off from R on R P the distance e 13 of elevation, as shown by R D", and from R on R S the distance D e of elevation, and connect D" e".

In Fig. 4 is shown by AFDC the half pattern of article, corresponding with AFDC of elevation. The stretchout of AC of pattern is derived

A"j" of the second set of triangles, intersect this arc by another, thus establishing the point i in the curve of the pattern. From A of pattern, with radius equal to 89 of profile, strike a small arc, as shown, and intersect it with another from j of pattern as center, with a' j' of the first diagram of triangles as radius, thus establishing the point a of pattern. Proceed in this manner, using alternately the hypotenuses of the triangles in Fig. 3, the spaces in DEF of profile, the hypotenuses of the triangles in Fig. 2, and the spaces in A B C of profile. The resulting points, as indicated by the letters in Fig. 4, will be the points through which the pattern lines are to be traced. Then A F D C will be the pattern for part of article shown in elevation by A F D C. The other part of the pattern, A F D C', can be obtained by a repetition of the above process or by duplication.

## Cheap City Made Gas in Philadel phia.

When the City Council of Philadelphia some time ago reduced the price of gas manufactured at the municipal works in that city from \$1.50 to \$1 per 1000 cubic feet, it was expected that the consumption of the illuminant would increase to an extent that would more than balance the loss in receipts from supplying it at the lower rate. Up to about two months ago, however, the low price apparently had no effect on the consumption, and had there been no change it is estimated the loss in revenue for the year would have been from \$800,000 to \$1,000,000. With the approach of winter, however, the expected increase appears to have at last materialized. From a recent article in the Philadelphia Record we note that the present daily excess in the consumption of gas over last year is from 1,500,000 to 2,000,000 cubic feet, bringing the amount daily manuthe demand could be increased nearly 5,000,000 cubic feet a day without getting beyond the capacity of the works. If the present rate of increase continues, however, the limit will be reached in a comparatively short time, and extensions of the works will be necessary.

#### Cheap Gases.

The following is a letter to au English exchange from T. Fletcher, a well-known gas expert, which is interesting for the information it gives as to the value of cheap gases for fuel:

That cheap heating gas for domestic cooking and warming purposes is once more coming to the front is apparent. The use of gas made by a simple cheap process, for heating purposes only, has been very strongly advocated by many who have not properly faced the whole question, and it is desirable that the actual facts and figures should be fully

be delivered into the holder at about the same cost. We must, however, take the whole of the facts into consideration. The use of unpurified gas in any ordinary household is out of all question, and this process costs within a fraction of a penny (2 cents) per 1000 cubic feet. The delivery of gas into the holder is only a part of the problem. Taking the average of the London gas companies the following additional costa are incurred per 1000 cubic feet sold (in pence and fractions):

or  $7\frac{5}{4}$  pence ( $15\frac{1}{4}$  cents) per 1000 cubic fect. There is no reason to suppose that the costs on heating gas would be smaller. No doubt the interest on capital and depreciation charges would be less, but the distribution would be very much greater, as the mains would require to be three times the size for the

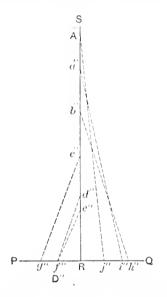

Fig. 3.—Diagram of Triangles Represented by Dotted Lines in Elevation.

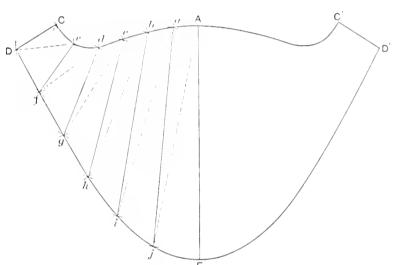

Fig. 4.—The Pattern Shape.

#### PATTERN FOR IRREGULAR FLARING ARTICLE.

factured up to about 15,000,000 cubic feet.

The increase of consumption has been of too recent a date to enable the Department of Public Works to form any definite estimate as to its character. Owing to the fact that any gas used for cooking or heating purposes would be taken from the same meter as that for illuminating purposes, the department has no means of ascertaining whether the bulk of the increase is due to that demand or to the general revival of business in the manufacturing centers. The December bills will go far toward solving the problem, and will enable the department to form some reliable estimate, based on actual figures, of the working of cheap gas.

It was a matter of considerable surprise to the city authorities that there was no larger demand for gas for cooking purposes during the past summer, as, at the reduced price, gas would have been cheaper for fuel than coal. This, together with its other recommendations, was expected to lead to a greatly increased demand for it for that purpose. The capacity of the city gas works is from 18,000,000 to 20,000,000 cubic feet daily. As the present consumption is only about 15,000,000 cubic feet daily,

considered. Of the gases available for these purposes there are three. "Producer gas" is a mixture of carbon monoxide with inert nitrogen and carbonic acid. It is extremely bulky, and so low in power as to be useless for domestic purposes. "Water gas" is a mixture of hydrogen and carbon monoxide. It is very powerful in heating, very poisonous if inhaled, and cannot be manufactured alone without the production of large quantities of poorer gas, making the process a very costly one where water gas only is required. "Dowson gas" is a mixture of the two previously mentioned and is made by a very simple process.

I think I quote Mr. Dowson correctly in stating that this can be produced at a cost of 4 or 4½ pence (8 or 9 cents) per 1000 cubic feet, including all costs, delivered into the holder, the heating power averaging one-third that of ordinary London coal gas. At this rate, comparing the two and taking ordinary gas at an average price of 3 shillings (75 cents) per 1000, the same heating power could be obtained from Dowson gas for 1 shilling and 1 penny (27 cents). This is the way the enthusiasts consider the question, ignoring the fact that ordinary coal gas, unpurified, could

same work. This could not be overcome by increasing the pressure, as the leakage would increase in proportion, and we are compelled to face the fact that the Dowson gas, delivered to the consumer, would cost over 1 shilling (25 cents) per 1000, without showing any margin of profit, and this means, for the same power obtained, a cost at least as great as the present cost of coal gas. When we consider that leakages of Dowson gas are dangerous, owing to its extremely poisonous nature, and that an entirely new series of distribution mains and special house service pipes would be required, it is evident that the attempt to introduce anything of the kind can only end in failure. It is not by any means a question of the cost of production only, as this is only one item to be considered, and the users of coal gas for heating and cooking purposes may rest content that the introduction of heating gas would not be an economy. That it would be dangerous on account of its poisonous nature is very well known, and although there is no doubt that Dowson and other heating gases have a distinct value for special commercial and manufacturing processes, their introduction into dwelling houses is anything but desirable.

# TIN PLATES.

Home Competition for the Welsh Tin Plate Industry.

A proposal is said to have been made by some of the ironmasters in the North of England to establish the tin plate industry in the Cleveland district. It is claimed in behalf of this project that the district is in a position to produce cheaply the black sheets required. Should this scheme be carried into effect, the Welsh manufacturers of tin plates will have more difficulties to face than the competition of American

works. A great deal of the pig iron and of the steel billets now used in the Welah works for the manufacture of black sheets for tinning is drawn from the Cleveland furnaces, and the Cleveland ironmasters are asking themselves why this iron and steel could not be profitably employed by themselves for conversion into tin plates. The Mechanical World, a leading English iron trade journal, says that during the last four years nearly 150,000 tons of Cleveland pig iron have been used in Wales, mostly by the tin plate works, and the Northern ironmasters contend that if the Welsh manufacturers can afford to import North Country iron and steel and make their industry pay, there is no reason why the raw materials cannot be just as profitably converted on the spot and exported to the United States, the chief market for tin plates, as cheaply, either direct or by way of Liverpool. Whether this project is likely to take shape or not is a very doubtful question. tion, as the difficulty of obtaining sufficient skilled labor will be a grave obstacle for the starting up of a new in-

The journal referred to says, however, that there is evidence that the present suggestion will not be allowed to be lost sight of, as it is felt that the establishment of the manufacture in the Cleveland district of some of the lighter descriptions of iron and steel would benefit the iron trade in that part of the country in many ways.

### The Tin Plate Wages Dispute.

The conflict between the Tinned Plate Manufacturers' Association of the United States and the Amalgamated Association, inaugurated by the starting up of the plants of Wallace, Banfield & up of the plants of warrace, Banneld & Co., Limited, at Irondale, Ohio, and the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., is now in its second week, and bids fair to be prolonged for some little time yet. concerns mentioned above are making good progress in their efforts to operate with non-union men, and while considerable time may clapse before auflicient competent workmen have been secured to operate all departments to full capacity, they feel sure that the outcome of the contest will be the defeat of the Amalgamated Association. At the plant of Wallace, Banfield & Co., Limited, the bar mill was started up on Monday, the 12th inst., with nearly a full crew, and after being operated four or five

days in order to get a atock of sheet bars ahead, it was closed down and two black sheet mills were started up, the plant containing four. On Wednesday of this week a sufficient stock of sheets had been made to warrant starting up the dipping department, and this was done on the day following. While it is not claimed that the output has been as large as it would have been with the old workmen, and that no imperfect sheets were turned out, it is claimed by the firm that so far they have had very little trouble, and the product in quality has been as good as was ever made in the plant. The manager of this plant is an experienced roller and so is the superintendent, and when the plant was started the manager had charge of the day crew and worked right with them, while the superintendent did the same with the night crew, and under this arrangement excellent results have been obtained. A high fence has been built around the plant by the firm to protect the employees, and the men are being lodged and fed in an unused building, and this will be done until all danger of violence from the old workmen has been removed. At the plant of the United States Iron & Tin Plate Mig. Company the attempt of the firm to operate with non-union men has been much more successful than the firm anticipated, both in the direction of securing competent workmen and in quantity and quality of the output. This firm are also feeding and lodging their new employees, and their personal comfort is being carefully looked after. On Wednesday, the 21st, the bar mill was in operation, and also several sheet trains and the tinning department. Very little trouble has been experienced as yet, either from breakage of rolls or inferior quality of product, and if the present rate of progress can be maintained it will not be long until the plant can be put on full in all departments. The firm are refusing positions ments. The firm are refusing positions to applicants every day, and only those who are skilled and come with good records are given employment.

#### SCRAP.

IF OCCULAR DEMONSTRATION goes for anything, business would appear to be picking up considerably in the tin plate and metal trade of New York. The and metal trade of New York. increase in the number of wagons and trucks loading up at the various ware-houses in the metal district has been very marked in the last week or two. That portion of Cliff street in particular which lies bctween Fulton and John streets, and which may be called the heart of the tin plate district, has been well-nigh impassable in the last few days for the jam of horses and wagons and the constant atream of trucks and porters emerging with loads from the stores, and there is an air of bustle withal which points to busier times, and is in sharp contrast to the comparative dullness which has ruled in that quarter for the last twelve months or more.

ACCORDING to official returns of the quantities and values of dutiable goods

remaining in the bonded warehouses of New York City at the end of last month, it appears that 6,237,584 pounds of tin plates, valued at \$148,413, were thus held on October 31. This amount is just about one-third of the quantity lying in bond on September 30, awaiting the reduction of duty on the following day. On October 31, 1893, the value of tin plates in bond at this port was \$138,977.

MERCHANT & Co., Incorporated, Philadelphia, are sending out printed slips calling attention to light weight plates that are being extensively traded in at present. They aver that such plates are frequently "sold as full weight plates, billed as such and paid for as such." They add the caution that when a purchaser gets an extra light price it is well to weigh the plates.

THE ATLANTA STEEL & TIN PLATE COMPANY, Atlanta, Ind., have superseded the Indiana Tin Plate Company of that place. Mail matter should, consequently, be addressed to the new firm. The concern are erecting three mills. Their tin house, with eight stacks, is already in working order and they expect to put that department in operation in a few days.

THE ELLWOOD TIN PLATE COMPANY, Ellwood City, Pa., have just completed the erection of a tinning house. It is equipped with four tinning sets while provision has been made for the erection of six more. This plant has been idle for some time, pending adjustment of the wage scale, but when operations are resumed two Morewood and two Thomas-White tinning sets will be started.

THE NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., will add a second pickling machine to their plant, and have placed the order for it with the Leechburg Foundry & Machine Company of Pittsburgh. When the plant of the New Castle Steel & Tin Plate Company was put in operation it was equipped with a pickling machine of foreign make, and when the increased business of the concern made it necessary to install a second pickling machine it was decided the Mesta pickling machine, made by the Leechburg Foundry and Machine Company, was superior to all others, and therefore the order was given to that concern.

The structe now going on between several concerns who are active members of the Tinned Plate Manufacturers' Association of the United States and the Amalgamated Association may possibly result in the disbandment of the Manufacturers' Association, but in all events will result in a considerable decrease in the number of members. The corstitution of the organization provides that all labor difficulties must be settled in conference, and all wage scales heretofore in existence have been signed by the secretary of the Manufacturers' Association and were binding on the members. On October 1, when the shut down of the tin plate mills occurred, some six or seven concerns' refused to be bound by the action of the Manu-

facturers' Association, and continued to operate their plants under the with scale of wages, understanding that they would be allowed any concessions that might be granted to the other concerns by the Amalgamated Association. Under the constitution these concerns have forfeited their right as members and can no longer he said to legally belong to the association. At the time that the Apollo Iron & Steel Company of Apollo, Pa., and Kirkpatrick & Co. of Leechburg, Pa., started with non-union men, it is understood that both coucerns sent in their resignations as members of the Manufacturers' Association. Now that Wallace, Banfield & Co., Limited, and the United States Iron & Tin Plate Mfg. Company have also started up with non-union men, it is expected that these two concerns will also sever their connection with the organization.

The Labelle Iron Works, Wheeling, W. Va., manufacturers of muck bars and steel cut nails have decided to engage in the manufacture of tin and terne plate. A force of men has already been put to work tearing down some old puddling furnaces to make room for the new buildings. The contracts for the equipment of the plant are expected to be placed this week. It will be a four-mill plant, and have a capacity of between 500 and 600 boxes of tin plate per day. Work will be commenced at once and it is hoped to have the plant ready for operations by April 1, 1895.

THE CONDITION of the British tin plate trade is reported as being very unsatisfactory. The wage question, which is still unsettled, is causing considerable disturbance among the Welsh works. In a few cases the men are said to have conceded a reduction ranging from 10 to 20 per cent., the reduction being offset by an increase in the output over the 36 box limit. This has caused a further fall in the price of plates, which are again down to the lowest notch, with little prospect of an early rise. The breaking of the hard and fast 36 box rule in several works is looked upon as the beginning of the end of that regulation. The men are beginning to see that the enforcement of this rule, by hampering the manufacturers in their output, has in several cases prevented them from running their works at a profit and has mainly contributed to the loss of work and reduced wages to which the tin platers have had to submit of late.

THE PROPRIETORS of the South Wales, Western and Old Castle Tin Plate Works, Llanelly, Wales, employing over 4000 hands, have informed their workmen of their decision to make a reduction of 25 per cent. in wages. If not accepted by the men, the various works will close.

A PRESS DISPATCH states that one mill of the Niedringhaus Tin Plate Works was started up last Monday independently of the Amalgamated Association of Iron and Steel Workers and at a reduction of 25 per cent.

The report of the California State Mineralogist states that during 1893 California more than doubled the silver output of the previous year, producing \$537,155, as against \$262,530 in 1892. The gold output was nearly the same for both years. This year 49 mines are being operated, and the State Mineralogist believes they will increase gold output by from \$12,000,000 to \$16,000,000.

New York Garbage Disposal.

The Garbage Commission appointed last summer by the Mayor of New York City to investigate the various systems pursued in other cities for the disposal of refuse have submitted their report to Mayor Gilroy. About 70 different methods of garbage disposal have been examined by the commission. Of these 21 were found unsuitable and were discarded. Of the remainder, 17 were for the incineration of the entire mass of refuse, including garbage, street sweepings and house refuse; six were for cremation of the garbage only, and seven were for the separation of the garbage by various processes, the resultant material being converted into merchantable greases and fertilizers. Other methods seen included the automatic separation of all the material, the valuable part being utilized and the residue burned; the incineration of the material in steel, self-propelling boats,

The committee's report is a conservative one, no particular system being recommended for adoption in New York; but the general recommendation being made that "the garbage should be disposed of by a reduction process, producing fertilizer and commercial grease." Cremation of the refuse is considered impracticable, being costly and wasteful, while by the reduction process it is estimated that the gross daily returns from 800 tons of garbage would be \$3,858, or \$4.82 a ton. This estimate is founded on reports submitted by four reduction companies now in operation.

The present practice of dumping the garbage into the sea is absolutely condemned by the commission as being the very worst way of disposing of it. The recommendation is made that it be absolutely prohibited, as it creates a nuisance at the city dumps, tends to fill up the navigable channels of the harbor, drives away the desirable class of fish, and creates a further serious nuisance on the neighboring shores.

The conclusions of the commission are summed up in their report as follows:

After a careful and thorough study of this question your commission has the honor to submit the following recommendations:

1. That dumping city refuse of any nature in the waters of the harbor, or its adjacent or tributary waters, should be absolutely prohibited.

absolutely prohibited.
2. That the ordinance requiring householders to keep separate the garbage or kitchen refuse from ashes and other house refuse abould be rigidly enforced.

3. That all house refuse should be collected in galvanized iron vessels with tight fitting metallic covers and of such size that when full they can be easily handled by one man.

4. That daily collections of garbage should be made by the city and delivered at the dump wharves into the temporary storage, or to self-propelling boats of an approved type, furnished by the party baving a contract with the city for final disposition of the garbage.

5. That the garbage should be disposed of by a reduction process, producing fertilizer and commercial grease; that the city should invite competition by the various companies controlling such systems, in order that the greatest benefit to the city may result. As the plant for reduction of the garbage of this city would necessarily be extensive and coatly, a contract for a sufficient

length of time should be offered by the eity to warrant the investment, say, not less than 10 years, with proper provision for the transfer of the property of the contractor at fair value when the contract is terminated. Ample provision should also be made and abundant security required for the performance of the work on the part of the contractor, in a clean, inoffensive and sanitary manner, and removal of the garbage daily from the city to the reduction works, which should be situated at a suitable point beyond the city limits.

6. That a separate collection should be made of the remainder of the refuse of the city not otherwise provided for, which should be used for filling in at Riker's Island or elsewhere, and for the transportation of this material a sufficient number of self-propelled thats of an approved type should be constructed and owned by the city. It should, however, be provided that whenever the whole or any considerable portion of the street sweepings can be disposed of by contract or sale for fertilizing purposes at a price greater than their value to the city for filling, then such disposition should undoubtedly be made of them.

7. That the city should adopt metal water tight covered earts or trucks of a uniform pattern for the collection of all refuse, and mechanical dust-collecting sweepers when a satisfactory type can be obtained. That whenever the sweeping of the streets causes dust to arise they shall first be sprinkled.

8. That each refuse eart or truck depositing its contents should be disinfected and washed out thoroughly before leaving the wharf.

In conclusion, your commission desires to suggest that, if the substance of this report be approved, as little delay as possible should intervene in carrying the recommendations into effect, in order to prevent a recurrence of the serious causes of complaint of the past summer. Six months, at least, will be required to make the necessary preparations.

While the first cost of the necessary plant to carry out these recommendations will be considerable, your commission is convinced that the public good demands it, that the scheme here outlined, fully carried out and properly administered, will abate the nuisances so long complained of, and place this city in the front rank of the cities of the world in the cleanliness of its streets and the sanitary and economical disposition of its refuse.

Horace Swartz, who has been bookkeeper for F. Sabin of Philadelphia for several years, has left to take a position in Alexandria, Va., with an electric railroad company. Mr. Swartz was very popular among the trade and on Saturday, the 17th, ten of his friends presented him with a handsome gold watch, the presentation being made at A. C. Votteler's, on Arch street. In presenting the watch suitable remarks were made by W. F. Habicht, the presentation being followed by a dinner, which took some time to dispose of. The ten members of the party consisted of J. B. Borden, Eugene McDowell, Jr., Harry Kirchner, Charles Votteler, F. Sabin, S. Hibbs, E Hibbs, Alvin Brandt, Mr. Miller and William F. Habicht.

The International Postal Congress will meet in Washington, D. C., in 1897.

# THE RETAIL STORE.

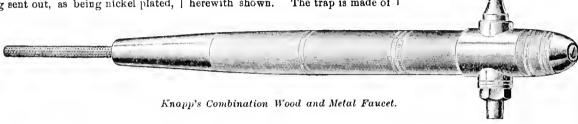

Knapp's Combination Wood and Metal Faucet.

The accompanying cut illustrates a combination wood and metal faucet put on the market by Knapp's Faucet Company, Syracuse, N. Y. The faucet is described as being made of hard maple, as impervious to any liquor, as tested under a pressure of S0 pounds before being sent out, as being nickel plated,

to doing all sorts of niekel plating work make a specialty of display racks and stands for show windows.

Streeter's Sensible Rat Trap No. 20.

N. R. Streeter & Co., Groton, N. Y.; New York office, W. H. Jacobus, 90 Chambers street, are effering a trap as herewith shown. The trap is made of the best known material for use in cutting live electric wires and cables with safety, as the fiber combines great atrength and perfect insulation. It is stated that the cutter blades are drop forged of the best tool steel, and that

polished and varnished, and as being equipped with an automatic strainer. The part of the faucet that entera the barrel is protected by a metal ferrule and tubular screw, while the head is protected by a malleable iron cap. A solid ateel band strengthens the key way, and the key is ground in a metal bushing to form a permanently tight and easily working joint. The key is wood lined to prevent corresion, and is an a constructed as to throw the atream to a point. It is explained that the automatic strainer is a perforated tin tube, which slides back into the bore of the faucet and releases itself automatically after the barrel is tapped. The manufacturers remark that the faucet is all wood even to the block tinned key, which is lined with wood, and that it is strengthened at the weak part of the ordinary wooden faucet, consequently that is has the strength of a metal faucet

malleable iron, with a device for setting, which they refer to as simple and effective. A game trap is constructed on the

all parts of the tool are interchangea b making it always possible to replace broken or worn out parts. The cutter

without its faults, and all the advantages of a wooden faucet without its weakness.

THE NORWICH NICKEL PLATING WORKS, Norwich, Conn., in addition

by James Brady, 83 Washington atreet, Brooklyn, N. Y. The cutter is 24 inches in length over all and is made of ateel drop forgings. The handles are 7½ inches in length, made of vulcanized fiber, which, it is remarked, is

made, might leak batter or juice of pies. The illustration shows the cake removed from the tin. The cake is supported on the removal bottom, from which it is easily alid off. The goods are also made square and oblong.

### Tap and Die Holders.

Wells Brothers & Co., Greenfield, Mass., are offering an improved form of tap and die holders, as shown in the accompanying cuts. The tap holder, Fig. 1, is provided with a two jawed

understands the wheel business, which would put us to a disadvantage as against a regular Bicycle dealer.

Look at the number of Bicycle dealers here and see how little they are

making, and how few of them make a success of it.

#### ANSWERS TO OBJECTIONS.

To these several objections I make

Bicycles can be and are being sold for cash by many retail Hardware dealers at a good profit, and even if some do have to be sold on credit the

Fig. 1.-Tap Holder.

chuck which, it is stated, holds taps perfectly true. The handle is made of perfectly true. The handle is made of cocobola wood, fully finished, and the top screws off, showing the receptacle where a number of taps are held while not in use. The die holder, Fig. 2, is made of similar material and is deaigned to hold 5 inch diameter dies up to and including  $\frac{1}{6}$ . The handle holds five dies, the top of which screws off, thus permitting the dies to be dropped out when needed, providing a compact and convenient receptacle for keeping the dies when not in use. The point is made that these holders permit the user to get the tools into close and awkward places, and that bicycle re-

same discretion can and should be same discretion can and should be shown as in selling a Srove or a bill of house trimmings. It will not be good business policy to sell a \$100 Bicycle ou time or on the installment plan to a person who is earning only \$6 per week and who must depend upon his savings to pay for his wheel.

It is not actually necessary that you should you a purching should you a purching should you a preching should you as preching should you as

It is not actually necessary that you should run a machine shop to be in the wheel business. I know of many Bicycle dealers among the retail Handwaremen who avoid their expense and who make a success of the business. Some retail Hardware dealers in larger civies now sell goodly number of stoves yearly and do not leave a timeson or true at in shoring any keep a tinner or run a tin shop in any

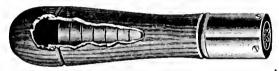

Fig. 2,-Die Holder,

pair shops and users of small sizes of acrew cutting taps and dies will find the holders practical and convenient. The manufacturers state that they are now prepared to quote prices on these and a large number of improved tools, which appear in their enlarged catalogue, now ready for distribution.

#### The Seiling of Bicycles by Hardware Merchants.

BY HENRY M. GAY.

I have been selling Shelf Hardware to the larger retail Hardware trade on the road since 1867, principally to larger towns in Wisconsin, Michigan and Minnesota, but the average retail Hardware dealer in my territory is as "scary" of the Bicycle business as he would be of the Sewing Machine business, and gives the following as the principal reasons for taking this posi-

OBJECTIONS.

No living man can do a Bicycle business on a cash basis. The business must be run on credit or on installment plan.

It would be necessary that we run a machine shop for repair work, &c.
The wheels would take up more room

than we have to spare for such slow selling goods.

There are now so many lines of wheels in the market, all claiming to be the best, that we would have to keep a different make or style for every customer we might strike.

We do not ride a wheel, and there is no one in the store that does or that

sense of the word. These men are merchants, not storekeepers, and understand their business. I also know of retail Hardware dealers who sell as high as 25 wheels per season who do all their Bicycle repair work in their own tin shop and their tinners are now getting to be quite expert at re-pairing Bicycles. There are 25 Hard-ware retailers in one city where I go to who are selling Lawn Mowers. Not one of them is prepared to do a general Lawn Mower repair business in its fullest meaning. Still these people its fullest meaning. Still these people all sell Lawn Mowers and some of them sell 25 to 50 per year now, while when they first started out they were afraid to put in any Mowers. They would order them one at a time as they found a customer for one. The same rule applies to Bicycles as to Refrigerators, Lawn Mowers, Clothes Wringers, Steel Ranges, Gas Ranges and many other items which in former years were sold principally by firms years were sold principally by firms who sold one of these items only. No trouble about the machine shop part of the business. What one cannot do in that line properly can be done at factory or elsewhere. factory or elsewhere.

#### IT WILL PAY TO

devote a reasonable amount of room or devote a reasonable amount of room or space to Bicycles in a store. Some retail Hardware dealers fill up the lightest and most valuable portion of their store with such goods as Mounted Grindstones. Stove Hollow Ware, Stove Pipe, Saw Bucks, Wagon Jacks, Wheelbarrows, Caldron Kettles, Bnilding Paper, Fence Wire, Poultry Netting, Horse Pokes, Post Hole Diggers &c. All such goods sell at little gers, &c. All such goods sell at little

or no profit to the retailer and can be kept in the cellar or basement or in the warehouse or on an upper floorif there is an elevator. These goods can be sold without having any special talent as a salesman. They sell themselves, consequently they are kept in the foreground. These store keepers tell you they have no room for Bicycles. On the other hand, some modern flard-ware merchants sell 10 to 20 Bicycles during a season and never find it necessary to keep over two or three samples in sight.

#### ASSORTMENT,

There is no more necessity for carry-There is no more necessity for carrying a large variety of makes of Bicycles than there would be of Refrigerators. Select one or two good makes, always including one high grade of established reputation, made by a manufacturer of good repute, Secure a wheel that has a sufficient number of good points that will good number of good points that will command themselves to buyers of Bicycles and then sell that wheel against all comers.

#### THE SALESMAN.

Learn to be a salesman

A salesman does not have to be a bicyclist to sell wheels. Some large Carriage dealers are neither coachmen nor horse jockies. You don't need to be a chopper to sell Axes or a cook to know how to sell House Furnishing Hardware. A Hardware dealer cannot expect to learn all the trades to fit himself for selling tools

#### BICYCLES AND HARDWARE.

Because exclusive Bicycle dealers fail in many instances to make a success of selling wheels at a profit the wide awake retail Hardware dealer wide awake retail Hardware dealer should not take fright. The exclusive Bicycle dealer had to run a whole establishment for the wheel business alone. A merchant has his establishment in good working order and can add one more line without adding perceptibly to your present expenses. Again, a merchant has more people coming into his store than the exclusive Bicycle dealer has in his. He has ive Bicycle dealer has in his. He has been established in business for years and has many friends who will trust to his judgment in the matter of selecting a Bicycle, even though there were au exclusive Bicycle house on either side of you.

My advice to the retail Hardware

dealer who is so timid on this subject would be to try the thing before he condemns it.

#### SUCCESSFUL MERCHANTS.

Very few retril Hardware dealers proportionately, who have ever given the Bicycle business a fair trial have discontinued it. They learn to like the business and usually end up with rid-ing a good wheel themselves. Don't get too many makes on the start. You'll soon be able to judge for yourself as to that part of it. Go lightly on Breycle sundries until you get ourther along in the business. Your customer will, as a rule, wait until ou can get in what he wants in that line from headquarters.

#### A GROWING BUSINESS.

Let it be known far and wide that you are in the Bicycle business with the rest of them. Conduct the busi-ness on the same lines as you do in other important items in your stock. Think for a moment of the hundreds of thousands of wheels now in use and the probable increase to be expected on an article that is growing in popular favor, and that has come to stay, and decide to get your share of the benefits to be derived in the way of profits on sales that will surely go to those who are not afraid to tackle the wheel business. Don't be a turtle, be an eagle.

# STOVE TRADE NOTES.

#### The New York Stove Trade.

The stove trade in New York City and vicinity may be said to be in an uncertain and eccentric condition, coming and going by fits and starts. The wholesalers' mail one morning will be large and rich in orders, to be followed the next day by a great scarcity of business communications. Customers make their appearance in numbers for an hour or two, and for the balance of the day things will take on a Sunday appearance. It is unsteady and erratic, though a cold wave is sure to develop a demand from unexpected quarters, and from dealers who earlier in the season were among those who felt sure from the number of stoves carried over they would not need to buy any this year. It proves beyond doubt that the masses apend their money from day to day for whatever the elements and conditions compel them to buy, and the dealers themselves are inclined to buy from hand to mouth.

But the tendency is certainly for the better, and while the volume of the trade this fall will not exceed that of the fall months of last year, owing to the many men who have been unemployed for months, yet there is a decided improvement in the feeling among dealers and an absence of any dread of harder times than we have passed through. Gradual improvement and returning confidence are further indicated by the fact that the decrease in sales for the month of September did not continue, and during October and so far this month sales equaled in volume the output for the corresponding period last year. Again, the middle classes and those who have not suffered from any reduction of wages due to curtailed salaries or loss of work are less inclined to hoard their money against further depression.

The demand has continued as earlier in the scason on the smaller sizes and cheaper patterns of heating stoves, as well as cook stoves and ranges. The high priced constructions are slow of The impression is still abroad, and probably well founded, that we are to have a hard winter-that is to say, that there will be much suffering this winter as there was last, and, notwithstanding the encouragement felt by the laboring classes that better times are in atore, they consider that there remain a few months when it behooves them to maintain economy in their expenses and postpone purchases till 1895. The belief is daily spreading that next year

will bring forth good business, and from the history of panics, known to be due in so large a measure to loss of confidence, and the consequent retrench ment by those not compelled to practice it, the contrary feeling pervading the people will produce contrary results so much desired by everybody.

#### The Ohio Stove Trade.

The past two weeks have developed no new features of special moment in the stove and range industry of the Ohio district. Orders have continued to be quite satisfactory in the aggregate, but the individual sales have been small and manufacturers have been furnished additional evidence that dealers are carrying only such stock as they are obliged to, showing no tendency to anticipate trade requirements. For this reason the manufacturer is much closer to the consumers than in ordinary times. and this close relationship gives rise to greater sympathy between the producer and the general public. The warm weather has interfered some with trade, giving a spasmodic nature to business, as on some days orders have dwindled to very small proportion while a succeeding day is likely to bring a heavy mail, bearing numerous orders which task the capacity of the producer to meet promply.

Although the returns for the first half of the current month have not fulfilled the promise of the activity in Octoher, and the fall trade has not entirely compensated for the deficiency contributed by the apring months, yet there has been a greater and more rapid recovery than has been anticipated by the trade at large, and confidence in the future has taken root in the improved tone arising from the clearing of the political atmosphere.

The more intelligent founders do not look for any marked improvement in business from now until after the winter months, as it is already late in the stove season, but the very character of the orders indicates that manufacturers are more apt than heretofore to be the recipients of desirable business extending far into the winter months.

As far as Cincinnati and its immediate territory are concerned there is evidence that the wage earner is meeting more encouragement and fuller employment, although there is much room for improvement. One manufacturer from whom we have recently heard sums up the situation tersely as follows: "Depressions come quickly; resumptions slowly."

#### Western Stove Freight Rates.

The Western stove trade is stirred up on the very important subject of rallroad freights The Western Classification Committee of the railroads have decided that on January 1 they will raise the classification on atoves in less than carload lots. They are now taking third class rates, and it is proposed to advance them to second class. The importance of this advance may be shown by a few instances. The rate from Chicago to Missouri River points is new 45 cents per 100 pounds; it will then be 65 cents. The present rate to St. Paul is 40 cents; it will then be 50 cents. The rate from Cuicago to East St. Louis will be advanced from 29 cents to 38 cents. Rates to other Western points are raised in the same proportion, the entire territory being covered weat of Chicago. The price of stoves will thus be materially raised to dealers and conaumers. A stove weighing 300 to 400 pounds will thus cost a dealer in the Missouri Valley almost a dollar more than at present.

It was at first supposed that manufacturers and dealers might avoid the greater part of this increased freight rate by shipping more in carload lots. But the railroads have headed this off by raising the minimum weight of a carload from 20,000 to 24,000 pounds. At present the trade is not in such condition that carloads of 24,000 pounds can be easily made up.

Stove manufacturers are using their utmost influence with the railroad authorities to have this action rescinded. Merchants and consumers should unite with them in making protests. This is not a good time to advance the cost of anything.

#### A Scientific Remedy.

BY X. PERIENCE.

The woman who had the range for some reason was not altogether pleased with it, yet had no good reason for complaint. She had concluded, however, to find fault and insisted that it did not bake, but that was found to be a fairy tale, and though she had no good reason to find fault that woman made the life of the stove man a torment. He had several traveling men from the house that made it stop in; some suggested hard iron as preventing the heat properly permeating the provender and promised a new plate for the oven, but that old gag didn't work. She wasn'e going to have her kitchen made a work shop, and it was a new stove or nothing, and she continued to kick on principle though her husband had pie three times

Another traveler wanted larger pipe put on, but the atoveman demurred, as that meant money out of his pocket and extra work: besides other stoves worked with the same size of pipe. One man said the chimney ought to be higher and that suited the stoveman, as he would raise it any reasonable hight with good galvanized iron pipe at 50 cents per foot. The woman said the chimney had worked all right for years and she would not build a chimney to suit any old makeshift in cast iron that some reople had the impudence to call a range. Finally a real smooth old fellow came along and he was taken to see this range and caught bread coming out of the oven that looked so delicious that when he saw it he said he wished it was dinner time all day. But one side of the losf was not as brown as the other, and he asked the woman if she had not had trouble with baking in that stove. "Why snybody could see it by that bread," he said. "It is too bad that you should have been so bothered and nobody fixed it. The trouble is simple and can be easily remedied, yet has made you fret and fuss."

The stoveman's eyes stuck out so you could have knocked them off with a stick, and his mouth was open so you could see his gizzard palpitating with surprise when he heard this. The old man said: "Plesse give me a pie plate and some water, miss." Miss! Why Whv she was a relic of the Revolution, but she simpered at the old rat's soft solder and brought what he wanted. He set the plate on the bottom of the oven and filled it with water and then an hour was spent putting chips under the stove legs to get the oven level. He said no oven would bake that wasn't level and he was surprised that no one had found it out and saved the good lady the worry she had had. He said she would never have any more trouble and she gave him a piece of that hot bread, some butter and a glass of milk, while he discoursed on baking to educate the stoveman and show the woman that she had cause for complaint. Well, when they got in the wagon and drove away the stoveman wanted to know how the ovens worked in stoves on vessels that were seldom on an even "Sonny, keel. The old man said: don't ask disagreeable questions and slwsys use science when your sense fails to suggest a quieting remedy."

### The Aurora Stove Works.

The visitor to Rathbone, Sard & Co.'s Stove Foundry at Aurora, Ill., is told that the works are not running full handed, but he would not be so impressed on actual observation. The large foundry is well occupied, every foot of space being in use. The cupols foot of space being in use. The cupols which was put in when the plant was built has been found equal to the heavy work required of it. Forty tons of stove castings are frequently made here in one working day, and the cupols easily meets the requirements of the situation. As originally planned, the foundry was to be extended to nearly double the present size, with a second cupola placed so as to serve the extension and a por-tion of the present floor space. The tion of the present floor space. The condition of the stove trade for the past year, however, has not warranted this great increase in facilities. This foundry is one of the finest to be found in the country. It was built with a view to securing the largest amount of light possible, the walls and roof being largely constructed of glass. The roof is also unusually high, furnishing an abundance of sir space above and providing fine ventilation.

Among improvements which have re-

cently been made is a large addition to the warehouse. This addition is a massive brick building, of mill construction, to support the heavy weight ef the huge stock of stoves accumulated in it before the active shipping season. It is 95 by 112 feet, three stories and a basement in hight, and would in itself make a very commodious warehouse for a stove foundry of some pretensions. But it is smaller than the old part, which is 95 by 212 feet, and of the same hight. The length of the entire front of the warehouse as now extended is 324 feet. It is equipped with several elevators, at convenient distances, to enable stoves to be easily handled be-tween the several iloors. Two parallel tween the several floors. side tracks run along the front of this building, so that two trains of cars can be loaded at the same time by running platforms across from the door of a car on the front track to the door of a car on the rear track. The shipping facilities thus secured are superb, and will un-doubtedly inure greatly to the advantage of the company whenever times improve and stoves are called for as they were in 1890 to 1892. A trade of huge dimensions can then be easily handled. The ground in the rear of the main buildings is gradually being covered by structures erected for special purposes. An isolated brick building has been put up for use as a carpenter shop and japanning room, the two being separated by a fire wall. The japanning room is equipped for handling the finest work of this character, and is furnished with a very large sized oven. Here the company's new Acorn signs are being finished at present.
They are made of two pieces of sheet metal, stamped elsewhere and brought here to be completed. These are said to be the largest sheets ever stamped, and required skillful treatment in the handling of the huge dies to produce the scorn shape. The carpenter shop is equipped with machinery run by power transmitted by rope from the mounting shop, a considerable distance away. Another isolated structure is a pattern storage house, in which are kept all the stove patterns, to reduce the risk of fire. This building is of the risk of fire. This building is of good size and is fitted with racks extending to the roof, all of which are indexed so as to be essy of reference. A storage tank, holding 65,350 gallons of water has been constructed near by, for use in case of fire here or on any part of the premises. The finishing departments of the

works are not the least interesting to the visitor, from the cleaning room through the mounting shops to the nickeling department. In the mounting shops every grade and style of stove is in process of erection from the parts which have been assembled. Especially active is that section in which the Acorn Radistor is mounted. This is the company's new air tight soft coal stove. The body of this stove is made of heavy sheet steel, to which a cast iron door frame is riveted. In mounting these stoves the bases are first put to-gether and arranged in rows on the floor. The cast iron fire pots are then set on the bases. The next operation is to fit the sheet steel body on the fire pot. It is driven down into place with a heavy hammer. Next a cast iron top is fitted on the sheet steel body. Long rods are then run from the top to the base outside of the stove, nuts are screwed on their ends, and the whole structure is made perfectly rigid. The open work cast iron jacket is then brought in four separate pieces, one for each side, and bolted in place. The top

is a's bolted on, and the stove is ready to be taken to the finishing room for the addition of nickel parts. stove all joints are covered with fire proof cement or soft fire proof packing before bolting or driving them together, to guard against leakage of air. doors have cam latches to enable them to be drawn perfectly tight. Throughout the whole establishment an air of perfect system and rigid discipline is apparent. The works have been running steadily throughout the present year, with the exception of a brief stop on account of the coal and coke strike, when there was a dearth of fuel.

#### ODD PLATES.

A WELL INFORMED CORRESPONDENT, writing of the general situation in Pittsburgh, states that the stove business this fall is fair and that the leading stove foundries are running full time. They are, however, as a general thing, operating with a reduced force and are not crowding their floors with work. Many of them report shipping more goods than they are at present turning out, and are in this way cleaning up their stock. After the first of the year they expect to run full capacity for the spring trade.

II. V. DRAKE of Mount Vernon, N. Y., visited the city during the week making his fall purchases of furnaces and ranges. During his sojourn here he was the guest of Frank Graff of Graff & Co.

The Standard Lightino Company of Cleveland, Onio, refer to the ease with which their New Process stove is controlled, stating that a slight touch of the finger produces a sub-fire, while snother touch extinguishes it. In cold weather, it is said, a sub-fire is needed only 20 minutes after the stove is lighted and should then be shut off. The burner drums for 1895 New Process stoves will be made so that cast iron surfaces only come in contact with the flames. The removable, cleanable sight feed employed in these stoves is made of glass and is easily cleansed.

"DETROIT'S POOR" was the subject of a conference held Sunday afternoon, November 18, at the Tabernacle Methodist Church in Detroit, Mich. Among those interested in the amelioration of the condition of the poor of that city is George H. Barbour, who made an address in which the ground was covered at considerable length. It will be remembered that Mr. Barbour was active last winter in this direction, and a great deal was done to render the poor of Detroit more comfortable.

REPORTS from Eastern Pennsylvania are to the effect that the Reading Stove Works, Reading, Pa., have recently been making some good sized shipments of their goods to various parts of the country, sending out as many as 500 stoves a week.

THE MANY FRIENDS in the trade of Frank H. T. Barbour, vice-president of the Detroit Steve Works, Detroit, Mich., will be interested in knowing that he has recently taken to himself a wife, having been married on the afternoon of November 8 to Miss Elsie Tower, daughter of Mr. and Mrs. O. S. Tower of Ionia, Mich. Edwin S. Barbour of Detroit was the best man. The bride and groom left at six o'clock in the evening in General Alger's private car on a special train over the Detroit, Lansing & Northern Railroad. After a journey through the East the couple

will be at home, at 210 Lafayette Detroit, after December 1. avenue. Among the guests present at the marriage ceremony were Mr. and Mrs. C. A. Ducharme, Mr. and Mrs. George H. Barbour, Mr. and Mrs. E. S. Barbour, W. H. Ducharme, George A. Ducharme and John M. Dwyer, all of Detroit.

THE ROUND OAK STOVE WORKS OF Dowagiac, Mich., are reported to be contemplating the use in the near future of electricity as a motive power. It is said that the dynamos will be located at a water power about 5 miles away, and the current carried by heavy copper wires to the works.

THE BELLAIRE STOVE COMPANY OF Bellaire, Ohio, are distributing to dealers handling their goods an embossed metal sign, measuring about 7 x 10 inches and intended for hanging on the entrance door in such a way that it can be seen through the glass from the out-The groundwork is copper color side. The groundwork is copper color on which are embossed dark letters reading, "Come in; shut the door; ssk to see Star stoves and ranges." In the upper left hand corner of the sign is a picture of the Star six hole range with elevated shelf and reservoir. The wrapper in which the sign is mailed has stuck upon it a red paster with the fol-lowing inscription in white letters: "Solomon had a thousand wives; the Bellaire Stove Company has millions of them using their stoves and ranges."

THE QUICK MEAL STOVE COMPANY of St. Louis, Mo., give to the trade a statement which indicates the number of Quick Meal stoves sold by them from 1882 to 1894, inclusive. A glance at the figures shows that there has been as steady increase in the sales of these goods. In fact, each year has shown an increase over the preceding year, with the exception of one or two. A glance at 1894 reveals the company's explanation for the falling off in their sales, which they attribute to the panic, coal strike, railroad strike and unsettled This is a startling array of reasons, and the only wonder is that the falling off was not more severe.

THE STAR COUPLER COMPANY, St. Louis, Mo., who are making a coupler of various sizes for connecting water back and boilers, have recently shipped a stock of couplers to the Marine Hospital, St. Louis, for use in that institution. The Louis, for use in that institution. Star Coupler Company have made con. siderable improvement in their coupler and have also increased their facilities for manufacturing these couplers so that they are now able to make prompt shipments.

THE CHICAGO OFFICE Of the Peninsular Stove Company has received under recent date a letter from the company's agenta at Sac City, Iowa, in regard to the Alr Tight Peninsular. Mr. Bauer, the senior member of the firm at Sac City, states that he has one of the stoves set up in his sitting room and that it gives very satisfactory results. Quoting from his letter with regard to the fuel used he says: "I have been burning stone in my stove for the past week and it does fine. I bought it for coal, but the dealer made a mistake and sent me stone, but it gets there all the same."

"THE MOSHER HOT AIR FURNACES," is the titte of a four page folder which reaches us from M. J. & M. R. Mosher of Troy, N. Y. These heaters are made in five sizes with fire pots ranging in diameter from 13 to 28 inches. The radiators are made of heavy steel plate or cast iron, the fire pots are heavy and dur-

able and the grate employed is either the plain or superior triplex. The manufacturers refer to these heaters as having great radiating capacity, as econom ical in the use of fuel and perfectly gas tight. The firm have been making laundry stoves since 1880, sending them to all parts of the world, and for three seasons their Nos. 26 and 32 furnaces have been used in California, Montana, Idaho, Washington and Oregon. Mosher furnace is adapted for heating large and small houses, churches, factories, school houses, &c.

### Manufacture of Saultary Goods in England.

A paper read before the North of England Plumbers' Teachers' Associa-tion of the Durham College of Science, Newcastle on-Tyne, England, by W. E. Bland, lecturer on plumbing at that college, is reported in the Plumber and Decora or of London. From this report we extract the following remarks of the lecturer in respect to sanitary goods and fittings as at present produced in England:

Water Closets.

Reviewing the progress of the manufacture of and the workmanship in connection with the fitting of water closets, Mr. Bland pointed out that the conditions of a good article were:

1. Simplicity of action in the work-

That the basin should contain such an area and depth as can be completely charged by an ordinary flush of from 2 to 3 gallons of water.

3. A perfect and sufficient seal of

water in the trap.

4. That no dry surface of the basin should be exposed to contamination. 5. That the outrun should have a con-

nection to the soil pipe or drain that can be made perfectly and permanently

He pointed out that this latter necessity, although the most important, was more frequently overlooked than the others, and instanced numerous cases which had come under his notice by the old and extremely dangerous putty

joint.

It was shown by disgrams that the closet known as the "hopper" in its varied forms, while complying with the first and second of his stated requirements did not comply with the others, and instanced the valve closet, which had kept in favor longer than any other form in use to-day, consequent upon its many alterations and improvements, as one that met the whole of the requirements nearer than any other, although that even lacked the element of simplicity of action. He pointed out how a good seal could be obtained, and that the outrun of the closet should be of an oval form, as reducing the size of the valve hox and aiding the discharge of water without forming the vortex which is common to the circular outlet, and that the trap and valve box should always be ventilated. The advantages of the pedestal, as compared with those inclosed by wood work, were also explained, and the silent action was commended.

### Shortcomings of Modern Closets.

Coming to more modern forms of closets, those known as the washout and the wash down were brought under notice, and it was asserted that notwithstanding the large demand for them those of a cheap make were unsafe, frequently having a seal of from 1 inch to 4 inch only in their traps and relying upon the faulty putty joint for their

connection with the soil pipe, and which, his experience had taught him, invariably failed.

The washout, although favored by some architects and introduced to remedy a failure in the "hoppers" as to a scarcity of water in the basin, has not gone far enough in that direction. has not sufficient area or depth of water to deal with the matter it receives, so ss to keep down the knowledge of its use, and this cannot be deepened without affecting the flush, and for the same reason the seal to the trap is reduced, and, again, the cleansing of the funnel and tran is imperfect, owing to the force of the flush being wasted on the side of the basin. Further, the connections to the vent pipe are not as they should be. He had seen this remedied by having bolted and flanged connections to these bent horns, similar to that to the soil pipe. When not required, a galvanized iron plate can then be securely bolted over, instead of the usual plug of wood or putty, which in time shrinks and becomes a source of danger.

### Desirable Improvements.

The washout was said to be a superior article, and when properly made, a really good closet, with ample water to drown the deposit, the flush being thrown direct on the water surface of the basin with such force as to insure its being changed each time used and allow a deeper seal to the trap, although an after flush is necessary to insure the seal being retained at its proper depth. It was pointed out that the combined cistern and closet introduced by an eminent Scotch firm deserved attention. The whole 3 gallons of water needed for the flush is thrown into the basin almost instantaneously through a 5 inch valve, and has a capital cleansing effect; the body of capital cleansing effect; the body of water thus accompanying the solid mat-ter down the soil pipe and drains pre-vents the sides of these pipes being contaminated and stained—an important point. Its appearance was good and the fittings readily got at. A London firm had also placed another on the marnrm had also placed another on the market of which great things were expected, but of which he had not yet had experience. The water was drawn from the basin by a siphonic action, by which means sufficient water was retained in the basin—both simple arrangementa.

### Baths and Sinks.

The question of baths was also dealt with by Mr. Bland, the self contained bath without its wood covering being strongly recommended, with suggestions as to its ornamentation. A 2-inch clear area by the holes of the grate and the same gauge of pipe throughout was considered necessary, and much stress was laid upon its use as a flushing tank for the drains and traps and the necessity of architects giving a proper posi-tion to it for this purpose. Its mode of delivery and ventilation was also fully explained, as well as the mode of inside fittings so as to minimize damage and inconvenience in case of failure. Where inconvenience in case of failure. Where the plug and chain was objected to he was in favor of a quick discharge clack valve and separate overflow in preference to the average atanding waste arrangement. Caution was given against allowing the supply and discharge to pass through the same pipe.

The trade returns of Canada for the first four months of the current fiscal year show a falling off in the foreign trade of the Dominion during that period amounting to \$8,744,305.

# TRADE REPORT.

### The Iron Market.

The most sensational report of the week is that relating to the placing of an order for three armored cruisers by the Russian Government. The reports, which are as yet unconfirmed, have it that the Cramps have captured the work and that the Bethlehem Iron Company have secured the order for the armor. That both shipbuilders and armor plate makers have had negotiations of this character under way is beyond any doubt. The reported success of the negotiations is certainly a flattering tribute to the ability of our yards and shops, and proves their capacity to compete with the Euro peans in this particular line of work.

Somewhat extravagant stories have been set affost about the 10,000-ton Cast Pipe order for the Tokio Water Works. The matter is still in abeyance. The first order for 10,000 tons of heavy Pipe for these works was taken by the Scotch founders at \$20, f.o.b. Glasgow, with a 30 shilling freight rate, which American shops could certainly best in spite of somewhat higher rates

of freight.

The prospects for work for the future are becoming more and more favorable. Bids are in for a four-track railroad bridge for this city, which will call for 35,000 tons of material, including the approaches. The work will extend over two years. Then there is the certainty that the coming years will witness a very large outlay of money for rapid transit in New York, with its large requirements of Iron and Steel.

The building of large structures, too, promises to absorb a very large amount of Structural Material in all the larger cities in the country, and in many of the smaller towns. Quite a number of buildings have been closed in New York, including the extension of the Waldorf Hotel, which puts 8000 tons into the shops of a Pittaburgh mill. Outside of that a few thousand tons have been taken in New York.

Still, the better prospects refer rather to the more distant future, and have less to do with the perplexing problem relating to the turn of affairs for the next three or four months.

In Foundry Irons sales are moderate and the market for the Southern product has displayed unmistakably a weakening tendency.

Plg Iron.-Aside from one order for 1000 tons for a pipe works in this State no transactions of any magnitude are reported in the New York market. Lower prices are being made by some Southern furnaces, but are not stimulating the demand.

Advices from Philadelphia indicate that sellers of Pig Iron consider that the market is in quite as good shape as they ought to expect in view of the lateness of the season and the steady increase in the output. There is no change in prices, which average steady, and the market is fairly active as regards demand. Taking everything

ing to the near approach of the holidays, the ultimate outlook is regarded as being in favor of better prices than are now ruling. General quotations for Philadelphia and nearby points are about as follows, and from 20¢ to 30¢ less 50 to 100 miles South or West:

The following report comes from our Chicago representative in regard to the Pig Iron market at that centre: The time is now at hand when buyers are generally doing very little in making new contracts, as the close of the year is approaching and stocks are permitted to run low. Yet an occasional consumer is found, the nature of whose business requires him to purchase material without regard to the inventory season. Enough business of this spasmodic character has been placed since last report to make a fair trade. Orders for 200 to 300 tons have been frequent and several 1000ton lots were sold. These transactions have almost invariably fallen into the hands of the local Coke Iron makers. Southern sellers have done but little, although offering concessions. The demand for Lake Superior Charcoal is fair but by no means large, the demand running only to small lots, with prices drooping. Quotations are given as follows for cash

Lake Superior Charcoal	\$13.00	0	\$13.50
Local Coke Foundry, No. 1.	10.1216	ã	10.25
Local Coke Foundry, No. 2	9,50	a	9.75
Local Coke Foundry No. 8.	9.25	0	9 50
Local Scotch	10.25	0	11.00

Alabama Car Wheel	17.50	0	18.00
Jackson County Silvery	15.50	a	16.00
Other Ohio Silvery	14.25	0	14.50

The situation in Foundry Irons is unchanged in the Pittsburgh district. Quotations for that market are given as follows:

There has been some increase in the demand from consumers of Pig Iron in the Cincinnsti district. Pipe works have been the largest buyers, with nave been the largest buyers, with single transactions of 2000 tons each for 60 to 90 days' delivery, but the majority of business is formed by numerous small sales of no special significance in themselves, but quite considerable in the sggregate. Furnaces in the South already have a number of orders for delivery up to the first of the year and the smaller stacks are not disyear and the smaller stacks are not disposed to accept or at least solicit any but very small orders for delivery after the New Year, except at an advance in price. The larger furnaces, too, are decidedly firm, refusing orders which are even 5¢ ton under the current market rates. While there is no marked increase in activity among the leading industries consuming Iron there is evidence of a more confident tone. Taking all facts into considerinto account, it may be assumed that the market is not weak, and while it may lapse into temporary dullness, ow-

able for larger sales at higher prices after the first of the year. Quotations are as follows:

Southern Coke, No. 1	@ \$10.25
Southern Coke, No. 2 9.25	ā
Southern Coke, No. 3 8.75	Ø 9,00
Ohlo Soft Stone Coal, No. 1 14.50	® 15,00

Hanging Rock Charcoal, No. 2., 15.50	<b>2</b> 16.00
Tennessee Charcoal, No. 1 13,00	@ 13.50
Tennessee Charcoal, No. 2 12.00	<b>(2)</b> 12.50
Bessemer 11.65	@ 12.00
Standard Southern Car Wheel 15.75	Ø 16.75
Lake Superior Car Wheel and	_
Malloable 14.25	O 14 75

The St. Louis market is reported as dull, and with no prospect of imas dull, and with no prospect of immediate improvement. There is an almost entire absence of inquiry, and the sales made are limited in quantity. A favorable feature of the market is the determined stand taken by the furnacemen, in refusing to shade prices. They argue that at this season of the year nothing will induce buyers to anticipate their wants, and if prices were cut 50¢ at on the volume of business would fail to show any increase. business would fail to show any increase. Under these circumstances a steady adherence to prices can be depended upon for the balance of the year. We quote as follows for cash, f.o.b. cars St.

dry ...... 9.50 @ 9.75 Southern Car Wheel ...... 16.50 @ 17.00

### Metal Market.

Pig Tin.-Prices have continued on the downward move during the week and a decline of about  $0.35\phi$  @  $0.40\phi$  is to be recorded, futures up to May being sold at the lowest rate. Buying has been very moderate. Consumers have purchased very indif-ferently, and jobbers bought in a moderate way only. It is estimated that there are now in sight for this and European markets 25,000 tons or more, and rumor has it that the foreign syndicate has completely tired of endeavoring to carry the load. The impression here is that their operations just center upon liqui-dating at the smallest possible loss. Some venturesome prophets have offered to wager that Tin will be sold this year at "eight pounds for a dollar," basing their opinion upon the weight of the supply in sight. Straits Pig in small retail lots from atore goes at about 17¢ # lb.

Copper.-Lower prices have been established and the market has a weak appearance. There is more pressure to sell and less inclination to buy, besides which an unfavorable influence has existed in the form of circumstantial evidence that the proposed agreement of producers is unlikely to be effected.

Jobbing business has been of comparatively small proportions, and prices for small quantities are unchanged on a basis of  $10\frac{1}{2}$  \$\vec{c}\$? Its for Lake Ingot. Sheet Copper in retail lots is quoted on a net basis of 15¢ # lb.

Pig Lead.—The demand from consumers has diminished to comparatively small proportions, yet prices are held fairly firmly. American Pig in small lots from store rules at  $3\frac{1}{2}\phi$  @  $3\frac{3}{2}\phi$   $\frac{3}{4}\phi$  lb.

Lead Sheet and Plpe.—The demand is extremely flat and the volume of inquiry gives no encouragement in regard to the ontlook. Dealers do not look for any marked improvement until spring. Prices are well maintained in accordance with the list, namely, at 5½ for Pipe, and 6½ for Sheet, with a discount of 20 %. As noted elsewhere the dealers in Plumbers' Supplies in this and the neighboring districts have this week formed an association for the purpose of maintaining harmony in trade action.

Spelter.—Dealings here have been on a moderate scale and the demand has undergone no improvement. Prices for small lots remain quite ateady on the basis of about  $4 \notin \textcircled{3} + 4 \notin$  for ordinary Western brands. This steadiness is attributed to conservative effering from primary sources of supply.

Antimony. — About the ordinary business is passing. Jobber's prices for small parcels are as follows: Cookson's,  $10\phi$ ; Hallett's,  $8\frac{1}{2}\phi$  id.

Tin Plate.—Quite a good business was done early in the week in spot stock, chiefly moderate-sized lots of ordinary Cokes and Ternes, which went at about the figures of last week. Later, however, business dropped somewhat and prices showed signs of weakening in sympathy with lower English quotations. Futures are somewhat flat, notwithstanding inducements of about 21¢. Concessions have offered in some quarters on December-January shipments. Shipments arriving from abroad have been rather lighter this week, and stocks are by no means ample nor the assortment complete. Brokers find it anything but easy to fill promptly orders for special sizes, and a great deal of interpurchasing is going on among the trade. Yet prices are weaker, if anything, and show no indication of present improvement. special London cable dispatch of November 21 to The Iron Age reports as follows on the British Tin Plate market: In Tin Plate there has been little doing and buyers of round lots have again reduced their bids. Makers are eager sellers at 9/9 for ordinary Bessemer cokes, at Swansea. There is more inquiry for small lots, odd sizes, but lowness of prices llmits business. Wasters are in exceptionally good demand. Many workmen have decided to accept 10 % reduction in wages. Shipments have been small the past week. Stocks amount now to about 249,000 boxes. Swanses quotations are as followa:

as rollo har			
Bessemer Cokes, IC 14 x 20	9/9	0	
Qiamona Cokes IC 14 v 20	10/	((1)	
T D Stool Cokes IC H x 20	0/0	((1)	10/
Ternes, 20 x 28	19.6	Ca.	( ) ( )
Charcoals, 1C 14 x 20	11/	Gr.	13/
Charcoais, 10 14 & 20			

Sheet Iron.—The demand for Black Sheeta is considerably quieter, but the Eastern mills are all sald to be comfortably supplied with enough business to keep them going until the end of the year. Galvanized Iron is in the same condition. Prices are somewhat less firmly maintained. Small lots of No. 27 Common Iron Sheets from store are quoted at 2.65%, but this price is shaded on desirable orders. Galvanized Sheets are ruling at 75 and 10 % off.

THE McLEOD & HENRY COMPANY, Troy, N. Y., Issue carda calling atten-

tion to the extensive line of Fire Brick of their manufacture. The back of the card gives an interesting table showing the distances from New York and the time of mail transit to the principal cities of this country.

## Chicago Report.

Scrap.--Railroads are forcing their Wrought Scrap on the market and selling at low prices. Other kinds are quiet. Dealers quote their buying prices as follows, Chicago delivery:

The U.S. Fuel Company, Limited, 19 Park Place, New York, with a factory at Binghamton, N.Y., made an assignment on November 20 to Henry Worma. The company are manufacturers of "sestallt," a prepared fuel, and of stoves for its use, as well as of a charcoal used for distilling and rectifying purposes. They were incorporated in West Virginia in 1891, with Chas. L. Cammann as president and Gustav Frank as secretary and manager. The failure is attributed to the general business depression and inability to sell the goods manufactured by the concern. The schedules show Habilities, \$34,683, with nominal assets, \$20,086.

SUTTON & Co., New Orleans, La., workers in copper, brass and sheet iron, have dissolved partnership and Joseph Tabst continues the business at 92 Tchoupotoulas atreet.

### CONDITION OF THE

# Hardware Trade.

THERE is little change in the characacter or volume of business since our last report. The demand from the smaller trade ismostly in the way of sorting up orders, which in view of the near approach of the annual inventory are kept down as much as possible. The fact that stocks generally are very much depieted tends, however, to make the present requirements of the merchants greater. There is also a good deal of attention being given to the market now by the large buyers with a view to placing their orders for next season. The market is therefore being watched carefully, but with the result of discovering few indications of an early advance in values. In some lines prices are, however, so low that some conservative houses are disposed to consider it wise to purchase before long. The possibility of a sndden advance as the result of concerted action among manufacturers or as a reaction from extremely low prices is recognized.

Aavices from Chicago.—The demand for Shelf Hardware is considerably better than had been expected, and the volume of business is now so large that the month promises to surpass October. Seasonable goods have been in particularly strong request during the past week. All such articles as Stove Boards. Elbows, Stove Pipe, Coal Hods, Snow Shovels, Skates, Sleds, &c., have been called for in unusually numerous orders, in consequence of the very light advance orders entered during the fall. Merchants now find that their customers need the goods and must have them. The demand for Tin Plate has, however, fallen off; it is by no means so large as in October. Consumers and country dealers appear to have pretty thoroughly covered their immediate wants. Terne Plate is extremely dull with the close of the building season through the country generally. Tinware factories are still behind in deliveries, but manufacturers now expect to catch up with their orders in a short time. The most important event in the Hardware trade which has turned up recently is the advance in Hammers and Sledges, which came very unexpectedly and caught the great majority of the trade with very light stocks. This is taken as an inkling of similar developments which may be expected in other articles from this time forward. It is known that many goods have for some time been selling down too close to cost to be comfortable and opportunities to advance rates will be quickly embraced whenever they arise.

## Notes on Prices.

Wire Nails.—The Wire Nail market is characterized by a good deal of activity, the volume of business being fair, if not large, and the mills generally well supplied with orders. There are also many inquiries from the larger buyers in regard to stock orders for next year's trade, and it is reported that some large purchases have been made. A good deal of negotiation is going on in regard to prices, buyers hoping to obtain somewhat better figures than the low quotations now current. The tone of the market is not at all atrong, and lower prices are ruling than a few weeks ago. The market is represented by the quotation of 90 cents for carload lots at mill, but this figure has been more or less freely shaded.

Advices from Chicago.—Manufacturers' agents report a much larger movement during the past week. Inquiries are now heavier than for several weeks. Factories which had been running single turn during the past month have atarted up double turn, in order to promptly fill their orders and prepare for the coming busy season. Prices show no disposition to advance as yet. Johbers quote small lots from stock at \$1.10

Cut Nalls —The Cut Nail market sympathizes with Wire Nails and is somewhat irregular and slightly lower. Small lots from store in New York are held at \$1 to \$1.05.

Advices from Chicago.—Nothing special has occurred in this line. Manufacturers report a fair trade for the season, and the local factory continues steadily employed. Prices are unchanged, jobbers quoting small lots at \$1.

Barb Wire .- The Barb Wire market is evidently in an unsatisfactory condition, and within the past week or two further weakness has developed not-withstanding the fact that inquiries are more frequent and the volume of business larger. The lack of an understanding among the manufacturers, tostanding among the manufacturers, to-gether with some outside competition, is evidently having its influence on prices. The market is represented by the quotation of \$1.85 to \$1.90, at Pitts-burgh and some other points, but it is understood that lower prices have been made more or less freely. There is little change in the figures at which the jobbing trade are selling small lots from stock. Baackes & Co., Pittsburgh, have issued circulars to the trade in which they refer to their facilities for furnishing Barb Wire, and quote for Novem ber shipment from Joliet, Ill., or Pittsburgh, \$1.85 for Galvanized and \$1.50 for Painted, with an advance of 5 cents for December shipment and a similar advance each month until April, for which month \$2.10 and \$1.80 are quoted for Galvanized and Painted, respectively.

Advices from Chicago.—A better business is reported by both manufacturers and jobbers. The trade has again begun to take hold much better and sales of carload lots and mixed carloads of Wire Nails and Barb Wire are much more frequent. Heavy inquiries are made for Barb Wire to cover the requirements of large dealers during the first half of next year. The outlook has thus decidedly changed with regard to the demand. Manufacturers, however, have not yet put themselves in perfect shape with regard to sustaining prices, but the threatening elements have so far not done serious damage. Extremely low quotations have been distributed broadcast to the trade by an Eastern house who recently leased a mill in the West, but they are of a peculiar character and the other manufacturers are inclined to pay but little attention to the competition, as the factory has only a limited capacity. Jobbers quote small lots of Galvanized from stock at \$2.20 to \$2.25, and for direct shipment from factory at \$2.10.

Family Grindstones.—The Cleveland Stone Company, Cleveland, Ohlo, are offering Family Grindstones at the following prices:

	Per	Dozen.
6 and 7 inch		\$5 00
8 and 9 inch		5.75
10, 11 and 12 inch		7.75

Loose Grindstones, 30 to 200 pounds each, are quoted at \$7 to \$9 per ton. They will also be pleased to furnish quotations on Mounted Grindstones. These prices are f. o. b. quarries.

Cordage.—The market is very quiet, the volume of business being exceedingly small. Prices are somewhat lower, especially in Sisal and New Zealand, there being comparatively little demand for the latter. Present quotations for large lots are as follows:

								Ce:	nts.
Manila, base		٠.			 ٠.				714
Sisal, base									
New Zealand,	bas	e.	 	٠.	 ٠.				414

Ash Sifter.—Streeter's Sersible Ash Sifter, an illustrated description of which was given in our last issue, as manufactured by N. R. Streeter & Co., Groton, N. Y., New York office, W. H. Jacobus, 90 Chambers street, is sold at a list price of \$6 each, subject to a discount of 20 per cent.

Vise Jaws for Tubing.—In our issue November 10 we gave an illustrated description of Spring Vise Jaws for Tubing as put on the market by the Newark Machine Tool Works, Newark, N. J. These Jaws are sold from the following list:

3 inc	ch.																			\$0,90
31/4																				0.95
4	6.																			1.00
41/4	٠.																			
5 -	6.6																			1.20
6	"						٠			٠		•	-	•	•	•	•		٠	1.40

The above prices are net in less than dozen lots. In dozen lots a discount of 10 per cent. is made.

Glass.—Since our report of last week nothing of interest has occurred in the American Window Glass market. Demand continues fair, but not up to what is usually considered a full fall trade. An increase is reported in orders from jobbers, but even these are not as large sa could be wished. Prices appear to vary in proportion to the amount of orders individual manufacturers have on their books and also in proportion to the amount of confidence they have in the immediate future of the Glass trade. A fair average mill price for Glass in large quantities is given as 90 per cent. discount for single and 90 and 5 per cent. discount for Double Strength Glass, at Pittsburgh. Importers report a fair business at 70 per cent. discount from Window Glass list of October 1, but there is reason to believe that in some instances this price is shaded.

Old Metals.—The demand for Scrap Iron is very fair, but prices show no improvement as yet. Old Metals of other descriptions are quiet at former rates. New York dealers are huying at about the follows quotations:

Heavy Copper	D D	7 #
Light and Tinned Copper	D D	6140
Heavy Brass	B D	18/19
Light Brass		
Lead		
Tea Lead		
Zinc		
No. 1 Pewter		
No. 2 Pewter	D 🐃	5 \$
Wronght Scrap Iron. # gross		
ton\$7.5	<i>w</i> w	\$5.00

Old Rags, Paper, &c.—Business shows some improvement, the demand for Paper stock being heavier than for some weeks. Prices remain, however, at their former level. The following quotations represent about the rates paid by dealers, New York delivery:

No. 1 White Rags	Th Ch	3 174 1	(C)	36	1

# The Illinois Pure Aluminum Company's Catalogue.

The Illinois Pure Aluminum Co., Lemont, Ill., issue an interesting catalogue and price-list, illustrating a large and varied line of Aluminum Cooking Utensils, steam jacketed Kettles, other vessels and many specialties. The manufacturers claim for these goods that they are entirely free from poison, that they are practically everlasting, that in them food may be cooked quickly and without scorehing, that they are three and one half times lighter than copper and that they are easily cleaned. The following partial list of the more prominent goods manufactured by the company, together with list prices, will afford an idea of the scope of the line, also of the cost of the goods. The following prices are subject to a discount of 50 per cent.:

Lipped Sauce Pans, with Handle.

Windsor Kettles,

In addition to the goods of which prices have been given, the company manufacture oul of Aluminum the following articles: Dippers, Drinking Cups, Cups and Saucers, Child's Night Food Cups, Soup Tureens, Funnels, Pancake Covers, Hotel Pans, Stock Pots, Fry Pans, Wash Bowls, Spittoons, Butter Dishes, Cracker Bowls, Camp Cooking Outfits, Sanitary and Water Pails, Water Pitchers, Candy or Confectionery Pans, Glue Kettles, Milk or Rice Cookers, Chafing Dishes, Spoons, Spoon Holders, Sugar Bowls, Peppers and Salts, Tea Strainers, Horse Bits and other specialties. The catalogue, which is of more than usual interest as illustrating a relatively new and important line, contains a large number of testimonials relating to Aluminum ware.

### Trade Notes.

THE CLAYTON AIR COMPRESSOR WORKS, Havemeyer Building, 26 Cortlandt street, New York, are sending out copies of their new publication on the "Uses of Compressed Air," citing 70 different applications of air under pressure. It is of general interest to all users of power.

THE CAROLINA MICA COMPANY, for whom J. A. August, 519 Twelfth street, N. W., Washington, D. C., is sole agent, issues price-lists of their mica. One list relates to first quality N. C., mica, the second to superior specked mica and the third to spotted mica. Tables of sizes and prices are given.

THE FIELD FORCE PUMP COMPANY, Lockport, N. Y., are about to build a large addition to their plant.

WITH THE COMPLETION of their new extension the aggregate floor space in the plant of F. E. Myers & Bro., Ashland, Ohio, is nearly 80,000 square feet. This firm, we are advised, are doing an annual business of nearly \$400,000. Two hundred men are employed in the shop, while 17 men represent the firm as salesmen in the different States of the Union. The company are also doing a gratifying export business.

WE ARE ADVISED that the statement that a large lot of new machinery has been installed in the plant of the Sharon Iron Company, Limited, Sharon, Pa., is without foundation. The statement is also untrue that the sheet mill of this concern has been closed down for 18 months. On the contrary, this department has been in full operation right along.

THE McDaniel & Harvey Conpany, Philadelphia, report that they are running their sheet iron mills at their full capacity. They are about closing a contract for rebuilding their bar mill, at North East, Pa., which was burned a short time ago. Its equip ment will be about the same as the old mill, with the exception of the engine, which will be a 250 horse-power Reynolds-Corliss, the order having been

given to the E. P. Allis Co. for the same.

ALL THE PRELIMINARIES in the way of procuring a charter, making surveys, &c., for the proposed iron and steel mill at Hyde Park, Pa., have been completed and the order given to rush the work to a finish. The \$75,000 stock has all been subscribed for and the following officers elected: President, J. D. Orr; vice president, J. M. Flscus; secretary, E. F. Schanwecker; treasurer, T. S. Irwin. The main structure will be built of iron, 113 x 175 feet; annealing house, 50 x 100 feet; wareroom and packing house, 50 x 100; boiler house, 65 x 75 feet. The mill will be fired with natural gas, and its product will include black plates, sheet steel and iron. It is intended that the plant will be in operation by March 1.

ARRANGEMENTS are being completed for the establishment of an extensive mica plant at Kansas City, Mo. B. J. Connor and W. H. Sills are mentioned as among those most largely interested in the project.

THE MONARCH STOVE COMPANY OF Mansfield, Ohio, call attention in their advertisement this week to the fact that the manufacture of Monarch vapor and gas stoves is in new hands, and that the company have large facilities for turning out the goods. The stoves are referred to as possessing interesting improvements, are highly finished and of handsome design.

The Smirk Refrigerator Company, whose Chicago office and wareroom was destroyed by fire October 15, are nowlocated at 254 Madison street, near Market. Their loss will not cause inconvenience in any way, as they have a stock of goods at their factory which will enable them to ship promptly. They have in preparation a new catalogue, describing improvements planned for the season of 1895, which will very shortly be ready for distribution.

Arrangements have been completed by which W. W. Pryor & Co., 81 Chambers street, New York, will represent John Stortz & Son of Philadelphia as agents in New York, New Jersey and the New England States. Messrs. Stortz & Son manufacture lines of Tools for mechanics, plumbers, tinsmiths, painters, weavers, cigar makers, butchers, upholsterers, besides many Hardware and House Furnishing Specialties, including Oyster, Bread, Cheese, Farrier and Butcher Knives, Box Hooks and Scrapers, Calking Irons, &c.

## Undervaluations of Imported Enameled Ware.

Reference was made in these columns last week to the fact of the arrest of a former senior partner in a well-known New York importing house, now dissolved, on a charge brought by the Custom House officials at this port of undervaluations to the extent of \$100,000 in involces of imported enameled from ware. Inquiries among the leading American manufacturers of and dealers in enameled ware bring out the fact that the impression, or rather the conviction, has long existed among them that enameled goods of German manufacture have for years been systematically sent into this country under false valuations. Comparison of the prices at which these goods are sold in Europe with those at which they are offered here, together with the knowledge possessed of the prime cost of manufacture in both continents, proves to the satisfaction of the American makers that

the foreign goods could not be sold here with profit at the rates at which they have been in many cases offered, provided the full duty on their real value had been paid. The alleged offender in the present case has been held in heavy bail, and the result of the present proceedings will be watched with great interest by the trade. It is rumored that a similar condition of things has been existing for some time in the case of enameled ware imports into Canada.

### Colonel Ayer's Tin Plate Report.

The report of Special Treasury Agent Ira Ayer on the production of tin and terne plates in the United States during the quarter ended June 30, 1894, which we print in full in this issue. shows a substantial degree of progress in that industry as compared with the preceding quarters. Despite the fact that trade was still suffering from unwonted depression during the second quarter of this year, the domestic manufacture of tin plates not only maintained its level, but made notable advance. There was an addition of four in the number of active firms reporting, making 40 in all, while the increase in the aggregate output of tin and terne plates for the quarter was nearly 8,000,000 pounds. The actual amount of commercial plates manufactured was 46,466,335 pounds, of which 33,-501,344 pounds, or 72.09 per cent., were made from sheets rolled in the United States, and of this amount 97 per cent. consisted of the lighter class of plates. The details as to the production of American black plates for tinning purposes during the quarter are not less remarkable, showing an output of 37,864,901 pounds, against 30,070,701 pounds in the previous quarter, or nearly 8,000,000 pounds of growth. Of these sheets the proportion that belonged to the class weighing less than 63 pounds per 100 square feet was 85 per cent., as compared with 78 per cent. in the March quarter. The statistical tables presented are particularly interesting and instructive as displaying the really remarkable growth of the industry during the first three full years of its existence.

### A Peaceful Strike Succeeds.

A peculiarly conducted strike has just been settled in a Western city. It appears that the managers of a large foundry attempted to compel their molders to remain in the works until

the regular quitting time on days when they had taken off a heat, the men having been accustomed to leave after that work was done. When the issue was made the men struck. New men were hired to take their places. And here comes the peculiarity of the strike. No attempt at violence was made. Not a man was hurt. Latterly rioting and bloodshed have become such constant accompaniments of a strike that this is very peculiar. Nevertheless, obstructive tactics were employed. The men were not disposed to stand by quietly and see their places filled by others. They managed, in some way, to be able to interview every new hand and convince him that it was wrong for him to take another's place. Perhaps some forcible talk may have passed on such occasions, but if so, it does not appear on the record. At all events, the company finally became very tired of breaking in successive gangs of new men, and the strike ended after a short conference between a committee of the men and some representatives of the company, which was conducted in the most friendly manner, clearing up all misunderstand-The company had been vanquished, and they gracefully surrendered. In the language of a local paper, during the entire strike "the men were acting like gentlemen," and their splendid conduct was an important factor in obtaining a favorable settlement. This is one of the very few strikes this year in which the strikers gained their point, and it is very significant that they accomplished it without resorting to violence.

### Should Manufactories Admit Visitors?

It is a fact well worthy of attention, says The Iron Age, that the treatment accorded visitors to manufacturing establishments by the proprietors is not the same now that it was a few years since. It is not so long ago that we heard much about shop secrets, mysterious and dark apartments where the product was incubated, and were told of special machines of wonderful design which could not be viewed by the vulgar eye because they were the vital part of the business. An atmosphere of mistrust pervaded everything, and the managers of a works closely watched a visitor to make certain that he did not carry away with him the foundation and roof of the building and all things intervening. Once in a long while a place was found where the visitor was welcome, where he was shown the special appliances, and where the methods making the business successful were explained to him in detail. These two classes or divisions differed

widely in the character of their output, no matter what it was. The mysterious man might or might not have devices of exceptional value, but the quality of his product seemed to bear a certain fixed relation to the degree of mystery-the greater the mystery the poorer the product. On the other hand, the man whose establishment was open for inspection almost invariably produced goods of the highest quality in design, material and workmanship. It seemed that he courted a scrutiny of his methods and did not dread a critical examination of his products.

This has now been changed to such an extent that the vast majority of manufacturing concerns are pleased manufacturing concerns are pleased at the advent of a visitor. This change has been aided largely by the technical periodicals and the many technical societies. We understand perfectly that business methods are not the same, and also that while there is the same sharp rivalry there is not the old feeling of district of one's registly or eeling of distrust of one's neighbors. We also appreciate the fact that the army of bright engineers has grown with the times, and that therefore it is with the times, and that therefore it is not so easy now as formerly to control the manufacture of any article by means of special appliances. The im-provement of these special tools would soon take place. But these influences, working unaided, would not have produced the liberal spirit now mani-fected by the manufacturer in the confested by the manufacturer in the conduct of his business. The technical press have, whenever there were meritorious features apparent, presented descriptions of methods and appliances for the benefit of their readers. The shop owner has found that when he permits the publication of a certain device for doing a certain work-perhaps some particular work in his own place—he derives a benefit from the prominence he receives as a designer of ability. The same result is reached of ability. The same result is reached when he describes his shop and business methods, and explains in detail just how he conducts his establishment. if his system is perfect, the reader knows that his product can be relied upon in every respect. When, as now, many do this, there is an interchange of opinion and experience of the greatest value to all concerned. The man who casts his idea as bread upon the water invariably finds that it returns to him increased many fold. The spirit of sociability engendered by the technical societies, the free and open discussions and the custom of explaining minutely valuable methods and apparatus, have done much toward doing away with the exclusiveness heretofore so common.

Manufacturers as a whole will be still more benefited when they adopt the custom of more generally and frequently visiting works in the line they are most interested in. This mutual in-spection will come eventually and will result in improvement in methods and appliances. Even now the leading concerns, particularly the most prominent builders of machine tools, cordially receive the visitor, no matter whether he is a direct competitor or not. being the case in one industry it is not too much to believe that before long door of a factory will be made

without a bar.

# THE LETTER BOX.

# Discoloration from Tin Strainers.

From S. M. E., Rondout, N. Y.—
"A. B. M.," Canton, Ohio, in The Metal Worker of November 17, wishes to know why perforated tin turns coffee blue-black. It is because the tin has been poorly coated or coated with acid. I have had a number of years' experience in hotel and restaurant work and have found that tea and coffee are sensitive, and that a good article caunot be cooked without good, clean utensils to cook it in. For good cooking nothing should be used but the best brands of tiu plate, and strainers should be punched by hand. Copper is preferable, as it can be retinned and kept from getting black.

### Is It a Leak?

From A SUBSCRIBER -I have just completed the gas fitting in a large church building, and while the test to which I have submitted it is satisfactory to the gas company, it fails to meet the approval of one of the church committee, and money for the job is being withheld. The main service pipe is 2 lnches in diameter and a few feet after passing the meter a ‡-inch branch is taken from it extending about 23 feet bafore terminating in several lights. The 2-inch main then continues to the center of the church, making two turns to reach it, and then makes another turn and runs 150 feet under the church. In making this run there are 28 branches taken from it, 14 running each way, and of the branches 12 are 1 inch in diameter and the balance are ‡ inch. All these branches are about 12 feet in length. At the end of the 2-inch plpe the main is reduced to 1½ inches and runs about 20 feet further with eight 4 branches taken from it, each having a length of about 12 feet. After completing the job, using red lead and japan instead of gasfitter's cement, which was objected to, I put a mercury gauge on the job and pumped the column to a hight of 8 inches at 11 o'clock in the morning, and it stood this hight until 6 o'clock in the evening. This test was deemed suffi-clent by the gas company and they signified their willingness to put in a meter. One of the church committee, however, insisted on a 24 hours' test, and atarting the test at 10 o'clock in the morning it ran until the same time the next morning, when the mercury had fallen 2 inches. In order to aid in find. ing the leak I pumped peppermint into the piping and still was unable to find any leak. The pump and gauge are lo-cated on the furthest branch from the meter and the test has been repeated without any leak being found, and it is a question in my mind if a leak exists. but I do not know how to account for the falling of the mercury in the gauge, and will be glad to receive any assistance that the readers of The Metal Worker can give.

Note.—We shall be glad to have our readers give any information which they have gathered in their experience on this aubject. It is quite possible that

the fall in the mercury gauge may be caused by the contraction in the air in the pipes, due to cooling during the night. Recently the temperature at night has been very much lower than that during the day from 11 to 6 o'clock, when the mercury gauge failed to show any change in hight.

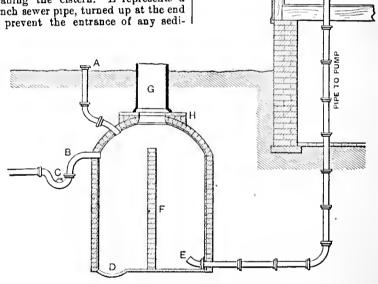

### Jug Shaped Cistern.

From M. L., Warren, Ohio.—I inclose a sketch of a jug shaped cistern which I have built that may be of interest to some of your readers. It is built of brick and cemented, and will hold about 40 barrels. Referring to the sketch, A represents an inlet of 3-inch pipe, B an overflow of 3 inch pipe with a trap at C, and D is a depression in the bottom of the cistern for sedlment. The bottom should grade down to this point in order to make easy work of cleaning the cistern. E represents a 3-inch sewer pipe, turned up at the end to prevent the entrance of any sedi-

tition F is sometimes built of red brick, but I think coarse sandstone better. There are people here who build cisterns made of sand, gravel and cement. The hole is dug and then a form is set in the shape of the inside of the cistern. Cement to a depth of about 3 inches is filled in, and next day the form, which is made in sections, taken out. All pipes are set and the inside given one coat of cement, first covering tight. In a day or two the cover may be opened a little to dry slowly. The water can be let in after a lapse of about three weeks. The cost is about \$1 a barrel.

### Steam in Boiler.

From F. G. N., Columbus, Ga.-I have a 30 gatlon boiler attached to a

Jug Shaped Cistern.

ment. It is cemented into the bottom of the cistern, carried through the wall into the cellar and up to the underside of the floor. All the joints are thoroughly cemented. F represents the filter partition, made of sandstone, and is 5 inches thick. It should be built slightly on a curve, bulging toward D The mouth of the cistern G, 20 Inches in the clear, is made of sewer pipe and is 30 inches high. H is a flagstone, 4 x 4 feet in size and 3 inches thick, with an opening the size of the sewer pipe. It will be observed that the top of the cistern is two feet below grade, and the sewer pipe projects far enough above the grade to prevent any slush or dirt getting in at the top. It is fitted with a neat cover, which should be ventilated by means of small holes, but not of sufficient size to allow toads to enter. This plan admits of using a straight galvanized iron pipe on the pump, thus doing away with all lead pipes. The cistern being set well in the ground keeps the water cool in summer. The filtering paratove for hot water and am annoyed by the boiler making a popping, cracking noise. The circulation seems to be all right, and while there may not be any danger, I would like you to inform me what is likely to cause such a kicking up; also how to prevent it.

Answer. - The noise, in all probabil. ity, is caused by steam passing from the water back to the boller. This may be due to the pipe being partially stopped. owing to incrustation, as the result of a deposit from the mineral matter that may be in the water used. The production of ateam can be prevented by the use of a smaller water back or firing less strong. Another method is to use a vent pipe from the top of the boiler, running up to a point that is higher than the supply. If supplied from a tank, the end of the pipe may be turned down over it so as to discharge any condensation into the tank.

# PLATES,

American Tin Plate Produc-

The special report to the Secretary of the Treasury of Ira Ayer, Special Agent of the Treasury Department, relative to the production of tln and terne plates in the United States during the quarter ended June 30, 1894, which has just been issued, is with the more important exhibits to the following effect:

Office of Special Agent, Treasury | Department, Costom House, New York, November 2,1891.

Sir: I have the honor to report that during the quarter ended June 30, 1894, 40 firms manufactured 46,466,-335 pounds of tin and terne plates proper, against an output of 38,260,411 pounds by 36 firms during the previous quarter.

Of the output for the quarter, 33,501,-344 pounds, or more than 72 per cent., were made from sheets rolled in the United States, and of this amount 32,477,703 pounds, or about 97 per cent., consisted of the class of plates weighing lighter than 63 pounds per 100 aquare feet.

Of the commercial plates manufactured during the quarter, 26,752,996 pounds were coated with tin, and 19,-713 339 pounds were terne coated.

### American Sheet Iron and Steel.

The quantity of American sheet iron and steel made into articles and wares tinned or terne plated was I,807,854 pounds. This makes the aggregate output of tin and terne plate for the quarter, from all sources, 48,274,189 pounds; that of the previous quarter was 40,423,300 pounds.

### Comparison with Net Imports.

The production for the quarter subject to comparison with net importa, under Department's ruling, inclusive of products from American sheet iron and steel tinned or terne plated, was 34,285 557 pounds, as compared with 28,545,162 pounds during the previous quarter.

The production for the fiscal year ended June 30, 1894, subject to such comparison, stated by quarters, was as

follows:	
Quarter ended : September 30, 1893. December 31, 1893. March 31, 1894. June 30, 1894.	28,545,162
Total for fiscal year ended June 30, 1894  By my report dated February 20, 1893, it was shown that one third of the net importa- tions of the class of plates weighing lighter than 63	88,642,045
pounds per 100 square feet, during the fiscal year ended June 30, 1892, was	79,307,939
The difference is	9,334,106

From these figures it is seen that during the fiscal year ended June 30, 1894, American manufacturers produced of tin and terne plates as defined in the law, solely from sheets rolled in the United States, 9,334,106 pounds in excess of the net imports during the fiscal year ended June 30, 1892, subject to

comparison with such domestic production.

#### Changes in List of Manufacturers.

The following companies made their first report of production to the Government, viz :

The Ætna Standard Iron & Steel Company of Bridgeport, Ohio; the Ellwood Tin Plate Company of Ellwood City, Pa., and the Meurer Brothers Company of Brooklyn, N. Y.

The American Tin Plate Company of

Elwood, Ind.; the Canonsburg Iron & Steel Company of Canonsburg, Pa., and the Pittsburgh Tin Plate Works of New Kensington, Pa., were engaged during the quarter enlarging their plant.

The Montpeller Sheet & Tin Plate Company of Montpelier, Ind., com-menced the erection of mills for the manufacture of black plates, and their name appears for the first time in the list of manufacturers.

The Cincinnati Corrugating Company of Piqua, Ohio, and the Laufman Tin Plate Company of Butler Junction, Pa., which had temporarily suspended the manufacture of tin plates, resumed operations and made the usual aworn re-

Twenty rolling mills made sworn returns of production, against 18 that made sworn returns for the quarter preceding.

#### Consumption of American Plates.

Of the 40 firms that made sworn returns of the manufacture of commercial tin and terne plates, 20 used wholly American plates, with an outwholly American plates, with an output of 25,558,798 pounds; 5 used wholly foreign plates, with an output of 4,700,197 pounds; 15 used both American and foreign plates, with an aggregate output of 16,207,340 pounds, of which 7,942,546 pounds were made from American black plates.

Sixteen stamping or other manufacturing companies, that used American sheet iron and steel in the manufacture of articles and wares tinned or terne plated, submitted sworn statements of production, as against fourteen during the previous quarter.

#### Comparative Statements.

a. The following is a comparative attement by quarters of the manufacture of tin and terne plates proper during the fiscal years ended June 30, 1892, 1893 and 1894, respectively:

b. The amount of American sheet iron

	Amount made from				
Period of manufacture.	American Per cent. Foreign black plate. American black plate			Per cent. foreign.	Total.

Quarter ended: September 30, 1892 December 31, 1892 March 31, 1893 June 30, 1893	5,920,082 8,043,449 11,371,968 18 264,225	54-05 40.71 28.46 46.19	5,032,643 11,713,042 (8,194.431 21,279,362	45.95 59.29 61.54 53.81	10,952,725 19,756,491 29,566,399 39,543,587
Total	43,599,724	43.68	56,219,478	F6.32	99,819,202
Quarter ended : September 30, 1893 December 31, 1893 March 31, 1894 June 30, 1894	8,794,027 15,907,669 27,765,162 33,501,344	32.40 58.16 72.57 72.09	18,351,453 11,443,572 10,495,219 12,984,991	67-60 41.84 27.43 27.91	27,145,480 27,851,241 38,260 411 46,496,885
Total	85,968,902	61.74	53,255,265	38.20	189,223 467

The names of the Alan Wood Company of Philadelphia, Pa., and the Western Tin Plate Company of Belle-Western Tin Plate Company ville, Ill., are omitted from the revised list (Exhibit 3).

### Black Plate Production.

The production of black plates in the United States during the quarter was 37,864,901 pounds, and of this amount 32,449,205 pounds, or more than 85 per cent., belonged to the class welghing lighter than 63 pounds per 100 square feet. The production of the previous quarter was 30,070,701 pounds, of which 23,514,881 pounds, or more than 78 per cent., were of the lighter

The production of American black of the class weighing lighter than 63 pounds per 100 square feet was 8,934,324 pounds in excess of that of any previous quarter.

and steel made into articles and wares, tinned or terne plated, during the same period was as follows:

### The Welsh Tin Plate Troubles.

According to a special cable dispatch of November 26 from Llanelly, Wales, to the Pittsburgh Dispatch, a crisis induced by the recent action of the manufacturers in demanding a reduction of 25 per cent. In the wage scale over-shadows the tin plate trade of South Wales. The Welsh tin platers are said to be just now in a very serious and perplexing position so far as unionism is concerned. The officials of the Tin Platers' Union are the only substantial remnants of a well-organized and powerful society of workmen. Their funds have lapsed into a poverty-stricken sum, and the contributions from the different branches in the various large works have drifted from the general fund into other channels. Consequently there are no funds at command, neither is there a combination among the men, so desirable to them when relations between employers and employed are strained on the questions of wages or the conditions of labor.

The Welsh tin plate makers, in order to meet the competition of the domestic works in the United States, have demanded a 25 per cent. reduction in the cost of labor at their works. The initiative was taken at the Llanelly works of Morewood & Co., where the workmen have been given two weeks to consider the proposition. Messrs. Morewood's course has been, or is likely to be, imitated by all the other employers in South Wales, and the latest advices disclose the fact that about 60,000 Welshmen, employed in 70 odd works, have been given to understand that whatever terms are agreed upon in any of the Llanelly are agreed upon in any of the Lianelly establishments will be put late operation all along the line. The workmen, with a practically collapsed union, are in no condition to offer any combined or sustained resistance. Some have already agreed to the terms, and as at the Burry worke, Llanelly, are now working, after an idleness of nearly

three years, at a reduction of 25 per

At a meeting recently held of men in the various branches of the trade it was decided to ask the employers to meet a deputation of workmen to discuss the situation. A joint conference was accordingly held at Llanelly on November 15, which was attended by all the principal manufacturers and two delegates from each of the works. The proceedlags were private and but little has transpired as to the conclusions arrived at; but it is understood that nothing definite came of the conference, and that the question is to be again re-ferred to a general meeting of the trade to be held at an early date. At the next meeting it is thought

something taugible will be produced and a definite reply strived at, and each delegate will be authorized to meet the masters again at a later date. The latter have expressed the determination of elosing their doors unless a definite answer is given to their demands. rumor has gained currency that the men will remain firm and refuse any overtures on the wage-rate question. Another report says they are agreeable to a 10 per cent. cut, and that a better offer even than this will be submitted. This seems certain—that the masters will enforce their demands, and a lockout will be the only alternative.

### Wages Agreement in Court.

The attempt of the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., to operate their tin plate plant with non-union men, and which gives good promise of being successful, has resulted in a move being made by the Amalgamated Association, the outcome of which will be awaited with much interest by employer and employee The move in question was the allke. filing of a bill in equity in the courts at Pittsburgh, on Saturday, the 24th ult, by the attorney of the Amslgamated Association, asking the court to grant a decree restraining the United States Iron & Tin Plate Mfg. Com-pany and the officers and agents thereof from operating their tin and black plate mills at wages less than the schedule of prices agreed upon for the work performed by rollers, heaters, doublers and shearmen. The bill sets forth that on July 6 a committee from each association agreed upon a scale of wages to be paid by the firms composing the Tinued Plate Manufacturers' Association to their employees engaged as rollers, heaters, doublers and shearmen for the year ending June 30, 1895.

The case will be heard by the court on Saturday, December 1. The filling of this suit has excited considerable speculation as to the line of defense that will be offered by the defendants. By many it is believed that the fact that the Manufacturers' Association and the Amalgamated Association are not incorporated bodies will cause the suit to be dismissed by the courts. In this connection it is pertinent to state that in addition to the agreement entered into on July 6, a resolution was adopted in conference to the effect that should a reduction in the tariff on tin and terne plate be made and a reduction in the selling price of same follow, then another conference should be held be-tween the Manufacturers' Association and the Amalgamated Association in order to determine what reductions in the wage scale had been made necessary. As is well known, a conference was held in Pittsburgh shortly after the passage of the tariff bill, at which the

manufacturers proposed a reduction of 30 per cent. in rollers' wages, 25 per cent. to heaters and 20 per cent. to shearmen and doublers. A vote was taken on this by the different lodges of the Amalgamated Association, and the vote was almost unanimous against accepting any reduction whatever. was followed by the complete shut down of the tin plate plants operated by members of the Manufacturers' Association, with the exception of some six or seven, most of which are located in the gas fields in Indiana. Should this suit in equity be allowed to pro ceed to a full hearing, the question will doubtless be determined whether wage agreements are legally binding on the parties making them or not. decision coming from a court would doubtless be of value to employer and employee.

### Tin Pack Shear.

The accompanying illustration is of a new tin pack and trimming shear, built by the Wais & Roos Punch and Shear Company of Cincinnati, Ohio, for the

THE LARGEST CARGO of the plates sent out from Swansea, Wales, for a long period was shipped last week on the steamship "Minnesota" for Philadelphia. It amounted to 3300 tons.

THE AVON VALE TIN PLATE WORKS, Aberavon, Wales, have lately resumed operations after a long shut down, giving employment to about 300 persons.

THE DECREASE in the value of tin and terne plates shipped from Great Britain to the United States in the first ten mouths of 1894, according to the British Board of Trade returns, was \$3,665,000. The falling off in exports to all countries in the same period was \$4,025,000.

THE LIVERPOOL CORRESPONDENT OF the Iron and Steel Trades Journal of London, in a recent issue, refers to the present position of the Welsh the plate trade as being most perplexing. Only a small business is being done and the trade is threatened with opposition on every side, just when prices are downto zero and little or no margin of profit is

Tin Pack Shear.

especial purpose of cutting packs and trimming sheets in tin mills. The machine is built with or without engine and with or without gearing, the cut showing it with both engine and gearing. It is supplied with front, back and side gauges. The standard length of blades is 40 inches, but it may be made wider if so desired. It is constructed with the view of compactness, strength and rapid operation, which features have recommended it to many of the large mills of the country. The manufacturers are at present making eight of them for one plant, and they have also received orders for a new combined shear and doubler, sheet doublers, leveling rolls, &c.

W. C. Brown, 45 La Salle street, Chicago, has been appointed agent for the sale of Tin and Terre Plates manufactured by the Old Dominion Iron & Nail Works Company of Richmond, Va. They have just completed the first Tin Plate plant in the South.

left. He comments on the fact that at the time when fortunes were being made in the trade, competition was never dreamt of. Five years ago there was hardly a tin plate made outside of Wales, and now they are being made in America, Spain, Italy, Germany, France and Austria. The only way he seems to see out of this difficulty is that the workmen should meet the manufacturers half way in the matter of wage reduction. This course he recommends as the sole means of staving off, at any rate for a time, worse evils, for it will, he observes, mean a tough fight for both masters and men to keep the trade at all. "This cau only be done by kceping prices so low as to starve out competitors."

W. H. EDWARDS, proprietor of the Liantrissent and the Maesteg Tin Plate Works and one of the best known tin plate manufacturers in South Wales, has been elected Mayor of the borough of Swanses. Mr. Edwards is well known to the trade in the United States,

having spent some time in this country lately and having started the tin plate works at Norristown, near Philadelphia. He is a son of Daniel Edwards, proprietor of the Dyffryn Tin Plate Works, and is known as one of the brightest and most successful men in the business.

THE DIRECTORS of the Globe Tin Plate Company, recently organized, with a capital stock of \$150,000, have, it is announced, selected the site for their tin plate plant, at Newcastle, Ind. The mill will be on a large scale, giving employment to about 400 persons, and it is expected to be in operation in about six months' time. A large proportion of the stock of the new company is said to have been subscribed by local business men of standing in Newcastle.

AT A MEETING last week of the directors of the new National Tin Plate Works, building at Anderson, Ind., an agreement was exacted from the contractors in charge of the construction to have the buildings ready for occupancy by January 1, and in a condition for operation by January 10.

When the tin plate mills of the St. Louis Stamping Company, St. Louis, Mo., atarted up again last week after nearly two months' idleness, about one-fifth of the old force of 800 men appeared for work and more are atated to have since joined. Two of the nine mills are reported to be at work and others will shortly be started up. The works have been thoroughly overhauled during the shut down and a number of improvements introduced.

ENGLISH ADVICES intimate that the recent floods in Wales materially interfered with the tin plate trade. In the Swansea Valley the river Tawe overflowed its banks and the tin plate works at Morriston were inundated, putting a stop to all operations.

IN THE Monmouthshire (England) Valleys the tin plate workers have consented to make a concession of ten boxes per 100 to December 31, in order to keep the mills going.

THE LA BELLE IRON WORKS, Wheeling, W. Va., manufacturers of muck bars and steel cut nails, have decided to engage in the manufacture of tin and terne plate A force of men has already been put to work tearing down some old puddling furnaces to make room for the new buildings. The contracts for the equipment of the plant are expected to be placed this week. It will be a four-mill plant and have a capacity of between 500 and 600 boxes of tin plate per day. Work will be commenced at once, and it is hoped to have the plant ready for operation by April 1, 1895.

INCORPORATION PAPERS have been accured for the Great Western Tin Plate Company of Chicago. The authorized capital stock is \$300,000. The incorporators are Charles H. Wilcox, John D. Lewis and Elisha C. Ware. Mr. Wilcox is known to the iron trade through his connection with the management of the Calumet Iron & Steel Company of Chicago. Mr. Lewis is a practical tin plate maker who has been managing the Chicago Tin Plate Mfg. Company. Their plans are not yet in shape to make public, but they propose to make black plates as well as tin them.

F. E. Briods, Deering Centre, Malne, is putting a power plant in his tinware factory, and will increase his line of manufactures by the addition of several novelties, and will also make razor strops.

## HEATING D PLUMBING.

### NEW WORK AND CONTRACTS.

J. J. Hogan of 972 State street, New Haven, Conn., has the contract for plumbing, gas fitting and tinning of Edward Carney's new house on Linden street and Michael Kane's two-family house on Nash street, besides several overhauling joba.

THE BAKER & SMITH COMPANY, 193-197 Van Buren street, Chicago, have the contract for steam heating in the residence of A. S. Stevens, La Salle avenue.

TAYLOR & TAYLOR, Meriden, Conn., have the contract for putting new water closets in the Palace Block.

A. C. HICKEY, 69 South Clinton street, Chicago, is overhauling the plumbing and putting in ten shower baths for the Illinois Charitable Eye and Ear Infirmary, West Adams and Peoria

W. S. Lines will build three \$6000 houses at Hartford, Conn., that will have modern plumbing.

THE THEO. JACOBS COMPANY, 72-74 Market street, Chicago, are to install a steam heating plant in the Palmer House, Jolief, Ill.

BARNARD & BAILEY, Milburn, N. J., have the contract for the plumbing in a new school building in their town. The Fuller & Warren system of heating and ventilation will be used.

B. D. DUGGAN, 207-209 Lake street, Chicago, is to install a No. 424 Richmond steam heater in the residence of J. T. Halls, Oak Park, Ill.

A. I. Jacobs, Hartford, Conn., will erect a \$6500 house that will have a hot water heating system.

Neil Bros., 495 Forty-third street, Chicago, are to do the plumbing, gas fitting and sewerage in the four houses of William C. Hill, Oglesby avenue and Sixty-first street.

Bonner & Co., Bridgeport, Conn., are using an Allen steam boiler in the West End Church and are doing the plumbing in the residence of Harry Nettleton and two houses for Frank Villante.

R. H. Lear, 156 Forty-third atreet, Chicago, has the contract for the plumbing, gas fitting and sewerage in the 25 flat building of W. G. Press, Wabash avenue and Forty-fourth street, and is finishing the plumbing in the residence of Gco. P. Barton, Lexington avenue and Fifty third street.

THE IDAHO PLUMBING & HEATING COMPANY of Boise, Idaho, are installing a steam heating plant and system of plumbing, using a Rider engine for supplying water, in the Idaho Soldiers' Home now being built near their city.

John Keahns, Bridgeport, Conn., is installing the heating plant and do-ing the plumbing in a club house at Smithtown, L. I., and is doing a fine job of plumbing in the cottage of Edward Thompson, at Northport, L. I. lie is also doing the plumbing in the residence of W. H. Fox, at Fairfield, Conn., and also installing the ateam heating plant, using the old-fashioned Gold sheet iron radiators.

THE FOSKETT & BISHOP COMPANY,

York, Dorr & Angel of New York and W. T. & M. S. Brown, Stamford, Con., are also using their new system heating boiler in plants that they are installing.

C. A. Ames, Bridgeport, Conn., installed a Perfect hot water boiler in the residence of J. S. Marshall and is doing the plumbing in a six-family tenement house. Ite is also doing the plumbing in a \$20,000 residence for J. S. Nash. He is using Florida steam heaters in the residences of W. D. Bishop, Jr., and E. P. Hinks and in the Taylor Library Building, at Milford, Conn.

THE THATCHER FURNACE COMPANY, New York, are installing four of their Thatcher steam heaters in the church and school, priests' residence and sisters' house of St. Ann's Church, at Nyack, N. Y.

H. B. MIDDLEBROOK, Bridgeport, Conn., is using two Sunray hot water boilers and 5000 lines feet of piping in a chicken brooder for E. A. Hawley, at Fairfield, Conn. He is also erecting a Domestic steam engine, to be used in connection with a Worthington duplex pump, for pumping water into a 5000gallon tank for supplying water as required throughout the chicken farm. The engine will also be used to cut feed for the chickens. Mr. Middlebrook is also doing the plumbing and heating in the residence of Mary Treat, and will use two porcelain lined baths, two Triple Jet siphon closets and two handsome lavatories. The Great American hot air furnace will be used for the heating of twelve rooms in this house, the cold air duct having a capacity of 600 square inches and feeding 13 pipes. He is also installing a hydraulic ram for James Lee, at Hawleyville, which will send the water 900 feet to supply a house, dairy and barn.

THE NEW PLUMBING FIRM of Lindley & Meredith, Bennington. Vt., have the contract for putting a hot water system into John Coleman's house, using a Volunteer boiler.

GAYLORD & EITAPENCE, Binghamton, N. Y., have the contract for furnishing and erecting the steam heating apparatus in the new Miners' Bank Building, Pittston, Pa.

THE BOARD OF PLUMBERS, Hudson, N. Y., accepted the plan for plumbing the Columbia County Court House, presented by William H. Hudson.

WOOLLEY BROS., Jamaica, N. Y., have been awarded the contract for plumbing and tinning a hotel at Sag Harbor.

### The Blackwell's Island Bridge.

In the market reports of The Iron Age reference was made last week to the fact that bids have been put in for the steel work for the Blackwell's Island bridge. The contract will be for the largest quantity of bridge material yet placed in this country. As we stated, it will take a few weeks before the bids received can be investigated and before the work is given out. The structure is to be built for the Long Island Railroad Company. The first coffer dam was sunk at Blackwell's Island a month ago, on the west side of the Island, and is now ready for pumping operations and the building of the first pler. The second coffer dam, on the east side of Blackweli's Island, has been started. New Haven, Conn., are installing one of their new steam heating boilers in the residence of S. B. Steinman, at New Blackwell's Island, has been started. The other two coffer dams, which are to be used on the Long Island end and

the New York end of the bridge, will be ready in about a month.

The whole bridge is to be constructed on the cantilever principle, with three spans-one span from Long island to Blackwell's, one across the latter island and a third from Blackwell's to the New York shore. The piers will be built of massive blocks of red granite. The contract for building them has already been awarded. The main piers, on Blackwell's Island and cach shore, will contain altogether 810,000 cubic feet of stone; the two anchor piers, 216,000 cubic feet. The total weight The total weight of all six will be 86,210 tons. There will be a span over each channel 846 feet long, and a continuous girder over Blackwell's Island, 613 feet long. four-track road will occupy the center of the bridge, with carriage ways and sidewalks on each side.

The total weight of steel in the bridge will be over 53,000,000 pounds. The weight of steel in the viaduct approaches at the New York and Long Island ends will amount to 25,000,000 pounds. The distance required by law between the two spans and high water has been reduced by an act of Congress from 150 feet to 135, as in the case of the Brooklyn Bridge. The total hight from high water to the top of the cantllever will be 255 feet.

The new bridge will be the heaviest long span bridge in the United States; and the weight it is calculated to carry makes it the heaviest bridge structure per foot in the world, not excepting the famous Forth bridge near Edinburgh. It is to be what is called "pin con-nected," and to give some idea of the magnitude of the structure from details it may be mentioned that each "pin" will be 18 inches in diameter and weigh 31 tons.

Charles M. Jacobs, consulting engineer of the Long Island Railroad, who put the gas tunnel under the East River and Blackwell's Island, says:

I have been engaged on this work for Austin Corbin and those interested with him in the Long Island Railroad for some time. For the last 12 months I have been working out the details. The company are now able to call for bids from the largest bridge builders, and propositions from all of them are now in our hands. The terminal station in New York will cover an entire block between Second and Third avenues. There are to be 12 tracks, 25 feet above the elevated roads, and connecting with both the Second avenue and Third avenue lines. Underneath will be a large market building, with elevated galleries, 75 feet wide. A sub-basement will provide a place for cold atorage for produce brought in by the rail-ways and left over unsold. The exact ways and left over unsold. location for the station has not been decided on, but as, under an act of Congress and the State laws, we have power to condemn all lands we may require, we see no difficulty in our way. Finally, men, money and brairs have been secured for the enterprise, and the summer season of 1897 will see communication between Long Island and New York by one of the finest pieces of engineering in a bridge structure and terminals in the world.

It is announced that the Russian Government has decided on the establishment of two large locomotive works, one at Warsaw and one at Kharkoff, to construct the locomotives required for the Russian State railways, in order that they may be independent in this respect of Germany and Austria.

# PLUMBING and GAS FITTING.

### The E. S. Wheeler & Co.

A walk through the warehouse of The E. S. Wheeler & Co., jobbers of tinners' and plumbers' supplies, New Ilaven, Conn., reveals to the visitor how peculiarly well fitted they are for handling this business economically and promptly. They seem to have a very large line of standard goods in tin plates and in about everything which comes under the head of tinners supplies, and in Iron and lead pipe, and a similar assortment of the materials which are bought by careful plumbers. They apparently do not deal in private marks of earthen ware and in similar specialties, but confine their business to handling standard goods for small commissions and for shipment both from warehouse and from the works where the goods are produced. Into their warehouse there runs a track of the New Haven Railroad system, and this connects directly with the Lehigh Valley and Pennsylvania systems of the South and West, so that not only in New England, but in all the country east of the Mississippi River, they solicit business, and would appear to be in excellent position to handle it advantageously. They also do a large commission business in tin plates, quite apart from their jobbing business, and are American selling agents for Gilbertson's Old Method roofing tln, acting as the tunnel through which the maker distributes his product in this country.

### Sanitary Earthen Ware.

BY OBSERVER

The excellence of vitreous earthen ware is so manifest that it cannot suffer when the good features of glazed ware are brought to notice. The only objection that has been heard so far to vitreous ware is in the color-an absolutely pure white not being successfully pro-duced with uniformity. In setting forth the merits of the vitreous ware no mercy has been shown the superior glazed earthen ware of the recent past, and all of the defects that the early productions developed are spoken of as if existing in their worst form to-day. As a result of the general talk among plumbers on this matter, a traveler through a section where the hotels are all fitted with sanitary earthen ware made close inspection of the closets and urinals for the supposed universal craze and wet rot so freely spoken of. In the closets none of the crazing was found that could be called serious, and in only a few eases where the pattern showed clearly that they had been manufactured in the early days of the in-Those of late patterns of the best grades showed none of the effects of wear and time. It is said that urinals are subjected to a more severe test, as the water in a closet seldom reaches a temperature much above that in the room, and the water in the flish tank ordinarily has become somewhat raised in temperature so that there is not so great a difference as is experienced with urinals. Often the flushing water for urinals is raised very little above the

supply temperature, and in use a much higher temperature is imparted to the glazed surface, so that the cause for crazing is much greater owing to the sudden and wider variation in temperature. An equally careful acrutiny, however, failed to find even the urinals of late production in a crazed condition, and those that were showed from their design that they had been made long since.

# Plumbing Showrooms. Pleasure and profit for the plumber

can be gained by taking a day away from the shop and looking over the handsome fixtures that are made for use in high grade work. A welcome and a wealth of attractions await the visitor at the elegant showroom at the home office of Peck Bros. & Co., New Haven, Conn., the whole second floor of a building 60 x 70 feet, with a 12-foot ceiling and lighted on all sides, is used for the purpose. The floors are of polished hard wood and the celling is painted a clear white, while the supports to the upper floors are incased in polished maple and used for displaying goods. On entering the room from the south the arrangement of the goods is noticeable in the tasteful grouping of the different classes. At the left of the door on the south wall is a large glass cabinet, where, displayed against a dark velvet background, are all sorts of cocks in silver, nickel and red metal, and some ornameted with Minton ware. At the right of the door, in two long show cases with racks above covered with green cloth, are bath and basin fixtures, shower sprays, bath plugs, strainers, soap cups, sponge baskets and a seemingly infinite variety of high grade plumbers' brass goods, all handsomely nickel plated. At one end of these cases near the door a full line of shower baths are shown, the first place being held by a sanitarium shower, with spray, bidet, liver apray, douch and shower. At the other end, laundry tubs of brown Yorkshire, white porcelain porcelain and stone and sinks of similar material are shown. The supports of the building are arranged in three rows of eight each, and the first three supports in each row are used for showing some handsome marble pantry sinks, a barbers' double lavatory with shower attached, arranged for hot and cold water, and a large variety of tile such as are used in wainscoting fine bathrooms. The next two posts in each row show lavatories with different styles of slabs in shape and kind of marble. Above the lavatories the supports are hung with beautifully ornamented lavatory bowls of many shapes and styles. On one support are shown four styles of drinking fountains, with cup holders, for residence and public use. The other supports are surrounded by an octagon apace covered with tile, on which are arranged the Marvel, Dorado, Monitor, Triple Jet, Atlas, Paradox, Gauntlet, Mascot and Henley water closets of the pneumatic siphon wash out and wash down construction, all connected so that their operation can be shown. The apaces between the rows of sup-

ports, for one-half of the building, are used to display baths in all styles, French and Roman, roll rim and wood rim enameled iron, plain and beautifully decorated. Also steel clad, fiber and lined baths of various styles. The other half of these spaces have handsome maple stands on which the different water closets are shown, elegantly decorated and embossed in many alluring designs. Along the north wall eight bathrooms are fitted out in such splendor as is in demand by the most luxurious patrons of the plumber, all being well lighted so that the full magnificence can be enjoyed. In one the feature is the water lily decoration of the bath, the foot bath and the sitz bath, in another is the silver satin finish of the fixtures, and two have Mexican onyx lavatories that are prizes in the beauty of the stone. This exhibit, with the showrooms of the house at New York, at Boston and Chicago, will impress the plumber that the buyer of sesthetic taste can be satisfied in sanitary fixtures.

### TRAPS AND VENTS.

THE PLUMBERS OF BROOKLYN, N. Y., are making complaint at the Health Department over a permit that has been issued permitting an alderman to use second-hand lead pipe in a new job, which is against the law.

Several of the plumbers of Savannah, Ga., who run tin shops in connection with their other business, have asked that they be relieved from taxation as tinners, as it is held that the city has no right to ask the plumbers who run tin shops to pay two taxes.

An increasing trade is being developed by Randolph & Clowes, Waterbury, Conn., for brass tubing among the plumbers. Owing to its strength the seamless drawn tubing is largely used for the supply or service pipes in buildings where a high grade of plumbing is done. It is also used owing to the excellent nickel finish it takes for the flush pipes from closet tanks.

J. H. Hayes is enlarging his plumbing establishment at 793 Tremont street, Boston, Mass., and improving the general appearance of its exterior.

RANDOLPH & CLOWES, Waterbury, Conn., are adding to their line of specialties for plumbers a new bracket for flush tanks made of rolled brass and nickel plated. The stay section has an ornamental twist giving an attractive appearance to the bracket. With an almost endless variety of ornamental brass tubing they offer the plumber a wide line of lavatory legs of handsome finish from which to make a selection. Special circulars, or rather sets of halftone engravings showing the beauty of these goods, can be had on application.

Disley & Weyand, Waterbury, Conn., have broken ground for a new plumbing and sheet metal shop and showroom. The building will be 60 x 85 feet, three stories high, with basement which will be well lighted. The building will have a sheet metal front

as a specimen of their work, and with large plate glass windows. The basement will be used for a plumbing shop, and will contain their pipe cutting machinery. The first thoor will be used for a plumbing showroom and offices. The second floor will be used for a sheet metal shop for cornices and skylights, which they make a specialty of. The upper floor will be used for storeroom.

SEWER PIPE MANUFACTURERS of Western Pennsylvania, West Virginia and Ohio held a meeting last week in Pittsburgh with the object of discussing methods of effecting an improvement in prices, which it was agreed by all are at present too low to afford fair profit. The general opinion was expressed that it would be advantageous to reorganize the old tri-State organization. A further meeting, to perfect the details, will be held at a future date, not yet agreed on.

THE TORONTO STEEL CLAD BATH & METAL COMPANY, L'mited, Toronto, Canada, issue a neat little circular emphasizing the advantages of their steel clad baths. The point referred to particularly is the absence of wood work.

As a result of an investigation of the Board of Health of Fall River, Mass., one of the schools containing a dry closet system has been closed.

ALBERT A. GRADY, who has recently established a plumbing business at the Highlands, Mass., has just finished the plumbing of a house for J. M. Currier, and will do the work on Clarence Milliken's house at the Highlands.

ONE of the latest additions to the already large manufacturing plant of Randolph & Clowes, Waterbury, Conn., are toola for making the weil-known Brown copper boiler of a capacity of 200 gallons. The largest size previously made was of 150 gallons' capacity. These boilers are made to carry a pressure of 150 pounds, but are made to carry a pressure of 300 pounds when so ordered. A feature of interest to the plumber in connection with the Brown boiler is that it can be repaired when burst or collapsed at either end, providing the other end is in good condition. On the boiler being returned to the factory by the firm the plumber buys from, the boiler will be repaired at a reasonable figure.

THE BOARD OF PLUMBING INSPEC-TION has granted a certificate of competency to do plumbing work to Edward K. Glngerbach of 33 Jackson street, Yonkers, N. Y.

LYMAN D. MILLS, Middletown, Conn., has been awarded the contract for furnishing the pipe for the new reservoir of the Durham Center Water Company.

F. & F. C. BOOTH have succeeded to the plumbing and heating business of the late Alfred Hopkins at 87.89 Middle atreet, Bridgeport, Conn. Having been connected with the management of the business for a number of years, they are amply qualified to serve their patrons satisfactorily.

IN REPORTING to the School Committee at Fall River, Mass., the Board of Health made the following comments on the latrine system of closets in use. "This system consists in a trough in which water is left standing. There is nothing automatic about the flushing. It is accomplished by operating a lever, and this part of the work with the refilling of the troughs with water is one of the janitor's duties. The

closets should be tlushed very frequently, but the members of the board report that some of the closets did not appear to have been flushed for several days and in one of the troughs there was no water. An automatic flushing tank can be used in connection with this system that would not be dependent upon the forgetfulness or unforgetfulness of the janitor. With such a method of flushing the system is much mere satisfactory, but at its best it is not a very good one. Its special recommendation for use in school buildings is that the scholars who might be inclined to mischieveusness cannot dis-turb the mechanism of the system." The directions of the Board of Health are that the old closets in use be changed for some improved system that will be connected directly with the sewer, and the flushing and ventilation of which will be certain.

THE HUMPHREY MFG & PLATING COMPANY, Kalamazoo, Mich., are sending to the trade an eight page pamphlet of their automatic hot water heater for supplying hot water instantly and for warming bathrooms. It is printed on enameled paper in two colors and the cu's are shown on a tinted background. The first cut shows the apparatus connected for use with a bathtub and lavatory and working under pressure.

The second cut is a sectional view showing the internal construction with the gas burner that is used for heating the water and for heating the bathroom. The construction consists of a spiral corrugated copper shell through which the water passes to be heated, and which is subjected to the heat of the gas flame from below. It is said that it will heat water for a bath in about ten minutes.

GAYNOR & MITCHELL, Bridgeport, Conn., make a specialty of the small brass screws, washers and spring washers and other small parts used in the manufacture of basin cocks, hibbs, &c., by the manufacturers of plumbers' brass goods and the larger supply houses.

No visitor to the machine shop of the Armstrong Mfg. Company, Bridgeport, Conn., can fail to be impressed with the care that is taken in the manufacture of their adjustable dies for threading pipes and their adjustable pipe cutter. These goods are found in many plumbing shops and are held in high esteem. The firm are developing a considerable trade for their power pipe cutting machinery. Their power machines cut pipes from 1 to 6 inches in size, and one of the special advantages claimed for them is that they occupy so little space on the floor. These machines and their hand cuttling tools are not only popular in the United States but large shipments are made both to Europe and to South Americs.

Zalmon Goodsell. Bridgeport, Conn., is one of the busiest plumbers in the city, and confines his work principally to jobbing for custom trade.

E. C. Hargrave, Hinckly, N. Y., has recently added a Curtis & Curtis pipe cutting machine to the tools in his shop for doing plumbing and heating work.

John Hamilton, Bridgeport, Conn., is one of the old manufacturers of plumbers' brass goods, including a varied assortment of compression and other bibbs and lavatory cocks. He runs a well equipped brass finishing shop in connection with a brass foundry and is prepared to make special goods on short notice. Excellence of material and workmanship is one of the claims he makes for his productions.

THE BRIDGEPORT STUAM HEATING Company, Bridgeport, Conn., are just going into the plumbing supply busi-The first floor of their building is used for offices and pipe cutting machinery. They have tools for cutting pipe up to 8 inches in diameter and carry a full line of iron plpe and fittings. On the second floor they have a large showroom in which they make a display of modern plumbing fixtures of The third floor ocvaried character. The third floor oc-cupies four buildings and was previously used by an athletic club as a gymnssium. This floor is fitted for storing soil pipe fittings, plumbers' brass goods, steam fitters' supplies, sanitary earthenware, various styles of bath and basin fixtures, lead traps and bends of different sizes, and pumps, and all of the small things that go to make a complete line of plumbing supplies. This floor is connected with the office floor by a small dumb waiter so that local orders may be filled promptly.

Montgomery & Patterson, Eighteenth street and Seventh avenue, New York, find the Douglass instantaneous water heater a device well suited to the requirements of some of their customers, and are using these devices in quantities with satisfaction.

D. W. Borett, who has been in the plumbing and tin business, at Dalton, Msss., for the past seven years, has bought out the interest of Pelham Hague of the firm of Hague & Noble of Pittsfield, and will close out his Dalton Biock store and remove there January 1.

John Warner and Lincoln Grow, Ashley, Pa., propose building a machine shop, to which will be attached a plumbing department.

DAVID E. WILLIAMSON has commenced work on the city plumbing shop to be erected north of the west side pumping station at Saginaw, Mich.

P. J. Toomay, New Britsin, Conn., has added tinning to his plumbing business and has engaged William Touterlock, formerly with S. II. Beard.

Christian L. Wolf, who has been elected Alderman at Manchester, N. H., has been in the plumbing business for ten years at West Manchester.

THE STANDARD SUPPLY COMPANY, a new house in the plumbing supply business at Jacksonville, Fia., are making a specialty of the Douglass instantaneous water hester.

Charles Moun, 156 Seventh street, Hoboken, N. J., has placed a Perfect gas controller on the gas main in his building with the idea of showing to his customers the advantages to be gained from its use in preventing undue pressure of gas on the burners, as is frequently the case when increased pressure is put on the service mains toward evening.

C. B. Hall, assistant engineer in the sewer department, Washington, D. C., has been appointed to the position of inspector of plumbing, made vacant by the death of Samuel A. Robinson, who held the office since its establishment. The salary of the office is \$2000 a year. Mr. Ball has been connected with the plumbing department for the past three or four years.

Erskine Rumsey has been appointed general mining engineer of the Alabama division of the Tennessee Coal, Iron & Railroad Company.

# STEAM AND HOT WATER.

### Society of Heating Engineers.

The American Society of Heating and Ventilating Engineers will hold its annual meeting in New York, beginning Tuesday, January 22, 1895, and continuing for several days. The programme for the meeting (now in preparation) will include the reading and discussion of scientific papers by prominent engineers of the society, topical discussions or discussions of problems presented by members, involved in the practice of modern heating and ventilating engineering, also visiting and inspection of noted heating and ventilating plants in and about New York, &c. The society, through its Board of Managers, has concluded arrangements whereby its headquarters will, after December 1, 1894, be located in the commodious and finely appointed building of the American Society of Mechanical Engineers at 12 West Thirty-first street, New York City. A fine library, reading room, assembly hall, &c, and excellent service being secured to the society and its members.

### Heating a Barber Shop.

From W. F. S., Bayfield. Wis.—I send herewith a plan, shown in Fig. 1, of a barber shop which the proprietor wishes to have heated with hot water from his bath boiler. The building is 13 feet front, 31 feet deep and has a 9-foot ceiling. It has two stories and is plastered, but the upper rooms are not occupied. The front is mostly of glass, amounting to a space 7 x 13 feet. On the plan there is shown a 66-gallon gaivanized iron boiler and a 16-inch Wilks heater. The heater is tapped on the top for two 1½-inch connections, and tapped on the sides near the bottom with

The building faces north, and the space along the west side is occupied by chairs for the walting customers.

Answer.—Considering the amount of heating surface that will be exposed by the heater, the boiler and the piping to and from the heating coil, it is quite probable that a coil, placed along the north end of the room, exposing 100 feet of surface, will be ample to secure

radiator exposing 100 square feet of surface is used, 200 lineal feet of pipe will be required. If 1-inch pipe is used 3 lineal feet of plpe exposes 1 square foot of surface, and 300 lineal feet of 1-inch pipe will be needed. As the water heater will be connected to the boiler any expansion of water will work against the supply to the boiler, whether that be city pressure or tank pressure,

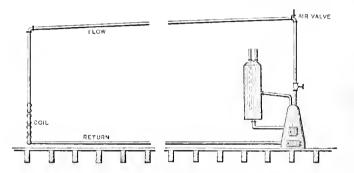

Fig. 2.—Method of Piping.

a comfortable temperature. In order to make the circulation easy a 1½-inch flow pipe will probably be best. This should run up to a point a few inches below the celling, as shown in Fig. 2, where it should run into a tee in the top of which an air valve should be connected. From the side of the tee, a flow main of the full size should be run over to the heating coil. It is quite probable that a radiator will be more orna-

and an expansion tank will not be necessary.

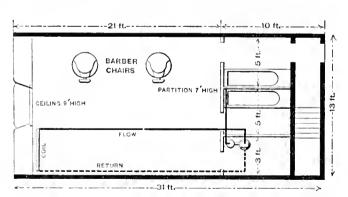

### Combination Heating.-I.

BY J. W. HUGHES

Noticing from time to time in the columns of The Metal Worker questions referring to combination heating that conveyed to my mind the belief that in many towns in the United States the furnacemen were passing through the same experience as occurred in the business in Montreal some 20 or more years ago, it occurred to the writer that a brief account of the evolution of combination heating, from a single coil in connection with the water back of a range or stove, to heat an adjacent or overhead room, to the apparatus as it finally has developed in connection with the hot air furnace, would prove both interesting and profitable.

both interesting and profitable.

The methods of heating commonly used during the writer's early experience in the heating trade were wood stoves, next coal stoves, which seemed to reach their highest possibilities as house heaters in the Littlefield Railway coal burners; then came the modern hot air coal burning furnace, although there were a number of hot air furnaces in use that were fired with wood, and one that was constructed by my old boss that was constructed by my old loss that combined the cooking range and hot air features, and gave very fair satisfaction. Very large buildings were warmed by steam, and a few by hot water. The oldest hot water apparatus of which the writer has knowledge, and which was working well up to about a year ago, when the house it was in was pulled down, must have been fitted about 50 years ago, as 25 years ago it was overhauled for the first time and it had then been 25 years in use. The original botter for this apparatus was made of boiler plate in England, and continued to do its work well and cconomically up to about six years ago.

Heating a Barber Shop .- Fig. 1.-Floor Plan.

four 1½ inch holes. Where is it best to connect the flow pipe—from the top of the boiler or from one of the unused holes in the top of the heater? Where should the return pipes be connected? What size of pipe should I use for the flow and return from the heating coil, and where should the heating coil be placed? What shape and size should the heating coil be? It will be noticed that the back part of the building is divided into three rooms, two of which are bathrooms and that the partition is only 7 feet high, leaving a space of 2 feet between the top of the partition and the ceiling for a circulation of air.

mental and satisfactory, but either a manifold coil made of 1-inch pipes or a return-bend coil made of 1½-inch pipes will render good service. The return from the radiator can readily be run along the floor on the west side, back of the waiting chairs, and where it comes into the small room where the heater and boiler are located it can be run across and connected at one of the openings in the side of the heater. Two lineal feet of 1½-inch pipe exposes 1 square foot of heating surface, and if a

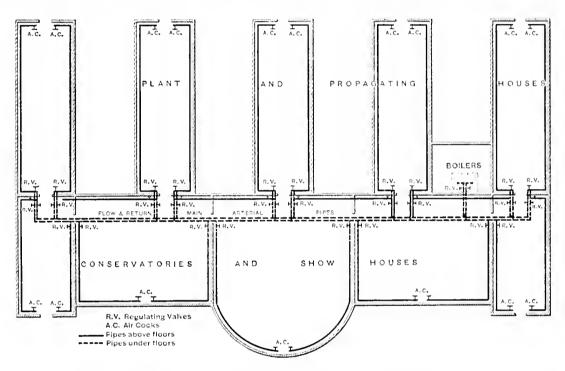

As the city increased in size and wealth, larger houses were built, and the problem of how to heat them economically, especially as to first cost, when they reached a size beyond the capacity of the ordinary hot air furnace, set the furnacemen scheming as to the possibilities of making a combination of two well-known and effective systems, viz : hot air and hot water, using the latter medium for the rooms too far from the furnace to be effectually warmed with hot air. Whether G. R. Prowse or C. Ryan is entitled to the credit of installing the first complete combination apparatus the "deponent sayeth not," but they were both early in the field and each fitted many very complete and excellent working furnaces.

But the original idea was conceived and acted upon by a gentleman not in any way connected with the heating trade and successfully carried out in his private residence, being one more a noise which, in its turn, raised a acare. From that there was a raise all around of talk and temper, and almost everything else but dollars and patience. Or the coil was too small and failed to raise the temperature, but was an eminent success in all the other raises. Theu it was the mains that were wrong, some coils got all the heat, others got none. Sometimes the whole energy of the apparatus seemed to exert itself in a very successful effort to keep the water in the expansion tank at the boiling point while zero reigned supreme in every other part of the system. the merry war went on for years. What seemed to work all right and make a perfect cure on one job failed entirely on another. Each job and each different kind of furnace seemed to call for an entirely different kind of treatment, but in the end we got it down fine and there was no more trouble to be expected

box is placed in the boiler house at a sudicient hight above the hoilers to regulate the supply of water and is joined to the return pipe to the boiler.
The pipes are preferably 4-inch cast iron, with rust joints, or the joints may be made with either red lead or Portland cement. A grating placed over the pipe below the floor level allows the heat in the arterlal pipes to be utilized.

### Standard Pipe Flanges.

The result of nearly three years' labor in relation to adopting standard tlanges is about to become effective, the exact time set for the new order of things being January 1, 1895. Over two years ago a committee was appointed by the American Society of Mechanical Engi-neers from among their members to investigate the subject of adopting standard flanges. About the same time a similar committee was appointed by

Heating a Greenhouse with Hot Water.—Plan View, Showing a System of Low Pressure Heating for a Range of Buildings.

proof of the fact that improvements are frequently brought to light by others than those who are more closely identified with the trade affected by the change.

After their lead the practice became general and spread from Montreal to other cities, both in Canada and the United States. Probably the first apparatus of the kind fitted in the United States was installed by W. H. Pennell, in Portland, Maine. He having heard of it from Canadians in that city, came to Montreal to see what the novelty was, and afterward fitted quite a number of furnaces. The men who went into the business were not steam or hot water fitters, but hot air men, and for years they had the piping done by the regular steam fitters. That is how the writer came to have experience in this particular line.

As the old saying about the weather "that all rules fail in a season of drought" is true, so it seemed to be with the combination furnace. moment a fitter struck a job of the kind all rules seemed to fail and he found out that what he did not know

from a combination furnace than from any other form of heating that had by years of good behavior established a character and reputation that saved it from threats of being thrown out, if something did occasionally go wrong. Now what we did and how we did it during all these troublesome times is what it is proposed to record in the article following this.

### Heating a Greenhouse with Hot Water.

From W. McD., Stapleton, S. I., N. Y.-I saw in The Metal Worker some time ago diagrams illustrating the manner of passing a doorway with heating pipes in a greenhouse. I herewith send a sketch illustrating the plan of a well arranged low pressure system in a range of houses, which several years' experience has shown me to be the best. idea is to have one or two saddle boilers and flow and return arterial pipes, with check valves for regulating. From these, at each side of the house, branch pipes are taken to the stand, these also being provided with regulating valves. about hot water circulation could fill a book. The coil in the furnace was too large and raised steam, that raised low the air to escape. The expansion

the Master Steam and Hot Water Fitters' Association to consider the same subject. Cast iron flanges of pipe, steam engines, steam pumps, and valves for steam, water, &c., have been ex-haustively discussed, and the table adopted, as shown in the report of the American Society of Mechanical Engineers of July 18, 1894, will be substantially the one adopted, there being a few modifications under advisement in a few of the larger sizes not com-monly used. The committees were instructed to devise some standard which would be sufficiently broad to warrant its adoption by the various manufacturers. Both committees have met individually and jointly, the Master Fitters' Association, at their annual convention last June, recommending a conference of the two committees. This resulted in a meeting at the rooms of the Mechanical Engineers, July 18. At this assemblage were not only the members of both committees but representatives of the following manufacturers interested: E. P. Bates, chairman Master Steam Fitters' Association Committee; Geo. F. Blake Mig. Company, represented by J. G. Winship; Crane Company, by Geo. T. Coppins; The Eaton, Cole & Burnham Company,

by E. H. Cole, W. H. Douglas and F. A. Strong; Gillis & Geoghegan, by Stephen J. Geoghegan; Jenkins Brothers, by A. B. Jenkins; Jarecki Brothers, by A. B. Jenkins; Jarecki Mig. Company, by Oscar Jarecki; The Kelly & Jones Company, by John T. Kelly; Knowles Steam Pump Company, by J. G. Winship; Morris, Tasker & Co., Incorporated, by M. B. Feldman; McNab & Harlin Mig. on. 16. Feidman; McNati & Harlin Mig. Company, by Geo. T. Coppins; Nason Mig. Company, by Carleton W. Nason and Frank A. Bucknam; Snow Steam Pump Works, by James II. Snow; the Solvay Steam Process Company and Straight Line Engine Company, by John E. Sweet; the Walworth Mig. Company, by Geo. T. Coppins and Levi R. Greene: the Walworth Construction R. Greene; the Walworth Construction & Supply Company, by A. C. Walworth; Henry R Worthington, by A. J. Caldwell; R. D. Wood & Co., by L. R. Lemoine; the Wheeler Engineering Company, by F. M. Wheeler. Carleton W. Nason of the Nason Mfg Company was chosen chairman and W. II. Douglas of Eaton, Cole & Burnham secretary. The fact was brought out secretary. The fact was brought out that the work of the committees was the result of careful acientific analysis, and that the cross section paper scale they had constructed was made for the purpose of exhibiting the lines of their work as plotted graphically. The table referred to above was unanimously adopted after much critical discussion, and it was decided to have the secretary send reports to interested manufacturers stating that it was the sense of the meeting that the diameters decided on be adopted, to take effect January 1, 1895.

### School Boiler Explodes.

The startling accident of a steam boiler exploding in a school building recently, where several pupils were injured, has brought about a very thorough investigation of the cause, which we give below, and which clearly shows that there is nothing at all dangerous in steam as a system of heating when the apparatus is good and properly attended.

Inspector Hawley of Chief Wade's staff of boiler inspectors in the State of Massachusetts has made an investigatigation of the explosion at the Centre Grammar School at Uxbridge, Mass., Nov. 22, in which the lives of 200 childreu where endangered, and submitted his report, which is as follows:

The exploded boiler had been in use about 15 years. It was of cast iron, nearly about 15 years. It was of cast fron, hearly square in shape, with an internal tire hox extending the length of the boiler to the rear water leg. The grate was not as wide as the fire box, the heated gases passing over each side of the grate under the bottom of the water leg and along the external shell to the flue.

The table, was conveyed of two inde-

ternal shell to the flue.

The boiler was composed of two independent sections over and surrounding three sides of a single grate, the sections being connected only by circulating pipes. The first section was 26 inches long by 40 wide, and the second section was larger, being 28 long by 40 inches wide. The top of the fire box was slightly crowning and was provided with a fusible plag, and the top of the external shell of each section was slightly crowning. A cover was bolted on the center of the top of each section and from these covers steam risers were taken.

were inken.

The second and larger section gave way, The second and larger section gave way, blowing the top of this section completely off, one piece weighing over 100 pounds. The line of fracture was from 2 to 4 inches from the sides of the boiler. The boiler plate varied in thickness from ½ to a scant 3- inch.

An examination of the fracture shows that it started from two cracks, one about 4 inches long at the rear, on the right hand side facing the boiler, and a smaller crack at the front right hand corner. These

cracks were evidently caused by the bulgcracks were evidently caused by the bulging of the top by the pressure beneath it, causing the plate to rise and fall with every change in pressure, finally cracking at the bending point. The crack had been bleeding and evidences of the leak were ou the external shell and I do not believe were of very long standing. The front plate gave way at the larger crack, this being clearly shown by the position in which the broken piece was found and also from the position of the steam riser pulled from this section by the explosion.

of the steam riser punch from this section by the explosion.

From the statements of the janitor it appears that he left the school at 8.45 o'clock, having another school to attend to. He left 4 pounds pressure upon the boiler, a beavy hard coal fire, with the furnace door closed and the automatic damper open, which was expected to else the draft door closed and the automatic damper open, which was expected to close the draft door with at increase in pressure. The boiler with at increase in pressure. The boiler supplied steam coils in six rooms, four of

which were occupied.

The day was warm and ull the coils but one were shut, hence there was almost no

one were shut, hence there was almost no demand for steam, and a heavy fire on the grate, which, with the fire door closed, would continue to burn freely for a long time after the draft door was closed.

The safety valve was 1½ inches on a ¾-inch pipe, making practically a three-quarters safety valve, and this was totally inadequate to discharge the steam as fast as produced, without an increase of pressure. That this is the case was also shown by an experience of the janitor last winter, when he returned to the boiler and found the experience of the jainter has whiter, when he returned to the boiler and found the safety valve blowing freely, set at 7 pounds, yet the pressure on the boiler was 20 pounds, to which it had risen despite blow-

pounds, to which it had risen despite blowing off.

All the conditions were present to bring about a heavy pressure on the boiler. A heavy fire, no use for the steam made, a safety valve totally inadequate to relieve the boiler, leaves no other conclusion than that the pressure reached a point unusually high with this boiler, and in the cracked condition of the plate, the explosion was the natural result.

Even with the crack and the high press-

Even with the crack and the high pressure at which this boiler exploded, it might still have held had not the boiler been naturally weak. The boiler itself, under any condition, is faulty in design and an unsafe one to use. The large section was almost flat on top,  $20 \times 40$  inches, in places less than the section was almost flat on top,  $20 \times 40$  inches, in places less than 1/4 inch thick, of east iron, and this large surface was not stayed in any ade-

large surface was not stayed in any adequate manner.

Deducting a ring four inches wide, as supported by the vertical sides, it leaves an unsupported, practically flat plate, with an area of 800 square inches, which, with 10 pounds pressure on the boiler, would bring a load of 8000 pounds on this unsupported plate. With 20 pounds pressure, at which the janitor has found it, the load would be 16 000 pounds, or eight tons.

the janitor has found it, the load would be 16,000 pounds, or eight tons. If a man should set up a plate of thin east iron, supported only on the sides, 20 x 40 inches and expect it to support a movable load of eight tons, the foolburdiness of the attempt would be instantly condemned by every observer; yet that is exactly what was done with that schoolhouse boiler, how often no one knows, but very frequently known to be very near that lond. Not only is the strain dangerously excessive, but it

often no one knows, but very frequently known to be very near that load. Not only is the strain dangerously excessive, but it acts to crack the boiler exactly as it could have been predicted it would.

In setting the boiler it was not furnished with check valves to prevent the loss of water by a failure to close the radiator return valves. This, bowever, has nothing to do with the explosion, but is dangerous, and is liable to produce low water, and is a common condition in schoolhouses. The fusible plugs, found melted, show it to be in working condition, but they did not melt until after the explosion, which indicates that there was plenty of water in the boiler when the explosion occurred.

To summarize: The direct cause of the explosion was a considerable increase in pressure in the boiler, made possible by the safety valve being defective in size, and a faulty hoiler, presenting a large unstayed that surface, further weakened by being cracked, the direct result of its faulty construction.

struction.

THE BELKNAP MFG. COMPANY, Bridgeport, Conn., have found a very saliafactory demand for their line of brass goods for heating plants. They make a specialty of quick opening hot water valves, angle valves, radiator clbows and unions, &c., for both steam and hot water work.

### HEATING NOTES.

THE CONSOLIDATED SAFETY VALVE COMPANY, New Haven, Conn., make a specialty of their nickel seated safety valve, which they claim will not become fastened together by corrosion. They also make cheaper grades of safety valves, such as are used in connection with heating boilers and in connection with high pressure or closed hot water heating aystems.

CURTIS & CURTIS, Bridgeport, Conn., recently shipped one of their pipe cut ting machines for cutting pipe from 2 to 12 inches in diameter to the Walworth Mig. Company of Boston. They are preparing a shipment of eight machines to go to South America and have recently made some large ship-ments to England. One of their very popular machines is made to cut pipe up to 8 inches in size by hand. Their shipments during the past week have taken in many of the principal cities of the United States.

THE MANY FRIENDS of James A. Harding in the heating trade will envy him the rest he is taking at his home in Vineyard Haven, Mass. After 18 years of active service, the latter portion of which was with the Boynton Furnace Company of New York, he has severed all business connections and closed up his deak to take up his gun for a season. He is widely known as the con-tributor of one of the letters in the series of essays on house heating that appeared in The Metal Worker and were later published in book form. He has frequently written for the papers on hot air, hot water and steam heating, always taking a practical stand and giving interesting information.
We will venture to say that he will find pleasure in learning the doings of the heating trade from his friends, though he is now in the pursuit of pleasure as a business at the above address.

THE ASHCROFT MFG. COMPANY OF Bridgeport, Conn., have furnished many of the heating boiler manufacturers with the steam gauges used in connection with their steam heating apparatus. The detail of the construction of these goods is very thorough, each dial and gauge being carefully tested and claimed to be absoluely correct. Their steam gauges are used by the United States Government and are on all of the new war vessels.

THE BUSINESS of T. C. Joy & Co., at 82 Lake street, Chicago, Ill., will hereafter be conducted under the manage-ment of William H. Harrell, formerly of the Harrell Heater Company of Dunkirk. Mr. Harrell, in addition to his knowledge of radiator manufacture, is a competent engineer as well as a master ateam fitter, and is moreover an agreeable business man, whom the Chicago trade will be glad to welcome. Mr. Harrell succeeds C. W. Wright, the former representative of T. C. Joy &

"FAULTLESS FURMAN BOILERS" is the title of a pamphlet issued by the Herendeen Mfg. Co. of Geneva, N. Y. It is the seventeenth edition of their catalogue, price list and list of references. The volume gives illustrations and full descriptions of the Furman boilers, together with a long list of relerences and illustrations of many residences and other buildings warned by this apparatus. Various other circular s of interest accompany the pamphlet.

# ROOFING AND CORNICE.

### Eave Finish for Metal Roofs.

From ROOFER.-Herewith is presented a number of methods for securing sheet metal roofs at the eaves. A very simple method is shown in Fig. 1, where the tin is bent over the roof boards and nailed. This manner of securing the tin is very defective, as the underside of the roof boards are unprotected, and, unless the tin extends be-

strip the tin is laid and locked over the edge. This does not form either a fire or wind proof fulsb, as the underside of roof boards are unprotected. In Fig. 4 the roof tin is so formed as to reach under the roof boards and cover them, and if the space between brick and roof boards is well filled with mortar or cement, a tight joint will result. As shown in Flg. 5, strips of tin are so formed as to extend

secured by nailing. The roof tin is then to be hooked on and double seamed over.

#### Laying Gravel Roofs.

From F. G. BUTLER, West Hartford, Conn.—In the reply to "J. A.," Chieago, in The Metal Worker, October 13, giving directions for laying gravel roofs, you have gone over the ground pretty thoroughly. Having experience with roofs which I have laid and watched for years, I beg to say that I have found the pitch mentioned—1 inch to the foot—just twice too much. If the roof pitches only  $\frac{1}{4}$  inch to the foot it is ample. If the pitch is more the sand washes off and wears the roof, requiring coating oftener. The roof boards cannot be too well seasoned and should be planed on one side and matched. Always lay the dressed side up. Cover first with two ply felt laid across the edges of the boards, lapping 2 inches; tack them just enough to hold in place and dust with fine, clean sand; then commence at the lower edge with

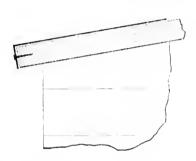

Fig. 1,-Single Bend in Tin.

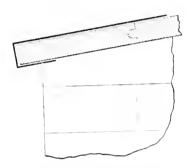

Fig. 4.—Tin Bent Under Edge of Roof.

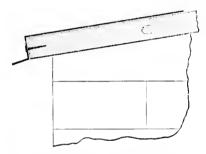

Fig. 2.-Double Bend in Tin.

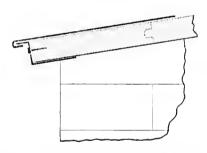

Fig. 5.—Drip Formed by Bent Strips of Tin.

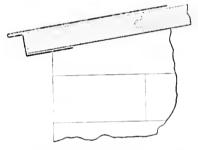

Fig. 7.- Tin Bent Under Roof Board.

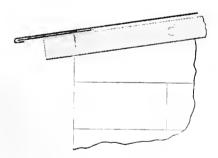

Fig. 3.-Sheet Iron Nailed to Roof.

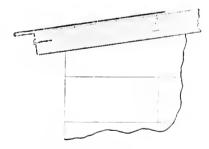

Fig. 6 .- Drip Formed in Roof Tin.

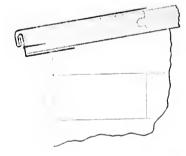

Fig. 8.-Double Seam at Eares.

EAVE FINISH FOR METAL ROOFS.

low the edge of the roof boards, capillary attraction will cause water to be drawn between the tin and the boards. In Fig. 2 the tin is bent down and out so as to form a drip, and while this form appears to be an improvement on the previous one, the underside of the roof boards being unprotected, there is a chance for either wind, fire or water to enter. In Fig. 3 is presented a method that finds favor with many tinners. A strip of galvanized iron is of tin can be formed, as shown in Fig. nailed along the eaves, and over this 8, and placed under the eaves, being

under the roof boards, and at the same time project sufficiently to allow the roof tin to be hooked on, thus protecting the under side of the roof boards and forming a drip. In Fig. 6 the roof tln is so formed as to produce a drip, the tin being secured to the roof boards In Fig. 7 the roof tin is by nailing. bent in such a marner as to form a drip, and at the same time extend under the lower part of the roof boards. Strips

the outside felt of four ply, if you can obtain it, as it costs but little more than obtain it, as it costs but inthe more than three ply; nail at the edge and unroll to the top or highest point of the roof; commence at the bottom with another roll, lapping the edges about 2 inches and nailing about 2 inches apart. Now cut strips of felt 4 inches wide and roll them. Use a thin, sharp butcher knife, dlpped in keroacne oil occasionally, for cutting the strips, and it will be found much easier to cut on a slight bovel. Com-

mence at the bottom and unroll the strips exactly over the 2 inch lap. Have a man precede you with a brush and hot roofing composition so that you will unroll the strips into the hot coating. Now, have another hand follow nailing each edge of the strip. No water can get through this seam. The advantage of the sanded surface between the two ply and the outside four ply is apparent. No outside felting should ever be stuck down to the roof boards, for no matter how well these are scasoned there will be more or less shrinking and swelling, producing cracks in the roof. I have laid roofs that never leaked a drop, and outlasted any tin roof, at half the cost. Having once had occasion to chop a hole through one of these roofs for the purpose of running a chimuey through it, I found it was more like chopping through boiler iron than anything else to which I could compare it. I prefer a broad headed tack, about 1 inch long, to the wire nails with tin washers, because the heads sink down level, and cover smoothly with the roofing preparation, and wire nails soon rust off in roof boards. A clean coarse sand is preferable to gravel, and I have found the old style farmers' grain separator, or fanning mill, admirably adapted to separating out just the right size for use. If the sand is dry it will work all right and blow out all the duet and right and blow out all the dust and shake out all too coarse.

# Instruction in Sheet Metal Work.

Some time ago H. M. Sanders of Washington, D. C., conceived the idea of starting an evening class in pattern cutting, but we are sorry to say that the enterprise, which he put in practice in Baltimore, did not result successfully. At a time when considerable interest is taken in this branch of work and classes are starting in various parts of the country, it will be interesting to read the account that Mr. Sanders has sent us of his attempt in this direction:

"Perhaps you may wish to hear the result of my evening achool enterprise for sheet metal works.

last September in Baltimore. It was a
the fact. Why it was failure—this is the fact. a failure, or some of the causes that worked against the success of the enterprise, you may be interested to know. In the first place, it was a new enter-prise which the Baltimoreans seemed slow to take up and appreciate, and while those prominent in the business here say it was just the kind of school necded, most of the mechanics working at the trade did not seem to appreciate the advantage of such an education. After they get through with their day's work the hight of their ambition, in most cases, seems to be to have a good time, take a sail on the river or go fishing for crabs. If they can get their \$2 or \$2.50 a day, that seems to fill to the brim their aspirations. Still all are not of this class. But mostly, among the older mechanics, they are satisfied to plod along in the old rut.

I found that most of those who show

I found that most of those who show any desire to take up this branch of study are among the young men in the trade, but the wages paid them especially are so low that they did not feel able to go to such a school. It is true I found a very few who were willing to pay the price I charged, but not enough to make me feel justified in going on with it. However, although the school project was not a success in one way, I think perhaps it may prove a success in another. It has been the means of stirring up the subject so that

the trade sees the need of some such a movement, and the Polytechnic Institute and the Maryland Institute, two prominent educational institutions here, are taking up this branch of study, and as a knowledge in this direction can be obtained at these places free, or at a nominal price, I am inclined to believe that there are quite a good many, especially among the young men, who will take advantage of it. I know of a number who have held off coming to my school in view of it.

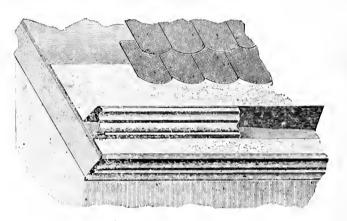

One of the first things I did after advertising the school was to send out circulars to a number of leading firms in different parts of the country for the purpose of getting an expression from them as representatives of the trade upon the value of such a school to the trade. There was a generous response and in every case favorable to the school, so much so that I have not wholly given up the idea of a school, though perhaps on a different basis from the late effort in Baltimore.

## The Sims Ornamental Roof Gutter.

The Sim's Manufacturing Company of Newark, Ohio, are offering the trade a new form of metal gutter, as shown contract for the school and parish buildings being erected in their city. They have completed the work on the Christ's Church, at Ansonia, and have nearly finished the work on the St. Cecilia's Church.

M. CULLEN, Hartford, Conn., has the contract for the tin roof, skylights and sheet metal front for the Fisher brewery. He is putting up 6000 feet of sheet metal cove in the insane asylum at Middletown, Conn., and is doing the sheet metal work on the Park Street Chapel at Hartford.

J. Reilly, Jr., Bridgeport, Conn., has a contract for the copper and galvanized work on the St. Augustine Church, the front of which will be covered with rock faced aiding and the cornice made of galvanized iron. The roof will be of 18 ounce copper, laid between wooden cleats atanding 3 inches high and 2 inches thick. The copper courses will be scant in width to fill the space between the cleats in order to allow for expansion. The edges of the courses will extend about \$\frac{1}{2}\$ inch above the top of the cleat, and will be turned down away from the cleat. A sheet copper cleat will be nailed to the wooden cleat and extend beyond the edges on two courses of the other cop.

The Sims Ornamental Roof Gutter.

in the accompanying engraving. It is made of either galvanized iron, copper, or terne plate, in 10-foot lengths and of any width from 12 to 30 lnches. Its construction permits of attaining any desired fall, yet always presenting a straight face the full length of the roof, no matter how long. The manufacturers make special claims for its cheapness and say that it carries off the water perfectly without leakage. It is made of one piece extending from the edge of the roof up under the top covering of the latter and presents a pleasing appearance when in position. It is also equally well adapted for porch roofs and can be furnished in various face designs.

### FLASHINGS.

GORMAN & ENGLISH, Wilkes-Barre, Pa., have the contract for roofing the new Miners' Bank Building at Pittaton.

Barlow Bros., Waterbury, Conn., are doing the roofing on the Fred Rice block, the American Ring Company's building and on the American Printing Company's building, besides a number of smaller roofing contracts.

THE copper cornices and sheet metal work on the Curtis Home at Meriden, is being done by Disley & Weyand, Waterbury, Conn., who also have the

per. These copper cleats will be placed about 8 inches apart, fastened with copper nails and the ends of the cleats will be turned down over the copper courses. A copper cap will cover the wooden courses lengthwise, and will be wide enough to have an edge turned over the edge turned on the courses, forming a seam which will be turned down tight against the wood work. By putting the copper on by this method no trouble is anticipated from expansion and contraction, which are apt to make trouble in copper roofing when proper provision is not made for them. Two copper crosses will be placed at the ridge of the roof, and with the pedestals will stand 16 feet high. These crosses are very handsome pieces of sheet metal work.

G. Dhouve & Co., Bridgeport, Conn., have a building that presents a very attractive appearance, the front being covered by the St. Paul rock faced siding, for which they have the agency, and the front has large plate glass windows with a bow window on the second floor, all in sheet metal. They have the contract for putting a roof on the new building of the Farrell Foundry & Machine Company, at Ansonia, Conn. The roof covers 40,000 aquare feet and will be laid of 14 ounce copper in the standing seam style, common in tin roofing, with the cleats about 12 inches apart, made of sheet

copper and fastened with copper usils. About 30 tons of Seymour copper will be used for the work. They also have the contract for making copper skylights for the same building.

FRANK H. SNEATH of Farmington, Conn., has taken the following roohing contracts: The lligh School Building at Bristol; the residence of Henry Freese nius; Miss Ellis' house, New Britain; four roofs for the Middlesex Quarry Company, and one for Shaler & Hall, Portland; a large roof for the Peck, Stow & Wilcox Company, Southington, and a roof for the Middletown Savings Bank of Middletown.

CHAS. ALDRICH, president of American Roofing Company, St. Louis and Cincinnatl, was one of the guests of the Cotton Belt and Iron Mountain lines on the excursion to points in Texas last week. Mr. Aldrich reports trade throughout Texas in good shape, not withstanding the low price of cotton. He states that collections are in excellent condition and the indebtedness of the merchants and manufacturers is considerably less than usual. He managed to pick up a few orders for his company.

F. W. STELLING, Franklin avenue, Hartford, Conn., has a number of contracts, among which are the contracts for the copper work on the new schoolhouse at Bristol, the Lyman house on Woodland street, the addition to the State Armory on Elm street, G. Fox & Co.'s alterations on Main street, and the new Watkinson Farm School Build-

C. H. KANE, Nyack, N. Y., is doing the galvanized cornice work and roofing on the St. Ann's Church, in his city, and is also making the ornamental sheet iron finials and crosses for the same.

An addition will be built to Garde's Hotel, New Haven, and galvanized iron imitation of stone will be used on the old as well as the new part of the build-

T. W. Dorsett, proprietor of the Hoboken Cornice & Skylight Works, Hoboken, N. J., was last week awarded the contract for roofing the Government immigration buildings at Ellis Island, N. Y. This work will require about two carloads of roofing tin. He will use for this purpose Merchant's Old Method, IX 20 x 28 Mr. Dorsett has lately carried out some important roof ing and galvanized corrugated iron work, such as the State Line Pier, the Hoboken Ferry Company's buildings, and the sheds for the Lehigh Valley Railroad at Jersey City. He is now completing a large contract at Snake Hill, N. J.

THE AMERICAN ROOFING COMPANY, St. Louis and Cincinnsti, are kept very busy. They report orders in one day aggregating several carloads, which were received from Texas, New Mexico, Colorado, Oregon and Washington. The demand for their American lathing, which was recently placed on the mar-ket, is steadlly increasing, and they are in receipt of a number of complimentary letters from the trade with regard to this lathing.

BERGER BROS. of Philadelphia report business booming and constantly increasing, requiring upward of 100 molders on their specialties in light malleable and gray iron castings, in the line of tinners' hardware, gutter hang-ers, pipe hooks and fasteners of every description. The late four story addition to their handsome new building being again too small, they have secured the five story building,

231 Arch street, specially for their | roohing supply department of gutter, pipe, sheet fron, corrugated iron and aiding, &c., together with all other bulky goods, for which their trade has been constantly increasing. The new building is already well stocked and so arranged that goods of this class can be received and shipped at the lowest cost and expense.

### C. C. Walworth.

C. C. Walworth, president of the Walworth Mfg. Company of Boston, Mass., dicd on November 22. For the last two years he has been in failing health, which has prevented his close

application to business.

Mr. Walworth was born in Canaan, N. H., on March 23, 1815. He received what was considered in that day a liberal education, and for a short time taught school in his uative town. For several years thereafter he lived in the West. Upon his return to the East, he was associated with his brother in the house of J. J. Walworth & Co., from which many of the leading engineers and steam fitters of this country have emanated. Heavy losses in Chicago, about the time of the fire, brought the concern into financial difficulties, from which it was rescued by Mr. Walworth, who formed a corporation under the name of the Walworth Mfg. Company. His efforts to place the new company upon a strong financial basis were ably accorded by the late E. C. Hammer, who eventually became its tressurer.

His numerous inventions, notably the multiple tapping machine, collapsing tap, die plate, manifold, pipe vise, and an automatic machine for cutting and threading pipe, as well as his improvements in steam traps, wrought iron radiators, wrenches and automatic sprinklers, placed the company in a atrong position to compete with other manufacturers in its line. His constructive ability was of constant and incalculable value to the corporation, and his inventions were the basis of the Malleable Iron Fittings Company of Branford, Conn., in which he had been for many years a director.

In 1881 the factory in Cambridge was found to be inadequate for the requirements of the business and the Crystal glass works at South Boston were purchased and a thoroughly eoulpped factory established by Mr.

Walworth.

Aside from his inventive genius and business asgacity, Mr. Walworth was a born organizer, and for 40 years his influence with the mcn, individually and collectively, was evinced by the fact that during various periods of discontent among the laboring classes no strike ever occurred in the works, pending troubles always having been averted by his warm hearted, judicious intercourse with all classes of his employees. He was ever ready to appreciate merit among those who worked for the company, and constantly incited the young men to use their brains in perfecting labor saving devices.

THE MAIL brings us a brown paper bag, tled with a cotton string and pasted to a sheet of cardboard. Above the bag a pair of turkey's feet are suggestively printed on the card, as though sticking out of the bag. On the card is the legend, "Don't miss the stuffing." Opening the bag, a very neat l

circular is found from the Ideal Boller Company, 36 Dearborn street, Chicago, wishing the reader an enjoyable Thanksgiving and incidentally ealling his attention to Ideal bollers. A wishbone is printed on the reverse side of the

### Trade Notes.

C. H PACKER has removed his pattern making shop to 107 Water street, Brldgeport, Conn, where he has in-creased facilities for making both wood and iron patterns.

THE BRIDGEPORT CRUCIBLE COM-PANY, Bridgeport, Conn., find a good demand for their crucibles for melting brass and other metals not only in their own State but in the nearby territory.

W. E. PLEADWELL has removed his nickel plating plant to 115 Kossuth atrest, Bridgeport, Conn., where he has increased facilities for turning out good

MERCHANT & Co., Incorporated, Philadelphia, have just filled an order from the Government for 20 of their 24 inch Star Ventilators for use on Government buildings in New York State. Their New York representative reports a very extensive and growing demand for these ventilators, as well as for their Spanish tiles in this section of the coun-

F. E. Myers & Co , Ashland, Ohio, manufacturers of pumps and hay tools, have one of the most complete factories in their line in the country. In their manufacturing department they have three rooms, 300 feet long and 52 feet wide, which they are now equipping with additional machinery and elevators, and in the most convenient and substantial manner, with a view of being able to produce goods of a high grade at a range of cost that will enable them to meet the views of the trade. The atorage rooms of this firm consist of three, 200 feet long and 50 feet wide. Their factory is large and roomy, and is equipped with latest pattern of 5 ton Collian cupola, so that the additions which have been made and the rearrangement of their factory throughout will give this firm what can be considered as an up-to-date manufacturing plant.

THE GOULDS MFG. COMPANY, Seneca Falls, N. Y, have in press a book which will be devoted entirely to efficient Power Pumps and their applications. In connection with these applications there will be a large number of sketches illustrating goods in operation for different services, &c. The book will be 61 inches long and 71 lnchcs wide, 96 pages, and handsomely bound, and will be replete, we are advised, with new goods and carry much information of value to engineers and pumpmen gencrally. The company are desirous of placing the book with all interested parties, and will be pleased to receive applications to add to their mailing lists. The book will be ready for distribution this month.

THE STAR COUPLER COMPANY, St. Louis, Mo., referring to the order re-cently secured by them for a supply of Star Couplers for the Marine Hospital, advise us that the Couplers were specified by the supervising architect of the United States. The Star Coupler Company are shipping goods to many parts of the United State, and recently filled a large order for a point in Canada.

### How Shall we Gauge Wire and Sheets?

BY CBERLIN SMITH,

It was Carlyie, if I remember aright, who said that the population of England was so many millions—mostly fools. However indignantly we may repudiate the descriptive portion of the dis-tinguished cynic's remarks as applied to the people of our mother country in general, we can scarce but admit the partial foolishness of that portion of the population who have been engaged at various times during a century past in the industry of inventing wire gauges. In America, too, we find that either heredity or example, or both, has caused a further development of this pernicious industry, and that the crowning absurdity of all its products has, not many months since, been indorsed and legalized by no fess eminent authorities than the two Houses of Congress and the President of the United States. The only comfort in connection with this ridiculous legislation is that it did not require any all night sessions or use of the cloture to pass it, and, furthermore, that few people will probably ever hear of itagain.

The measure referred to, which became the law of the land last year, creates a new United States Standard gauge for measuring iron and steel sheets. This gauge, instead of remedying the evils pertaining to the so-called wire gauges which have for so long afflicted a much enduring mechanical and commercial public, only intensifies them by adding a new set of arbitrary measurements to the numerous others already in use, by making these measurements more inexpressible in terms of any known unit, and by giving them names more complicated than usual. In Fig. 1 is quoted the text of this piece of interesting engineering literature (let us hope it will prove nothing more practi-

cal) in its entire enormity.

The pity of it all, in regard to the eslishment of the above mentioned law, is, firstly, that we should exist in such a crude state of civilization as for it to be possible for an intelligent set of iron manufacturers, followed by a Congressional committee, and afterward by a majority of the members of both Houses of Congress, and finally by the President himself, to establish such a wild and rambling set of figures as an improvement over the chaos that before existed. Such a state of mind among our legislators betokens but ill for sundry further public action which many engineers hope for, such as reformation in the Patent Office, the establishment of various scientific standards, the testing of materials upon a really comprehensive scale, &c. The second point for which we should grieve is that the Government has been put to the expense of passing this bill, and more especially of making complete sets of the new gauges for the use of our customs officers. This I suppose has been done to meet the law's requirements, but I have no certain knowledge thereof.

Criticising the law itself, sa given in full in Fig. 1, the chief point that strikes one is its entire superflulty, its mission being merely to add another to the already too numerous gauges which are based upon no scientific principle and are but poorly adapted to our practical wants. One of the chief points about this remarkable latest "standard" is that it is almost everything it should not be and fails to be almost everything of may afterward occur.

that it should be, utterly ignoring many attributes that should be embodied In a good gauge, some of which are as follows:

- 1. The popularity and universality which are necessary to secure definite-ness of measurement in the commercial world.
- 2. Suggestiveness, preferably by making its unit of measurement in harmony with some other well-known unit, as, for instance, the English inch or convenient fractions thereof.

3. A logically progressive scale, with the smaller numbers for the smaller sizes, rather than a retrogressive one.

A merely casual inspection of the table, Fig. 1, will show a non-fulfill-ment of those conditions. Viewing the first column, it will be seen that, in common with many other of the foolish gauges in use, the scale is retrogressive, having the smaller numbers for the larger sizes, which is manifestly an absurdity, as far as the use of the gauge is concerned. The only excuse for this arrangement that I know of is that the numbers are given in the order of the operations of the wire drawer, who originally adopted the ingenious and really somewhat scientific idea of calling his rolled iron rod No. 0; his wire after

An Act Establishing a Standard Gauge for Sheet and Plate Iron and Steel.

Be it cuacted by the Scuale and House of Representatives of the United States of America in Congress assembled. That for the purpose of securing uniformity the following is established as the only standard gauge for sheet and plate from and steel in the United States of America, namely:

Number of gauge.	in frac	Approxi- mate thickness in decimal parts of an meh.	Approximate thickness in millimeters.	Weight per square foot in ounces avoirdu- pois.	Weight per square foot in pounds avoirdu- pois.	per square foot	Weight per square meter in kilo- grams,	Weight per square meter in pounds avoir- dupois.

And on and after July 1, 1893, the same and no other shall be used in determining duties and taxes levied by the United States of America on sheet and plate iron and steel. But this act shall not be construed to increase dulies upon any articles which may be im-

But this act half not be construed to increase duffer upon any articles which may be imported.

Sec. 2. That the Secretary of the Treasury is authorized and required to prepare snituble standards in accordance herewith.

Sec. 3. That in the practical use and application of the standard gauge hereby established a variation of 2½ per cent, either way may be allowed.

Approved, March 3, 1893.

4. Uniformity of names or numbers, as, for instance, from unity upward, rather than mixing in a number of elphers having no meaning in themselves.

5. A uniform or uniformly increasing increment in each successive size.

6. Adaptibility to the convenient measurement of any substance, rather than with a limitation to a particular metal or a particular form thereof.

7. Simple and decimal fractions, rather than complicated vulgar fractions, when translated into the inch or other wellknown units.

8. Capacity for additional sizes, either smaller or larger than the original ones or interpolated between the same, as requirements at first unthought

once being pulled through the drawing plate, No. 1; after twice, No. 2; after thrice, No. 3, &c. This was all very well from his point of view, until he commenced to use larger rods, when he was obliged to lose sight of the beau-tiful numbering of his operations, or rather to accept a false numbering, and to adopt a group of naughts for his starting point. Furthermore, as different kinds of wire and different kinds and qualities of metal were afterward introduced, different gradations in drawing plates were necessary, and thence probably arose some of the various other gauges which are shown in the tables on the following pages. This was a sort of a natural evo-lution, based as usual upon ignorance of the future, and one which perhaps led the poor wire drawer to think life hardly worth living, as the numerous gauges adopted from time to time gradually got mixed up, and when gauges of this sort were used for sheets and bars, as well as for round wire, &c. Just why the makers of the new law in question should have followed this old system, and, if they did, why they should have assembled groups of ciphers up to seven in number for their starting point, instead of beginning with unity, is a conundrum too profound to be solved by the merely engineering brains

column, we find the same pleasant varlety in the character of the decimal fractions, some of which run to only nine places of figures, and which, moreover, appear to have no definite symmetry or co-relation to each other. In the fourth column, when translated into millimeters, we still, as might be expected, see no apparent law governing the vagaries of figures, which again in some cases extend to the billionth splace. The distances expressed thereby are about one twenty-fifth of one billionth linear inch, and only go to show

The above values all in inches,

Fig. 2.

of this age and country. It is probable, however, that to the political brains at Washington the scale in question acems a very ingenious affair, and therefore scientific.

Looking at the second column, it will be seen that the sizes determined upon are approximate only when expressed in the beautiful vulgar fractions given, which, by the way, enjoy a series of different denominators, having the one good point of a capacity to be resolved into the convenient (?) common denominator of 2560. For the fact, however, that some of the sizes mentioned, as  $\frac{1}{1250}$ ,  $\frac{1}{2150}$ , &c., do not consist of more than four figures in the denominator, a long suffering public should be profoundly thankful. Inspecting the third

how accurate our Government measurements are becoming. We will merely imagine the future international complications that may arise from some dispute between a French importer and an American customs officer seeking a strict construction of the law, when they attempt to measure some sea rusted piece of sheet iron and cannot agree by a few parts of a billionth, on account of one patriotically preferring the fourth column and the other the third.

In the fifth column a little daylight begins to appear, for here the figures representing the weight per square foot, in avoirdupois ounces, appear to run in certain series of round numbers in the upper part of the column, fading away

into merely whose numbers in the middle part and branching out into fractional ones toward the end. The first eight of the-e siz's actually run in a diminishing series with a uniform decrement of 20 ounces. This figure suddenly changes to 10 for a time and then to 5, 4, 2, 1, 4 and 4 respectively. It will be noticed that these decrements are not in uniform groups of any sort, nor have they a uniform difference. As far as can be seen the whole arrangement of the new standard purports to be especially adapted to the convenience of the sellers of iron, which is concentrated in these groups of round numbers of ounces. As, however, sheet iron is not sold by the ounce, but usually by the pound or ton, it is difficult to see wherein this convenience consists, especially when we look at the sixth column and see that the number of pounds per square foot represented by the different gauge sizes nearly all run in fractions, which in some cases are expressed by six places of decimals!

An examination of the seventh, eighth and ninth columns will still show nothing but a dreary array of decimals, having no apparent systematic relation to each other, which obviously is only natural in translating any gauge founded upon pounds and alleged inches into French metrical measurements.

It is, of course, possible that the supe rior wisdom of the inventors of this new gauge may be exemplified by its users finding practical benefit in the ounces per souare foot feature above referred to, al. though the writer in his ignorance must confess to searching for it in vain. Even were this true, however, it must be remembered that such convenience would apply simply to black sheet iron, and that it would fail somewhat (at any rate to the extent of a few of the millionths of pounds expressed in the sixth column) when applied to sheet steel, whose spe cific gravity is slightly different. Still more would it fail as a practical working device if applied to galvanized iron or tin-plate, either of whose weights is quite perceptibly varied by the coating thereon.

When applied to copper, brass, zinc, nickel, silver, &c., these being ordinary commercial metals for which a gauge is frequently required, this weight per foot system utterly falls to the ground; and still further does a gauge of this kind prove itself entirely without sys-tem when applied to wire, not only when made of the other various metala in the market, but of iron itself. A careful study of this interesting law of the land caused the writer's wrath to wax hotter and hotter as the studying further progressed, until he had made notes for what he hoped would be a powerful philippic against its utter atrocity, not only from a strictly engineering point of view, but from the standpoint of ordinary business and common sense. Words, however, failed him and he was consoled only by the comforting fact that the text of the law, as given, with its accompanying table, would itself speak louder to the eye of the reader than would further mere words of criticism.

The table, Fig. 2, gives the dimensions in thousandtha of an inch of 13 different American gauges, whose nominal size or number is shown in column A. In Fig. 3 will be found a table giving in like manner the dimensions of 12 different foreign gauges, with the numbers in its column A. These numbers are not continued beyond 50, although in a few cases the gauges themselves extend to a distance which might too far trespass.

upon the editor's patience. From the same feeling of consideration for the editor I have not, in giving the inch values, carried out the decimals beyond three places of figures, although some of the gauge numbers run to millionths and even billionths of inches. In cases where these transcendental figures have been dropped a plus sign has been inserted, the third figure remaining normal, although the quantity would really have been better expressed in some cases (where followed by a figure larger than five) had such third figure been increased by one. For the practical purpose, bowever, of comparing the degrees of foolishness embodied, the three figures in question will doubtless be sufficiently accurate. The values given in the tables have been carefully compiled from a variety of sources, including both Enlish and American engineering handbooke, catalogues of gauge, screw, wire and sheet makers, &c. Since preparing this article I have seen the description of a chart gotten up by Dr. S. S. Wheeler, in which he has plotted a graphical comparison of all the principal gauges. I have not yet been fortunate enough to see a copy but, knowing the author, have no doubt that it is a valnable addition to the literature of this aubject.

An inspection of column A will show the absurdity (for any new gauge at any rate) of using groups of ciphers in advance of unity. The first group given can easily be remembered by thinking of Wordsworth's We-are-seven, Conway-dwelling, cottage-girl, and has the advantage of requiring counting to identify it—thus preventing undue haste. In practical use it is probably column B we see again our glorious national standard, as referred to upon a previous page. In column C we have the real "American gauge." so called pronounced number seven naught. In the real "American gauge," so called, which is largely used for measuring sheet brass and sometimes for brass The best thing that can be said of it is that it is the least bad of the whole lot, being scientifically designed so that its measurements will plot a parabolic curve with a uniform reduction of 11 per cent. between each con-secutive size. It is thus better proportioned to meet the generality of sizes required than are the other ones, but it has many of the faults common to them as, e. g., being retrogressive, starting with four naughts, being expressed in odd thousandths, and even millionths, of the English inch, &c. The notch gauge in actual use for messuring these values is a beautiful tool—as might be expected of a product of the eminent engineering firm who designed it and whose name it bears.
In columns D, E, F and G we have

In columna D, E, F and G we have other srbitrary standards, the first three of which seem to bear a close relation to each other. Possibly they may have, long ago, been evolved from some common source by the interesting copying process of measuring old worn out gauge notehes to make new ones by. The music wire gauge shows a decided change of tune, being the first with progressive numbers yet brought to our notice, though apparently being just as unsystematic as all the rest.

In column II we have another progressive gauge whose figures, regarding Tolog inch as a unit, are the respective square roots of 1000 times the gauge number in column A. This probably may be convenient to electricians, some of whom compare all cross sections of their wires by a special unit, the "mil," which is a denomination of a sort of a special "circular square measure," so

to speak. The particular gauge numbers selected, however, do not appear to run up with a uniformly increasing increment, as is shown by the series 3, 5, 8, 12, 15. &c. This gauge, as will be seen in the lower half of the column, advances by fives to 50 and goes beyond in the same way to 100; thence to 200 the advance is by tens, and after that by twenties up to 360.

In column I we have another progressive gauge which appears to be a

and Z .413 inch. The increments between are neither uniform nor uniformly increasing, but run in a sort of a wild-cat series somewhat thus: 4, 4, 4, 4, 7, 4, 5, 9, 5, 14, 7, 11, 7, &c., with various other numbers interpolated.

In column L we have a progressive gauge for measuring American acrews which seems to be founded upon nothing and to start nowhere, except that its increments are approximately .013 each. In column M we have a retro-

The above values all in inches.

Fig. 3.

little more systematic than some of the others, as the sizes are expressed in whole thousandths, and run with a not wholly crazy series of increments, though why near the end of the table the measurements should jump suddenly from ½ inch to 1 inch between two consecutive numbers, and this for measuring sheets as thin as zinc is usually made, is not quite comprehensible. Neither is it apparent why it starts where it does, or for that matter, why it goes on, or stops, or is.

In columns J and K we have two more arbitrary and retrogressive gauges with no special features of interest. They both continue onward in the same style to No. 60. The drill-rod gauge is thereafter continued further, as a sort of supplement, in a progressive form, with letters for names instead of numbers, A representing .234 inch

gressive gauge used by some of the large sheet iron manufacturers, but, like most of the others, the question why it did not die before it was born will remain one of the conundrums of the ages. Its comparatively slight difference from the Birmingham gauge in common use must make it extremely inconvenient in practice. The next gauge, in column N, is a progressive one, and is, as far as I know, the only one used by glass manufacturers. Its numbers, like several of the others, are not consecutive and certainly seem to skip around in a rather lively fashion. They appear to be without any particular definiteness, either in position or in relative measurements. In column O in the next table (Fig. 3) we have a retrogressive gauge which is, I believe, the only legally standardized one in England, it having been adopted by the

Board of Trade some years ago. seems to be founded upon the older gauges somewhat evened up, so to speak, but has, as far as I know, no special re-lation to anything else in heaven or on earth.

Column P represents the well-known Birmingham, or B. W. G., or Stubs, gauge, which is almost always referred to (by some or any or all of these names), in this country at least, when wire and iron and steel sheets are designated by number, although brass wire is sometimes, as before stated, measured by the Brown & Sharpe gauge. The gauge in question is often referred to in this country as "English standard," these words sometimes being stamped upon the gauges themselves, even in the factories of the best makers. This is evidently a misnomer, in view of the fact that England seems to have a dozen or so standards, one of them (not this one) being legalized, as before mentioned.

In columns Q, R, S, T, U, V and W we have another pestilent brood of gauges starting and ending nowhere in particular, all different, all retrogressive and all belonging apparently to the class of literature the reading of which might have made Carlyle so cynical. It will be noticed that no less than three of the gauges in this table enjoy the adjective "Birmingham," and the names of the others are rather uncertain some being derived from places and some from people. In gauge nomenclature it may be observed that, besides having one name for several different thirgs, the same thing has several names, as shown by more than one of the instances given. The Lancashire gauge, shown in column S, goes on beyond the figures tabulated to No. 80, which is .013 inch in size. It then has a supplementary progressive series named by letters from A to Z, the same as does the gauge already described in column K. After that, however, it indulges in a certain vagary by starting with No. A1, whose value is .420 inch, and onward alphabetically to No. H1, with a value of .494 inch.

In column X may be seen the first glimmer of common sense yet appearing as recorded by history in the industry of gauge inventing. Previously, everything had been allowed to grow up of itself in the most haphazard manner, but here we see the work of the practical mind of Sir Joseph Whitworth, who, as soon as he tackled the subject, hit upon the obvious and only sensible way, in a country using the English inch, of designating the small sizes in question. This was, of course, to express them in inches, like other measurements used in mechanical work, which he did while retaining the old word "number" as a prefix - probably with a view of catering to the prejudices of a gauge using people. This gauge in its complete form extends onward beyond the table to No. 100, increasing by fives; thence to 120 by tens; thence to 180 by fifteeus; thence to 300 by twenties; and thence to 500 by twenty-fives. This progression, it will be noticed, is not quite uniform in character, nor is the progression in the lower part of column X, where the increment of two suddenly changes to five beyond No. 40. This, however, may be forgiven, as a gauge of the kind in question is not limited to any particular numbers, it being perfectly logical to insert or omit, as may happen to be required for the particular work in hand. The system always remains the same, the sum expressed by the number agreeing with the quantity of thousandths of inches invoived. Just how much this gauge is used in England I do not know, but it is difficult to see why It has not, from its inherent merits. become popular both there and here.

In columns Y and Z we have two French gauges, both of which are progressive, but which have the usual non-relation to each other, or to any other principle, person or thing. It is but fair to state, however, that when expressed in millimeters (which are not given in this table, in the interests of unifor-mity) they do not have so much of the ragged-edge effect as appears in the The progression, though, is not very uniform, and the actual sizes are in two places of decimals—that is, in hundredths of a millimeter No. 0 being, in the Jauge de Limoges, .39 mm.; No. 5, .90 mm., &c.

In addition to the 25 gauges given in the tables there are a few odd ones, not so much used, which need not be given in detail. One of these is the French socalled millimeter gauge for iron rods, &c., which starts at No. P, equaling 5 mm.; followed by No. 1, 6 mm.; No. 2, 7 mm.; and thence onward, numerically, to No. 30, equaling 100 mm. The increments, however, are not uniform, being represented by 1 mm. up to No. 16, and then increasing by steps of various sizes. Another gauge, also French, is used for zinc sheets, and is almost like the zinc gauge given in column I, varying, however, in some of

its higher numbers.

Still another gauge is the German millimeter, so called. This is founded upon the same correct idea as is the Whitworth, No. 1 representing one mm, No. 2 two mm, No. 3 three mm, &c. Practically, however, its sizes would ohviously be too large and too far apart for ordinary thin sheet metals or wire. Besides those above cited there are a German, a French and an English screw gauge, and a German rivet gauge, about which I have obtained no information. Among the curiosities of gauge literature may be cited a hoop-iron gauge, about which I have read somewhere but have mislaid the specification. It, as I remember, playfully runs its numbers in reverse order part way through the scale, each having a small circle (like a degree mark) printed after it. It then duplicates these numbers ie natural order without the mark. Just what the sizes are I do not recollect, but practically hoop iron is, I believe, nowadays sold by the B. W. G. Another curiosity in the gauging business is to have no gauge at all, as is the case in measuring tin-plate, whose thickness is commercially known by such names as Taggers when anywhere from .004 inch to .008 inch; as IC from .008 inch to .014 inch; as IX from .013 inch to .017 inch; as IXX from .015 inch to .017 inch; as IXX from .015 inch to .019 inch, &c. It will be noticed that these numbers lap each other in most cases, so that the same sheet might be called by either of two of the names given. There is, however, no attempt to measure this thickness, either by makers or users, it being guessed at by weighing a box of plates and knowing the number of sheets therein, these usually varying individually to a considerable degree in any one box. sorting, which is generally necessary, is done by shaking each sheet flatwise and judging of the thickness by the stiffness and weight.

A supplementary set of sizes, lying between any of the gauge numbers of any of the 25 gauges mentioned, are in practical use, and are known by the following names. No. so and so easy, or bare, or acant, or loose, or light.

Also No. so and so full, or tight, or

heavy. Still another set of sizes are represented by these same adjectives with the word "rather" as a prefix; and still another set by the use of fractions. No. 151, &c., the 1 serving as a suffix to, and in some way modifying, a regufar gauge number. Furthermore, the people who use the above adjectives, with or without their qualifying adverb, and who use the fraction spoken of, do not generally make it very clear as to whether the scantness, or fullness, or increase expressed by the fraction, refers to the actual size of the gauge notch in question or to the numbers designated. Such indefiniteness in the case of retrogressive gauges may of course reverse the meaning intended. and therefore the occupation of receiving and filling orders for sheet metal, rods, nails, rivets and wire becomes a somewhat puzzling one to say the least. A customer merely states that it is to be No. so and so, qualified occasionally perhaps by the adjectives, &c., just mentioned, but says nothing about what gauge is meant, and how the adjectives and fractions are intended to be applied, nor whether he is depending upon duplicating material which has been measured by some old gauge with worn out notches. This is no fancy picture, but merely a portrayal of some of the misery daily occurring in commercial life.

A thorough discussion of some possibly successful and popular remedy for the evils indicated in this article, and a remedy, moreover, that should be international rather than merely American, might well require a volume to itself. In the limited space herein at command, therefore, I will only say that the subject is constantly attracting more and more interest among engineers and other scientific men, with a probable result of some definite standard methods of dealing with the measurements in question being settled upon in the not too far off future. Were it an Anglo American question only there would be but little difficulty in popularizing the Whitworth gauge, this being, I think, the only logical system where the English inch is the unit of measurement for larger sizes. Such gauges would be made not only for all varieties of sheet metals, wire, rods and bars; but for paper, cloth, leather, glass, &c., one system answering perfectly for all. The apparent unnecessary magnitude of a gauge comprising every 10 to lnch, say, from 1 to 1000, can be easily overcome by preparing notched gauges for particular trades and industries, contalning only such sizes as are in com-mon use therein. Each industry or group of industries needing about the same range could thus have as small and simple a gauge as possible, with all superfluous numbers omitted; and any gauge would absolutely agree with any other, whenever they happened to have

any numbers in common.

The real difficulty in this matter, however, fooms up when we attempt to contrive an international guage, which will be equally welcome to the peoples of the earth using the English inch and the French meter. It has been suggested that a gauge founded upon a hundredth of a millemeter as a unit, each number to express the quantity of these units embodied, would answer perfectly well for the whole world's use, and this view is advocated by a number of scientists in this country as well as abroad. Such a scheme has the disadvantage for England, America and Australia of not being easily translated into and compared with our standard measurements. It has, however, the advantage of having a unit of about 25 or inch, which for very small sizes is better than the 1000 inch unit of the Whitworth gauge. Whichever of these two most feasible schemes may be adopted, the commercial and engineering world will certainly be happier and better therefor. One strong point in favor of the general principle herein advocated is that any of the notched gauges (which form seems to be popularly demanded) founded thereupon can be easily ealibrated and kept in order by the ordinary micrometers such as are now in use in all machine shops, measuring by thousands up to 1 inch, or similar ones arranged for the metric system.

This very important subject is now being looked into by a committee of the American Society of Mechanical Engineers, which will probably co operate with committees from the other great national engineering societies. Interesting discussions have for some years past taken place in the various society conven-

right angles as seen in the cut, by which, the manufacturers claim, one turn is equal to three or four of the ordinary crank acrew as regards speed. The gauge ou the lower arm is solid and milled out, and runs on a milled bar constructed at a proper augle so that when the set screw is tightened the gauge comes to a right angle.

## Address to New York Trade School Students.

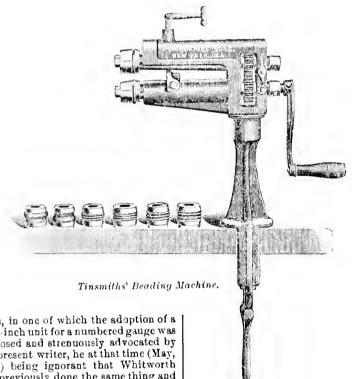

The New York Trade School was visited and inspected on Wednesday evening, November 21, by President R. Fulton Cutting of the Board of Trustees, who was accorded a warm reception by the students. Owing to unavoidable absence from the city, Mr. Cutting had been unable to visit the school earlier in the course. On being introduced by Superintendent H. V. Brill, he took the opportunity to address to the young

sable supplements to the skill science acquired at the school, Mr. Cutting continued: "Sometime ago 1 was talking with a man, a member of a large heating firm of this city. man came right up from the ranks him-He said he never would bid low for the sake of getting a job, but would ask a price at which he could afford to do the best possible work. He never felt quite satisfied with any piece of work unless, after it was done, it was a little bit better than the last one. Such a man cannot help but succeed, if industrious, faithful and honest. You will succeed if you have this sustaining quality and honesty. I bope, young men, you will stop and think a bit tol bope, young night on one point and that is, whether you are going to endeavor to put into your trade your highest skill. The kind of young fellows we want to send out are those who have got the spirit of true men in them and the determination to make their trade an honorable calling to which they can always point with satisfaction. We want our graduates to be not simply tradesmen but also tradesmen.

Owing to some mistake, on Friday of last week, the natural gas at Shelbyville, Ind., was given high pressure in the low pressure mains. At midnight it was discovered that more than 500 stoves and heaters in all parts of the town were melting under the intense heat and many buildings were igniting. The bells were rung and whistles sounded, arousing all the citizens who found themselves in the midst of a general fire. Happily, by the adoption of prompt fire extinguishing measures and by arresting the flow of natural gas, the fire was limited to the destruction of three dwelling houses.

Richard H. Edmonds of Baltimore, writing to the London Times on the progress of the Southern States in the past ten years, gives some striking illustrations. Fifteen years ago, he points out, the cotton seed was a waste product; now nearly 300 cotton seed oil mills are in operation, representing a capital of \$40 000,000. In 1880 the South mined 6,000,000 tons of coal, in 1893 the output was 28,000,000 tons. Ten years ago the agricultural, manufactured and mine products of the South were valued at about \$1,200,000,000 as year. They are now nearly \$2,000,000,000 and are annually increasing. The railroad mileage has been more than doubled and the traffic quadrupled. The iron and coal industries and the cotton mills have added nearly \$2,000,000,000,000 to the assessed value of Southern property, while its banking capital has more than doubled.

The United States consul general at Frankfurt reports to the State Department that American securities are now held in such distrust at that money center that not only are new invest-ments of all kinds uniformly refused because of their American origin, but large quantities of railway bonds and stocks which have been held there for years past have been recently returned and their proceeds invested in Prussian consols and other domestic securities. Mr. Mason believes that the existing American system of receiverships for bankrupt railroads, whereby the president or a director of the defaulting company is given the office of receiver, has done more than anything else to shake European confidence in American railroad securities.

tions, in one of which the adoption of a 1000 inch unit for a numbered gauge was proposed and strenuously advocated by the present writer, he at that time (May, 1889) being ignorant that Whitworth had previously done the same thing and also had put it in practical shape. Nobody appears to have ever seriously opposed this scheme, but there seems yet to be the inertia of a heavy mass of conservatism and indifference to overcome. Active forces have, however, been set in motion and it is earnestly to be hoped that before the twentieth century shall have dawned the civilized world will have forgotten its past incomprehensible foolishness in regard to the measuring of its smaller dimensions, and that some gauging system as simple and definite as it is universal will have been adopted as merely the embodiment of common sense applied to common things.

### Improved Beading Machine.

Jacob Brombacher's Sons, 30 Cliff street, New York, have put a new beader on the market, as here illustrated. The frame is cast in one piece instead of being in two parts, thus in creasing the strength of the machine. Further, the adjustment of the upper shaft is accomplished by means of a crank acrew in connection with a lever, which may be operated vertically or at

men some warm words of welcome, mingled with good advice and encouragement. Observing that he hoped they would follow in the steps of their predecessors in the school and make a record that would be creditable alike to themselves and the institution, he spoke in substance as follows: "You come here with both brains and hands, and these if rightly used will make you important factors in your country's progress. He who learns a trade puts a gap between himself and unskilled labor, for a man who has only his muscle to offer and does not know how to do anything requiring skill can only make, at best, an uncertain living. The fact is when you have commenced to learn a trade you have laid a foundation for the building of a successful and useful future. By directing your energies to the mastery of your trade you can make yourself a good workmanand first-class mechanics are always in demand—and in addition you have the opportunity, in the future, of enterlng the ranks of employers."

Inculcating the value and necessity of industry and application as indispen-

# STOVE TRADE NOTES.

Western Freight Rates on Stoves.

The Western stove manufacturers are working diligently to change the new railroad classification of stoves. They realize that it is a difficult task, almost as difficult as to induce Congress to repeal a law just after it has been enacted, but they hope to accomplish it by dint of perseverance. Over 40 milroad companies compose the association governed by the rules established by the Western Classification Committee, and amsjority of these companies must be favorably influenced by the manufacturers in order to secure the desired action. officials are being seen on the subject as rapidly as possible, but the co-operation of stove manufacturers generally is strongly needed in order to make the deepest impression as well as secure early action. Next week a meeting of manufacturers will be held at Chicago at which this subject will be considered and concerted action will be taken.

Stove manufacturers claim that stoves are among the most profitable freight carried by the railroads at their old rates. They are always crated, are neither exceptionally heavy nor bulky, but are easily handled by warehousemen, are largely moved in full carloads. and freight rates have always been fixed on a remunerative basis to the railroads. Further, the trade is a large and important one, affording a heavy tonnage to railroads, not only on the finished stoves, but also or the materials assembled for their manufacture. The prices of stoves have not been advanced to consumers, while manufecturers' costs have been increased by the demand latterly falling so much below the capacity of their foundries. Therefore, the proposition to increase the railroad profit in handling this class of freight by advancing the classification is received with a feeling of indlgnation. It is not regarded as fair treatment of a great business giving vast amounts of freight to railroad lines, nor considerate treatment of the masses of consumers, who cannot afford to pay more for stoves with their incomes curtailed as they have been for the past

The stove manufacturers of Illinois are particularly handicapped at this time by the railroad companies. A maximum freight rate was established for that State some ten years since by the State Warehouse and Railroad Commission which has never been changed. It was regarded as reasonably low then, but it is now high as compared with

rates ruling in other States. The Illinois railroads adopted the commission's rate and have it still in force. The consequence is that shipments originating outside the State are hauled to their destination in the State at lower rates per mile than the same roads charge on shipments from points in Illinols. The manufacturers of that State consequently find themselves as completely debarred from transacting business in some portions of their own commonwealth as if an imperial decree had been issued to that effect. The regulation of the railroads is provided for by law; but it is spasmodic and not continuous. State commissions should revise such maximum rates from time to time, making them conform to changing trade conditions, and they would then avoid the periodical upheav als of sentiment hostile to railroads which result in acvere measures ruinous to railroad investors. This is a time for prudent counsels in the boards of railroad managers, and their revisions of rates and classifications should be downword rather than upward, if they feel that some change must be made.

# Chat About New York Stove Business and the Bowery.

It was predicted years ago that the stove business would fill up Beekman atreet, but that thoroughfare is not much sought after at present. The J. L. Mott Iron Works and Abendroth have an extensive plumbing business and in the case of the former house aside from furnaces and ranges they don't trouble stoves. The Union Stove Works still atick to the "light" and are well equipped for the local trade.

The change in the retail dealers throughout the city has probably been more pronounced. The foreign element is rapidly monopolizing it. After the Americans came the Irich, in old times, but both are now superseded by Potca, Russians, Italians, Germans, &c.

The foreign population on the east side of the city is immense and they have to provide their own atoves; consequently, atove stores are quite numerous in that section. But the stoves are somewhat mixed with the household arrangements in many of the stores. A real first-class stove store is a rarity. Babics, Frankfurters, wire, bread, coffee pots are mixed up indiscriminately. But they are all happy; they enjoy themselves their way. Balla, parties, weddings, excursions are constantly occurring. Benefit societies, lodges, &c., are plentiful, and getting "on the lodge" is quite common among some of them.

The Bowery used to be an excellent business street, both for stoves and other goods, but not only has the stove business gone from there, but even the "business" so celebrated in the song of the streets of New York, east side, west side, were the daily scenes of snatches of these plays as the boys amused themselves. What do they see

"The Bowery," and, in fact, almost everything that has kept the street before the public so promiuently has disappeared or nearly so. Really, the Bowery is more respectable to-day and is freer from saloons than the majority of H. W. Monatrects of its magnitude. II. W. Mon-sus and M. Marks are the only stove atores on the whole street. The former is a son of the original Monsus, and the store has been there since way back hetween 1830 and 1840. Marks is near Grand street, and bought out Sellin many years ago. Sellin used to be a circus rider before he went into the stove business. Abendroths also kept on the same block many years ago. A big fur-niture trade was done there, but that has almost entirely gone from the street. and even the gin mills are scarce. doubt if any street of its importance has so few of them on it.

Nothing could be completely said about the Bowery without mentioning the old theater. It would make all the deceased Old Bowery Theater habitués, whether they frequented the pit or "nigger heaven" or strutted its famous boards, turn in their graves to see the audlences there now, without saying anything about the lots of other "jours" who used to be around New York and are scattered from Maine to California, and wherever you find them it is pretty certain they will entertain the new gen-eration with Old Bowery reminiscences whenever New York comes up. Such a crowd of foreigners fills it nightly, and "Nigger in the pit," "Hey Reilly," "Boots," "Histe that rsg," if shouted there now would mean nothing to the Smyrkoskels and Showlokies who fill the old seats. It would knock an Old Bowery boy silly to hear kofs-kies up where nigger heaven was exclaim when he saw Stofkie down in a quarter seat. But these people enjoy a performance and are wrapped up in it and are polite. The plays are worth witnessing for the acting, dreases, &c., though you do not understand the language and I have no doubt they are of guage, and I have no doubt they are of

a higher grade than many of our pretentious American play houses.

No greater contrast can be made on the theatrical taste of the Old Bowery day than to compare the style of amusement furnished now, especially tta effects upon the younger gen-The older régime gave Shakeeration. speare abundantly, without counting "Metamora," "Putnam" and other playa of that kindred. Minatrelsy and serenaders abounded, but they were darkeys pure and simple. You didn't find pure and simple. Thompson street mokes and plantation niggera doing acrobatic performances. They were what they represented themselves to be-essences of Old Virgiuny and city coons, as they were. The younger portion of New York was filled with the humor of these performances, and a one-ring circus that they could see each act and enjoy it; and instead of the stuff spread out now, "Mac-beth," "Damon and Pythias," "Ham-let," and other kindred plays were familiarized. The streets of New York, east side, west side. were the daily scenes now? Whole families are treated to the refuse of the Bowery variety pattern that has become tiresome to that crowd over there, as the performers as a rule have done them to death. Now they import the whole thing to the continuous performance shows, and the amount of rot dished out is disgusting. Yet the people howl at the old Bowery chestnuts that were freze years ago. But when performers and hirers of them are sunk so low that they have to get off stories of what "Pete in Heaven" said and done to them, they ought to be driven out of the business. gusting saloon jokes and knocksbouts are fine things for children to see and hear. There are some original perform ers acattered among these shows, and no doubt they could be made very entertaining, but not with the saloon rot stories and their attendant matter. If this be true then the Bowery is degenerated and they do not "do such things and say such things," as the samous song has it.

# The Leibrandt & McDowell Stove Company

of Philadelphia, Pa., favor us with a copy of their stove catalogue for 1895-96. It is a voluminous publication, consisting of 170 pages, measuring 9 x 111 inches, and bound in heavy paper covers. The central feature of the side title is a fac simile of the company's trade-mark, with lettering above and below, all printed in old gold upon a black ground. The cuts of stoves are of a good size, clearly showing the external features. The opening pages are devoted to terms, remarks to dealers and an illustrated description of some of the improvements incorporated in the company's goods. Under the head-ing of "Portable Ranges" attention is invited to the Victor, a five hole con-struction made with right or left hand oven and ornsmented in an artistic man ner; the Target, a massive six-hole stove, made in four sizes and the usual modifications; the Arcadian, offered in two sizes and adapted for either hard coal, soft coal or wood; the Jolly, a new construction, together with the Prompt, Reliance, Duval and Daisy. The following ten pages are given up to portable ranges with boller attach-ments, after which we find a number of pages devoted to semi-portable and brick ranges. The cook stoves are represented by the New Ironsides, a recent addition to the company's ss sortment, adapted for hard or soft coal or wood; the Farmer Girl, Our Friend, the Farmer Boy, the Prize and Rival. The heaters occupy something like 60 pages and cover a varied assortment, ranging from the rich and artistic parlor heater to the cheap laundry stove. Cellar furnaces constitute a chapter in which the llome, Victor, Solar and Victor Solar are illustrated. There are also shown the Combination Home heater, Victor portable heater, the Vesta, the Oval and the Ironsides. The closing chapter is given up to open grates and fire place heaters, of which an interesting assortment is presented. The catalogue is arranged with care and contains a general and alphabetically arranged index to facilitate reference.

RECENT ADVICES from the Northwest are to the effect that the Grand Rapids Vapor Stove Company of Grand Rapids, Mich., have secured through purchase the old felt boot factory next to the Bissell factory on Mill street. We understand that the consideration was \$20,000.

### James B. Taylor.

A familiar figure in the stove trade in New York City has been removed in the person of James B. Taylor, a confidentisl employee of the Richardson & Boynton Company, who died at his home in Brooklyn, on Monday morning, November 26, from hemorrhage of the stomach, at the age of 58 years. Mr. Taylor was brought up in the iron trade and up to 25 years ago was engaged in business in this city as an iron and metal broker. He then entered the employ of the Richardson & Boynton Company, 232 and 234 Water street, of which firm he was for a long period one of the most trusted employees. His knowledge of the trade was remarkably extensive, and his executive ability and sound judgment in business matters were extremely valuable to the firm, to whom his loss is a matter of deep regret. Mr. Taylor possessed the respect of a large circle of friends who honored him for his integrity and many encellent qualities. His health had for some time been in a very unsatisfactory condition, largely the result of overwork, producing nervous pros-tration and insomnia. He took three tration and insomnia. He took three trips to Europe by the advice of his physician within the last four years, returning from a prolonged tour on the Continent only a few months ago with his health apparently restored. A recurrence of his old trouble last month again sapped his strength, and eventually induced the attack which caused his death. The funeral services, which were held at his home, 12 Clinton place, Brooklyn, on Wednesday last, were attended by a large number of friends in the trade.

### ODD PLATES.

KRUSE & DEWENTER, Indianapolis, Ind., have been very busy in supplying the trade with their line of hot air furnaces this fall.

The Conover Fire Place Mfo. Company, with a capital of \$50 000, were chartered at Albany, N. Y., on November 24, to manufacture fire places, gratea, fenders, mantels, &c., in New York City. The directors are Alonzo E. Conover, Wm. E Conover, A. Edward Conover, Jr., Charles J. Coutter and Alex. R. Gulick of New York City.

A VERY BENEFICENT WORK is being carried on in Cleveland, Ohlo, in connection with the Bethel Associated Charitles of that city—namely, the gratuitous supplying of old cook and heating stoves to the very poor and On the first cold snap which needy. On the first cold snap which struck the district lately, the applications for this kind of relief became very numerous, and the superintendent of the Bethel Charitles was obliged to is sue a special appeal to the citizens for donations of old stoves for this purpose, which he stated would be highly appreclated. This is practical charity of a sort that might well be imitated in other large cities and which could not fail to meet with good support.

THE ST LOUIS GAS RADIATOR COM-PARY have been granted incorporation papers, at Springfield, Ill. The capital stock is \$100,000. Incorporators: J. W. Cowperthwait, Edgar W. Mc-Donald, R. L. Little, Clarence E. Blake and Wm. D. Tompkins.

THE MICHIGAN STOVE COMPANY of Detroit, Mich., are the assignees of a patent granted on November 15 to William J. Keep, covering the damper

of a stove or small auxillary door through which the air necessary for combustion is admitted to the fire. The opening covered by the small door or damper is so located that it may be utilized not only for the admission of air and the regulation of the draft, but also for the admission of a poker or shaker. The damper is operated by means of a cam, and may be locked open or closed.

THE CLEVELAND CO-OPERATIVE STOVE COMPANY, Cleveland, Ohio, are inviting bids for the reconstruction of the foundry building recently damaged by fire.

THE LANSING CO-OPERATIVE STOVE, FURNACE & FUEL COMPANY have recently been incorporated at Larsing, Mich., with a capital stock of \$5000. The incorporators include William May, Nelson A. Madden and William Ferris.

REPORTS from Troy were to the effect that Burdett, Smith & Co. of North Troy, N. Y., would close their works on Thanksgiving Day for the usual inventory and repairs.

THE MIDDLEBY OVEN MFG. COMPANY have recently been incorporated at Chicago, Ill., with a capital stock of \$25,000 for the manufacture of Baker's ovens, stoves, lamps &c. The incorporators are John I. Marshall, Howard L Smith and Arthur W. Underwood.

THE UNITED STATES FUEL COMPANY, Limited, of 19 Park place, New York City, and factory at Binghamton; N.Y., made an assignment last week to Henry Worms. The company were organized in 1891 under the laws of the State of West Virginia with a capital stock of \$125,000. They manufactured a prepared fuel known as Sestalit, as well as stoves designed for its use. The failure is attributed to general depression in business.

GEORGE W. McFadden, manager of the Auburn Stove Foundry Company, Auburn, Maine, has been making a short tour in the interests of his company, and in a recent interview stated that the stove and furnace business has been very good the past season. The company have built up an especially large trade in Norway, Maine, which was one of the places visited by Mr. McFadden.

THE LATEST REMINDER from the Gobeille Pattern Company, Cleveland, Ohio, is sent to the trade under date of November 20, asking that they be permitted to make sketches and give prices on patterns for next season, adding that it will cost nothing and the trade will thus have an opportunity of seeing the work of the best designers, artists and mechanical experts. This is the matter of the announcement, but it would not do to pass it by without reference to the manner in which it is made, as all the circulars of the Gobeille Pattern Company are distinguished by some feature of attractiveness. This last circular is printed in brown ink on a small sheet of parchment attached to a card backing with a silk cord.

CHARLES S. MULLICA, who has conducted the iron foundry business in Salem, N. J., for more than 48 years, has opened a new place just over the Covered Bridge. The building is 40 x 50 feet and is thoroughly equipped with machinery, flasks and other appliances necessary for the casting of all parts of machinery, stove fittings, &c. There are in the building two furnaces, one with a capacity for melting 2 tons of iron, the other 5 tons of iron.

FOLLOWING OUT the custom pursued by them for several years, the Barstow Stove Company of Providence, R. I., distributed to their friends in the trade just before Thanksgiving a unique card, designed by Livermore & Knight Company of the city named. On the address side of the card, in the upper right hand corner, is the picture of a wishbone of a Thanksgiving fowl tied with ribbon. On the other side is pasted a small paper bag tied with a string, and so placed as to show above it the feet and claws of a turkey, the whole being managed in such a manner as to create the impression that the legs are sticking out of the mouth of the bag. Close beside this is the inscription, "Don't miss the stuffing." Opening Opening the bag we find a Thanksgiving greeting in the way of an illustrated circular calling attention to the goods and speciaities of the company. The wish is expressed that the day may be bright, the turkey done to a turn and that the recipient may have much to be thankful for. Then follows the warning not to forget the stuiling and that to our commercial success we all owe many of the good things of life. The company state that they feel they have occasion to be thankful in this generally dull year of business for the fine trade they have experienced in their Bay State ranges, furnacea and parlor stoves.

THE TWIN BURNER VAPOR STOVE COMPANY are sending out their catalogue showing the line of stoves made by them for the coming sesson. trations are given of the Twin Burner process cabinet with two top burners and step attachment, and also without the step attachment. Following these are three and two burner Twin Burner process stove, with and without low step. Complete lines of high junior stoves with and without step attachment and cheap junior stoves are also given. The catalogues conclude with instructions how to operate gasoline atoves and a list of stove furniture, gasoline torches,

THE Cotton Beit and Iron Mountain Excursion to points in Texas last week was attended by a large number of representative business men from St. Louis. L D Vogel, assistant secretary of the Excelsior Mfg. Company, was among the number and gives The Metal Worker the following account of his observations. "A week's respite from work makes a great difference in a man who generally has his time pretty well occupied, and my trip with the merchants and manufacturers of St. Louis to Texas and Arkansas points has refreshed me. hustlers' that I had the honor of accompanying from St. Louis and those I met in Texas and Arkansas have in used new life into me and made me absolutely eager for work. Honeat Indian, I'm not joking, for it is impossible to be in auch company without getting your appetite for business sharpened. manner in which we were treated by the people of the two States was simply beyond criticism. Nothing was too good or too much for us; and if you think that those good people do not know how to entertain, you miss it. We were gone a week and had everything to our heart's content except sleep. What particularly impressed me from a business view was the high char acter and intelligence of the stove and hardware dealers and the admirable establishments they conduct. I took pride in the very large representation of the Charter Oak in all pieces we visited and was glad to learn that dealers read and appreciate 'trade papers,' yours

among them. In fact the trip from the moment we left St. Louis to our return was perfection in management and de-

### The Open Fire Place, Past and Present.-III.

### The Teate Principle,

Mr. Teale recommends that the gridiron should be made with narrow slits. undoubtedly an advantage, preventing cinders from falling through, and thus being wasted. Others object to the slits when the coal is not of a first-rate quality, but for a model fire place we should at least calculate upon good fuel. Instead of building the gridiron into the wall in the usual way, it is better to have it made to stand on feet and placed independently in the opening, thus enabling it to be renewed at any time without the aid of the brickinger. grate embodying the foregoing features is generally known as the Teale principie, doubtless as a result of Mr. Teale's able lectures on the sul ject in which he so earnestly called attention to the neglected doctrines of Count Rumford and various improvements from other sources. To this improved form of grate has been added a movable canopy by means of which the combustion of fuel can to a greater extent be controlled. It also forms a register door, with which the flue can be shut off at will. In addition to these advantages, the canopy being removable gives the bricklayer greater freedom when fixing, and with the lean over back it is invaluable, because its removal gives free access to the flue for aweeping purposes. The Mariborough grate embodies nearly all the features I have mentioned. a practical point of view I think it is the best form of grate made; but there are certain minor details about the conatruction and design which can, and I hope soon will, he remedied. As practical proof is at all times preferable to theory, I give an epitome of a trial I made with a similar grate that I have had fixed in my own house. The fire was kept burning continously for over 36 hours, during which time it was mended only six times, and received no other attention, the night stoking being made with a lump of coal weighing 12 pounds, backed up with 3 pounds of fine slack. This was put on at 10 o'clock, and after hurning slowly all night, the remains of the lump was broken up at 8 next morning, and fresh fuel added at 9. The thermometer registered an average of 75° in a .room of 2000 cubic feet; it was placed in the center of the room in the direct rays of the fire. The total amount of fuel used was 56 pounds of coal and 14 pounds of fine slack, making 70 pounds in all, the cost of which, at 16 shillings 6 pence per ton, was 61 pence. The total waste in ashes was less than 11 pounds. The whole of these ashes fell under the grate out of sight, so that during the whole period of this trial the hearth did not have to be swept or attended to in any way. The grate retained so much heat afterward that at the end of 46 bours - i. e., 13 hours after last fuel was added-the general temperature of the room was 54°, while in the grate itself a thermometer registered 98°; the cutside temperature at that time was below freezing. The value of this retaining power cannot be too highly esteemed, because a room in daily use need never become very low in temperature, even in the severest weather, and with a hot grate in a morning the new fire is rapidly kindled, and there is no fear of getting a chili at breakfast. In the sick room it la also of the greatest value, as the lasting nature of the fire enables one, with litt'e attention, to keep a continuous fire and an even tempera ure for an indefinite period.

#### Furnishings of the Fire Place,

Before concluding my paper, 1 thick it well to make a few remarks concerning the furn'shings of the fire place. Firstly, there is the all important tel piece. Whatever material this may be made in, the design should be controlled by the material, and that design which is the most readily wrought and easiest of sound construction in the material used is the best design, provided it fulfills its purpose as well. three materials most used for making our mantels are stone, iron and wood, each of which has its own special advantages. Of the first of these I shall say little, beyond regieting the lamentable want of design in most of the marble and enamel slate chimney pieces offered for general use. The next in acquence fs iron, and this material, where practical economy is concerned, has proved itself to possess immense capabilities for small chimney pieces; and since a chimney piece should be designed not to come in contact with the rays of a fire more than can be avoided, its conducting power does not decrease its value for the purpose named; but for larger and more important fire places it is much icas suita-The uncontrollable vagaries of cast iron in cooling after being poured moiten into the mold render its production in anything like perfection inconsistent with the same economy it possesses when used for smaller work. We either have to put up with twisted shelves and jambs, miters that do not miter, and other joints that do not fit, or else so much labor has to be spent upon fitting the parts together that it ceases to possess ita fullest economy. On the other hand, it is almost indestructible when fairly used, all its defects being apparent from the day of its birth, while stone and wood ahow deterioration in wear as time progresses. For offices and school rooms it is invaluable; it is vain for the office boy or scholar to try his knife on its surface; his desire to hand down his name carved on its frieze to future generations is fruitless. The last of the materials named is wood, and this requires more careful consideration For domestic purthan the others. pores it is unquestionably the most in harmony with our other furnishinge, and it is this fact that accounts for its present popularity, but its inconsiderate use sooner or later will prejudice its continuance in favor. The conditions necessary to the satisfactory use of wood for the chimney piece are numerous, the more important of which are: t. The chimney piece should not come in centact directly or indirectly with any of the metal work used in constructing the fire place, but be reparated from it by stone or tiles, or both. 2. It should be so designed that, as far as possible, no part of it should come within the direct rays of the fire. 3. It should be made of we is easoned timber, and when made not be delivered into the building till it is acutally wanted. It is not unusual to be asked to deliver into a damp building, the windows of which are unglezed and the doors unhung; the consequence is the porea of the wood absorb the moisture in the atmosphere, and if ili consequences ensue the maker is blamed for using unsessoned timber.

there are things to be observed in connection with fixing the wood chimney

### The Wooden Chlmney Plece.

The damp walls, which are favorable to the proper fixing of stone, are most injurious to the wood work. They are frequently fixed on a wall recking with moisture, sometimes set into the plaster, and the plaster carefully made good all round, making for the time being a neat job; but immediately they are fixed an immense fire is lighted in the grate, which drives the moisture out of the brick work, and the hermetically scaled chimney piece forms a veritable steam chest at the back till the joids open from twisting and the condensed water oczes through and forms a little stream upon the surface. This is no exaggeration, but a statement of simple facts. There is nothing worse for wood work than steam. It is the power used to bend it when so required; wood work cannot absorb moisture and be rapidly dried again without very great risk of warping and unequal shrinkage. As the fixing of a wood chimney piece is extremely simple and inexpensive, the safest method is to complete fixing the whole fire place, including the chimney piece, and when this is done the actual wood work should be unserewed from its plugs and placed elsewhere till a few fires have extracted the moisture from the brick work\*, then it can be replaced; the cost of such extra work is trifling as compared with the annoyance it 38 Ves . Special care should be taken in plastering the chimney breast to avoid unevenness, it being in all cases undesirable to let the wood work of a fire place into the plaster, entailing as it does making good round it, thus leaving no escape for damp. An additional precaution should be taken by painting the backs of wood chimney pieces. This renders them less liable to absorb any moisture that may be left on the brick work. Even if the general walls have been built some time and the house is fairly dry, the new brick work filling up the arch above the grate is quite sufficient to do great mischief. It is quite surprising the quantity of water a brick is capable of absorbing, a very large percentage of which must escape in vapor. Another smaller matter l have adopted in the construction of wood chimney pieces to facilitate the fixing of them is to fix a strip of wood 1 or a inch thick round the opening of the interiors; then any slight inequality in the projection of the grate tiles and marble work, when compared with chimney piece, is easily rectified by re-ducing this strip. It has a second advantage. Wood work is always liable to shrinkage while it retairs its natural properties. If shrinkage to any extent takes place and the man-tel is forced thereby from the wall, by reducing this strip-which is an easy matter—the mantel can be made to go back into its original position. This is not a contingency that would often happen when other conditions are observed, but it is a small safeguard worth taking, an insurance against accidents at an accidental rate of premium. When overmantels with mirrors are added even more care should be used. and if the mantel and overmantel are made separately, it is well, if practicable, not to deliver the overmantel until the other furniture is taken in, otherwise the damp is liable to destroy the quicksilver of the mirrors. Lastly.

when the chimney pieco is to be made of wood it should be ordered as soon as possible. The longer the work is in the shops before it is finished and pol-ished the less chance there is of unpleasantness after fixing. To plane some woods means to render them capable of fresh twisting and shrinkage, however dry they may appear to be; oak espeeially is liable to twist after being worked, although it may have been in the log 100 years. It is therefore best to order in ample time, thus giving it a chance to show its inclinations before being finally fitted together. The disregard of these conditions in the use of wood chimney pieces will be certain, sooner or later, to bring them into diseredit, and thus a more suitable fitment may fall into disuse from no demerit of its own, but in consequence of the want of a little thought and care by those responsible for its fixing. It is usual to fix marble or slate strips as a protection inside the openings of a wood chimney piece. These are more generally made to show about 2 inches, but it would be much better if they were made to be more of a feature in the building of a fire place, and a wider margin shown especially in the frieze, by which means the wood work, and particularly the shelf, would be more easily protected from the direct rays of the fire. Marble or stone strips should always be used in this way when there are no tiles, also when the tiles are fixed to form splayed cheeks or a recessed fire place, but they may be safely dispensed with when the tiles are fixed in a line with the grate. The tiles then answer all the purposes the marble is intended for.

### Recessed vs. Straight Fire Places.

Whether a recessed fire place or a straight one is best must be a matter of opinion, but there can be little doubt that the more forward a fire place is built the greater is its heating power in the room. In the larger fire places tile cheeks should be considered a necessity; not tiles in an outer frame work of iron, which method of treatment dwarfs the fire place and renders it insignificant, but either built in separately or in slabs. In the recessed fire places they form good reflectors for the rays of heat discharged upon them, in addition to their protective and ornamental merits. The tile hearth is equally good in this respect; it cannot be too strongly recommended, equally on account of its cleanliness. With regard to the tiles themselves, unless really good, artistic, hand painted Perslan or luster tiles can be used, plain glazed enamels in suitable colorings will be found best for all purposes of the fire place. For fenders and necessary fire irons, very good effects may be obtained by using the smith's work, but these should be kept simple and for use only; the elaborate brass work is at once a useless expenditure and an exhibition of bad taste. Why a man wishes to make his hearth look like a brass founder's showcase is an unsolved problem, and the panic that ensues if one inadvertently uses one of these elaborate ornaments to mend the fire with proves conclusively that they are totally out of place, and yet they not infrequently are as costly as the fire place itself. I am afraid I have made a long story, but the fire place is worthy of our most careful attention. Of all necessary fittings in our homes there is none to rank with it in importance; it is the very center upon which our home life hinges. Few of us would be willing to adopt from choice any other method of warming our living rooms, and many of us would

gladly go back, were it practicable, to the log fires of our forefathers, but failing this, the modern fire place is dear to us as an institution, and rightly If it is not so economical in fuel as other methods of warming it is the most healthy, and that, after all, is the greatest of all practical economy. Then how it appeals to our sentiments! What welcome more cheerful than the rich, warm glow of a bright fireside in months of wintry blasts? How it cheers us mentally and bodily—how we thaw under its influence! What circle so genial as the fireside coteriewho has not felt its spell? What tales have been told in its fantastic light! What memories of childhood's happy hours! Could the old stories have had the same fascination if told elsewhere than in the firelight's ruddy glow? Who has not lived over again some pleasant past while gazing into its glowing caverns? What stimulant so effective to the imagination as the dear old fire place! What fantasies in its forked tongues of living flame, in its curling smoke and its weird embers! How accommodating to our every mood! How glad with us in our joyous moments! How sympathetic in our times of sadness! And yet with all its glorious accordations how it in our times of sadness! And yet with all its glorious associations, how it is neglected. The most precious of all our boughold institution. is neglected. The most precious of all our household institutions, the one that repays more than all others, is but too often treated with scant consideration. They who will admit the justice of my panegyric in the hour of temptation think anything good enough for this shrine of shrines. Men who will spend freely on other furnishings, which they may look at without seeing once or twice a day, will deem it an extravagance to spend proportionately on the fire place before which they will sit and contemplate for hours, and which would return more interest than all the others put together if treated in the same generous spirlt. But with all this neglect the fire god triumphs and gives us some gladness, though he be buried in cast iron, which does its best to absorb his generous warmth. Still the noble god struggles gallantly, and does his best to warm our bodies and glad-den our hearts. But how much easier task when assisted! How the flames dance and the embers glow in a sultable home! How they reflect their magnificence in the glaze and luster of the tiles when offered no obstruction in their lighter easings, and how the whole forms one grand picture when framed with a noble yet simple mantel adorned (and not vulgarized) by the craftman's skillful hand !

W. E. MELLINGER, well known in the Western heating trade, on the 30th ult, ceased his connection as heating engineer with the Baker & Smith Com-pany, 193 Van Buren street, Chicago, with whom he had been pleasantly assoclated for nearly ten years. He removes to Louisville, Ky., to take up the duties of his new position as president and manager of the Southern Heating Company.

Several of the transatlantic steamship companies have recently issued strict regulations forbidding their agents in Europe to book as passengers for the United States certain undesirable classes of emigrants, including paupers, deaf and infirm persons, persons under contract, assisted emigrants, persons who within a year have been convicted of crime and anarchis's.

<sup>\*</sup> Fires should not be lighted in grates the day they are fixed, as such a practice destroys the property of the cement used.

# TRADE REPORT.

### The Iron Market.

We are in the position to make the official announcement that an arrangement has been arrived at by the Steel Rail manufacturers for the year They have decided to lower the price \$2 \$\overline{2}\$ ton on all Rails 45 lb per yard and upward, thus making the price \$22 East and \$23 West.

It is of course too early to judge what effect this action will have up on buyers, since the new quotations have only been out a few days. In the trade generally opinions are divided. It is urged on the one hand that requirements must nec-essarily be heavier this year than they have been, even when due consideration is given to the wretched financial con dition of many great systems. Others insist that the necessity for the strictest economy will keep even strong buyers out of the market, and that there is no inducement to them to give out winter work.

The Iron trade is more particularly interested in the matter so far as it bears upon the general business for the months intervening before spring, the feeling being that then the trade can take care of itself without any reference to the large Rail concerns.

In the Foundry Pig Iron trade there is more activity in Western centers, but apparently at the expense of prices, which are irregular. Makers do not seem to have much confidence in the first quarter of next year, since they are willing enough to contract at present prices for that period.

Pig Iron.-New York market has been very quiet, with a weakening tendency on the part of some Southern makers. Some efforts to develop our export trade lately have been rendered futile by lately have been rendered futile by high ocean freights. We quote standard brands \$12.25 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2; \$10.50 @ \$11 for No. 2 Plain, at tidewater. Southern Iron, same delivery, \$11.50 @ \$12 for No. 1; \$10.50 @ \$11.25 for No. 2; \$10.25 @ \$10.75 for No. 3; \$10.50 @ \$10.75 for No. 2 Soft, and \$10.75 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.40. @ \$10.40.

The demand for Pig Iron in the Philadelphia market is quite active, considering the season, and tardiness in making deliveries is a matter of general complaint among consumers. Furnsces are evidently carrying very little Iron, although they are entering orders for 1895 delivery for almost all that a buyer is willing to engage at current quotations. In some cases the opportunity is accepted for deliveries running for a period extending three or four months, but it cannot be said that there is any general disposition to abandon the policy of hand-to-mouth buying, especially while prices continue as they are to-day—casy, if not weak. General quotations for Philadelphia and nearby points are about as delphia and nearby points are about as follows, with a reduction of 25¢ @ 30¢ for such deliveries as Baltimore, York,

NY of 1	SAFF			11410	1114	4 6 4 5 1 1
			 			4 1 - 4

Advices from Chicago intimate that Local Coke Iron has had another week of much better business than had been anticipated. The largest order placed was one of 2000 tors, but numerous other contracts were made for 200 to 500 tons, while carload orders were plentiful. Shipments are extra-ordinarily good; hardly a case exists in which deliveries are not running ahead of the monthly quantity still ulated. Foundry Iron is not any dearer, but indications appear to favor an upward movement in Bessemer. Southern Iron is in only moderate demand with some irregularity in prices. The large companies are very firm, but the smaller concerns are making concessions in order to secure orders. An increased business is reported in Lake Superior Charcoal, more tonnage now being booked than for a long time. Orders are not large, but their number is stesdily growing. Quotations are given as follows for eash.

do Iono na tor case			
Lake Superior Charcoa	\$13,00		\$13.50
Local Coke Foundry, No. 1.	10/12/9		10 25

Reports are going of some large sales of Bessemer Pig Iron in the Pittsburgh district, for delivery next year, and some of the Valley furnaces have sold up their entire product to April 1, 1895. The demand for Foundry Irons is light and prices are weak. No. 1 Foundry is said to have been sold down to \$11, Pittsburgh. Quotations are as follows:

From the Cincinnati market an incressed volume of business in Southern Coke Iron during the past week is reported, several round lots, aggregating 12,000 tons, have been sold at about the range of prices indicated in the table. No. 3 Foundry has been especially firm, but No. 2 Foundry, being in relatively larger supply, has not been so well sustained. There has been apparently a general increase, though not large in any special instance, in the melting of Iron by both foun-dries and mills. The large purchases, however, have been mainly by mills of No. 2 Foundry and No. 1 Soft. One sale of 5000 tons and four additional sales of 1000 tons each are reported, as well as several lots of 200 to 250 tons each. The 5000-ton lot was sold to a large Eastern mill, 1000 tons of the Southern Iron was sold in the West and 1000 tons Northern Iron to Pittsburgh consumers. While the general market has been firm and hardening there have been instances where quotations on certain grades have be shaded. Quotations are as fo lows:

At St. Louis the Pig Iron situation remains practically unchanged. There are no new contracts being made, for the reasen that most consumers are anxious to work their stock down to the lowest possible point, so that they will be able to wind up the year without carrying over heavy stocks of Irou. As heretofore, the demand runs largely to carload orders, with an occasional 200 ton lot. Prices are unchanged, and in the absence of any large inquiry are well maintained. We quote as follows for cash, f.o.b. cars St. Louis :

### Metal Market.

Pig Tin .- Early in the week selling pressure was even more severe than it was during the preceding week, and wholesale prices underwent a further considerable decline. On Wednesday, however, the market gained some renewed strength under the influence of a rise in London prices. Quite liberal purchases were made at bottom figures by consumers, but the jobbing demand has been quite moderate. Prices for small lots of Straits from store are the same as those quoted last week—namely, 16¢ @ 16½¢ to lb.

Copper.-The market has shown semewhat firmer tone and rather more animation, the result chiefly of rumors that the leading producers have at last come to an agreement in the matter of restricting production the coming year. Merchants who are in a position to know state positively, however, that ro agreement of the kind has been effected. and also that there is no likelihood of any being made. The consumptive demand has been only fair, and prices for small quantities show no change, Lake Ingot being quoted by jobbers at about 10¼¢ per lb.

Sheet Copper.—Irquiry is slow, and purchasing by consumers is limited to moderate quantities for immediate use. The basis of prices for small lots of Sheet Copper is 15¢ per Il net.

Pig Lead. - Only a very slight movement in prices has taken place, but the market has weakened somewhat in tone, under the influence of freer offering here and extreme indifference on the part of buyers. For small lots from store, the ruling price is  $3\frac{1}{2}\sqrt[4]{6}$   $3\frac{3}{2}\sqrt[4]{6}$  lb. Manufactured Lead is in very limited demand.

Solder.-The demand is fair. Prices for small lots have been marked down to 110 @ 1110 for 1 and 1 guaranteed; and 90 @ 910 for No. 1. Speiter.—The market is positively flat. Spelter is and has for some time been the dullest metal in the market. Orders are invariably for only moderate quantities, and business all round makes a very modest showing. Western in small parcels fetches 4% 7 lb.

Antimony—The market has remained steady with a moderate demand at about 10¢ for Cookson's and S½¢ for Hallett's, in small retail parcels.

Tiu Plate. - Dealings have been on a smaller scale during the past week, and the market has shown almost uninterrupted duliness both in the matter of spot goods and of forward deliveries. Buying has been confined to small lots for current use, and even orders of this nature have exhibited a failing off. Can makers are holding cff, placing their contracts for January and February deliveries, which are usually made about this time, and consumers generally appear extremely indifferent in the matter of laying in atock. Stocks in importers' and dealers' hands are by no means excessive, however, and the assortment in some lines, notably Squarea and imported Ternes, is very meager. Only slight changes have taken place in prices, but there has been a tendency to general weakness all along the line. The wage scale dispute in the domestic Tin Plate works is still unsettled and the production of American Plates continues restricted. The wage question is also causing great uneasiness on the other side, and on the whole the market is in an exceedingly unsettled condition.

A special London cable dispatch of November 28 to The Iron Age reports on the British Tin Plate market as follows: Tin Plate business has been moderate and the inquiry is small. Ordinary Cokes obtainable at 1½ pence less this week than last and prices generally weak. Lianelly makers threaten to close works owing to workmen refusing to concede in wages. This is due to lowness of prices and smallness of contracts. Shipments are smaller and stocks at shipping points have increased to 280,000 boxes. Sellers' quotations at Swansea are as follows:

Bessemer Cokes, IC 14 x 20. 9/9 @ ...
Siemens Cokes, IC 14 x 20. 10/ @ ...
J. B. steel Cokes, 1C 14 x 20 9/9 @ 10/
Ternes, 20 x 25 19/6 @ 22/
Charcoals, IC 14 x 20 11/ @ 13/

## Chicago Report.

Scrap.—The railroads are still making efforts to unload their stocks of O.d Material. Dealers quote their buying prices as follows, Chicago delivery:

## CONDITION OF THE

# Hardware Trade.

SUALLY at this advanced stage of the season a marked falling off in the volume of business is expected, but at the present time it is the general report of those in close touch with the market that the demand continues fair, not showing the usual diminution. A great many small orders are being received by the jobbing houses, covering assortments of goods in which winter specialties and holiday articles have a prominent place. The jobbers also are sending in a few orders for immediate chipment to supply their present requirements, and many of them are negotiating for goods for spring de-In the matter of prices there is livery. In the matter of prices there is little if any improvement in the general tone of the market. On many goods ruling prices are weak, and within the past few months there has been more or less of a decline in many articles. The condition of the iron market unfortunately does not give indications of an early improvement or furnish a basis for expecting advanced prices and a stronger tone. Owing to this state of things buyers are limiting their purchases to such goods as are sure soon to be taken off their hands in the regular course of business. The fact that on one or two lines advances have been made within a few weeks is referred to as indicating the possibility that buyers who defer placing orders too long may be obliged to pay higher prices. Recognizing the fact that there may be a reaction from the extremely low prices now ruling, careful merchants are watching the market closely so as to perceive, if they can, the tirat indications of a turn. Many of them express the opinion that prices are not likely to go much lower, and consider it a wise policy to purchase conserva-tively and carefully such goods as their business calls for.

Advices from Chicago.—Shelf Hardware jobbers report another very good week as compared with the record for the preceding part of the year. The aggregate of sales is, of course, very much better than that of last year at this time. Localities in which farmers were reported to have suffered from crop failure are even doing fairly well in purchases of merchandise. The hand-to-

mouth policy pursued among merchants is having the effect of prolonging trade and making it very steady. The demand is of a general character on this account. The full line of shelf Hardware is moving, and seasonable goods are going out in a steady stream. Inquiries are improving for heavy goods, and country merchants are quite generally asking quotations on carloads and half carloads, showing that they are inclined to stock up a little in these lines. The shortage in tinware continues, although the factories have turned out larger quantities the past six weeks than during any similar period in their history. Heavy Hardware is not quite so active as last week, but the condition of this branch of trade is still fairly good.

## Notes on Prices.

Wire Nails.—There continues to be a good deal of inquiry for quotations on amall lots for comparatively early delivery and larger parcels to cover future requirements. The volume of business also has been very satisfactory and the mills are well occupied on orders and have comparatively small stocks on hand. Notwithstanding this the manufacturers are competing very actively for business, and prices are low and somewhat irregular. The market is represented in a general way by the quotation of 90 cents for carload lots at mill, but orders have been placed at 85 cents.

Advices from Chicago.—A few good sized contracts are reported by manufacturers, but trade generally has been light. The large buyers appear to have covered their requirements fairly well during the season of water delivery. Inquiries now coming up are chiefly from the interior. Prices are about the same as they have been. Jobbers report a much larger inquiry for mixed cars of Nails and Barb Wire. They quote in a regular way \$1.10 for small lots from stock and are making strong efforts to maintain this price in spite of competition from jobbers in other localities.

Cnt Nails.—The Cut Nail market continues in about the same condition as at our last report, with a fair though not heavy volume of business. Small lots from store in New York are held at. \$1 to \$1.05.

Advices from Chicago.—Orders are reported by manufacturers to be of the same character as heretofore. Merchants are only buying what they actually need and are not contracting ahead to any extent, but their orders keep the local factory well employed. Prices are unchanged, small lots from stock selling at \$1.

Barb Wire—There has been little change in the Barb Wire market since our last lasue, prices being represented by the quotation of \$1.85 to \$1.90, a figure which, however, has been slightly shaded. There is a good deal of inquiry for lots for future delivery, and a number of orders have been booked. Manufacturers refer to the indications of an exceptionally large business during the coming year. Some of them are disposed to be conservative about naming low prices for future delivery.

Advices from Chicago.—The outlook for Barb and Plain Wire is growing very much brighter, so far as demand is concerned. Inquirles are being received from a very large part of the Northwest, both for early shipment and

future delivery. Every effort is being made by buyers to secure lower prices than manufacturers have thus far quoted. The circular recently sent out from a Pittsburgh house appears to have had the effect of stirring up much of this inquiry, which is now coming in to the standard manufacturers. They refuse to meet the quotations which have been made by their competitors and express the belief that in a short time it will be shown that it is not necessary to make the great concessions asked. Jobbers' prices for small lots from stock are now \$1.75 for Painted and \$2 10 for Galvanized. The movement in Plain Wire and all classes of Market Wire and related goods has been exceedingly active of late and the prospects are very flattering for a very much heavier trade than usual after the close of the year.

Parker Portable Heater. — The Charles Parker Company, Meriden, Conn., and 97 Chambers' street, New York, request us to state that the discount to the trade on the Parker Portable Heater is 50 per cent., instead of 50 and 10 per cent. as previously announced.

Rat and Game Traps.—Streeter's Schaible Traps, manufactured by N. R. Streeter & Co., Groton, N. Y., New York effice, W. H. Jacobus, 90 Chambers street, an illustration of which appeared in our last issue, are sold at a discount of 33½ per cent. from the following list:

No.		Gross.
20.	Rat Trap	. \$21 60
30.	Game Trap, without chain	28.50
30.	Game Trap, with chain	. 36,00

Knapp's Faucets — Knapp's Faucet Company, Syracuse, N. Y., are putting on the market the Combination Wood and Metal Faucet, a description of which was given in our last issue. The Faucet is sold to the trade from the following list, which is subject to a discount of 25 per cent.:

	Per dozen.
No. 1, 20 inches long, for lager.	\$36.00
No. 2, 18 " " ale	36.00
No. 3, 20 " " ale	36.00
No. 4, 18 inches long, for stock	k ale.
with automatic strainer	
No. 5, 20 inches long, for stock	k ale.
with automatic strainer	

Oil and Gasoline Can.—The New Idea Oil and Gasoline Can, put on the market by A. F. Chable, 2827 Euclid avenue, Cleveland, Ohio, and described in our issue, Nov. 10, is sold to the trade at \$12 per dozen, subject to a discount of 30 per cent.

Glass.-The American Window Glass market is in a slightly improved condition over that reported last week, in the way of both prices and demand. There is little difference in the printed prices of the various manufacturers, which are nearer to the market price than usual, and manufacturers less inclined to make concessions. There is an equivalent to 1356 pots reported as being in operation, a larger number than were working this time last year. This fact, taken into consideration with the statement that no great amount of Glass is being put into stock, indicates a fair and steady demand. Pittsburgh prices in carlots are reported as being 89 per cent. discount for single and 90 and 5 per cent. discount for double strength Glass. The Plate Glass business is not ln a condition satisfactory to the manufacturers, as demand has fallen off considerably, with a not very encouraging outlook for the future.

Old Rags, Paper, &c.—Business is fair. Prices are about at their former

level, the following quotations representing about the rates paid by dealers, New York delivery:

D.	9 08 91. 4
	3 02 34 6
	840
	1 (4) 140

SILVER & Co., 304 to 310 Hewes street, Brooklyn, N. Y., manufacturers of house furnishing specialties, have contracted for important additions to their plant in order to meet the increasing business which each month brings to them. Two years ago the present buildings were considered too extensive for their requirements, but they have become already too small to their business in its various branches.

T: actory contains departments for the manufacture of stamped and pieced Tin Ware, for nickel plating, polishing and grinding, a blacksmith shop, japanning and tinning departments, glass blowing, sheet iron and metal working, and the manufacture of aluminum utensils. The last named branch has grown to large proportions in the four or five months in which the firm have undertaken this work. The existing plant includes a four story and basement building, corner Broadway and Hewes street, containing about 40,000 square feet of floor apace, devoted exclusively to the manufacture of the firm's house furnishing inven tions, and two smaller buildings ad-joining. All this space is overcrowded. For the past three weeks the factory has been running night and day to keep abreast of orders, and November has been the banner month of the firm's ex-

BRITISH AGENCY: The Ironmonger, 42 Cannon street, London, England.

#### A Preparatory Trade School.

A very successful trade school for the benefit of the boys of the East side of New York City has been established in connection with St. George's Protestant Episcopal Church, of which the well-known Rev. Dr. Wm. Rainsford is rector. The school, which is located at 520 East Eleventh street, was started three years ago and has been growing in attendance and in scope each year. At present over 300 lads of the poorest class, of from 10 to 20 years of age, are receiving instruction in various handicrafts. Three plumbing classes have been added this season. The instructor in this department, W. J. Tucker, a Harlem master plumber, is an enthusiast in trade school work. and has already brought his boys to a remarkable degree of proficiency. The school was established and is mainly supported by the munificence of a wealthy member of St. George's Church, with the idea of preparing the boys for eventually entering the New York Trade School. Free Scholarships in that institution are awarded to the most promising lads. Three of the St. George's scholars have in this way entered the day carpentry class of the New York Trade School in the present term.

#### Fuel and Solar Heat.

If people were asked what warms our houses, in these days of improved heating appliances, most would say "it is heat produced by the combustion of fuel," coal or wood, as the case might be, and this would be correct. Occasionally one would be found who would say, "it is the heat of the sun," and this would be correct also. The fuel we burn in the present age has been produced in a past age by the action of solar heat, to which all known activities available to man for increase of his powers, his comfort, or his pleasure can be traced. Without the

sun's heat the masses of luxuriant vegetation that have been transformed and stored up as coal in the earth would never have existed. Without solar heat the trees whose wood is used as fuel would not have grown. Recent experiments of Professor Dewar indicate that at temperatures so low that oxygen liquefies, chemical action either ceases or is so much diminished as to justify the inference that it would cease altogether at still lower temperatures. It is certain that all life, as we know it. whether vegetable or animal, would end at a temperature higher than is necessary to liquefy oxygen. Without the heat of the sun all things on this earth would soon reach lower temperatures than science has ever been able to produce artificially, and all life as well as all other forms of activity would terminate. If the ancient snn worshipers had even an imperfect idea of the part this great orb plays in the grand activities of the universe, they are not to be wondered at for regarding it as the source of all power and beneficence and adoring it as such.

#### Making Pictures.

Opinions may differ whether the evidence of our eyes or our ears, which includes reading, which is the same, either seen or heard, is the more reliable, but for the sake of argument if may be assumed that a matter shown is plainer than the same told. Therefore, the "eyes have it." There is a temptation to refer to the hieroglyphics of ancient times and the universal sign language of the moderns in proof of the advantage of object or illustrated lessons. But what we shall now consider is the practical good to be derived from the ability to make a picture of the thing or transaction we wish to describe, and in a measure answering the question, "Should the workman be a delineator?" A course of technical study and practice in any branch of mechanics which did not include both the understanding of drawings and the knowledge of making them would be thought incomplete. Also the apprentice whose education is purely practical will find that it pays to devote occasional time to making pictures. It is not expected that the ordinary workman will become an expert draftsman, but it is a great advantage to be able to construct the thing on paper which we have in mind. One of the simplest things in sheet metal work would seem to be the drawing of a working plan for a common stove pipe job. But some tinners (not the reader) cannot mark it out so as to show the distance and angles, and their practice is to take plenty of pipe and elbows

and butcher the job on the premises. The same ignorance of plans and drawing is shown where furnace work is done by thumb rule. It may be stated that it is the province of the foreman or employer to take measurements and draft working plans. But as the energetic apprentice is a possible foreman he cannot afford to be without the "accomplishment" in question. Also there are some men in business who regret their inability to make simple sketches which would illustrate their ideas. Such an one was he who, lacking thename and number of a furnace repair, ordered it like his sketch. An answer was returned that the firm had no patterns for side saddles. We are living in the illustrated age, and every one who would be up to the demands of the times should cultivate the practice of making pictures.

Immigration Superintendent Stump in his recently issued annual report for the fiscal year ended June 30, 1894, shows a very material falling off in the number of immigrants arriving in this country. He estimates that from October, 1893, to June, 1894, the number of foreign born steerage passengers leaving the country was greater than the number arriving from abroad. The extraordinary ratio of decrease is shown in the following table, which gives the number of immigrants arriving from the principal supplying countries during the fiscal year 1893-94:

Country,		Decrease.
Italy	42,977	29,168
Germany	52.989	24,942
Sweden	18,286	17,424
Poland and Russia	38,666	13,334
Ireland	20,231	13,347
England and Wales	18,748	10,926
Hungary	14,700	8,129

The system of co-operative building associations has taken very firm root in Pennsylvania. According to the latest returns 250 of these associations have been chartered in the State since June, 1891, and the whole number is now stated to be 1239. The membership is 272.580; cash income in one year is \$44,432,686, and the assets, \$103,943-,364. These assets represent the accumulation of an average period of about seven years, and it is estimated that in the last 10 or 12 years another \$100,000,000 has been returned to the members in cash and redeemed mortgages, and nearly 100,000 homes have been secured through these societies.

According to the report of Governor Sheakley of Alaska, submitted to the Interior Department, the gold mining industry of the Territory Is now very extensive. The adoption of the latest methods and machinery for the treatment of gold ores has rendered easy, successful and profitable the manipulation of the low grade gold bearing quartz found extensively in Alaska. During 12 months past 240,000 tons of ore were treated, yielding \$768,000, or \$3.20 per ton. The cost of mining and milling was \$324,000, or \$1.35 per ton, leaving a net profit of \$444,000.

## THE LETTER BOX.

Hot Water from Cold Faucet.

From J. T. C., Winchester Ky .- One of our customers wishes me to explain to him why it is that he cannot get warm water at all times from his tixtures. This particular job was done by a reliable firm from a distant city. It is in a two-story brick building which is supplied with water from a tank. It has the usual boiler connections with kitchen sink and bathroom on the second floor and to all appearances is faultless. The owner claims, however, that at times hot water comes out of the cold water pipe and vice Please give me some idea of rersa what is the cause.

Answer .- Without a sketch of the piping it is doubtful if a satisfactory answer can be given to the problem submitted. It is natural to suppose that cold water comes from the hot water faucet when there has been no fire in the range and the water in the boiler ia not heated. Where the supply is taken from a tank it is not uncommon to get hot water at the cold faucet, particularly when the water back has a great heating capacity. Under such circumstances hot water will back up the supply pipe to the tank and frequently heat all the water in the tank, especially if the tank is not large. One way to overcome this difficulty is to reduce the size of the water back or reduce its heating capacity by fastening fire brick or a piece of cast iron between it and the fire. If the water is cold when it first comes from the hot water faucet and a waste of time and water is objected to, it can be avoided by a circulating pipe running from the hot water faucet back to the boiler and connecting with the pipe to the water back. This pipe need not be over & inch in diameter and will secure a circulation that will have hot water always at the faucet.

### Tools for Clearing Chimney Flues.

From James F. Ilobart, Brooklyn, N. Y.—I see in an old number of The Metal Worker an article by "Casar" of Louisville. Ky., who describes his method of teating chimney flues and also tells about a weight and rope business for clearing flues that may have become stopped or partially closed by swallow nests or brick dropped in by the matens when the chimney was constructed. "Casar's" weight and rope will do the work when half a dezen brick have become lodged, or when a colony of swallows may have preempted the location, but how would the weight and rope work when a foot or two of the chimney had been disloiged by lightning or by a tempost, and when about half the brick and mortar had fallen into the chimney and stuck there? I have had this thing happen

several times, and the only way I could get around it was to cut a hole in the chinney on the level with the obstruction and then remove the brick. The trouble, dirt and muss which such a job makes are bad enough without speaking of it. After cutting out several ob

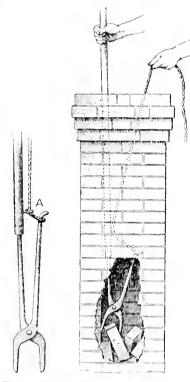

Fig. 1.—Tongs Fig. 2.—Showing on Pole, Method of Operation

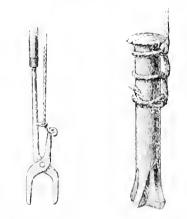

Fig. 3.—Tool for Small Flues.

Fig. 4.—Stone Drill.

Tools for Clearing Chimney Flues.

structions of this kind I set my wits to work and constructed the device shown in Fig. 1 of the sketches. This did the work in fine shape. The tool is nothing but a large pair of blacksmith tongs in combination with a rope and pole. A hole was burned in one end of the pole, a ferrule driven on to prevent its splitting, and then one leg of the tongs was driven into the hole. The tongs were of such a aze that they had a throat

large enough to receive a brick the 2-inch way. The free leg of the tengs was bent outward to form a slight hook, and then the rope was spliced or tied on, after which it was passed through the screw eye A, as shown. In Fig. 2 is represented the manner in which the tool is used. The pole is let down into the chimney until the tongs reat on the obstruction; the bricks are pried about until the tongs get hold of one, as shown; then the rope is pulled very tight and kept so until it is raised,

bringing with it a brick.

In small chimneys difficulty was found in opening the jaws of the tongs far enough to get hold of a brick. This was due to the fact that the long free handle struck against the side of the flue. The difficulty, however, was over-come by cutting off one leg very short and forming an eye in the end of the stump, as shown in Fig. 3. The acrew eye then had to be put on the remaining leg, and then when the rope was alackened the tongs could open much wider than when the whole length of leg was employed. A number of times I found it necessary to knock one or more brick out of a chimney when they had become lodged after falling into it. To knock a hole through such obstructions I took a 4-inch stone drill, as represented in Fig. 4, a drill of this kind being used for making 4 inch holes in atone for setting iron fence posts. There are two cutting edges at right angles to each other, and these corners soon cut each other, and these corners soon cut and break up the brick against which the drill may be churned. As atated, however, the drill will only do when the obstruction is tight. It is better to use tongs and pick out all the brick possible before attempting to drill through. If the stoppage is close to the top of the chinney, within sight, a pretty stiff pole will work well to carry the tongs, but if down a long distance and the chimney has bends in it, then a and the chimney has bends in it, then a alim pole of hard wood must be used so

#### Incasing Indirect Radiators.

that it will readily pass through a crooked flue.

From W. D., Scranton, Pa.—Will The Metal Worker please inform me how an indirect radiator box should be made, and how much larger it should be than the radiator.

Answer .- Indirect radiators are incased in galvanized iron boxes more generally than was previously the custom. Sometimes they are incased in wooden boxes lined with tin and so constructed that they can be readily taken down, screws being used to fasten them together. In The Metal Worker of March 17 of the present year are illustrations of different forms of indirect stacks showing the radiator in place with the piping and the box surrounding it. It is the general opinion that the box should fit close to the sides of the radiator so that all air passing through it must come in contact with the radiator, and that there should be a

space not less than 12 inches both above and below the radiator for an air chamber.

#### What Is a Pedestal Closet?

From E. E. H., St. Louis, Mo.—I wish you would favor me by answering through The Metal Worker what water closets the manufacturers class in the pedestal pattern.

Answer. - During a recent visit to one of the sanitary earthenware potteries at Trenton, N. J., this inquiry was discussed, and at the catablishment in question only those were classed as pedestal closets which inclosed the trap and all the water passages so that they were not exposed, and the inclosure formed a substantial support to the closet. It was suggested that any closet which rested on its own base might properly be included in the pedestal class, whether inclosed or not. While this view of the question was conceded as correct, it was stated that it was not customsry to term such a closet a pedestal closet.

#### Water in Heating Boiler.

From S. H. C., Waverly, Ioua.—I wish to ask how often should the water be changed in a house heating boiler—that is, does the water lose its heating power? We have a customer who changes his every two months. I use rain water and have not drained it off in three years.

Answer .- We think the plan followed by our correspondent is decidedly the preferable one. There is no loss of heating power in the water through long usage. If there is any reason for drawthe water, it would be simply to remove any dirt or rust that might have accumulated. The first effect of heating water is to drive out the air that is held in solution, after that it remains practically unchanged for an indefinite period. This driving off of the air is seen in a kettle when small bubbles form before boiling begins. The effect of driving off the air is, if anything, to permit the water to attain a higher temperature, even though the change may be insignificant in amount. The correspondent's plan of using pure water and not changing it is to be commended.

#### Frosty Show Windows.

From D. L. R., Jacksonville, Ill.—A few days ago I was called on to fix a show window in a store so that the moisture would not condeuse upon the glass in damp weather and freeze in cold weather. The window is a double one, supposed to be air tight. Is there any way to ventilate it by taking cold air from the bottom on the outside and putting in small ventilators at the top? I saw an article on the subject in The Metal Worker some years ago, but have forgotten the principle upon which the remedy is applied.

Answer — Various means have been adopted for overcoming the difficulty mentioned by our correspondent, and we cannot do better than to refer to some of those described by members of

the trade and published in earlier issues of the paper. According to one correspondent the plates of the show windows are first encased inside with glazed sash well fitted. One and a quarter inch holes are then bored about 6 inches apart through the outside panel under the floor of the show window. Then 1 inch holes, 2 inches apart, are bored through the floor of the show window as close to the outside plates as possible. At the top of the window, either through the sash or ceiling, the same number of holes of the same size are made as in the base. This arrangement is said to secure entire freedom from the frost collecting on the glass.

Another dealer has the windows made in sections, matched together and placed on the outside of the plate glass, with the desired results. He has two windows 7 feet wide and 9 feet high and three windows 21 feet wide of the same hight, with a light transom sash over each. Still another writer has sliding sash well fitted at the back of his show windows, leaving a space for the display of the goods between the sliding aash at the rear and the plate glass in front. Half a dozen 4-inch holes are mettod bar deas abiatom mettod and as many more at the top of the sash. As a result of this arrangement he says that for ten years he has had clean windows, while those of his neighbors are obscured by frost in cold weather. Lamps or gas cannot be used in the window without the glass frosting, but electric light can be employed without any ill effects. In one of the cities in Michigan there are a number of stores having the show windows arranged with a ventilator at the bottom, admitting the cold air from the outside, and a conductor pipe at the top of the window leading into a chimney, which causes a circulation of air, resulting in about the same temperature on the outside and inside of the plate glass, which keeps it free from frost. Still another plan for preventing the gathering of frost on show windows is to case the windows on the inside with sliding sash, thereby keeping out dust and making a good showcase for the display of goods. Over the door is a transom 3 x 4 feet, which is never closed within 6 inches, it being hung from the bottom, and serves as a ventilator, taking air from the ceiling. When the show windows are lighted in the evening one of the sliding sashes is left open, in order to secure the benefit of the transom ventilator. The store is ateam heated, although a stove or furnace heated store will probably work under the same plan. A correspondent in the State of Maine writes that he had two show windows in his store encased with glazed sash for the display of cutlery, guns and other goods of iron and ateel. Noticing that one of the windows remained entirely free from frost

while the other one was completely ob-

scured by it, he examined the frosty one and found that the carpenter in putting up the inside sash had not made a close fit between the sash and the walls. This permitted the warm air from the store to enter and come in contact with the outside glass, where it condensed and formed a thick coating thereon. This opening was stopped and there was no further trouble with frost. Neither of the inside sashes was air tight, but the correspondent states that they need to be reasonably tight and the doors kept closed as much as possible. A wlndow without inside protection may be kept clear of frost by creating a circulation of the air in contact with it by means of a revolving fan or other contrivance for keeping the air in motion.

#### Cleaning Solder.

From W. F. SARGENT, Bayfield, Wis.
-I wish to thank "Oliver I wist" for the timely information on how to clean wiping solder, that appeared in The Metal Worker of November 17. I al-ways receive my old instructor and bureau of information, The Metal Worker, Tuesday evenings. Tuesday of that week I could not think what had gone wrong with my wiping solder. It was like trying to keep dry sand on the pipe, seeming to have no adhesiveness at all, so I gave up in disgust and told the boss I would have to quit the job (as we didn't have any other solder), until he could order some more solder, which would make a delay of four or five days. That evening I received The Metal Worker, and in perusing its columns I came across Oliver Twist's article on how to clean wiping solder, and may be I didn't read it with avidity. Next morning I tried his receipt of putting in sulphur and it worked like a charm, and my solder was as plastic as white lead. Zinc was the trouble. I had been wiping on a good deal of brass work and it has got in the solder that way. I am always very careful not to overheat my solder and tin my brasses with copper bit.

#### Sheet Metal Boat.

From Louis Giclas, Washington, D. C.—As I have had numerous inquiries for details of construction of my steel launch, I concluded the best way to give them something of value was to prepare a set of drawings and specifications for which I will make a small charge. I propose to furnish a set of blue print drawings, showing in detail the construction of the bost as well as the motor arrangement, with complete written instructions, and all so simple that any ordinary sheet metal worker can build himself a launch.

#### Steam in Boiler.

From I. N. PHILLIPS, Nashville, Tenn.—If "F. G. N.," Columbus, Ga., whose letter appeared in The Metal Worker December 1, will use larger pipes from water back to boiler the cracking will stop. If there is no workout pipe at bottom of boiler, let him put in one and use it for a minute or so, at least once a week.

#### Address Wanted.

From C. T. MAGUIRE, Hornellsville, N. Y.—I want to know where I can get Seaman's Automatic hot water heater for gas to heat 100-gallon range boiler.

# STEAM AND HOT WATER.

A Heating Plant as a Pump.

BY A. VENT.

In discussing the use of air valves on steam heating plants it was ventured by one of a party that they could be entirely dispensed with; another said they would be as effective and less conspicuous at the bottom of the radistor, and further remarked that there was no reason why they should be used

at the top of a radiator.

at the top of a radiator.

"I know of no more effective pump," said another, "than a perfectly tight steam plant from which all the air has been exhausted. If there are no leaks or other means for air to enter when the fire goes out and the steam condenses in the radiators, a vacuum will be formed there that will lift all the water out of the boiler and hold it in suspension. If a new fire is then built in the boiler its life for effective service will be very short, for no material has yet been discovered that will stand such use. In a first class steam heating system the air valves are a very essential feature in my opinion, unless some other method of performing their function la provided.

#### HEATING NOTES.

THE MODEL HEATING COMPANY OF Philadelphia report a very successful introduction of the Novelty Steam Generator, and also that there is an increasing disposition to use hot water as a method of heating in their city, having largely increased sales for this year for the Novelty Circulator.

THE HEADLEY-LEAVITT COMPANY, Trenton, N. J., are making a fine display of gas heaters and grates. Their specialty is wood mantels and fire place fixtures and gas and electric fixtures, although they do a full line of heating work, using the Kernan hot air furnace and the Richmond boilers. They have at present a \$1200 contract for the combinstion gas and electric lighting fixtures for the new Mechanics' National Bank. They also have the contract for heating the residence of Charles H. Wardell, at Parkville, N. J., with a Richmond boiler. They claim that the recent cold weather has found the 12-section Richmond boiler which they put in the Alms House, in connection with 3300 feet of radiation, to be amply capable of heating the building satisfac-

CURTIS & CURTIS, Bridgeport, Conn., have prepared plans for an extension of their machine shop in order to be able to meet the demand for their hand and power pipe cutting and threading machinery. The extension will be a machinery. The extension will be a continuation of the present shop, so that the new machinery will be on the same line of shafting, which will be extended in the new building. This building will be two stories in hight, the upper floor being fitted with light machinery for making small parts and for the smaller tools, for which they have a good trade.

THE OWNER of a new row of flats in New York advertises that "the steam heaters are warranted not to give the usual imitations of a boiler factory during the night or at any other time.

THE HOLLAND RADIATOR FACTORY, at Elwood, Ind., which recently passed into the hands of Chicago and Indianapolis capitalists, on the failure of the Elwood Iron Works, recommenced operations this week. The former manager, John Halloran, will have charge of the works for the present.

Jones & Jaeger, 92 Greenwich avenue, New York, have ordered two carloads of Holland radiators for use in the buildings of the Cutting estate at Thirteenth atreet and Fifth avenue.

SUPERINTENDENT YOUNG of the W. H. Page Böller Company, Norwich, Conn., was visiting at the New York office of Dubois & Darrow this week.

OFFICIAL BULLETIN No. 4 comes to us from the New York headquarters of the Master Steam and Hot Water Fitters' Association, giving the latest actions of the association and embodying the "Trade Resolutions," "List of Manufacturers in Accord" and the constitution and by-laws. It gives some of the comments of the manufacturers on the "Trade Resolutions" and a list of the officers of the association and the State vice-presidents, also a list of the secretaries of local associations.

A course of instruction that should attract attention in the heating trades is about to open at the New York Trade School on January 2. The Master Steam and Hot Water Fitters' Associagion of New York have appointed a special committee to supervise a course of instruction in steam and hot water fitting. The pupils will be taught methods of calculating the surface required in radiation for heating a building, the sizes of pipe necessary for supplying the radiators and all of the scientific information that is necessary in connection with it. They will also be given a course in drawing plans, showing how the radiators should be placed and the method of piping. Tho manual instruction will commence with the simplest work and continue to the piping of a building, explanations being given on all the little details that go to make a job a success or a failure in operation. Well informed, skillful workmen in this trade are eagerly sought and a knowledge of the installation of heating relation at the state of the state tion of heating plants, both from a practital and scientific standpoint, practital and will, it is believed, be secured at the school in a much shorter time than in working regularly at the trade.

THE steam and hot water heating establishment of F. W. Lamb & Co., 258 Michigan street. Chicago, has been closed by the sheriff.

THE WESTERN STEAM & HOT WATER HEATING COMPANY, 67 West Washington street, Chicago, have moved to 51 West Division street.

Calculating Chart for Areas and Cubic Contents.

J. L. BIXBY, JR.

As it is desirable and is the general practice to figure out the wall and glass areas and cubic contents of rooms to be heated, and as the time and labor required to perform these operations con stitute a large percentage of the cost of estimating, any means by which this expense and labor can be reduced, even though the results be not absolutely correct, will, I trust, be appreciated by my fellow workmen. The calculating chart herewith Illustrated will be found useful in estimating areas and cubic contents in rooms from 5 to 25 feet square and from 6 to 14 feet high. stated on the chart, the first left hand column of figures represents the width of the room, and the diagonals adjoining it the length of the room; the intersecting diagonals, marked from 6 to 14, represent the hights; the figures in the right hand column represent hundreds of cubic feet, and the figures at the bottom the area in square feet. The letters on the vertical lines are shown to facilitate reading. Points between figures or lines must be approximated. To illustrate the use of the chart the

following examples are given: Estimate wall area and cubic contents of a corner room 10 feet wide by 15 feet long by 10 feet high (the room would have two outside walls, one 10 x 10 feet, one 10 x 15 feet). Starting at 10 in the left hand column, follow across the chart toward the right hand until this point

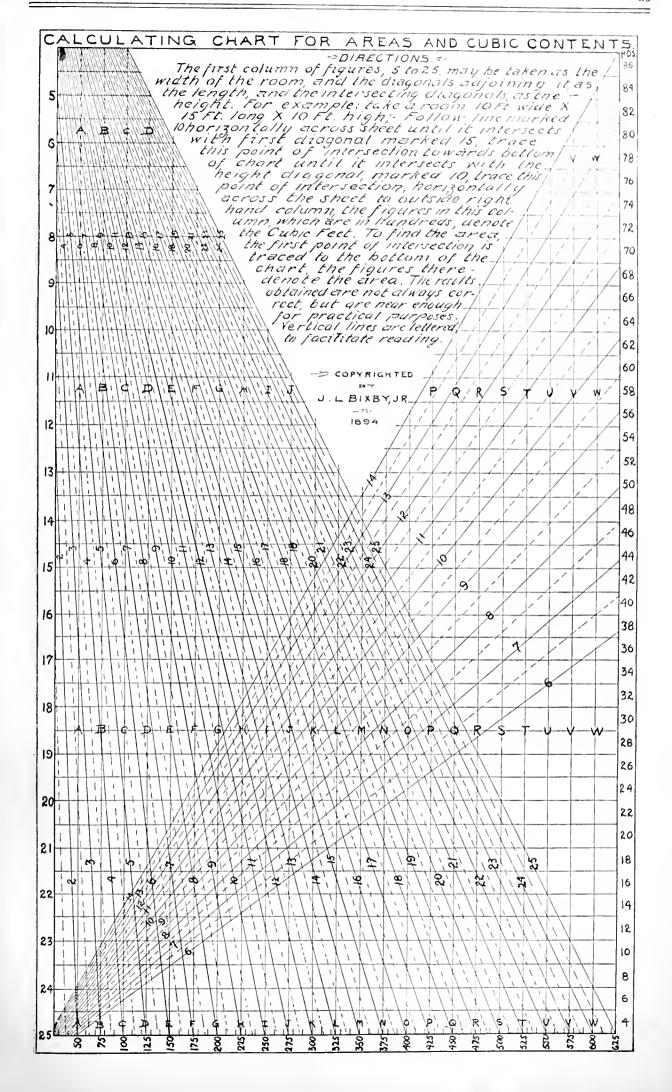

or line intersects with the first diagonal

marked 10, which is the hight of the wall. [It may be well to state here that when the area only is to be found what is termed above "the hight diagonals"—6 to 14—are not used.] To continue with our example, the width line 10 will be found to intersect with diagonal 10 on line C. Follow this point of Intersection to the bottom of the chart, and the area, 100 aquare feet, will be found. With the other wall the operation is the same, except

that we start at 10 and locate point of intersection with diagonal marked 15, which is on line E. At bottom of chart, at foot of line E, will be found 150, which represents 150 square feet, the area of the other wall. The area of the tree walls being therefore 100. the two walls being, therefore, 100 +

150 = 250 square feet wall surface. For the cubic contents proceed as follows: Start at point 10 in left hand column, and find point of intersection of this line with diagonal marked 15, which, as before found, is on line E; follow this point or line toward the bottom of the chart until it intersects with the hight diagonal marked 10. which is on the line 22; follow this line to the right hand column, and it will be found to end half way between 14 and 16; the figures represent hundreds, and as it is half way between 1400 and 1600, the answer would be 1500 cubic feet, the cubic contents sought.

Believing that this example in detail elucidates the mode of operation, the detail will be omitted in the fol-

lowing example, it being understood that where lines and figures are not shown the same must be approximated. Example: Cubic contents of room 13½ feet wide by 16 feet long by 12½ feet high. Starting at the horizontal line between 13 and 14 in the first column, find the point of intersection of this line with diagonal marked 16, which will be found to be about 11 inch to the left of line II. Follow this point down to the hight dlagenal 121, which is the dotted line between 12 and 13, and it will be seen that the point of intersection of lines 13½ and 16 with hight diagonal 124 is on a live between 26 and 28 in right hand column, which is 2700—the cubic feet. In practice the chart can be made much plainer by covering in red all diagonal lines and in blue all vertical and horizontal lines, also opposite the figures in the right hand column and half way between the horizontal lines, drawing short black lines similar to those at bottom of chart.

#### HEATING PLUMBING.

#### NEW WORK AND CONTRACTS.

PECK BROTHERS, Montpelier, Vt., have the contract for plumbing the Kellogg-Hubbard Library Building.

Disley & Weyand, Waterbury, Conn., are doing the plumbing and cornice work and installing a hot water heating plant in the Root Bleck. They are doing the plumbing in the residences of G. W. Connor and H. W. Hotchkiss.

GORMAN & ENGLISH of Wilkes-Barre have secured the contract for placing the heating apparatus in the new Polish Church at Plttston, Pa.

Barlow Bros., Waterbury, Conn., are using a Gold's steam boiler for heating the Town Hall at Naugatuck. They are placing a steam heater and doing the plumbing in the residence of George Lamb and are using a Magee combination hot air and hot water heater in the residence of Archer Smith. They are doing a very fine job of plumbing in the residence of Earl Smith.

J. J. SULLIVAN, New Haven, Conn., has the contract for the plumbing at the Dwight Kindergarten School Building.

W. H. Morrison, Torrington, Conn., has just put a Gorton boiler in the house of A. H. Palmer.

THOMAS J. BARRY, 316 North Twenty-first street, Philadelphia, Pa., recently completed a job of plumbing in the Convent of Notre Dame, on Logan square.

H. N. Jones, Merlden, Conn., is to build a \$5000 residence, to be heated with hot water and have a plumbing system.

THE CITY COUNCIL of Delaware, Ohlo, recently contracted with Armstrong Brothers of Springfield for steam heating boilers for the City Building, for the sum of \$1140.

WILLIAM GEREMEYER, Carlisle, Pa., has secured the contract for placing a steam heating plant in the residence of Rev. Dr. J. W. Richardson, in Getlyshutg

A NEW \$24,000 CONSERVATORY will be erected at Franklin Park, Columbus, Ohio, cext spring, which will be heated by hot water.

THE CONTRACT for the steam heating of the new McCusker-Hahne Building has been let to E. J. Rysn & Son, Danville, Ill.

Bips have been solicited for the heating apparatus for the Town Hall at Union Hill, N. J.

Tue: Stuntevant system of heating and ventilating is being placed in the mills of the Glens Falls Paper Company, in South Glens Falls, N. Y.

FOSTER & GLIDDEN, 53 Dearborn street, Chicago, are to place a Farquhar warm air furnace in the residence of J. C. Cox, Morgan Park, Ill.

THE CONTRACT for the plumbing of the Lincoln School has been awarded to Miller & Johnston, Fall River, Mass., for \$1471.

THOMAS K. LEMON, New York, will use 10,000 feet of Holland radiators in the Casey Flats, at Elghty-eighth street and Columbus avenue, in which he is installing the heating plant.

A. B. Noves & Co., St. Johnsbury, Vt., are heating the town almshouse and St. Johnsbury House, using Exeter radiators.

John Hickman, Paterson, N. J., installed two Sunray boilers, and the heating plant in Helvetia Hall, at Paterson, N. J., where the Paterson plumbers recently held a "Smoke." All the plumbers present agreed that the work was as fine as any they had seen.

LEVI McBRIDE, Paterson, N. J., has the contract for the plumbing and heating in the residence of J. Raymond, Ridgewood, N. J.

THE CITY OF DAVENPORT, IOWA, will erect a new City Hall which will have a modern plumbing system and be heated by steam.

Schuster Bros., 234 North Clark atreet, Chicago, are to do the plumbing, gas fitting and sewerage in the residence of O. Foremann, Michigan avenue and Thirty-fifth street.

ALVA HUBBARD & Co., Washington, D. C., report the following contracts on hand: The heating plant in the Masonic Hall Building and in the atore and apartment house of William Hahn & Co. Heating plants are also being installed by them in the residences of Dr. Louis Kolipinski, A. Z. Tyssowski, Col. Weston Flint, Jas. T. Bradford, R. Harris and Leo Simmons, besides that of William B. Daingerfield, at Alexandria, Va., the hot water system being employed.

THE UNION FURNACE COMPANY, 65 Dearborn avenue, Chicago, are finishing the steam heating in the Lenox Building, Cottage Grove avenue and Thirty-fifth street.

COOK & CHICK, 253-255 Kirziestreet, Chicago, have the contract for hot water heating in the residence of Dr. W. D. Lonergan, Summerdale, Ill.

THE SAMUEL I. POPE COMPANY, 207 Medinah Temple Building, Chicago, are to install a steam heating plant in the Post Office Building, Sioux Falls, S. D.

THE L. H. PRENTICE COMPANY, 203-205 Van Buren street, Chicago, have the contract for steam heating in the residence of A. A. Sprague, 2636 Prairle avenue. All of the latest improvements in indirect steam heating will be used and all of the rooms are to be ventilated.

E. BAGGOT, 169-17i Adams street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the Music Temple, Van Buren street, between Wabash and Michigan avenues.

H. R. LEAR, 156 Forty-third atreet, Chicago, is to do the plumbing, gas fitting and sewerage in the tlat building of C. E. Follensbee, Twenty-third and State streets,

Among the contracts recently taken for warm air heating by the Foller & Warren Company, 147-149 Lake street, Chicago, can be mentioned the following: Two residences of L. Gregorie, 110 Lawndale avenue; residence of John Smith, 154 North Clark street; residence of Chandler & Co., 1504 Rosalie court; seven houses of J. L. Cochran, Edgewater, Ill.

THE KELLY & JONES COMPANY, 48 52 North Clinton street, Chicago, are to install a steam heating plant in the store and apartment building of P. L. Underwood, Cottage Grove avenue and Forty-aixth street.

THE J. L. MOTT IRON WORKS, 311-313 Wabash avenue, Chicago, are placing 16 Sunray hot water boilers in the stations of the Metropolitan Elevated Railroad.

Among the contracts recently taken by J. J. Colvin, 159 La Salle atreet, Chicago, can be mentioned the following: Galvanized iron cornice work and slate roofing for the flat building of Charles Peterson, 571 North Robey street; galvanized iron work and slate roofing for the residence of A. B. Towers, Newport avenue; galvanized iron work and slate roofing for the residence of H. J. Thompson, Fulton atreet, near Francisco.

THE CONTRACT for heating and plumbing the new Chase Block, at the corner of Main and Pleasant streets, Concord, N. H., has been awarded to Lee Brothers of that city.

MAYOR GILLETT, Rome, N. Y., is readvertising for bids for the plumbing and drainage work at the Rome State Custodial Asylum.

THE SCHOOL COMMITTEE of Dayton, Ohio, have been empowered to purchase two heaters, not to exceed \$1200 in cost, for school buildings.

THE CONTRACT for the steam heating work at the lowa State Agricultural College, at Ames, was awarded to Wallace & McNamara of Des Moines. Their bid was \$4210.

SUNKEL & HECKMANN, Zanesville, Ohio, have secured the contract for the plumbing and ateam fitting for Sturtevant & Co.'s new building.

THE CONTRACT for heating the Center School House, at Uxbridge, Mass., has been awarded to the Springfield Coil Boiler Company, Springfield, Mass., who will put in one of their improved non-explosive boilers.

THE CONTRACT to furnish the heating apparatus for the county farm huildings has been awarded to the T. A. Lane Company, Manchester, N. H., for \$6714.

VICKERS & BROOKER, Binghamton, N. Y., have secured the contract for the plumbing for several houses being erected by W. W. Reynolds at Mount Vernon Park, N. Y.

Daniel Proctor, Rockland, Maine, is in charge of a steam heating crew who are installing the plant in the Knox House, at Thomaston.

#### Galvanizing.

Arbinteresting paper, the full title of which is "Rustless Coatings for Iron and Steel, Galvanizing, Electro Chemical Painting, and other Preservative Methods," was presented by M. P. Wood at the December meeting of the American Society of Mechanical Engineers, held in New York. From this paper we quote in part as follows:

Galvanizing, as a protecting surface for large articles, such as enter into the construction of railway viaducts, bridges, roofs and ship work, has not reached the point of appreciation that possibly the near future may award to it. Certain fallacies existed for a long time as to the relative merits of the dry or molten and the wet or electrolytical methods of galvanizing. The latter was found to be too costly and slow, and the results obtained were erratic and not satisfactory, and soon gave place to the dry or molten bath process as in practice at the present day; but the difficulty of management in connection with large baths of molten material, the deteriora tion of the bath and other mechanical causes, limit the process to articles of comparatively small size and weight.

The electro-deposition of zinc has been subject to many patents, and the efforts to introduce it have been lamentable failures in both a mechanical and financial sense. Most authorities recommend a current density of 18 or 20 ampères per square foot of cathode surface and aqueous solutions of zinc sulphate, acetate or chloride, ammonia, chloride or tartrate, as being the most suttable for deposition. Herman's process has been experimented with on a commercial scale, the chief feature being the addition of the sulphates of the alkalies or alkali earth to a weak solution of zinc phosphate. Electrolytes made by adding caustic potash or soda to a suitable zinc salt have been found to be unworkable in practice, on account of the formation of an insoluble zinc oxide on the surface of the anode and the resultant increased electrical resistance; the electrolytes are also constantly getting out of order, as more metal is taken out of the solution than could possibly be dissolved from the anodes by the chemicals set free on account of this insoluble scale or furring up of the anodes, which sometimes reaches 1 inch in thickness.

To all intents and purposes the deposits obtained from acid solutions under favorable circumstances are fairly adhesive when great care has been exer. cised to thoroughly scale and clean the surface to be coated, and which is found to be the principal difficulty in the application of any electro-chemical process for copper, lead or tin, as well as for zinc, and that renders even the application of paint or other brush compounds so futile unless honestly complied with. Unfortunately, these acid zinc coatings are of a transitory nature, their durability being incomparable with hot galvanizing, as the deposit is porous and retains some of the acid salts, which cause a wasting of the zinc and consequently the rusting of the iron or steel. Castings coated with acid zinc rust comparatively quickly, even when the porosity has been reduced by oxidation, aggravated no doubt by some of the corroding agents, sal ammoniac, for instance, being forced into the pores of the metal.

Other matters of serious moment in the acid electro-zincing process, aside

from the alowness of the operation, were the uncertain nature, thickness and extent of the coating on articles of irregular shape, and the formation of loose, dark colored patches on the works; the unhealthy, non-metallic look and want of brilliancy and luster prevented engineers and the trade from accepting the process or ita results, except for the commoner articles of use. The Cowper-Coles process of electro-zincing articles claims to overcome all these difficulties, and plants are in process of erection with a bath of some 14,000 gallons capacity, capable of turning out 40 tons of light work per week, and in which it is proposed to treat the plates of vessels 60 feet in length upon one or both sides, and the frames of such vessels as torpedo boat destroyers and kindred craft after riveting up. These plates and frames are given a thin coating of zinc by this process that appears to be perfectly uniform in character and extent, whatever the shape of the piece may be and however numerous the iugs, tlanges, mortises or core holes, and is called "zinc tlashing"—that ia, coating the iron or steel article, after pickling and cleaning, with a thin coat of zinc about 1 ounce per square foot of surface, which resists the inclemency of the weather and mechanical injury as well as a thicker coat, and is found to afford sufficient protection in most cases, and is adequate protection until such time as it is ready to receive the usual paint coatings.

To obviate any tendency of the paint to peel off from the zinc surfaces, as it generally manifests a disposition to do, it is recommended to coat all the zinc surfaces, previous to painting them, with the following compound: One part chloride of copper, 1 part nitrate of copper, 1 part sal ammoniac, dissolved in 61 parts water, and then add 1 part commercial hydrochloric acid. When the zinc is brushed over with this mixture it oxidizes the surface, turns black, and dries in from 12 to 24 hours, and may then be painted over without danger of peeling. Another and more quickly applied coating consists of bichloride of platinum, 1 part dissolved in 10 parts distilled water and applied either by a brush or sponge. It oxidizes at once, turns black, and resists the weak acids, rain and the elements gen-

erally.

Zinc surfaces, after a brief exposure to the air, become coated with a thin film of oxide-insoluble in waterwhich adheres tensciously, forming a protective coating to the underlying zinc. So long as the zinc surface remains intact, the underlying metal is protected from corrosive action, but a mechanical or other injury to the zinc coating, that exposes the metal beneath In the presence of moisture, causes a very rapid corrosion to be inaugurated, the galvanic action being changed from the zinc positive to zinc negative, and the iron as the positive element in the circuit is corroded instead of the zinc. When galvanized Iron is immersed in a corrosive liquid, the zinc is attacked in preference to the iron, provided both the exposed parts of the iron and the protected parts are immersed in the liquid. The zinc has not the same protective quality when the liquid is sprinkled over the surface and remains in isolated drops. Sea air, being charged with saline matters, is very destructive to galvanized surfaces, forming a soluble chloride by its action. As zlnc is one of the metals most readily attacked by acids, ordinary galvanized iron is not suitable for positions where it is to be much exposed to an atmos-

phere charged with acids sent into the air by some manufactories, or to the sulphuric acid fumes found in the products of combustion of rolling mills, iron, glass and gas works, &2., and yet we see engineers of note covering, in important building, with corrugated and other sheets of fron and using galvanized iron tie rods, angles and other construction shapes, in blind contidence of the protective power of the zinc coating; else in supreme indifference as to the future consequences and catastrophes that arise from their unexpected failure.

The comparative inertia of lead to the chemical action of many acida has led to the contention that it should form as good if not a better protection to iron than zinc, but in practice it is found to be deficient as a protective coating against corrosion. A piece of lead coated iron or terne plate placed in water will show deelded evidences of corrosion in 24 hours. This is to be attributed to the porous nature of the coating, whether it is applied by the hot or wet (acid) process. The lead does not bond to the plate as well as either of the other metals, zine, tin, copper or any alloys of them. The usual weight of lead conted terne plates is about 4 ounce to a square foot, while hot process zinc coatings weigh from 11 ounces minimum to 3 ounces maximum, depending upon the temperature of the bath, and the slowness of removal therefrom giving time for the article to drain off. The following table gives the increase in weight of different articles due to hot galvanizing:

Description of article.	Weight of zinc per square foot.	Percentage of increase of weight.
Thin sheet iron = 0.026 inch No. 22 B. W. G	1.196 ounces. 1.76 onnces. 2.19 ounces.	18.2 2.0 6.72 1.00

Tin is often added to the hot bath for the purpose of obtaining a smoother surface and larger spangles or facets, but it is found to shorten the life of the protective coating considerably. A portion of a zinc coating applied by the hot process was found to be very brittle, breaking when attempts were made to bend it; the average thickness of the coating was 0.015 inch.

An analysis gave the following re-

TinIron	 2.20 3.78
ArsenicZinc (by difference	 I THEE

A small quantity of iron is dissolved from all the articles placed in the molten zinc bath, and a dross is formed amounting in many cases to 25 per cent. of the whole amount of zinc used. This zinc-iron alloy is very brittle and contains by analysis 6 per cent. of iron and is used to cast small art ornaments from. A hot galvanizing plant having a bath capacity of 10 x 4 feet by 4 feet 6 inches outside dimensions, and about 1 inch in thickness, will cost \$625 and will hold 28 long tons of zinc, which at 4 cents per pound will require \$2500 to fill it. The heating of this mass of metal and its ever changing cold immersions, with the waste by dross and extra thickness in spots, is a constant source of annoyance and expense.

The cost of an electro-chemical or wet bath Cowper-Coles plant of 6700 gallons bath, size 30 x 6 feet by 7 feet, will be but slightly more than the hot bath given. There is no dross formed by the use of the Cowper-Coles process, and the zinc coating formed is said to resist the corroding action of a saturated solution of copper sulphate—English Post Office test for telegraph whre—much better than hot galvanized iron wire, as per following table:

Result of Process Test Made on Samples of Charcoat Iron Wire Coated With Zinc by Various Processes.

Process used to test the iron.	Grains of zinc per square foot.	Ounces per square foot.	Number of one- menute dips; samples stood without show- ing metallic copper.
Hot galvanized	648 5 446.4 552,64	1.02	3 4 5

A Cowper-Coles process bath of a capacity of about 4000 gallons will treat ship plates 18 feet long, and will require an electrical energy of 2000 ampères of 5-volt electro-motive force.

With equal amounts of zinc per unit of area, the zinc coating put on by the cold process is more resistant to the corroding action of a saturated solution of copper sulphate than is the case with steel coated by the ordinary hot galvanizing process; or, to put it ln snother form, articles coated by the cold process should have an equally long life under the same conditions of exposure that hot galvanized articles are exposed to, and with less zinc than wou'd be necessary in the ordinary hot process. The hardness of a zinc surface is a matter of some importance. With this object in view, aluminum has been added from a separate crucible to the molten zinc at the moment of dipping the article to be zinced, so as to form a com-pound surface of zinco-aluminum, and to reduce the ashes formed from the protective coverings of sal ammoniac, fat, glycerine, &c. The addition of the aluminum also reduces the thickness of

the costing applied.

Cold and hot galvanized plates appear to stand abrasion equally well. The thickness of the coating being the same, tests by means of the Schlerometer show: cold galvanized sheet, 6°; terne plate, 2°; tin plate, 2°. The figures represent the load in grams upon a diamond point, just sufficient to cause it to acratch the specimen. The attempts to electro-zinc iron and steel wire for wire standing rigging, bridge, or other eables have not been successful; it has not been found practical to produce a wire capable of withstanding more than one immersion in a copper aulphate

solution.

Both pickling and hot galvanizing reduce the strength, distort and render brittle iron and steel wires of small sections. Zinc fuses at 775° F, and the bath is usually kept at about 1000° F. Steel wire of high breaking strein has its hardness, and consequently its ultimate tensile strength and elongational efficiency, reduced by drawing of the temper and the formation of an iron zinc alloy on the surface of the wire, by as much as from 5 to 10 per cent. It is the practice when coating steel wire to keep the bath at as low heat as possible and to run the wire through it at a high rate of speed. Both

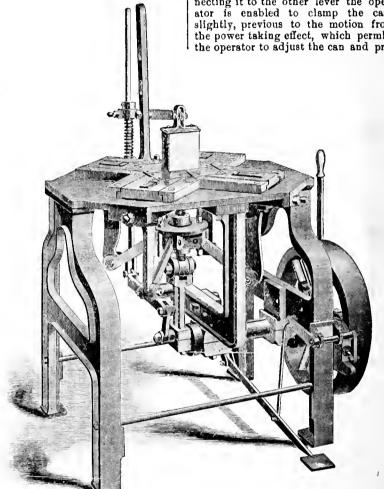

these operations lead to a waste of zinc by reason of the rapid solidification of the metal on the comparatively cold wire, and consequently the ready breaking or cracking off of the covering metal on bending or twisting it, owing to the difficulty with which molten zinc adheres to the steel except after long coutact in the bath. In some cases the wire is wiped between asbestos rubbers as it leaves the bath, but wire thus treated is found to resist corrosion but a very short time.

The English manufacturers have ceased galvanizing their high grade steel wire that cost some \$175 per ton, on account of the great risk of rendering it worthless, which is clearly a disadvantage,

calculated that it would take between \$17,000 and \$25,000 to transport the dragon to Tokio.

#### Power Squeezers.

The illustration presented herewith shows a power squeezer for can makers' use, made by G. A. Crosby & Co., Chicago, Ill. The bed or top of the machine is level or flush with the top of the jaws and center block, thua permitting the operator to slide the cans along without the ends of the cans coming off, as there is no obstruction, such as screw heads, &c., in the way. The improved foot motion is not shown in the cut, but it is so arranged that by moving one bolt from the lever and connecting it to the other lever the operator is enabled to clamp the cans slightly, previous to the motion from the power taking effect, which permits the operator to adjust the can and pre-

Power Squeezers.

although the advisability of protecting the steel is unquestionable, as corrosion is found to be very marked on the lnner strands of ropes or cables formed from uncoated whres. The Cowper-Coles or cold galvanizing process is in operation at the works of Messrs. Laird Bros., Birkenhead, England, and used for the purpose of zincing the skin plates and frames of the torpedo boats and torpedo boat destroyers built by them for the English Navy.

The Miyako Shimbun, a Japanese journal, describes an extraordinary work of art, of great age, now in Corea. This is the image of a dragon, most skillfully sculptured in sospstone, the size being quite that of an ordinary dwelling house. The huge figure is carved with special attention to details, and its like is not to be found in any Eastern land. A Japanese of means contracted last month to buy this giant eurlo, the owner asking only \$2550 for it. It was

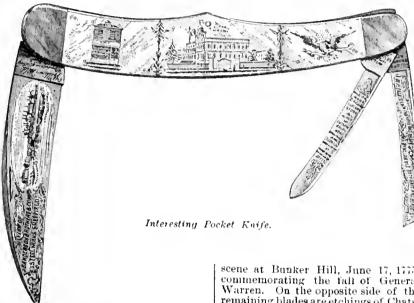

vents the spoiling of many packages. This feature is referred to as being particularly valuable when beginning on a new size of can. This attachment can be quickly disconnected when not required. All the jaws and center blocks made by the firm are to templets, so that they will be interchangeable with any other squeezers of Messrs. Crosby & Co.'s make. The machine is equipped with their patent automatic stop motion, which is so arranged that the jaws always atop open at the end of each revolution. The machine is made in two sizes, of 900 and 1200 pounds weight.

The possible value of waste products has never been more strikingly illustrated than in the case of cotton seed. Twenty years ago the Southern planters used to pay men to haul it away and burn it. Now they are getting from \$6 to \$8 a ton for cotton seed, which is pressed for the extraction of oil.

# THE RETAIL STORE.

#### An Elaborate Knife.

[Several interesting pieces of Cutlery recently came to our notice, one of which is here illustrated. These were made by William Wild, Sheffield and New York, and by him used for display purposes. They are delineating the unfinished Capitol at Washington; the new British Houses of Parliament on the banks of the Thames, London, and Newstead Abbey, Nottingham, the family seat of the Byrons, and where the early years of the poet Byron were spent. On the reverse of the large blade is etched a battle

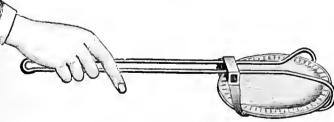

now in the possession of White, Van Glahn & Co., successors to the old house of W. N. Seymonr & Co. Chatham square, New York, into whose possession they came more than 30 years ago. The three-blade Knife here shown was part of the World's Fair exhibit in 1853, at the Crystal Palace, in what is now Bryant Park on Fifth avenue, New York. When open the Knife is 3314 inches over all, the handle being 1534 inches in length. Between the German silver bolsters there is a mother of pearl covering on each side, divided into three sections, the joints being hidden or disguised by the engravings of leaves. In the first section

scene at Bunker Hill, June 17, 1775-commemorating the fall of General Warren. On the opposite side of the remaining blades are etchings of Chatsworth Park, England, depicting among other things a stately building with large grounds. A smaller Knife of a more modest character, 1314 inches extreme length, is similarly etched and engraved, the eagle and stars, if any significance attaches to them, indicating that the Knife was made prior to 1836. The remaining curio is a German silver fob, with mother of pearl sides in four sections, in the four corners of which are ten miniature Knife blades, Saws, Hooks, Watch Keys, &c.

#### The Safety Grip Lifter.

The Safety Grlp Lifter shown herewith is made in two pieces; \$\frac{a}{2}\$-inch steel wire bent to shape, forming the

The Safety Grip Lifter.

at the left is a reproduction of the New York warehouse of William Wild. on Division street between Ludlow and Essex streets, where these emblems of trade were kept in the show window. The central engraving represents the New York City Hall, surrounded by the high iron fence taken down in the 70's under the Tweed regime. Above the eagle on the right are 27 stars, which probably indicated the number of States in the Union when the Knife was made, which would fix the date as 1845, on the admission of Florida. On the reverse of the handle the engravings are more elaborate in character,

front arms and handle, upon which the back arms, made of east iron, readily slide. The lifter is designed to remove hot dishes without injury to the hands. The maker states that the lifter will hold a bowl, plate or dish, either round or square, and that the article to be moved cannot possibly detach itself from the lifter. In operation the forward arms are placed under the plate, when the movable back arms are slid forward until a firm hold is obtained. The Lifter is offered by George W. Hobbs, 111 Main atreet, Charlestown, Mass.

#### The Iceland Freezer.

The accompanying cut represents an entirely new freezer put on the market for the season of 1894-95 by the Peerless Freezer Company, Cincinnati, Ohio. It is explained that the tub and can are of similar quality as their Peerless freezers, and that the dasher is what is known as the leaf form with a wood scraper attachment. The tops and bottoms of the cans are composed of iron heavily galvanized, obviating, it is remarked, liability of their becoming dented or becoming filled with pin holes, as is apt to be the case with

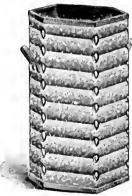

The lecland Freezer.

the ordinary tin tops and bottoms. The gearing is completely covered above and below, concealing it from view, insuring cleanliness and adding to the appearance of the freezer. The company state that important improvements have also been made on their line of Peerless freezers.

#### Corrugated Ash Can.

Illustrated herewith is a corrugated ash can put on the market by the E. E. Souther Iron Company, St. Louis, Mo. The can is hexagon in shape, and this feature is claimed by the manufacturers to be a valuable one, as it absolutely

Corrugated Ash Can.

prevents denting, no matter how hard the usage the can is obliged to stand. It is pointed out that as the can is made of galvanized corrugated fron this renders it practically indestructible, and that with ordinary usage it will last a lifetime. The handles are securely fastened, and the entire can is made unusually strong.

#### The New Rochester Lamp.

The Rochester Lamp Company, 42 Park place and 37 Barclay atreet, New

Fig. 1 .- Chimney Lift.

York, are placing upon the market a lamp embodying the improvements il-lustrated in the accompanying cuts. Fig. 1 shows the new chimney lift, so-called, on the lamp By this device the lamp can be lighted without taking off the chimney. The whole top part of

lighted, when it can be dropped into

place ready for burning.

Fig. 2 is a section of the burner showing the perforated cone or thimble with double deflector, which is slipped over the outside of the air tube, a sectional view of the cone also being shown in Fig. 6. The lower rim of metal seen about ‡ inch below the top of cut deflects a portion of the air rushing up the tube and forces it into the flame. The upper deflector, the top of

Fig. 2.-Perforated Cone or Thimble, with Double Deflector.

guard, which has oblique oval openings to prevent crusted wick, flies, &c., from accumulating in what came to be known as a dirt pocket in the old pattern, the particles absorbing oil and

Fig. 3. - Wick and Wick Sleeve.

which is also perforated, feeds into the | emitting an odor when the lamp was tlame fresh supplies of oxygen, thus | burning.

wick, which can be easily lighted from under the chimney holder. Provision la also made for locking the top part of the burner up, so that it will remain in position with the wick exposed until

Another Improvement in the lamp is consuming any gas which may have Another improvement in the lamp is eacaped below. This illustration also the draw bar or wick lift. This is

Fig. 7.-Table Lamp with Handles,

brings out clearly a radical improve-ment known as a perforated raised dirt | lamp, Fig. 3. The wick sleeve is made

in two longitudinal sections, hinged together near the lower end of the sleeve. Around the top edge of each section are points for holding the wick In putting on a new wick the sleeve is

closed at the top, as shown in Fig. 4.

The wick is then slipped over the sleeve, and as the sleeve is slipped over the central draft tube with wick surrounding it, the sections of the sleeve expand and the points at once enter the expand and the points at once enter the wick and firmly hold it in place, as shown in Fig. 5. The wick is lowered into the lamp and the burner screwed on in position. Fig. 6 shows the New Rochester stock lamp, with the inside mechanism clearly represented. The cone slips over the outside of the air tube, thus preventing any required. weeping-a technical term to designate the siphoning out of the oil over the top and down the inside of the air tube. In Fig. 7 is shown one of the popular styles of the New Rochester table lamp, with handles.

The New Rochester is made in a large number of different designs, but all having the same burner. This lamp is now made under the direct super-vision of the Rochester Lamp Company, at Bridgeport, Conn., and an exceedingly full line of samples is displayed at their capacious salesrooms in New York.

#### Parker's Victor One-Pound Mill.

The cut here shown is of a 1-pound coffee mill, put on the market by The

The Bellaire Stamping Company, Harvey, Ill., are now putting on the market a desirable line of decorated tea and coffee pots finished in blue, plum and chocolate colored enamel, with

Decorated Tea and Coffee Pots.

white ensuel inside. An example of the line is illustrated in the accompanying cut. The decorations are "hand work" of a new character, employing enamel colors so that the design stands out from the surface of the ware, giving a unique and pleasing appearance. The goods are finished with cnameled wood handles, preventing

Parker's Victor One-Pound Mill.

Charles Parker Company, Mcriden, Conn., and 97 Chambers street, New York. The body of the mill is of light wood in natural finish, surmounted by metal in copper bronze finish.
The receptacle to receive the ground coffee is of japanned tin, resting on an arm attached to the door, so that it is drawn forward when the door is opened. The hopper is of a size to contain a pound of unground coffee. The manufacturers remark that the mill is a rapid grinder; that it is well made throughout, and that it is attractive in appearance.

heating, and the covers and other metal trimmings are of heavy brass, nickel plated. A catalogue descriptive of these goods with prices will be sent on application, aed the firm are prepared to furnish special catalogues illustrating the goods in colors.

#### MEMORANDA.

THE ROME MEG. COMPANY, Rome, N. Y., are issuing circulars calling attention to the Rome nickel plated copper tea and coffee pots, 300 series. The illustrations show very neat and attract-

ive looking articles, and the accompanying text explains that the pot is made with wooden handle, wire tops, with sponts and lids attached to the inside of the pot and cover full size of top. The teapots are made in 3, 4, 5 and 6 pint sizes, and the coffee pots in similar sizes.

THE STOVE STORE Of Charles S. Stevens, Cedarville, N. J., was destroyed by fire on December 5.

THE ILLUSTRATED CATALOGUE AND PRICE LIST FOR 1895 Issued by the Wisconsin Refrigerator Company of Enu Claire, Wis.. is a nest volume of 30 odd pages, bound in heavy manila paper. In a note with which this seventh annual publication of the compacy is prefaced, particular attention is directed to the Wisconsin Pecrlesa refrigerator, the meritorious features of which are emphasized. The reasons for the superiority of this refrigerator are given at full length a little later on, and then comes the catalogue proper, with illustrations of the several styles. Sectional views in the beginning show the construction of the refrigerator, and later general views are presented of a large number of different sizes and styles of the Wisconsin Pecrless. They show refrigerators of the plainer sort adapted to household use, and others of more elaborate design; also grocers' and butchers' refrigerators and several styles of sideboard refrigerators, as well as ice chests.

THE DOMESTIC OIL CAN COMPANY, Canton, Ohio. issue an attractive circular and catalogue of their manufactures. The oil cans illustrated are the Domestic, the Royal and the Imperial. A pretty half tone engraving shows a child filling a lamp with the Domestic can, and the point is emphasized that there are the property of applies a drop of oil is no danger of spilling a drop of oil.

These various cans are made in several

GEORGE W. Fox, Trenton, N. J., has his store located at the corner of two streets and uses almost his entire wall exposure for show windows for the display of tin and copper utensils of every description, as well as stoves for oil and gas, all of which are attractively presented.

An inonmonger, tays an English journal, had occasion to take a lady customer into the show room where shrouds were kept, and she, evidently noticing the boxes marked "Lawn Robes," said, in an inquiring tone, "I didn't know that you kept 'tennis robes.' What are they like?" Needless to say, when the ironmonger explained she did not ask for any further information. An inonmonger, tays an English information.

A NEW ADVERTISING SCHEME has been perpetrated on New Yorkers by a Broadway merchant. The large plate glass in the front show window has apparently been shattered by stone throwing. On the glass is displayed an offer of \$1000 reward on the firm's letter head for the arrest and conviction of the person who threw the missile. closer inspection reveals the fact that pieces of window glass have been fast-ened ingeniously to the inside of the plate, radiating from an irregular hole 5 or 6 inches in diameter, over which is pasted a piece of manila paper. The illusion is kept up by streaks of a pale green color, resembling cracks, reaching to the sides of the glass. The object, naturally, is incidentally to get the pedestrian's attention to the goods in the window.

# TIN PLATES.

### The Morton Tin Plate Company.

About the middle of last June a party of gentlemen met at Cambridge, Ohio, and discussed the advisability of build ing a tin mitl. It was decided to take chances in regard to tariff legislation and commence the erection of a plant. The company was named the Morton Tin Plate Company, as the site selected was on the Morton estate. On July 5 articles of incorporation were issued, and the following officers were elected : John W. Marquand, president; Chas. L. Campbell, vice-president and treas-urer; John C. Beckett, secretary; A. Beard, Jr., general manager, and John C. Morton, director. About 75 acres of the Morton estate were purchased, and 220 lots were laid out in the part of it known as the Cambridge Fair Grounds. These lots were sold to the people of Cambridge at a common price of \$120 each. After five monthly payments had been made the lots were distributed and the arrangement gave general satisfaction. The tin mill company receive a handsome profit on the undertaking, and the lots are deeded to a trustee until all parties to the agreement have filled their contract.

The location is at the junction of the Cleveland & Marietta Railroad and the Baltimore & Ohlo, each road having tracks on either side of the building, which is elevated to the level of the

floors of cars.

The building of this plant presents a remarkable illustration of what can be done with push and energy. Ground was broken on August 20, and the work has been accomplished by a body of workmen who were, with one exception, inexperienced in the work performed. Notwithstanding this fact the result has given perfect satisfaction to the projectors, and the plant is modern in every particular. Every plece of machinery and all other material is new, nothing second hand being used.

The plant consists of three hot mills for black plates driven direct by a Hamilton Corliss engine 32 x 60 inches. Also three stands of cold rolls, with foundations already laid to double this capacity, which is now 2000 boxes per week. All the machinery is placed under one large building 200 x 130 feet, and the only outbuilding is a blacksmith and carpenter shop combined.

The building, constructed of iron and steel, was furnished by the Wrought Iron Bridge Company, Canton, Ohio.
Two engines, one 32 x 60 inches and

Two engines, one 32 x 60 inches and one 24 x 48 inches, were furnished by the Hooven, Owens & Renstachler Company, Hamilton, Ohio.

The boilers (return tubular) were bullt by the Eric City Iron Works, Erie, Pa. The Leechburg Foundry & Machine Works, Pittsburgh, Pa., furnished three stands of hot rolls 24 x 32 inches, and three stands of cold rolls 20 x 32 inches, three doubling shears, two vertical trimming shears, one roll lathe and one Mesta patent pickling machine; 650,000 brick were used in the foundations and boiler settings.

If nothing interferes some trial heats

of black plates will be rolled about December 17, and every detail of the construction will be completed six months from the time when the projectors held their first meeting. The plant was designed by and erected under the personal supervision of A. Beard, Jr., General Manager. The company will shortly commence to build a tinning house.

#### Tin Mines of Australasla.

United States Consul General Diniel W. Maratta, at Melbourne, Australia, in a recent report to the State Department on the mining industries of Australasia, gives the following information in regard to the production of tin in that region:

#### New South Wales.

In New South Wales, within the past few years, large quantities of tin have been discovered. The area in which this mineral is found is estimated at 8500 square miles, the principal source of supply being in the beds of rivers and creeks (stream tin). Small quantities are also found in veins and lodes. In 1892 the output of tin from the New South Wales fields was 3492 tons, valued at \$1,529,735.

#### Queensland.

In Queensland the principal tin mines are found in Herberton, Stanthorpe and Cooktown districts, near the Northeast coast of the colony. It is thought by many geologists that this metal will be found to be almost inexhaustible in Queensland. In 1892 the output was 2389 tons, of the value of \$599,487.

#### Victoria.

The tin mines of Victoria only produced  $52\frac{3}{4}$  tons of ore during the year 1892. The Eldorado Mine contributed most of this.

#### Tasmania.

The most valuable product of the colony of Tasmania is tin, which, to a certain extent, rules the tin market of the world. From 1873 to 1890, inclusive, 53,874 tons of metallic tin and 6414 tons of ore were exported from the colony. R. M. Johnson, F.L.S., the Government statist, states that the yield of metallic tin up to the present time would represent a column as high as Mount Wellington (4166 feet) and nearly 8 feet square.

#### Tasmania Tin Credited to Australia.

The greater portion of the tin produced in Queensland and Tasmania is usually returned as the product of New South Wales, owing to the fact that the two former colonies ship the greater part of their tin to New South Wales, whence it is shipped to England, together with the tin actually produced in that colony. This has the effect of exaggerating the actual yield of tin in New South Wales, and diminishes the importance of the tin production of Tasmania and Queensland. The following

table will show the false position in which the colony of Tasmania is placed:

Value of Imports, by Countries, of Tin Into the United Kingdom and the Actual Exports From Countries of Production in the Year 1893:

Country. Straits Settle.	Nominal Imports.	Actuat exports.
ments	\$6,541,558.44	\$6,541,558.44
New South Wales Tasmania	3,208,903.16 118,629.20	1,130,838.35 1,741,448.69
Queensland Alt other coun-	135,883.05	759,597.26
tries	612,107.76	443,638.87

Total...... \$10,617,081.61 \$10,617,081.61

Of the 324,023 tons of metallic tln imported into the United Kingdom from 1877 to 1890, inclusive, Tasmania produced 58,242 tons, or nearly 18 per cent., and therefore atanda next to the Straits Settlements as the most important tin producing country of the world.

#### Principal Mines.

The most important tin mine in Tasmania is the Mount Bischoff, at Waratah, in the northwestern part of the colony. The mine was discovered by James Smith in 1871, and at the present time produces one-half the tin product of Tasmania. The other mines are the Arba and "A. J. J.," at Branxholm; Kruska Bros. and Black Boy, at Ringarooma; Blue River and Ruby Flat, at George's Bay, on the east coast, and a number of smaller claims. Tin has recently been found on the west coast, in the Mount Zeehan district.

#### SCRAP.

THE FORD & DONNELLY FOUNDRY COMPANY, Kokomo, Ind., are reported to have considerably increased their working force for the manufacture of the tln plate machinery they are putting in at Atlanta, Montpelier, Anderson, Gas City and other Indiana works. They have just completed a shipment of four additional tinning pots and four tubular boilers to the Atlanta Steel & Tin Plate Company, Atlanta, Ind.

THE WELSH TIN PLATE SITUATION continues to be critical. Representatives of the tin plate workers had a conference with the manufacturers at Llanelly, Wales, last week, at which the former declared their unwillingness not only to accept the reduction of 25 per cent. in their wages, but even to make any concession at all. They offered, however, to stop work one week in every four in order to reduce the stocks, but the employers replied that this would simply increase the cost of production, which at present was greater than they could bear, and tend to throw the trade into the hands of the American makers. The London Iron and Steel Trades Journal states that nearly all the tin plate works in South Wales are going on day to day contracts, and it is expected that unless the men either submit to a reduction in wages or make a concession in the number of boxes turned out the manufacturers will suspend operations, throwing a large number of workers out of employment.

THAT TIN PLATE PROPERTY in England is not looked upon just now as desirable investment was proved at the recent auction sale of the Abercarne Iron & Tin Plate Works, Abercarne, Monmouthshire. These works, which are situated about 10 miles from Newport, are held under a lease, having an unexpired term of 42 years, at a ground rent of about \$2000 a year. They consist of four works, viz: the Lower or Old Works, having four tin plate mills (one works, naving icur tin plate mills (one of which is driven by water power) and the other necessary auxiliary plant; and the Upper or New Works, having a forge, five tin plate mills and the other auxiliary plant. There are also a manager's house and eight cottages, vitrol works and gas works. The vitriol works and gas works. The works are well provided with railway accommodation and the water rights are an important feature. In accordance with instructions from the executors of the late owner, Daniel Whltehouse, the whole property was placed at auction last week. The bidding was very slow, mounting up to only \$50,000, a sum which was considerably below the re-serve price. The property was consequently withdrawn.

THE BALTIMORE IRON, STEEL & TIN PLATE COMPANY, Locust Point, Baltimore, Md., whose works have been closed down for some time owing to a dispute as to the wage scale, have issued a notice to their former employees that work will be resumed next Monday. All the former workmen will be received back who agree to the new rates proposed, which embrace a re-duction of about 25 per cent.

WE ARE ADVISED by cable from London that the management of the Morewood Tin Plate Works, at Llanelly, Wales, have accepted their workmen's offer to continue at a 10 per cent, reduction in wages.

ARTHUR MORGAN, formerly with the American Tin Plate Company, Elwood, Ind., and more recently superintendent of the tinning plant of the St. Louis Stamping Company, has been appointed auperintendent of the tinning department of the Atlanta Steel & Tin Plate Company, Atlanta, Ind. Mr. Morgan has had very wide experience in the manufacture of tin plates, both in this country and in Wales.

THE arguments in the equity case of the Amalgamated Association against the United States Iron & Tin Plate Mig. Company, Demmler, Pa., to restrain that concern from operating their plant with non-union men and at a lower scale of wages than was fixed in conference in July last, came up in the courts in Pittaburgh on Monday, the 3d inst. After the bill of the plaintiffs had been recited the court inquired if there was a remedy in equity in personal contracts. The counsel for the plaintifla answered in the affirmative, but the court expressed a doubt, and after a long argument on this point the prayer for a preliminary injunction was withdrawn and a plea for a decree for damages for the wages of the workmen on the contract was substituted. M. M. Garland, president, and J. C. Kilgallou, secretary of the Amslgamated Association, were the only witnesses examined. They related the circumstances of the several conferences M. M. Garland, president, and with the manufacturers and told of the atipulation for a change in the scale contingent on a material reduction in After long arguments by the tariff. both sides the hearing was adjourned, and a decision was expected to be rendered later.

#### Drawback Rates.

The Treasury Department has issued a synopsis of all the decisions rendered during the past few years in regard to drawback rates. We print below those likely to be of interest to the readers of The Metal Worker

The Metal Worker:

Agate Iron Ware: manufactured by the Lalance & Grosjenn Mfg. Company of Woodhaven, N. Y., from imported sheet iron, same as duty paid. Add to the weight of the sheet iron blanks entering into the manufacture the following percentages of said weight, viz: Add for wastage in cutting: All circular blanks, 21½ per cent.; all oval blanks, 11 per cent. Add for wastage in stumping: All circular blanks for milk boilers, 20 per cent.; all circular blanks for Berlin and convex squeepans, and stove pots and sauce pots, 16 per cent.; and all circular blanks for all other stamped goods, Sper cent. De luct forvalue of scrap resulting from finishing all blanks "spin" and "trimmed." ½ per cent.

Cans and boxes from tin plates, same as duty paid. Quantity to be ascertained as follows: For rectangular 5 gallon cans, allow 258 pounds for each hundred cans (unde from a combination of plates 14 x 20) inches and

allow 258 pounds for each hundred cans (made from a combination of plates 14 x 20 inches, with plates 10 x 20 inches) and for each hundred cans made from a combination of plates 14 x 194, inches with plates 10 x 20 inches, allow 252 pounds. For cans and boxes of other capacities, add to the weight of the blanks the following percentages: On rectangular

For cans and boxes of other capacities, add to the weight of the blanks the following percentages: On rectangular blanks, 3 per cent.; on body pieces of frustum shaped cans, 7 per cent.; and ou circular, elliptical and oval blanks 15 per cent. When no blanks are furnished, the quantity of tin may be determined by adding 5 per cent, to the surface of finished cans to cover seams and wastage.

When articles entitled to drawback on exportation, made whofly from imported tin or terne plates, and on which no allowance for wastage is to be made, are exported in such condition that their weight may be determined by a United States weigher at the time of exportation, such weight shall be accepted as the basis for the liquidation of the drawback entry.

When 5-gallon tin caus are made from a combination of two plates, each 14 x 1914 inches, with one plate 10 x 20 inches, all standard IC tin plates, the quantity of plate used in their manufacture may be determined by allowing 214 pounds for each can exported; provided that, should the plates used he shown by the records of importation to weigh less than 215 pounds, the rate here fixed shall be correspondingly reduced.

The superficial quantity of tin or terne

pounds, the rate here fixed shall be correspondingly reduced.

The superficial quantity of tin or terne plates used in the manufacture of boxes or cans other than the 5-gallon can above noted, or of other articles made from such plates, may be determined by measurement of the blanks or parts of which the box, can or article is composed, and by the addition to surface quantity of the respective parts, to cover wastage in manufacture, of the following percentages:

uses of tin terne plate, provided that such allowance shall in no case exceed 25 per cent, of the weight of such blanks, except under special instructions from the Department.

When articles are made from uncut plutes or from rectangular blanks ent from plates from which the rough edges have not been trimmed in process of manufacture, no allowance shall be made for wastage.

In case samples of caus or boxes and In case samples of caus or toxes and blanks (when blanks do not so appear in the finished articles that they may be measured; are not furnished by the ex-porter, the quantity of the unterial used may be determined by adding 5 per cent, to the surface measurement of the flato the surface measurement of the fin-ished article, to cover seams and wastage in manufacture.

m manufacture.

Cans, from tin plates, completed, with the exception of soldering (blanks), same as duty paid. The exported quantity determined by a United States weigher.

Cons, cracker, from tin places and glass, same as duty paid. Exported quantity determined by measurement of the pieces

determined by measurement of the pieces before they are put together. Caramel Tins: manufactured by Ginna & Co., New York, from imported tin plate, 14 x 20 inches, weighing 85 pounds per box of 112 sheets, same as duty paid. Allow for every 165 caramel tins exported one sheet of tin plate, size and weight in-dicated above, provided no scrap tin is used.

orrugated Iron roofing, painted, from orrugated Iron roofing, painted, from sheet iron, same as duty paid on the iron. Deduct I per cent, from exported weight on account of weight of the paint, bust I rans, embossed tin trays; manufactured by Leo Schlesinger & Co., same as duty paid; add to weight exported articles, for 13 inch round trays, 22 per cent;

cles, for 13 inch round trays, 22 per cent.; for dust pans, 2 per cent.

Embossed Ton Cuspidors: manufactured by David Block of New York wholly from imported tin plate, same as duty paid. Add to net weight of exported goods 33 per cent.

Embossed Tea Trays: manufactured by Franklin Hallet & Co., Philadelphia, Pa, same as duty paid. For all sizes round and oval trays add 25 per cent. Allow for all sizes, square, oblong and rectauring trays and respondents.

Franklin Hallet & Co., Philadelphia, Pa, same as duty paid. For all sizes round and oval trays add 25 per cent. Allow for all sizes, square, oblong and rectaugular trays equal weight.

Embossed Tin Trays: manufactured by the Palmer Mfg. Company of New York City, same as duty paid. Add to net weight 10-inch round trays, 41 per cent.; 13-inch round trays, 37 per cent.; 14-inch round trays, 37 per cent.; 14-inch round trays, 27 per cent.; 18-inch square trays, 6 per cent.; 11 x 14 oblong trays, 7 per cent.

Galranized Wire Handles to tin cans, made wholly from galvanized wire, No. 9, manufactured from imported spelter, and iron rods, or bars, billets, or blooms, and attached to tin cans, same as duty paid. Allow for each 1000 handles weighing not less than 31 pounds to the 1000, 1.55 pounds of spelter, and, as the case may be, 31 pounds iron rods, or 33 pounds of iron bars, billets, or blooms; and for each 1000 handles weighing not less than 28 pounds to the 1000, 1.4 pounds of spelter and 28 pounds of iron rods, or 31 pounds of iron bars, billets, or blooms.

Lithographic Tin Plates; Manufactured by S. A. Ilsley & Co. of Brooklyn, N.Y., from imported tin plates, same as duty paid. Deduct from net weight exported articles 4.6 per cent. of such weight.

Nestable Dinner Pai's: Manufactured by F. G. O. Ehle & Co. of Buffalo, N. Y., from imported tin plate, same as duty paid. Deduct from gross weight 15 per cent.

The process of placing the colossal bronze statue of William Penn on the top of the tower of the Philadelphia City Hall was completed on November 28, and the figure now stands at the highest elevation of any statue in the world. Alexander Calder, the aculptor of the statue, has protested vigorously against the action of the people in charge of the work in fixing it so that the face of the figure looks toward the northeast instead of the south. claims that the latter position, facing this light, is the only one in which the details can be seen at such a hight. The Commission have, however, overruled his protest.

#### The New Norton Can Factory.

The can factory which has just been erected at Maywood, Ill., by Norton Brothers is a model factory. So many Brothers, is a model factory. So many excellent ideas have been embodied in its construction that it is well worthy of extended description. While it has been built for a special purpose, there are many points in connection with it which will be found of value by manufacturers in other lines. It is somewhat difficult to enumerate all the purposes which have been kept in view by those who planned the factory, but among them are the thorough distribution of natural light, the highest possible comfort of the help, the economical handling of materials, the absolute safety of dies and patterns, the reduction of the fire risk to a minimum, the prevention of stoppages from break downs, close supervision of all departments from the central authority, &c. How well these various matters have been provided for, as well as many other important details in manufacturing economy, will appear in the course of this de-

scription. In the first place, the owners of this establishment have not been hampered by lack of room. They were therefore able to apread out instead of building up in the air. The factory is only two stories high, but it is 243 feet aquare. As will be seen by reference to the accompanying plans, it is built with an open space or court in the center, which is 101 feet square. The various thoors of the factory, therefore, are 71 feet in width, and aggregate over 120,000 feet of floor space. The walls of both the of floor space. The walls of both the exterior and the court side are pierced with windows, placed only about 2 feet apart. In this way, as the ceilings are high, natural light easily penetrates to the center of every room even on the gloom-The basement of the buildiest days. ing is unusually high, as it is not used for manufacturing purposes, the floor of the first atory being over 4 feet from the ground level. This affords room for the passage of shafting or for access to pipes, and also enables the dressing rooms in the courtyard to be constructed with their roofs below the level of the windows of the first floor, so as rot to obstruct the light. The kilns which are seen along one side of the building are used for drying painted and japanued packages, lithographed work, &c., and are built in two tiers on the roof of a tin plate storage house. This house is built of brick, with a roof of 12-inch ateel beams apanned by brick arches, has a cement floor and is heated by hot blast to keep the tin plate from sweating and rusting. The roof of the tin plate storehouse also comes below the level of the windows of the first floor, so as not to obstruct light, and the kilns above are arranged in separate blocks for the same purpose, instead of extending in one unbroken line. The interior walls and ceilings are whitewashed, except in the lithographing and painting rooms, in which the ceilings are painted to prevent dust from failing on the work. The courtyard wails are also whitewashed. shows the pains taken to secure the ut-most amount of natural light.

It has long been the theory of Norton Brothers that the comfort and convenience of employees should be carefully studied by those who employ them. In the arrangement of this factory, therefore, the utmost consideration has been given to the care of the help, with a view to promoting their health and comfort, instilling into their minds the love of order, inculcating cleanliness,

The approach to the factory is therefore made inviting. A fine lawn is arranged in front of it, in the center of which is a fountain surrounded by a large basin holding 125,000 gallons, which serves as a reservoir for fire pur-The employees pass through an arcade, as shown on the plan, into the court. Here they find nicely arranged dressing rooms with rows of wardrobes, each numbered to correspond with the time numbers of the employees. Room is each wardrobe is a drawer. thus provided for wraps or extra garments. As girls are employed to a considerable extent in this factory, separate dressing rooms are provided for them. At one end of each dressing room is a

such as to create an outward flow if a door or window is opened, so that there are no drafts. The care which has been given to the comfort of the employees is highly appreciated, and Norton Brothers believe that the money spent for this purpose has been well invested.

Referring to the plans it will be seen that two fire walls divide each floor into three compartments. These fire walls are pierced by doorways only. The doorways are guarded by sliding doors covered with metal, which are always open, but are weighted on an inclined runway, the weight being released by a fusible plug which melts at a low temperature. They will thus close automatically in case of fire. Automatic sprink-

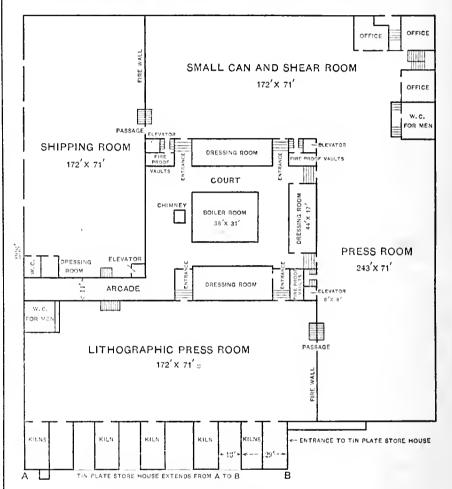

Fig. 1.-Plan of First Floor.

NORTON BROTHERS' FACTORY AT MAYWOOD, ILL.

long slate washstand with a number of hot and cold water faucets, so that the employees can wash before going home. There are no water closets in these dressing rooms. The water closets are arranged in the several departments of the factory, separate closets being provided for the sexes. In each case there are a number of separate compartments fitted up in the most improved modern style of plumbing with automatic time The men'a closets contain flushes. urinals. All the surroundings are of a character to promote cleanliness. ilbors of the closets are cemented so that they can be frequently washed. Special attention has also been paid to heating and ventilation. The entire fac tory is heated by hot blast, a steam coil being placed in each department through which a fan forces a constant aupply of fresh air, provision being made to exhaust the impure air. The pressure of the heated air, however, is

iers are also placed throughout the entire building as an additional safeguard against fire. Elevators are placed in the corners of the court outside of the They are inclosed in brick building. shalts so that they will not form fire conductors. Fire proof vaults are built projecting into the court for the atorage of dies and patterns, a great deal of room for such storage being necessary on account of the variety of work done. A very large fire proof vault is built in the second story immediately over the arched brick roof of the arcade. It is The used for sheet metal patterns. method of storing these is noteworthy. Iron tracks are hung from the celling across the vault from side to side. Wooden racks of heavy frame work are ers. The patterns hang on pins on the racks, filling both sides. The vault is wide enough to permit two racks to hang on each track with a passage of the width of a rack between them. rack can thus be pulled out into the passage to be examined. These racks are asystematically indexed, so that a

pattern can be instantly located.

A system of railroad tracks for narrow trucks connects this factory with the other portions of Norton Brothers' The cars on these tracks are plant. drawn by an electric locomotive operated by storage battery. The buildings connected are the rolling mill and foundry, the tin plate factory and the fruit can factory, all in detached buildings. Tin plates are brought to the new factory on trucks loaded in the tin plate works, and they are then stored in the tin plate storage house or

run to line shafting in one department and to dynamos which supply current for electric motors in other departments, no fire walls being pierced by shafting. The three-wire Edison electric system is used, by means of which incandescent are and power service are secured from the same source About 100 horse-power is used for mechanical purposes. The lighting plant consists of 70 are lights and 560 incandescents, the arc lights being used for large open spaces and incandescents for work around machines and benches. electric plant is not dependent upon the power in this factory alone, as it can be operated from the power plant of the tin plate works if that should be-

NORTON BROTHERS' FACTORY AT MAYWOOD, ILL.

can be drawn on a hydraulic elevator and hoisted to either floor, whence tracks run through the several depart-ments. The arrangement of the factory is such that from the time the tin plates are landed at a presa the work goes constantly forward until it reaches the shipping room, from which it is loaded directly into cars on a track running by the side of the building.

The power for operating the ma-

chinery is furnished by two Babcock & Wilcox boilers, located in the boiler room in the court. One of these is held in reserve, each being capable of running all the machinery. Oil is used for fuel. It is stored some distance from the building and pumped in. The engine room is in a portion of the fac tory opposite the boiler house and con-tains two 150 horse-power Ball compound engines, so connected that they can be run together or separately. Either will do the work required. A jack shaft is used, from which belts are come necessary at any time. This interchangeability of power is also extended to the pumping plant by which water is forced into towers at the corners of the court for operating the aprinkling The pumps take steam either system. from the boilers of this factory or from boilers in other parts of the works.

An admirable system of telephoning has been installed. The several departments of the new factory, as well as the older portions of the plant are connected with a central exchange in the office connecting the 20 telephones. Thus the superintendent can slt at his desk and be put in instant communication with the foreman of any department, with two separate foremen when it becomes necessary for a three cornered conference or investigation. The local wires are further connected with the main office in Chicago and with the whole Chicago telephone service and with the long distance telephone to the leading cities of the country.

The tln scrap made in this factory is utilized on the premises. As rapidly as it accumulates it is collected at a baling press and compressed into small bulk, after which the bales are taken to the foundry and the metal is run into sash weights. The sash weight foundry was started some two years since and has proved to be a very satisfactory channel through which to convert tin scrap into a marketable product.

The products of the new factory cover all kinds of packages made of tin plate except fruit cans, a separate building, heretofore referred to, being devoted to the manufacture of these by the Norton Automatic system. The machinery, therefore, comprises a very great variety of presses for cutting tin plate into the necessary sizes and shapes, gang presses being introduced wherever practicable. Machinery of original design, made in Norton Brothers' machine shop, is used for special operations; but there are, nevertheless, many styles of packages which must be made largely by hand, involving the employment of much skilled labor. In the lithographing and painting department the most elaborate decorations are designed and executed for packages requiring such treatment. Throughout the entire plant the visitor is impressed with the thoroughness with which everything has been done to make the factory as perfect a workshop as possible.

A novel plan for catching trade is mentioned in the Ironmonger as having been adopted by the Arma and Ammunition Mfg. Company, a London cor-poration. Under this plan customers purchasing the goods of the company to any specified amount in one year are presented free with a life assurance policy for the same amount covering the following year. Thus, if a customer buys \$500 worth of goods in 1894, he is given a policy for that amount, valid during 1895, the assurance being great test by the year. ance being guaranteed by a well-known assurance office. The idea is good, and will probably be largely imitated.

The King of the Belgians has offered a prize of \$5000 for the best plan of supplying the city of Brussela with drinking water. The competition is open to all the world.

The aggregate length of telegraph lines in existence throughout the world is computed at 1,069,12 3 miles. total is made up as follows: Europe, 382,937 miles; Asia, 67,875 miles; Africa, 21,687 miles; and Australasia, 47,812 miles. This leaves 548,822 miles for America.

The Canadian Trade Review reports that the subscriptions for the 3 per cent, loan of the Government of the Dominion of Canada have aggregated over \$56,000,000, although the loan only called for \$11,250,000. The min-Imum price was fixed at 95, but the bulk of the loan was subscribed for at an average of 974

During a single month the Western branch of the Hartford Steam Boller Inspection & Insurance Company inspected 13,391 steam boilers and found 11,308 defects, of which 976 were dan-The most important defects were the following: Incruitation, 1903; internal corrosion, 630; deposit of sediment, 840; defective riveting, 1600; leakage, 1656; defective gauges, 525, &c.

### PLUMBING and GAS FITTING.

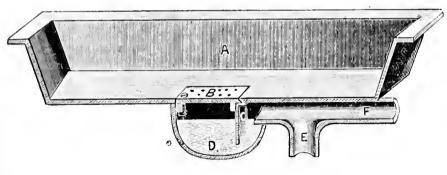

### The National Conventions of Plumbers for Business.

The following letter is received from John Mitchell, president of the National Association of Master Plumbers:

On behalf of the Executive Committee of the National Association of Master Plumbers I have been requested to say through the medium of the trade press a few words to manufacturers and jobbers of plumbing material. It has been noticed at the last two conventions that an imposing association, known as the Knights of Tabasco, have been in attendance. It is to be regretted that at the conventions alluded to there has been considerable jollification on their part. The attendance of these gentlemen, mingling with the delegates from the various fillal associations, has had the effect of diverting the attention of the delegates from the business of the convention. I speak on this aubject with regret, but with the hope that what I may say will not be directed against those courteous and elegant gen-

jobbers sending their agents to confer with the delegates upon any questions, business or otherwise, but it is hoped that when their object shall have been accomplished their mission will end. I am an advocate of harmony and good fellowship between manufacturers and master plumbers, as I have always regarded their interests as identical, and if pursued in a business like manner might result beneficially to both. I have hopes for the conventions of the future and my associates in each of the cities in which they may meet. The proceedings should be conducted orderly and without delay, enabling the return of the members to their homes and vocation.

I was convinced by the last convention at Detroit of the necessity of precluding from the floor of the convention all others than members coming from filial associations. I have, therefore, at the request of the Executive Committee, been delegated to provide to all delegates having proper credentials a ticket of admission. The ticket is to have the name of the delegate for

Cambinatian Sink and Trap.

tlemen connected with the Knights of With entire respect for this Tabasco. large, social and respectable organiza-tion, I regret that there are a few who have given displeasure to the many. feel that the better course to he pursued is to allow the members who have come from long distances at great sacrifice as representatives of their associations to attend to the business of the convention without having any other business to take up their attention than that which they were delegated to look after, and also free from all tendency to intemperance and nonsensical display. Many manufacturers and jobbers may, perhaps, think it is a duty expected of them to send their agents to our conventions in order to secure trade. Such is not the case. Delegates attending the conventions have left such business behind and the manufacturer who hopes for large orders and pecuniary success from the attendance of their representatives will, I think it is safe to say, be disappointed. It is to be hoped that the manufacturers will relleve themselves of the large expense incident to sending their agents to our conventions, as, unfortunately, their time is mostly spent in having a good time and with no resulting financial in-terest to the acuders. Of course, we cannot prevent the manufacturers and whom it is intended, with the name of the national accretary. These tickets will be ready immediately after the report of the Credential Committee and will cause no delay in the order of business, but in the end will facilitate business. By this means it is hoped that only delegates will be admitted to the floor. This proceeding is not intended to interfere with any body of men who wish to attend the sessions, from taking seats in the gallery or any other place set aside for that purpose.

#### Combination Sink and Trap.

Johnston & Meyer, 1606 South Seventh atreet, St. Louis, are placing on the market a combination trap and sink as illustrated herewith. Reference to the cut will indicate the arrangement of the trap. A, shows the sink proper; B, the strainer; C, the rubber valve or seal plate; D, the water in trap, while E and F are the waste and vent. It will be noticed that the sink and trap are all in one piece, being cast in that manner. The manufacturers claim that it is impossible for the trap to hurst, though it may freeze. In addition to pointing out the advantages of a trap that will not burst, the manufacturers also state that the price of the combination trap is about the same as the lead trap.

#### A Plumbers' Smoke.

The Master Plumbers' Association of Paterson, N. J., issued a handsome card inviting their friends to their first "Smoke," held at Helvetia Hall, last Tuesday evenlng, in that city. Invita-tions were sent to the journeymen and helpera, also to the tinsmiths of the city and to their friends in the plumbers' supply trade and to the trade press. The hall was attractively decorated, and the following committee of arrangements received the guests: T. S. Wilson, John Campbell, A. J. Flelding, George Thomas. George P. Whritenour, J. Davenport, J. S. Asbell. The first to arrive were the tinners in a body, headed by the president, Walter Brooks, and accompanied by the Marshal drum and fife corps, who wore badges made of tin by Benjamin F. Gould, one of their mem-bers. The "Smoke" occurred on the same evening as the regular meeting of the Piumbers' Association, who arrived next in a body, headed by President next in a body, headed by Fresident John Hickman and Secretary McNab, accompanied by a band of music. Among the guests were D. A. Crowley, representing the Holland Radiator & Mfg. Company; William G. Kimber, E. O'Brien and Wayland E. Smith, representing the plumbers' supply house of George D. Kimber of Brooklyn; C. V. Haynes, representing the steam and hot water department of Dubois & Darrow; James Watson and J. Males, representing the McNab & Harlin Mig. Company; W. M. Cosgrove, representing the A. A. Griffing Iron Company; W. H. Utz, representing Jenkins Brothers, and Irving S. Davis. The Board of Health of Paterson and Plumbing In-spector McDonald were also present. President Hickman welcomed the guests in an appropriate speech and the entertainment of the evening began with music by the drum corps, which was followed with selections by the string band and a mandolin chorus, a violin solo by George M. Thomas also being rendered. Several of the members favored the gathering with songs, and J. Beggs danced several jigs and clogs. Several of the visitors were introduced by President Hickman, with characteristic remarks, and made entertaining apeeches. During the entertainment clay pipes and tobacco ad libitum were distributed among the guests. Letters of regret were read from John Mitchell, president of the National Association of Master Plumbers and H. C. Coles of the National Association of Master Plumbers and H. G. Gabay of the National Executive Committee, stating that the regular meeting of the New York Master Plumbers' Association prevented their attendance. At the close of the entertainment President Hickman made allusion to the loyalty of the New York Master Plumbers and to the surprisingly large turn out of Paterson plumbers at this meeting, and hoped that as good an attendance would be found at the next meeting of the Paterson master plumbers. He closed his remarks with an invitation for all to proceed to a banquet hall, where an extensive collation was served, and the guests, after manifesting their appreciation of it, de-parted, expressing their delight at the hospitality of the Paterson plumbers.

#### New York Trade School.

The fourteenth season of the New York Trade School, at Sixty-seventh atreet and First avenue, New York, was opened by an assembly of the scholars for the new day classes of the different trades in the lecture room at 3.30 last Thursday afternoon. The plumb ing class, as usual, seems to be the most popular, the day class having 128 scholars and the evening class 106. The carpentry class has 15 scholars, house painting 9, sign painting 15 and brick-laying 11. The large class in plumbing last year was considered by the management somewhat of a disadvantage to those who were in it, and an attempt was made this year to limit the number to 120, but the pressure brought to bear has made it necessary to increase it, as is shown by the total number. On assembling in the lecture room, President R. Fulton Cutting addressed the young men with words of welcome, which were in substance as follows:

#### Address of President Cutting.

I extend to you a cordial welcome to the institution and am glad to see the school so full. In founding this institution Colonel Auchmuty had a bigher end than to aid young men to make dollars. His desire was to make good men as well as good workmen. He appreciated that the honor and success of any country depends upon its young men, and it was his desire to make trades men of them rather than tradesmen. Now that you are bere I hope you will be determined to acquire all possible skill in the manual portion of your trade and thoroughly master the theoretical and technical portions, so that you may not only elevate the trade which you have selected, but also reflect credit on the school. There is reflect credit on the achool. another point to which I would call your attention: That capital composed of money is not the most desirable capital to You are endowed with a capital have. in youth, health and strength that is invaluable, and by industry and integrity you can add to this capital a good reputation, which, as you grow older, you will hold of inestimable value. In talking with an old tradesman recently, he said that he never bid low to get work, but preferred to do each job a little better than the last. I would recommend his example to you, and will again endeavor to impress upon you that the success of your career depends upon your industry and integrity.

Mr. Cutting then introduced John Beatty of the Master Painters' Association.

#### Mr. Beatty's Address.

Mr. Beatty opened by saying, "Fellow Mechanics," and then, asking, "Is that right?" asserted "it will be if you keep on." When I entered the painting trade as a boy I so covered my suit of clothes with paint that my father said that 'as you have selected a dirty trade you have to stick it out therwise I might have been a to it,' otherwise I might have been a plumber. I know a good thing when I see it, and I commend your discernment in selecting the New York Trade School, as I venture to assert that it will exert a strong influence in molding the trades of this country. If you have come to the New York Trade School with the idea of having a gay old time you had better have staid at home. If you intend to learn all you can you could not have selected a better place. I have seen cheek and shrewdness succeed for a time, but your president has given you the key

for a lasting success, in integrity. that follow you in all of the little details of your manual and technical study and life at the dormitory. Do not eonsider that you have learned it all after leaving here, but study the literature of your trades dlligently. Become quick workmen, time yourselves on different work that you do. If you start in doing your best at first you will always do your best. To the plumbers I would say, keep your hands off the relationship. the painters' work if you want to reap blessings instead of maledictions. Another thing, nothing is of greater value to you than your self respect, and this can only be maintained through an absolutely proper life. If you have this you can face all things and no power on earth can keep you from ris-ing. Here you will have the advantage of patient, experienced instructors, and as you accept their teachings and live and work here, so your future life will be. You will find old men all around you who have succeeded, and I will say to you that to acquire the same success in your life you will have a harder struggle, inasmuch as the standard is higher to-day than when I learned the trade. That you can achieve it I have no doubt.

Mr. Cutting then introduced Edward Murphy of the Trades School Committee of the Master Plumbers' Association of New York, the main points of whose address we print below:

#### Address of Mr. Murphy.

I do not address you to urge you to any high deeds, but to assure you that you are here for a very important purpose, and you will be carried from the smallest details of learning your trade to a point higher than can be reached by many journeymen. Further, you will only have a few months for this will only have a few months for this work, and I would impress you with the idea that you should use every moment and effort to profit by coming here. Here you will acquire a very thorough knowledge of the underlying principles for a practice, which, if you put it in operation during your life, will eventually make you a practical plumber and a successful one. The scientific instruction which you will receive in the lectures here is such as is rarely in the reach of an apprentice. When I was a young man of your age I could do with my hands all of the work which you will be able to do when you leave here, but I knew nothing of siphonage, ventilation and all the other scientific portions of the trade which are absolutely necessary to know to-day, and furthermore, I took no interest in them. I would impress upon you that the understanding of these things is quite as important as clean workman-ship, for in understanding the theory and principles of sanitary plumbing lies the success of putting them in practice, and in practical operation they are very important as preventives against danger to the health of the community. During your course, examinations will be made of your handiwork, and examination of what you have learned at the lectures, and if you are worthy at the end of the course you will be presented with a certificate which, through the excellence of the Trade School and the value of its graduates as young workmen, is becoming of increased value each year. See to it that as graduates the standard of value of these certificates is Increased.

Mr. Cutting then introduced A. II. Mackay, and said that Mr. Mackay would be a frequent visitor at the dormitory building during the season, and would be glad to be of use to the young

men in their debates or social life.

The members of the day class in plumbing for this year come from widely different sections of the country, as is shown by the following list:

#### " Day Plumbing Class.

#### TRAPS AND VENTS.

THE PLUMBERS will agree with the recommendation made in the President's Message for a national Board of Health.

AT A SESSION of the Quincy, Mass., city council, last Monday evening, J. J. Keniley was appointed inspector and J. B. Landers assistant inspector of plumbing.

THE PATERSON HANDLE WORKS, Paterson, N. J., make a specialty of hickory and lignumvitæ turnpins and dressers for plumbers, molders' rammers, boilermskers' mauls, mallets, and all sorts of hammer and sledge handles.

JOSEPH McGILVAREY, West Lynn, Mass., recently austained a losa in his plumbing shop by fire.

THEODORE D. KALBFELD has been appointed Supervisor of Plumbing at St. Louis by the Board of Public Improvements, at a salary of \$2000 per vesr.

A ST. LOUIS JUSTICE recently cut a plumbing bill 50 per cent. in a suit be-fore him, at which the plumber demurred, but the justice looked severe as he rendered the judgment, and said: "You plumbers have a right to collect reasonable charges for your work, but not any more than that." Would that the plumbers could exercise as arbitrary power on the enormous bills charged by the lawyers for the small and often inefficient service rendered.

THE BUSINESS CARD of Thomas S. Wilson, Paterson, N. J., is all plumbing on one side, while the reverse side to the uninitiated is hard to understand.

THE MASTER PLUMBERS of Cleveland, Ohio, are not satisfied with the fact that work in certain large buildlngs of their city is let out to workmen of other cities. At their last regular meeting this theme was fully discussed. In looking up the matter Secretary Bonesteel of the Cleveland Builders' Exchange found that since January 1, 45 new firms have commenced business. This is due to the easy manner in which a license may be obtained. During the summer just past an examination of the license books of the Waterworks Department showed that four firms were working without a license, 12 licenses had been irregularly granted, and 35 men who have managed to get licenses have no shops. In the case of irregular licenses the applications had generally

been signed by men who have no licenses, or have obtained their licenses irregularly. The city ordinance covers the following points in general: It is unlawful for any person to perform the work usually done by plumbers, be it new work or repair work, unless he has a license; nor shall a licensed plumber allow his permit to be used by others in doing any work, unless he be personally on the ground to superintend. Any applicant for a liceuse must furnish a certificate signed by at least two reputable plumbers or sewer builders, according as he may intend to do either kind of work.

A BOARD OF SUPERVISORS in New York State refused to expend \$358 to improve the sanitary condition of their jail and to make needed repairs to the roof, but ratified the action of the Sheriff in offering a reward of \$1000 for catching a firebug.

THE ANNUAL MEETING of the Master Plumbers' Association of Wilmington, Del., was held last week and the following officers were elected: President, James F. Traynor; first vice-president, Charles Stewart; second vice president, Dennis J. Harrington; treasurer, Alfred Gawthrop; secretary, John Greenlee; members of the Conference Committee, B F. Shaw, Isaac N. Eaton, Alfred Gawthrop, John C. Brison and James F. Traynor.

THERE is a suit in Brooklyn over the refusal of the Health Commissioner to accept vitrified pipe for sewer connec tions from some new school buildings. The defendant says that vitrified earthen pipes have been used in that city for years for such sewers and drainage, cast iron pipes being used inside build-The vitrified pipe did not rust nor corrode and was more healthy, and has been used in the public schools for 15 years without objection from the Board of Health. He further deposes that he has supplied the city with vitrified earthen pipe for sewers and drains for 22 years and that it has been used by the city over 30 years.

L. A. GARRETT has opened a plumbing and tinning establishment at Cobleskill, N. Y. He has several hesting and other contracts on hand.

A TAILOR of Boston thawing out a pipe raised the price "out of sight" of plumbers. It will take \$3300 to repair the damage done by the fire he started.

Two PLUMBERS of Minneapolls were brought before the public court for violating the city ordinance by making a water pipe extension without a permit.

THE ALPENA (Mich.) PLUMBERS have formed an association and will endeavor to have the common council of that city pass an ordinance similar to that in force in Detroit, which requires a plumber to pass a satisfactory examination before he is allowed to practice his trade in the city.

ALEXANDER MUSGRAVE has established a plumbing office on Spring atreet, Watertown, Mass., under the firm name of Musgrave & Burke. The firm have just completed an elaborate job in the new house of Mr. Pancoast on Vernon street, Arlington Heights.

A BUFFALO PLUMBER flushed the contents of a privy vault into the sewer and was fined for the violation of the

PEPPERS LOUIS W. GAY of Buffalo, N. Y., and Jules Zimmermsn of Detroit, Mich., were in New York this week, as was Old Pepper Thomas Cushing of the Knights of Tabasco. The

interests of the society did not suffer, though plumbers' supplies and Ideal closet sests and flush tanks were features of their discussions.

THE ALBERENE STONE COMPANY, agents for the Smith & Anthony Company, 219 Like atreet, Chicago, are to furnish 77 Sanitas traps for a new building at Duluth, Minn.

B. C. Berch of the plumbing class of '94 was one of the audience at the opening of the day class in plumbing at the New York Trade School this vear, accompanied by J. Vickers of Vickers & Brooker of Binghamton, N. Y., in whose shop he is working.

I. L. VARIAN has removed his plumbing business to 7 Maple avenue, Daubury, Conn.

J. A. FAIRBANKS & Co., tinsmiths and plumbers, Brewer, Maine, are to remove to Bangor, where they will occupy the new block on the corner of Centre and Harlow streets.

The Paterson Heater Pipe Company, Paterson, N. J., are issuing a catalogue of round and oval heater pipe and elbows with register boxes, heads and col-lars for oval pipe, all of IX tin. They also make floor and side wall register boxes of various sizes. They make a full line of stove pipe and elbows in galvanized, Russis, and black iron of different gauges. They also make a line of plain round leader pipe in both tin and galvanized iron. The shop is tin and galvanized iron. The shop is under the management of Thomas S. Wilson, one of the plumbers of Pater-

We are indebted to W. G. Creamer, 96 John street, New York, for a pamphlet copy of a very interesting address on the ventilation of railroad cars, read before the New England Railroad Club, at Boston, October 10. Mr. Creamer is an expert in car ventilating, having studied it for the past 30 years, and has devised methods of ventilation to overcome the present difficulties. The paper recites the well-known facts of faulty car ventilation, both street car and steam car. Where he mentions that thousands of dollars are expended on the decorations of a sleeping car and little if anything upon giving it proper ventilation, he siludes to a fact of which all travelers are only too well aware. Mr. Creamer explains his appliances and at the end of the pamphlet are views and further description.

N. & G. TAYLOR COMPANY, Philadelphia, are offering to the trade what they call "Roofing Tin in rolls." These are referred to as sheets of Tin thoroughly soldered and painted on one side, ready to put on the roof. They are made in widths of 10, 14, 20 and 28 inches 105 source feet in a roll of IC. inches, 105 square feet in a roll, of IC and IX thickness, and can be furnished in any quality that may be desired, from the Old Style brand of extra costed Roofing Tin down to the cheapest grade. The rolls are referred to as particularly desirable for dealers who keep no timen or for work at a distance, as the Tin is ready for use at a moment's notice. The rolls are in straight lengths and require no resquaring. The seams are said to be well soldered by hand.

The completed portion of the Henne-pin Canai, near Davenport, Iowa, was opened on Thanksglving Day.

### STOVE TRADE NOTES.

### Meeting of Western Stove Makers.

On Tuesday, December 4, most of the large and prominent stove manu facturers, members of the Northwestern and Southwestern branches of the National Association, gathered at the Grand Hotel in Cincinnati. The subject of prices and other important matters were discussed at the preliminary meeting, Tuesday morning, preparatory to bringing certain affairs before the subsequent meeting in the evening, as well as before the annual meeting of the National Association to be held at Chicago.

At the meeting on Tuesday night the matter of freight rates was discussed and fully considered. As is generally known in the trade, stoves in less than carloads have been until recently classified by the transportation companies as third, and in full car lots as fifth class freight, and subject to tariff accordingly. Two weeks ago, however, stoves were transposed into second class, with, of course, a corresponding advance in rates of freight. This change has been regarded, naturally, with disfavor by the manufacturers.

One of the prime objects of the meeting was the sincere desire to harmonize the differences which have heretofore existed between the Southwestern and Northwestern branches of the parent organization. One of the branches, it is stated, has heretofore enjoyed priority because of having first entered the general society, and it has been regarded as desirable to eliminate any source of trouble arising from this fact by mutual concessions and modifications of rules and by-laws.

The subject of prices, however, proved to be the most fertile of any considered, and was the occasion for some hot words among the disputants. The fact that the trust or anti trust laws were run counter to in the attempt to arrange prices would indicate that such a combination was under consideration, or rather that the establishment of uniform prices upon certain classes or grades of castings might be construed by legal ability as in violation of the trust taws which have been enacted recently.

The most important meeting of the series was held on Wednesday afternoon, following a complimentary lunch, tendered the members present by Matthew Addy & Co. The lunch, or rather banquet, was a handsome affair, with flowers and all the other accessories to make the feast enjoyable and pleasant. The toasts were grave and witty and brilliant. James A. Greene of Matthew Addy & Co. occupied the head of the table as host, while Geo. H. Barbour of Detroit was toastmaster. Mr. Addy was presented by the toast-

master in a few fitting remarks and gracefully responded to the acclamations which greeted his introduction. Lyzard Kahn of Hamilton, D. M. Thomas, secretary of the National Association; Grange Sard of Albany, N. Y.; J. W. Van Cleave of St. Louis, J. A. Greene of Clucinnatl, Frederic Gardner of Chicago and W. W. Baldwin of Cleveland responded in turn to the call of the toastmaster, with good words for Mr. Addy, the Queen City and the trade.

After eigars, the entire company joined in singing "Auld Lang Syne."

On Tuesday evening the members were entertained by F. & L. Kahn & Bros. and the S. Obermayer Company jointly, and on Wednesday evening the assembly were the guests of the S. Obermayer Company.

About 50 members arrived on Tuesday, and this number was about doubled before the assembly finally adjourned. The various cities represented were Detroit, Albany, Chicago, St. Louis, Piqua, Vincennes, Zinesville, Quincy, Aurora, Ill.; Cleveland, Muncie, Marietts, Columbus, Hamilton and others.

Geo. D. Dana of St. Louis presided and D. M. Thomas of New York was secretary.

Among the founders were noticed G. H. Barbour and John M. Dwyer of the Michigan Stove Company of Detroit, Lazard Kahn of Hamilton, W. W. Baldwin of Cleveland, Fred. Gardner of Chicago, Grange Sard of Albany, W. H. Cribben of Chicago, A. T. Nye of Marietta, Ollo Kirschner and H. L. Wilton of Detroit, C. L. Collins of Bay City.

#### The Stove Trade of the West.

In the matter of supplies for local markets, says a Denver paper, a marked change acema to be taking place and to be intensified by the duliness that has prevailed during the past year. The average retailer has grown tired of ruinous local through rates, or the equally disastrous policy of overstocking to secure carload rates. The natural tendency of this is to concentrate the trade at important distributing points. For the Pacific Coast the trade is now virtualty controlled by the houses carrying stocks at the different centers, only the largest retailers caring to take the risks of transcontinental freight, breakage, delays, overstocks, loss of interest, &c.

In the region tributary to Denver the same conditions prevail, and how important a stove market our city has become is perhaps not generally under-stood. Aside from a few houses with something of a jobbling trade in stoves, we have one foundry and four branches or exclusive wholesale agencies, equivalent to branches, of Eastern houses, each carrying full general stocks of stoves suited to the market, for prompt shipment from Denver. That these advantages are appreciated by the trade is With one of these quite evident. houses a prominent Eastern manufacturer has lately placed a full line of hot air furnaces, the first exclusively wholesale stock of furnaces carried in Denver.

It all emphasizes the tendency to which we refer—to make this city more and more a distributing point for goods, particularly of this class. Until the West more largely manufactures her own goods, this method of supply must increase, and to every branch or agency so established we bid cordial welcome.

#### The Ohio Stove Trade.

Advices from the stove manufacturera covering trade for the past two weeks are somewhat conflicting in tenor. Most, if not all, of the foundries heard from throughout Ohio refer to a satisfactory trade, and one manufacturer characterizes business during the month of November as more satisfactory than any month during the preceding 18. But from other sections of the Ohio Valley reports are far from reassuring, and one foundryman expresses his realizstion of facts in most emphatic but gloomy terms, the gist of the matter being that trade has dropped off so much in the last four weeks that he can hardly realize that he is doing business at all.

These two views form the extremes of the information under review and between them are various grades of contentment or dissatisfaction, denoting fewer or larger orders for castings and finished stoves. The weather, too, has been changeable, but upon the whole too warm to encourage the placing of orders, and therefore deslers have continued their policy of buying only to cover immediate needs, especially as the holiday season is almost upon us, during which time there is usually a bull

Some of the delayed replies to inquiries aent out two weeks ago were received too late for our last publication. These reports, as a rule, while noting a decline in orders as compared with November, were still of an encouraging nature, being larger than generally anticipated. Some manufacturers are evidently not easily diabeartents and are already making arrangements for bringing out new and improved patterns, and upon these build an expectation of trade which will cause them to double present capacity next year.

Not a few of these anticipations seem to have been well founded, as evinced by the active inquiries being received for agencies of the new stoves already upon the market. Throughout the manufacturing industry the sentiment apparently prevails that the trade of the future will be largely governed by quality, and strenuous efforts are being made to place patterns upon the market re-

markable for strength, durability and convenience, as well as beauty and finish. More and more attention, too, is being paid to the construction of both stoves and furnaces upon sound scientific principles and hygicuic laws.

It seems to be recognized that such attention paid to the output of any foundry will do more than anything else to assure business success when full recuperation has taken place.

#### Cupola Tuyeres.\*- I.

BY DR. EDWARD KIRK.

The cupola furnace may be supplied with the air required for the combustion of the fuel by natural draft induced by a high stack, a vacuum created by a jet of steam, or by a forced blast from a fan or blower. In either case the air is generally admitted to the cupola through openings in the sides near the bottom. These openings are known as tuyerea or tuyere holes. The location, size, number and shape of these tuyeres is a matter of great importance in constructing a cupola, and is a subject to which a great deal of attention has been given by eminent and practical foundrymen for years, and to these men is due the credit for the advancement made in the construction of cupolas.

It is only a few years since 10 to 15 tons was considered a large heat for a cupola, and when a large casting was to be poured two or more cupolas were run at the same time and the greater part of a day consumed in melting. Now 60 tons are melted in one cupola in four hours for light foundry work, and hundreds of tons are melted in one cupola in steel works without dropping the bottom. This improvement in melting is largely due to the improvement in the size, shape and arrangement of tuyeres.

There have been epidemics of tuyere inventing several times in this country in the past 25 years, and during these periods it has been almost impossible for an outsider to get a look into a cupola for fear the great secret of melting would be discovered in the shape of the tuyere and made public. During these epidemics tuyeres of almost every conceivable shape have been placed in cupolas, and great results in melting claimed for them. Many of these tuyeres were soon found to be complicated and impracticable; or the advantage gained by their use in melting was more than offset by extravagant use of fuel.

It would be useless for me to describe all the tuyeres I have seen employed, for many of them were never used out of the foundry in which they were invented, and only used there for a short time. I shall, therefore, describe only a few of those that have been most extensively used or are in use at the present time.

The round tuyere is probably the oldest or first tuyere ever placed in a cupola. It was used in cupolas and blast furnaces in Colonial days in this country, and long before that in France and other countries. In the old fashioned cast iron stone cupolas three round tuyeres were generally placed in a row, one above another, on opposite sides of the cupola. The first or lower tuyere was placed from 18 to 24 inches above the sand bottom, and the others directly over it from 3 to 4 inches apart. The tuyere nozzle or elbow was attached

to the blast pipe by a flexible leather hose, and first placed in the lower tuyere and the two upper tuyeres temporarily closed with clay. When a small heat was melted the nezzle was permitted to remain in the lower tuyere through the heat. But when a large heat was melted and the eupola melted poorly at any part of the heat, or if molten iron was to be collected in the eupola for a large easting, the clay was ramoved from the upper tuyeres, and the nezzle removed from one to the other, as required, and the lower tuyeres closed with clay.

In these cupolas the tuyeres were generally too small to admit a proper volume of blast to do good melting. In one of 28 inches diameter I saw at Jamestown, N. Y., a few weeks ago the original tuyeres were only 3 inches in dismeter. Two tuyeres of this size could not possibly admit a sufficient volume of blast to do good melting in a cupola of the above diameter, and in this one they had been replaced by two of a much larger diameter placed at a lower level than the old ones. The round tuyere is still extensively used in small cupolas where the tuyeres can be made of a diameter not to exceed 5 or 6 inches, but in large cupolas it has generally been replaced by the flat or oval tuyere, which admits the same volume of blast and permits of a smaller amount of fuel being used in the bed than could be used with a round tuyere of large area.

#### Oval Tuyere.

In Fig. 1 is shown the oval or oblong tuyere now extensively used. It is made of different sizes to suit the diameter of cupola, the most common sizes used being 2 x 6, 3 x 8 and 4 x 12 inches. They are laid flat in the lining and generally supplied from an outside belt air chamber. This tuyere is the one most commonly used by stove, bench and other foundries requiring very hot iron for their work. They are placed very low, generally not more than 2 or 3 inches above the sand bottom, and in large cupolas the slope of the bottom

Cupola Tuyeres.-Fig. 1.-Oval Tuyere.

frequently brings it up to the bottom of the tuyeres on the back side of the cupola. This tuyere admits the blast to a cupola as freely as a round tuyere of the same area, and the tendency of the stock to chill over the tuyeres in settling and bridge the cupola is no greater than with a round tuyere of the same capacity. They admit of a lower bed than the round tuyere and are to be preferred to the round form for cupolas requiring tuyeres of large area.

#### Expanded Tuyere.

In Fig. 2 is seen the expanded tuyere, which is made larger at the outlet than at the inlet. It is reducd at the inlet so that the combined tuyere area may correspond with the outlet of the blower and equalize the volume of blast entering the cupola at each tuyere from the air belt. It is expanded at the outlet to permit the blast to escape freely from the tuyere into the cupola, and in case the stock settles in front of the tuyere in such a way ss to close up part of it there may still be sufficient opening for the full volume of

blast entering the tuyere to pass into the cupola. The tuyere is made from 2 to 4 inches wide at the inlet and 6 to 12 inches long. The width of the outlet is the same as that of the inlet, and the length of the outlet is from onefourth to one-half longer than the inlet.

Fig. 2.-Expanded Tuyere.

The tuyere is laid flat in the lining, the same as the oval tuyere, and the only advantage claimed for it over that tuyere is that it cannot be closed so readily by the settling of the stock and chilling of iron or cinder in front of it. The expanded tuyere is preferred by many to the oval tuyere on this account and is extensively used at the present time.

#### Doherty Tuyere.

In Fig. 3 is seen the Doherty arrangement of tuyeres designed by Mr. Doherty of Bement & Doherty, Philadelphia, Pa., and employed in the

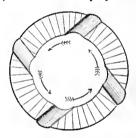

Fig. 3.—Doherty Tuyere.

Doherty cupola, a cupola that was extensively used in Philadelphia about 25 years ago. The arrangement consists of two or more round tuveres placed in the lining and at an angle to it, instead of passing straight through the lining as tuyeres generally do. The blast pipes connecting with each tuyere were placed at the same angle as the tuyere, the object being to give the blast a whirling or spiral motion in the cupols. The blast took the desired course, as could be plainly seen by its action at the charging door, and it had the appearance of making a more intense heat in the cupols than when delivered from the straight tuyere. the appearance was deceptive, and after careful investigation it was found that no saving in fuel was effected or faster or hotter melting done on account of this motion of the blast. The cupola and tuyeres were, however, constructed of proper proportions and were a decided improvement on the small tuyere cupolas in use at that time. Many of them were placed in foundries and are still in use, but no importance is attached to the spiral motion of the blast.

#### Sheet Blast Tuyere.

In Fig. 4 is seen the horizontal slot tuyere. This tuyere consists of a slot

Fig. 4.—Sheet Blast Tuyere.

from 1 to 2 inches wide, extending onethird around the cnpola on each side, or a continuous slot extending all the way around the cupola. The slot is

<sup>\*</sup> Copyrighted 1894 by Edward Kirk.

formed by two east iron plates, on one of which is east separating bars to prevent the plates being pressed together by the weight of the lining or warped by the heat. This tuyere is known as the sheet blast tuyere. It admits of a smaller amount of fuel being used for a bed than any other tuyere placed in a cupola at the same hight above the bottom. It distributes the blast equally to the stock, and does fast and economical melting in short heats. But the tendency of the cupola to bridge is greater than with almost any other tuyere, and a cupola with this tuyere cannot be run successfully for a greater length of time than two hours.

#### Mackenzie Tuyere,

In Fig. 5 is seen the Mackenzie tuy ere, designed by a Mr. Mackenzie of Newark, N. J., and used in the Mackenzie cupola. This is a continuous slot or sheet blast tuyere, but differs from the one just described in that the cupola is boshed and the bosh over-

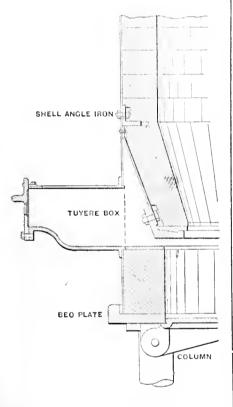

Fig. 5.-Mackenzie Tuyere.

hangs the slot from 4 to 6 inches. The slot is protected by the overhanging bosh and cannot be closed up by the settling of the stock. The Mackenzie cupolas with this tuyerc are constructed of an oval or oblong shape, with an inside belt sir chamber. The blast enters the sir chamber from a tuyere box at each end of the cupola, and passes into the cupola through a 2-inch slot extending all the way around the cupola.

The MUNICIPALITY of Manchester, England, is erecting in one of the leading thoroughfares of the city an imposing building specially designed for the exhibition of the various types of gas appliances and the most recent improvements in gas cooking and heating apparatus, which they are prepared to losn out to their gas using customers. The Manchester corporation own the gas works.

#### "Home Comfort and Steel Ranges"

is the title of a volume of 166 pages which reaches us from the Wrought from Range Company of St. Louis, Mo. The pages measure about 10 The pages measure about 10 x 11 inches, which permits the use of cuts showing the larger sizes of wrought steel ranges as well as the use of a number of cuts to a page in that portion of the estalogue where culinary appliances are illustrated. The catalogue before us gives attention to the Home Comfort wrought steel cooking ranges in almost endless variety, French ranges, steam tables, carving tables, laundry stoves, urns, ovens, &c., sdapted for hotels, restaurants, private dwellings, public institutions, dining cars, steamboats, railroad camps, army posts, &c. In every case sufficient descriptive text is presented to enable the desler to obtain an idea of the principal features of the goods illustrated. The assortment of culinary appllances is extended, covering everything required to make a kitchen outfit complete. A number of Lages are given to miscellaneous hotel goods, as well as hotel cooks' and outchers' cutlery. The company's wrought iron range fire grates are illustrated and described, as well as the Home Comfort furnsee. A long list of names of users of the company's goods judicates in some measure their wide popularity. An alphabetical index covering five pages will be found a valuable feature.

#### New Tropic Vapor Stoves.

Rathbone, Sard & Co., Wabash avenue and Randolph street, Chicago, now exhibit on their sample floor a full line of Tropic gasoline stoves, as pre-paged for the season of 1895. Their pared for the season of 1895. success with new process stoves last year was so gratifying, not a single stove of all they sold having been returned, that they are fully convinced that these stoves have come to stay. Therefore they have this year decided to prepare for the trade a complete line and will make a more vigorous push for their share of the vapor stove business than ever before. A number of new features have been introduced. The tank is made in two parts, with an upper and lower cylinder, for the purpose of equalizing the pressure of gasoline on the valves. With a single cylinder tank, it is pointed out, the pressure gradually diminishes as the tank empties. The valves for regulating the flow from the tank are made so as to be easily cleaned. If the tube below the valve should become clogged a cover can be opened to enable a splint to be run through it. A portion of this tube is made of glass to enable the dripping gasoline to be easily seen. A cast iron collar covers and protects the lower supply pipe so that the flames from the cooking holes cannot atrike the sheet iron pipe. The mixing chamber below the cooking holes is made of heavy polished brass, with a cast iron bottom, to prevent rapid corrosion and make this part of the stove durable. The defects of previous con struction are therefore overcome. The large drip pan below the stove is placed several inches higher from the floor than before, so that the floor beneath can be readily swept. These stoves are very handsomely finished and are ornsmented with nickel plate and polished brass. A very tasteful bickel plated high shelf has been placed under and in front of the tank. The several styles of new process stoves comprise one with three

burners on the top and one on the oven step; another with two top burners and oven step; a third with three top burners and no step, and the fourth with two top burners and no step. In addition to these styles a cast iron cabinet range is made, similar in appearance to a gas range. It has two top burners, a burner under the inclosed oven and a step burner, which gives it large cooking capacity. It is built with a drop oven door, whose motion is controlled by a coiled apring. A full line of junior stoves with individual generators are also presented for the favor of the trade. These are all made with safety tanks. which must be lowered below the level of the burners or they cannot be filled. This feature is highly commended by insurance companies. The high junior stoves are constructed with a folding step so that the stove takes up less floor space when the step is not in use. This line comprises three sizes of low juniors, three sizes of high juniors and two sizes of high juniors with step. The com-plete line of Tropic gasoline stoves cov-ers no less than 19 different sizes and styles. The new estalogue is now very nearly ready for distribution.

#### ODD PLATES.

In our issue of November 24 we referred to the contemplated Introduction of electricity as motive power in the plant of the Round Oak Stove Works, at Dowagiac, Mich. We now learn that the managers of the estate of the late Mr. Beckwith propose running the factory and the electric light plant for commercial lighting from the power thus furnished, and it is expected to be in operation in about 60 days. It has been decided to use what is known as the General Electric Company's three-phase system. The current will be transmitted over three No. 1 copper wires.

The CLEVELAND CO-OPERATIVE STOVE COMPANY, Cleveland, Ohlo, are rebuilding their foundry, which was recently damaged by fire, the new structure being of brick and iron, with slate roof, and equipped with the best known appliances. The company expect to have the new building completed by February 1, but they do not intend to occupy the premises just at present with their own business, as they are now under lease to the Cleveland Foundry Company. The company are, however, reconstructing the foundry building with a view to occupying it later, as the business is rapidly increasing and the additional facilities will be required.

F. V. Knauss, president and general manager of the Portsmouth Stove & Range Company of Portsmouth, Ohlo, recently visited Cincinnati, and during his sojourn called at the office of The Metal Worker in that city. He reports business for the past year more than ordinarily satisfactory in view of the severe depression that has existed in business circles for the period named. He attates that during the entire year the works have not been idle and that the demand for the company's wrought goods has been especially noticeable. New and important features will be added to the company's heaters for the coming season.

THE MONARCH STOVE COMPANY, Mansfield, Ohio, have leased from the Baxter Stove Company for a term of years theor space aggregating about 30,000 square feet, exclusive of brass

and iron foundry and plating department. The company will use this space for the production of Monarch vapor and gas stores, to which many improvements have been added for 1895.

ISAAC A. SHEPPARD & Co., Philadelphia, Pa, are about adding to their line of hot air furnaces a new furnace for brick setting which has some special features to recommend it to the trade who prefer this character of furnace. They are also bringing out a water heating device to be used in connection with the Paragon hot air furnace, so that they will have a full line of combination hot air and hot water furnaces.

The Pennsylvania Gas Furnace Company, Buffalo, N. Y., are opening a store at 615 Main street, where the Pennsylvania gas furnace of their manufacture will be shown in operation, both with illuminating and natural gas. With the increasing use of gas as a domestic heating agent particular interest attaches to the appliances for its utilization.

Announcement is made by the Superior Furnace Company of Little Falls, N. Y., that Henry A. Kelley, formerly with effice at 28 Union street, Boston, is no longer identified with the Superior line of furnaces and heaters. All communications should be addressed to the company, at Little Falls, N. Y., to which prompt attention will be given.

Fire Caused a damage of \$15,000 to the stove foundry of Oscar G. Thomas, Weir Village, Mass., on December, 4. The loss is fully covered by insurance.

Chas. E. Brackett, well known to the stove trade of the country, is now editor of the Furniture Record and Interior Decorator of Chicago. Mr. Brackett is a writer of versatility and originality, and it is to be hoped that his genius will be even more highly appreciated in his new field of labor than when he was discoursing on stoves and "men and thinga."

The Quick Meal Stove Company. St. Louis, Mo., favor us with one of their 1895 calendars, which are similar to those issued by this company in former years. The calendar is arranged with aix days to each sheet, and opposite each day is sufficient space for jotting down business engagements or other memoranda. The calendar sheets are attached to a handsomely decorated tin back which carries the company's name and address, and also a view of their factory. The calendar will be found very convenient, as it can be either used tlat on the desk, hung on the wall, or placed standing like an easel.

THE WESTERN STOVE MANUFACT-URERS met in Cincinnati on Tuesday and Wednesday of the past week and not in Chicago. Our correspondent had been misinformed, probably through inadvertence.

THE WAIS & Roos l'OWER AND SHEAR COMPANY, Cincinnati, Ohio, have been running steadily right through the depression of the past year, not shutting down at all only for a few days' repairs. In the mean time they have been enlarging their plant and getting ready for the busy season now beginning. They have added a 72 inch planer, traveling crane, &c., made necessary by the growing demand for heavy machinery.

THE PLANT of the Keystone Fiber Company, East Stroudsburg, Pa, was destroyed by fire last week, caused by an explosion.

#### FLASHINGS.

B. D. CHILDREY, 2007 East Susquehanna avenue, Philadelphia, Pa., has a contract for the rooting of an extension of Rumph's mill. The roof will contain 5000 square feet and will be covered with Taylor's Old Style IX 14 x 20 tin, which will be laid standing seam. The tin will be put together in stripa 14 inches wide.

CHARLES W. CARLL, Trenton, N. J., makes a specialty of sheet metal work in all its branches and in hts show windows and store has a handsome line of sheet metal ornaments and various styles of cornices and ceilings attractively arranged. He has the contract for the sheet metal work for the chapel of the Lawrenceville School, at Lawrenceville, N. J., and also has the contract for 30,000 feet of No. 22 corrugated iron roofing for the Electric Street Car Company of Trenton. He recently completed a fine piece of sheet metal work in the ceiling of the First Presbyterian Church at Rahway, N. J.; also in the Baptist Church at New Brunswick, N. J., where he did the roofing and cornice work.

The tin and sheet inon workers and cornice makers of Paterson, N. J., have formed an association with Walter Brooks as president and Edward Dennis as secretary, meeting every Monday evening, for sociability and for studying the scientific portion of the trade. During the winter special attention will be given to teaching advanced pattern cutting.

FRED. STOPP, Denver, Col., laid the roof on the new union depot at that city, using Merchant & Co.'s Spanish tile.

On January 2 a new course of instruction will be opened at the New York Trade School. Tinsmithing and roofing and cornice work will be taught in all their branches. The shop is fitted up with such tools as are used in this work, and the pupils will be taught the mechanical portion of the trade, and, by means of a course of lectures and drawing lessons, the pattern cutting for all the work done in the ordinary tin shop will also be taught. This is an opportunity that cannot be secured in the ordinary shop, and a scarcity of high grade sheet metal workers who have the ability to lay out their own work is felt all through the trade, the pattern cutters in some of the larger establishments receiving wages far in advance of those paid the average work-This class will be under the supervision of the Trade School Committce of the New York Association of Roofing and Manufacturers in Sheet

THE KNISELY & WELDHAM COMPANY, 68-74 West Monroe street, Chicago, have the contract for the slate roofing and copper work on the Illinois Central fluit house, South Water street.

KNORR & BLOCKS, 165 Wells street, Chicago, are to furnish the copper cornice, eight dormer windows, ridging, gutters and conductors for St. Andrew's Church, North Paulina street and Adison avenue.

THE SILICA MFG. COMPANY of New York City have been granted letters of incorporation at the office of the Secretary of State, at Albany. The directors named are Wm. Calhoun, J. Walter Straub, Emil O. Meyer and Thos. D. Prentiss of New York City. The company will carry on a roofing business and manufacture fire proof paints in New York City. Capital \$10,000.

J. C. McFarland, 2511-2519 State street, Chicago, has the contract for the galvanized iron work and slate roofing for the new school house at Galva, Ill.

James A. Miller & Bro., 129-131 South Clinton street, Chicago, are to furnish the skylight on the roof of the large new building of the Bettendorf Metal Wheel Company, Davenport, Iowa, as a sub-contract from Riter & Conley, Pittsburgh, Pa.

Hamsley Metal Roofing Company, 18 Cliff street, New York, have been appointed agents for the Wheeling Corrugating Company for New York and nearby territory. They are prepared to deliver from stock or mill direct. They will carry all stock sizes in 6, 7, 8 and 10-foot lengths V shaped Crimped Roofing, Pressed Standing Seam, Clapboards or Weather Boarding, Black or Galvanized Rock Faced and Brick Siding and Corrugated Iron. They will also handle Metal Shingles, Cornices. Skylights, &c., in conjunction with the above. The company have just completed a rock face front for a large dry goods building at Long Branch, N. J., together with a similar front for an office building at Red Bauk, N. J.

#### Trade Notes.

THE BANSFIELD WOODEN WARE COM-PANY'S office and factory in Minneapolis, Minn., were destroyed by fire on November 24. The loss is estimated at \$50,000, mostly covered by insurance.

THE ATTENTION OF OUR READERS is called to the advertusement of the Geuder & Paeschke Mfg. Company, Milwaukee, Wis., the well-known manufacturers of Tinware, relative to their celebrated Cream City Flour Bins and Sifters. The letter forming the body of their advertisement, is, as they inform us, an entirely voluntary testimonial, and as such is entitled to the careful consideration of dealers. For the convenience of the trade in the East, the Central Stamping Company, 23 and 25 Cliff street, New York City, have been appointed Eastern agents for the Cream City Bins, and will furnish them at factory prices.

THE MAYO DAMPER is referred to in an advertisement elsewhere of Mayo, Bechtel & Co., 465 North Franklin street, Pottstown, Pa. These Dampera are adapted to Stoves, Hot Air and Steam Heaters, and, it is claimed, save a large percentage of coal.

THE JOSEPH DIXON CRUCIBLE COM-PANY, Jersey City, N. J., send us their usual monthly calendar card with blotter backing, the design of which shows an extended hand with a pencil in it, suggestive of the time of Christmas giving.

AN ADVERTISING CARD distributed by the Burgess Soldering Furnace Company, Columbus, Ohio, under recent date announce that having outgrown their former manufacturing facilities for the production of the Gem soldering furnace they have leased the premises at 238 North Third street, where they have installed a complete outfit of latest improved machinery and appliances.

THE ENTIRE PLANT of the Egyptian Pottery, Trenton, N. J., was destroyed by fire on the evening of December 5. The loss is placed at about \$20,000, fully covered by insurance. The Egyptian was one of the sanitary ware potteries not owned by the pottery trust.

## TRADE REPORT.

#### The Iron Market.

Very conflicting accounts are rendered as to the condition of the Iron trade. Some manufacturers and mer-chants have drifted into a frame of mind which may be characterized as hopeless resignation. Others see daylight ahead, but frankly admit that they are thinking rather of the volume of business than of prices.

Chicago is encouraged by the appearance of some car orders, and the suggestion is thrown out that some buyers are going about their purchases in a very secretive way, in order not to raisc the market on themselves. The feeling among buyers is, however, that they have nothing to fear from any influences

Work is coming out in a spasmodic way, and that may account for the wide variations in opinion.

The attempt to revive the short lived Barb Wire pool by increasing the penalty to \$5 % ton for exceeding allotment has failed. The refusal to base the percentage claimed by a new works upon its capacity was the cause of the rupture.

In Foundry Iron the most important development is the withdrawal on the part of local makers of low quotations in the Chicago market. On the other hand, outside producers are pressing in Pittsburgh, and very low prices have been made by Virginia and Alabama furnaces in New England.

Tin has continued to decline and has

now reached 13.50¢, thus showing that the campaign of the London Tin king against the syndicate is progressing favorably. Copper and Lead are quiet, with sales of foreign Lead recorded at 3.10¢. The market for Tin Plate is without spirit and tends to favor huyers, in spite of the troubles in the American mills.

Plg Iron.-A number of round sales have been made lately in the New York market, but at very low prices. Included in them is one lot of 1200 tons to a local Architectural works and 1500 tons to a Troy stove foundry. There is a good deal of complaint of sharp cutting on the part of Virginia and Alahama furnaces in New England, and some talk of concessions on some of the Lehigh Valley brands. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2; and \$10.50 @ \$11 for No. 2 Plain, standard brands, tidewater deligery. z riain, standard brands, tidewater delivery. Southern Iron. same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11.50 for No. 2; \$10 @ \$10.50 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.25.

Our Philadelphia advices indicate that that market is extremely dull

that that market is extremely dull, although deliveries are still called for with considerable urgency, indicating that consumption is well maintained, and that yards are somewhat bare of atock. New business is not large, however, there being a general disposition to await developments before entering 

than there was some time ago, and while prices are not lower the feeling is heavy, and it is just possible that somewhat lower figures may be made before there is anything like general activity. Business is mostly of a hand-to-mouth character, although in some cases sales have been made for deliveries covering the first three months of '95, and at about the same quotations as for spot lots. General quotations for Philadelphia and nearby points are about as fol-lows, and for deliveries within a radius of 100 miles south or west 20¢ @ 30¢

In Chicago the local Coke Iron makers have withdrawn their lowest quotations and the market is now much firmer. Transactions of the past week were unexpectedly good, embracing several lots of 1000 to 2000 tons. The demand grows out of the improvement in general business, consumers finding their requirements running beyond anticipations and they are ordering larger monthly deliveries. The market for local Iron has also been considerably widened and shipments are now being regularly made to the territory bordering on the Ohio River. Southern Iron is in no better demand than before and prices are in the same condition of irregularity, the smaller companies making lower figures than the leading concerns. Lake Superior Charcoal is in moderate demand, but the quantity moving appears to he gradually increasing. Quotations are given as follows for cash:

Lake Superior Charcoai	\$13.00	0	\$14,00
Local Coke Foundry, No. 1.	10.25	0	10.50
Local Coke Foundry, No. 2	9.75	0	10 00

Ourer oursers		-	_,,,,,

The condition of the Pig Iron trade in the Pittsburgh district, both as regards demand and prices, is unsatisfactory and at the same time is puzzling. It is admitted on all sides that stocks of Iron are light, and while the demand is not heavy, prices are weak and are probably as low as ever before in the history of the trade. Both buyers and sellers of Pig Iron ad mit that there is no warrant for the present low prices, and it is the general opinion that a few purchases of round lots would soon bring about better prices. Indications point to a heavy consumption of Pig Iron next year, and it seems certain that prices cannot well go much lower, but should improve with a better demand. Reports are going of some very low prices being made on Foundry Iron by furnaces in outside districts, and it is probable our quotations on both Nos. 1 and 2 could be shaded. We quote as follows:

As regards the St. Louis Pig Iron market there is practically no de-mand. Sales during the last week were probably lighter than they have been at any period during the entire year. A few orders have been booked for delivery during 1895, and the readiness with which furnaces accept these orders would seem to indicate that they place little faith in any improvement in prices after the turn of the year. We quote as follows for eash, f.o.b. cars St. Louis:

dry 9.50 & 9.75 Southern Car Wheel 16.50 & 17.00

Sales are reported as numerous in the Birmingham, Ala., market, in fact some fair sized orders have been turned down, owing to demand to shade prices, while outputs were covered by sales already made. There has been an encouraging incresse in this respect. Prices are firm, and little shading is reported. Some good cired and respect 1000 to the respect to the shading is reported. sized orders of 1000 tons each are reported at firm prices; those were for Nos. 1 and 2 Foundry and Gray Forge. The demand is very general in all grades, the higher grades, in fact, showing a gratifying demand. Quick de-livery is demanded in many cases, even in 1000 ton lots, showing a lack of supplies in hands of consumers. Collections are reported as very good, with little demand for time. Inquiry with little demand for time. Inquiry is decidedly stringent for delivery to cover 1895, but is meeting with no encouragement, few sales being reported beyond April. A sale of 1000 tons of No. 2 Foundry is reported to a local pipe works at ruling prices.

#### Metal Market.

Pig Tin .- The upward reaction in prices mentioned in our last report has given place to an almost uninterrupted downward movement. Prices in this market have been carried down to the lowest figures yet reached, and it is freely predicted that "8 lb of tin will be bought here for a dollar" before long. Whether this will be so or not, the market presents a weakish appearance between the pressure of promment operators and the weight of heavy supplies. Ordinary trade buying has been very moderate, notwithstanding the current low prices. For small lots from store, jobbers' prices are 151¢ @ 16¢ for Straits Pig, with an advance of 1¢ to lle on Straits Bars. Banca Pig is quoted at 161¢ @ 17¢.

Copper.-Judging from the meager information imparted by producers' agents, business has been moderate during the past week. The general statement was that no purchases have been made except of moderate sized lots needed to tide over immediate wants. The usual rumors are about to the effect that contracts have been made for stock for delivery early next year, but the rumors go into no details as to amount of business or prices. Whether large

contracts have been made or not it is clear that almost any variety of Copper may be purchased at the prices that ruled a week ago. Inquiries from consumers are limited, and buying is of a very tame character. Prices for small lots are unchanged from those given in last week's report.

Sheet Copper.—Inquiry is slow, and orders limited to comparatively small quantities for direct consumption. The basis of prices for small lots of Sheet Copper from store is 15¢ ‡ lb, net.

Pig Lead.—Spot supplies have been light, and offerings for shipment this month have averaged rather small also. Purchases were not at all heavy, nor were the inquiries anything more than fair, and the indications are that there is no great confidence in the future of the market, whatever present conditions may be, since foreign Lead is quietly offered to consumers at comparatively low prices for future delivery. Sales of foreign have been made this week at about 0.05 % less than domestic Lead is selling at. The jobbing demand has been exceedingly flat and prices somewhat weaker. Small parcels fetch  $3\frac{5}{8}\%$ 

Lead Sheet and Pipe.—The consumptive demand for Manufactured Lead in this section is referred to as being of very moderate proportions; and no improvement is looked for this side of the holidaya. Prices are satisfactorily maintained, however, on the list basis of 51¢ for Pipe and 61¢ for Sheet, with 20 % discount.

Spelter.—The demand shows no improvement. Orders are, as a rule, confined to moderate quantities; and offerings have increased, giving the market a rather soft tone. Western in small parcels fetches about  $4\phi \approx 10$ .

Sheet Zinc —There is only a tame movement in this material, and prices are rather easier, 600-lb casks being quoted by dealers at  $4\frac{1}{2}\phi$ , with smaller quantities at  $5\phi \gtrsim 10$ .

Anthuony.—A fair jobbing business has been done, which serves to keep prices at about their former level. Small lots of Cookson's are quoted at  $9\frac{1}{2}\phi$ , and Hallett's at  $8\psi \approx 1b$ .

Tin Plates.—The falling off in demand, which usually marks the approach of the holiday and stock taking season, appears to have developed during the week to the further detriment of business in this market. Nothing beyond buying in a small way for current needs is noted. Inquiry has been slack, and consumers generally take hold in a very indifferent manner. Little or no interest is taken in future shipments, and spot business is of a purely routine nature. Advices from either the home or the foreign producing centers are not encouraging, and the market has shown a softer tone, as stocks have increased and sellers are more anxious than buyers. The assortment of foreign Plates is more ample, some heavy shipments having arrived during the past week. Pricea, while showing little radical change, are weaker, and shading of quotations on desirable orders is more common. Collections are referred to as satisfactory.

The condition of the British Tin Plate market is thus described in a special London cable dispatch of December 5 to The Iron Age: Tin Plate market has been weaker. Makers are eager sellers at late rates, but orders are scarce and buyers' views about 2d. per box lower. Orders are scarce. Terms went at 18/6 for double box, ordinary Cokes at 9/6

and ordinary Charcoala at as low as 10/6. Stocks at shipping points show a further alight increase. Sellers' quotations at Swansea are as follows:

Bessemer Cokes, IC 14 x 20 Siemens Cokes, IC 14 x 20	9/6 @ 9 '9 9/9 @ 10/
I. B. Steel Cokes, IC 14 x 20 I	8,6 @ 21/
Ternes, 20 x 28 I	10/6 @ 12/6

Sheet Iron.—Trade is quieter in both Black and Galvanized Sheets. Although mills are said to be well furnished with orders, manufacturers' agents are pushing more urgently for business, and prices are in some cases quoted a shade lower. No. 27 Common Iron, in small quantities from atore, is quoted by jobbers in this city at 2.60¢ @ 2.65¢, while Galvanized Sheets in small lots rule at 75 and 7½ % @ 75 and 10 and 2½ % off.

### Chicago Report.

Scrap.—The market for Old Material is stronger, notwithstanding the large offerings by railroads. Old Rubber, particularly, is in heavy demand. Dealers quote their buying prices as follows, Chicago delivery:

Per	net ton.	Per th
No. 1 Wrought Scrap	. \$7.00	
Machinery Cast		
Malleable Cast	. 5.50	
Stove Plate (free of burnt)	4.25	
Burnt Iron and Grate Bars.

THE COLUMBUS WROUGHT STEEL SINK is the subject of an advertisement presented elsewhere in this issue by the Kilbourne & Jacobs Mfg. Company, Columbus, Ohio. These Sinks are drawn from single sheets of steel without seam. An illustration shows the general apearance of the Sink.

#### CONDITION OF THE

### Hardware Trade.

USINESS is showing the falling off which usually comes with the com-mencement of the last month of the year, when both wholesale and retail merchants are giving their atten-tion to closing up the year's business, getting stocks in order for inventory, and endeavoring to keep them down as low as possible. Purchases are therefore limited to urgent and immediate requirements and special holiday and winter goods, which are heing ordered more freely. There is also a good deal more freely. There is also a good deal of negotiation going on between large houses and the manufacturers in regard to the terms on which stock orders for next season may be placed, and some of the manufacturers report gratifying results as to the extent of orders already booked. Buyers, both large and small, however, realize that the market is weak as well as low, and it is a difficult question which they are called upon to decide as to the extent to which orders should as to the extent to which orders should be placed at this time. It is evident that a policy of delay carries with it not only the chance of a further decline, but also of a stiffening in the market and advanced prices. In some staple lines advanced prices. In some staple lines manufacturers, who are anxious to have orders to keep their plants in operation during the year, are refusoperation during the year, are refus-ing to quote prices at present current for deliveries later than March or April, the opinion being entertained by many that a recovery from the present low prices is likely to come with the increased demand. It is, how-ever, a fact that at this time there is a good deal of weakness in many lines, and the tendency in both heavy and a good deal of weakness in many lines, and the tendency in both heavy and shelf goods is toward lower prices. It is plainly the part of wisdom for the trade to watch the market closely. There is some complaint in regard to collections, but financial conditions, on the whole, appear to be fairly satisfactory.

Advices from Chicago.—Shelf Hardware keeps up remarkably well for December. The mails of the past few days have been almost as heavy as at any time in the year. This is doubtless due, as previously explained, to the careful manner in which country merchants have long been buying, so that they are compelled to continually replenish their stocks; nevertheless jobbers are expecting their trade to show a gradual decline for the remainder of the month, and will not be disappointed if the next two or three weeks prove to be dull. The Tinware and House Furnishing jobbers report a better demand. Small goods in this line show special improvement. Salesmen are sending in very favorable letters regarding the outlook for the future; factories are catching up on orders and are now able to make more prompt deliveries. Heavy Hardware is inclined to quietness, as usual this month. The jobbers themselves are buying sparingly with the close of the year approaching, and their customers follow the same practice. A very much larger business is looked for after the turn of the year.

#### Notes on Prices.

Wire Nalls.—There is an excellent demand for this season of the year, but it begins to show signs of falling off. Some large orders have been placed for next season, but some of the principal buyers are delaying their purchases thinking that possibly prices may go lower. The desire of the manufacturers to keep their mills in operation during the next few months makes competition very active, and nearly all of them ar

evidently anxious to secure such business as they can. Small lots from store are held at \$1.20 to \$1.25.

Advices from Chicago.—Plenty of inquiry is reported for January, February and March, but the demand for early delivery is light. Some of the manufacturers have taken large orders for delivery during the first quarter, but others are not disposed to meet present prices so far along luto the future, and are discouraging this class of orders. Johbers are endeavoring to maintain \$1.10 for small lots from stock, but this is shaded to best buyers by some houses.

Cut Nails.—The demand for Cut Nails is moderate, and with the approach of the close of the year is lighter than it has been during the past month or two. Small lots from store are held at 95¢ to \$1.

Advices from Chicago.— The Cut Nail trade appears to go on in a very even way. Orders continue to come in in single carload lots, but they are be ing received steadily. Prices are unchanged. Small lots are quoted at \$1 from stock.

Barb Wire.—The Barb Wire market continues in the same state as at our last report. Some large orders have been placed, so that with the business previously secured the mills have a considerable portion of their output covered. There is still a good deal of inquiry, and the indications point to an exceptionally large business being done during the coming year. In the matter of price the market shows little change. It is represented by the quotation of \$1.85 to \$1.90 for Four-Point Galvanized in carload lots at mill.

Advices from Chicago.—Barb Wire manufacturers have recently been resching out for business very actively. The season was rapidly passing for making contracts for spring delivery, and the breaking up of the pool enabled each manufacturer to go on his own account and sell without restraint. The consequence is that mills in this vicinity have their order books well filled now for at least the first three months of the year and possibly beyond that. The demand for other classes of Wire products continues very good, and the outlook for the future is as bright as before. Jobbers are quoting small lots of Painted Wire from stock at \$1.75, and Galvanized at \$2.10.

at \$1.75, and Galvanized at \$2.10.

Cordage. — The market on Cordage has not improved during the past week or two, and the low prices to which we recently referred have become more general. The competition between the manufacturers is active and the demand moderate. The market is represented by the following quotations for large lots, f.o.b. factory or New York, prices given being subject to 1½ per cent, discount for cash:

 $\begin{array}{c} \text{Base.} \\ \text{Cents.} \\ \text{Manila.} & \begin{array}{c} -7 \frac{1}{2} \sqrt{3} \\ \text{Sisal.} & \begin{array}{c} 4 \frac{1}{2} \\ \text{New Zenland.} & \begin{array}{c} 4 \frac{1}{2} \end{array} \end{array}$ 

Family Grindstones.—We are advised by the Grafton Stone Company, Grafton, Ohio, that they are furnishing their goods, f.o.b. quarry, at the following prices:

Family Grindstones.

		ozen.
6 and 7 inch	 	\$4,00
6 and cineu	 	4 60
Sand 9	 	0.5
10, 11 and 12 inch	 • • • •	, 0,00

These are referred to as having their special enameled base boards and screw clamp, the stone being polished and the goods packed half dozen in a

box. Loose Grindstones, 30 to 200 pounds, are quoted at \$6 to \$3 per ton. The following prices are also announced:

No. 1 Grafton Mounted Grindstone...\$1 50 No. 2 " " ... 1.30 No. 3 " " ... 1.15

Glass.-Reports regarding the condition of the American Window Glass trade indicate that a steady demand has taken the place of the spasmodic handto mouth orders, and that in some in stances manufacturers have booked orders equal to the capacity of their factories for some time to come. It is actories for some time to come. It is understood that some orders are of a speculative nature, those placing such orders being confident enough of the future to anticipate an advance in prices. More conservative dealers, however, do not look for higher, prices before conservative and the conservative dealers. higher prices before spring and are not making purchases much beyond their probable requirements. Business among jobbers is reported as fair and as showing an improvement over that of the early fall. Building prospects are considered good, and a large amount of work in this direction is being contemplated throughout the coun-Factory quotations at Pittsburgh for Glass in car lots are given as 90 per cent. discount for single and 90 and 5 per cent. discount for double strength Glass. Cleveland, Ohio, jobbers quote Glass from store in full boxes at 85 and 20 per cent. discount for single and 85 and 20 and 5 per cent. discount for double strength Glass.

Old Rags, Paper, &c. — Demand shows a slight improvement and prices are better for some qualities of Paper Stock. The following quotations represent the current rates paid by dealers in the city:

#### Heating and Ventilation.

It is too late in the day for any one in the heating trade to take the position, as some have done lately, that heating and ventilation are distinct arts, and that on this account they ought to be considered separately and practiced separately. An inventor of a hot water boiler recently avowed that he was going to heat buildings only by direct radiation, except in cases where he was compelled to use indirect radiators. He gave as his reason for this resolution the fact that, in indirect heating, trouble is often experienced through the freezing up of radiators when proper attention is not given to the prevention of this accident, and, also, that indirect heating costs more both in the first instance and in current expense for fuel than direct heating, and consequently he should direct his salesmen to discourage indirect heating as much as possible in securing contracts. He soon found, however, that he could not ignore the question of ventilation, and that in order to secure contracts he had to use indirect radiation. Probably others have had a like experience. Not long ago there appeared in an English paper what was intended to be a caustic criticism of an article written by an able writer on the subject of ventilation. The would-be critic took the ground that the consideration of ventilation ought to be summarily divorced from heating plans and that the sooner this was done the better it would be for the heating trade. That this expression of opinion was considered by some as being not utterly valueless is proved by the fact that it was quoted in other publications with approval. The fact is, however, that the proposed separation cannot be brought about, because the kind of heating now demanded cannot be accomplished without ventilation; and the converse is also true that in cold weather the ventilation of dwellings

and other buildings too small to justify the cost of mechanical ventilation cannot be effected without heat.

Business Prestige.

Prestige is defined as being that moral influence which past successes. as the pledge and promise of future ones, breed. It is directly dependent upon the character of the individual or the corporation, and being a moral influence must of necessity be the result of honest methods and square dealing. It is the "good will" which is left to the succeeding partner when a partnership is dissolved. It concerns the small store keeper as well as the extensive corporation. The store keeper may well study its meaning, for it is something for which he seeks and upon which he feels that his established business must stand. He can only attain to it, however, by the fairest dealing, the strictest attention to business, and the establishment of perfect confidence in his word and his goods. Many concerns, however, built up by the untiring energy of a single individual, fail to appreciate that the character thus established cannot remain untarnished if they resort to doubtful methods. A family name is not enough to maintain the honor of the concern. The son, if he inherit the father's business, must neither fall back npon the father's character, nor merely strive to live up to it. He should go further and endeavor to add luster to that name, to make it even more a sign of integrity, of lusiness sagacity, and of upright dealing. He may more than once be called upon to choose between great riches and honor that demands an honest life, but if he would plant his business upon bed rock he must ever seek for honor, and then the riches will follow.

#### As to Business

The settlement by Congress of the long drawn out tariff question, and by the people of the November elections, has not been followed by any such wonderful improvement in the general business of the country as it was confidently predicted by the knowing ones would surely develop thereupon. A moderate revival of activity did occur in the middle of last month: but this has again simmered down into a condition very similar to that which has prevailed for so many weary months; a mere hand to mouth buying of commodities for the supply of current needs. As regards the trades with which The Metal Worker is more particularly concerned, this statement is especially true. Week after week the reports have been almost identical, "Nothing new," "Very quiet," "Inquiry moderate." "Orders small and

slow, and so on, in a monotonous chorus of reiteration. It is true that December is nominally a dull month in the metal trades, on account of the annual stock taking and adjustments of business at the close of the year. But the general conditions of business have been so peculiar this season, stocks being of the very lightest character and the presumed needs of consumers greater than usual, after so many months of apathy, that it was expected. December would be a much more lively trade month, than customarily. That such has not been the case generally is proved by the clearing house returns from all the principal cities of the United States -a very reliable gauge of the volume of business. They exhibited for the first week of December an increase of only 4.6 per cent, compared with the corresponding week of last year, which was one of peculiar dullness; while as compared with the same week of 1892, a fair average one, the decrease was about 20 per cent.

#### The Outlook.

Nevertheless, the tone of the trade reports from nearly all quarters is distinctly more hopeful as regards the prospects for business after the first of the year. Stocks in retailers' and consumers' hands are so low that buying must, it is claimed, be more liberal. Money is plentiful and cheap, and much that has been lying idly in banks and trust companies is waiting to be invested just as soon as signs of a revival of industrial and commercial activity develop. There has been progress already, as compared with three or four months ago, but it has been very slow and so gradual as in some cases to be almost imperceptible. Nevertheless the encouraging fact remains that it is progress and not retrogression. Valuable experience has been gained, and lessons of trade economy have been learnt which are worth some temporary loss and suffering. Certainly prices are low, and are likely to remain lower than they were a year ago. Wheat and cotton are down to the lowest figures ever known. All manufactured goods have dropped in price anywhere from 5 to 25 per cent. in the past year or two. Wages, too, have fallen; but so has the cost of living, so there is compensation in the lower rates.

The cotton spinning industry has made great headway in the South during the current year. The latest New England concern announced to move thither in order to be nearer the source of supply of the raw material is the Massachusetts Cotton Company, who have determined to build a Southern plant to cost \$600,000, with a capacity of 30,000 spindles. The actual location is as yet not decided on.

# THE LETTER BOX.

Some Tin Plate Inquiries.

From A. S. R., New York.—What is the difference between bright plates and terne plates? What kind of sheet metal do the manufacturers use in making tomato and other cana, the cheaper or the better grade of plates?

Answer.—The difference between a bright and terne plate is in the metal that is used for the coating. A bright plate is coated with pure tin, while the terne plate is coated with lead, or rather with lead having a small proportion of tin mixed with it, the amount varying with different plates. The plates used by can manufacturers are the cheaper grades of bright plates—that is, for the ordinary vegetable can.

#### Insufficient Air Supply.

From A. H., Milwaukee, Wis -1 would like to be informed through the columns of The Metal Worker of a remedy for the following trouble: I set up a portable heating furnace a year ago the working of which has puzzled me ever since. The furnace in question is of sufficient size to heat the house, is prowided with a double casing with a 1inch space between the two walls, yet the outer casing becomes so hot the hand cannot be held on it. When first set up the furnace was placed over a pit and connected by means of a 12 x 30 inch cold air box with a north-west window. The stacks to second west window. The stacks to second floor are 5 x 13 inches inside and provided with 8 and 9 inch connections, while the first floor runs are all 10 and 12 inch, with registers in proportion. The rooms are all ventilated and most of the ventilators go into flues direct, while some connect with flues in the while some connect with nues in the attic. These flues all have a good draft. There are two grates on the first floor and one on the second. The doors on both floors are kept open, so there is a free circulation of air. While the furnace has a good draft, it is impossible to heat the house properly during zero weather. The cold air box was changed to a weat window, with no better results. I then took a 14-inch return from front and a 10-inch return from rear hall, run them into furnace pit with elbows to turn up, so as not to interfere with the air from outside. The returns both worked a little, but not as desired, the casing being as hot as before. After the above change had been made I took the furnace down, filled up the pit, cemented level with basement floor, reset furnace and connected the circulating returns as before. No improvement resulted from this change. I will state that one trial was change. made before the cold air box was changed, with a west wind blowing at the rate of 25 miles an hour, yet the furnace casing remained as hot as ever. I have set furnaces for many years, but never before experienced such a difficulty.

Answer. — After considering the trouble reported from the information

given, which is not all that could be desired, it seems to be a clear case of an insufficient cold air supply. This is given as a 12 x 30 inch duct having an area of 360 inches. Stacks to the second floor are spoken of having 8 and 9 inch connections, and it is supposed there are at least three of each size. The first floor connections are said to be all 10 and 12 inches, so it may be presumed that there are at least two of each size, with a total area as follows:

Three 8-inch pipes, area 50 inches each. 150
Three 9-inch pipes, area 63 inches each... 189
Two 10-inch pipes, area 78 inches each.... 156
Two 12- inch pipes, area 113 inches each... 226

Having a combined area of .... .......... 721

Air taken at 22° would have to be heated to about 550° to double in bulk. which would be necessary to fill the above mentioned pipes, which are only supposed, as the number and size of the pipes actually in use are not given in the description. A cold air duct 20 x 30 inches, having an area of 600 inches, would be nearer right. Some furnacea, however, are "hide bound"—that is, the radiator leaves too little space between it and the casing, and the openings through it are too small to let enough air pass through to furnace to absorb the heat and carry it away. A common report then is that the air is excessively heated and varies in volume at the registers. In such cases the only thing to do is to make a casing of larger size so that plenty of air can pass through. A common error is in the idea of the velocity of air passing through furnaces. While the statement that the higher the temperature the higher the velocity is true, the speed never approaches that of a gale, and, unless the air spaces are generous, sufficient air cannot pass to carry away the heat. Sometimes when a furnace is large the heating pipes are too small to let the air pass off fast enough to keep the furnace cool. An 8 inch pipe with an area of 50 inches is hardly the size to feed a 5 x 13 atack having an area of 65 inches. A 9 inch pipe running horizontally, having an area of 63 inches, is not any too large if the bottom connection is properly made. It is not stated whether the first floor registers are in the aide walls or in the floor. If they are in the side walls and the stacks are 5 x 13 inches, it is not strange that the house is not well heated, particularly as ventilating flues are in each room. The location of the ventilating registers is not given. If they are near the ceiling and open it will require much larger pipes and stacks to do the heating.

The experiments of "A. II." have been in the wrong direction. He should give his air supply an area of threefourtha to seven-eighths of the combined heating pipes. Then if the casing gets hot he should either increase its diameter, so that there will be at least 3 inches between it and the radiator, or put a No. 20 black iron casing between them, arranged so that it will not obstruct the upward air currents. If necessary, after this is done, the furnace should be covered with some insulating material. Our readers are invited to make free use of The Metal Worker in describing their experience in furnace heating bearing on this inquiry.

#### Distinguishing Iron and Steel.

From Enamel.—It is very important for us to be able to distinguish in a simple manner whether iron or steel sheets are being delivered to us. Can you give us such a test?

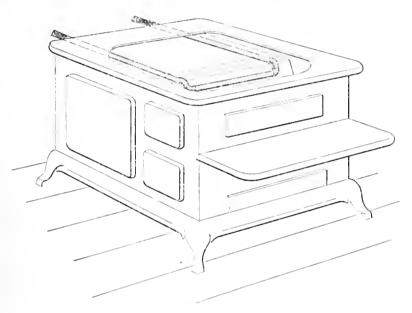

Answer.-We know of no better way than to try the method of doubling up pieces of the sheet metal you wish to examine, hammer them flat and examine the bent surface. There are two signs which mark the difference between the two. The iron is duller, has less luster than the ateel. If you feel the bent aurinces you will notice the steel feels smoother under the touch, or slight rubbing, than the iron. This is especially pronounced in the thicker pieces. This difference in feeling is the greater the more ordinary the iron is. With very thin sheets this difference naturally disappears more or less, and we have to call in the aid of a pocket lens. With the help of that we notice that the surface of the iron is rougher than the aurface of the atcel, even in the best aheeta, due to the difference in atructure of the two metals. The best iron and the best steel (sheet) come nearest each other, but there is still some difference. On close examination you will notice that the iron has a finely grained skin, as if there were pores. This contributes to its duller luster. On steel the scale comes off more easily, too. There was a time when sheet steel could be distinguished from sheet iron by its "ring" or sound when struck with a hammer, just as some experts can pretty nearly tell a passenger axle from a freight axle if laid among a plie on the ground and atruck on the journal, by lta "ringing" or higher pitch and the feeling of a "spring," as they call it. So it was with sheet steel. But now this distinguishing mark does not exist any longer. In its make up and working qualities it is so much like best sheet iron that, as the foreman of the tin shop of a great establishment states, no one is able to tell which is which.

#### Water Front or Pipe Coil.

From "OLIVER TWIST."-In The Metal Worker of November 10 "S. & S." of Massachusetts describes a little trouble they have with a water front, which since its insertion has prevented the range from baking as it dld pre-viously. They ask if a coil would not viously. do the work better and allow the oven to be properly heated. The sketch herewith shows how a coil may be inserted in a range without taking up much room in the fire box and without interfering with the heating of the oven. Instead of putting the pipes through the end of the fire box, as is usually done, they are taken through the back of the range and continued along directly on the top of the oven plate and dropped down in water heater, about which he inquires, is manufactured in all sizes by Irving M. Seamans, 377 Maryland atreet, Buffalo, N. Y. The apparatus may also be obtained from Howell, Shanklin & Dowman, 75 Capital street, Charleston, W. Va.

#### Flow of Water Through Pipe.

From C. T., Nora Scotia.—A short time ago you explained in The Metal Worker how to find the quantity of water a pipe would deliver. Unfortunately, the method was so complicated that common tinkers could make no use of it. If I was able to use algebra in that way I presume other parts of my education would be equal and I would not be a tinker but au "M. E." or a "C. E.," or something after that style. My object in writing you to day is to ask how much water a 1-inch lead pipe will deliver per hour, the pipe being 318 feet long. The first 100 feet is nearly

Water Front or Pipe Coil.

front of the fire back, as shown in the sketch, by means of elbows and close The writer has a 30-gallon nippers. boiler now thoroughly heated after this fashion, except that the pipe is not dropped down into the fire box, but continued, as shown by the dotted lines, across the oven plate, and which has a 30-foot run of pipe between the range and boiler, in addition to five elbows on each line. The whole of the piping is 4 inch. This method of connection has been used satisfactorily, with the range boiler close to the range, or in a bathroom a considerable distance away upatairs. A water front or back reduces the capacity of a fire box to a great extent, and, naturally enough, the effect of a water front on the heat-ing of an oven would be more marked when added after the range had been used than though it were in position from the first. By this plan, therefore, it is seen to be practicable to heat the water without diminishing the size of the fire box or impairing the heating of the oven.

#### Seamans' Automatic Water Heater.

From X. Y., New York.—Replying to the inquiry of C. T. Maguire, Hornellsville, N. Y., that appeared in The Metal Worker of December 8, I beg to inform you that Seamans' automatic

level, then there is a fall of 14 feet, the only power being gravitation.

Answer .- We are sorry that our correspondent was not able to make use of the article that appeared in The Metal Worker on the flow of water through pipes, and we are afraid that there are a good many other readers who are in a similar difficulty. As a matter of fact, however, the formulas which we gave do not require any very great acquaintance with algebra, and the subject was put in the simplest way possible. There are certain rules to be followed in calculating the flow of water which made it necessary to use terms and methods that are perhaps hard to understand. If, however, it could be put in any simpler way, we would most assuredly have done it, and it would be a great advantage if a very simple rule could be deduced for figuring the flow of water through pipes. If our correspondent saw some of the complicated formulas frequently used by engineers he would not complain of the comparatively simple formula which we presented. If he will follow the explanation that accompanied the formula he | Territory.

will see that the only difficulty is ln extracting square root, and this is a process that can be easily mastered. Had he been given a formula which involved the extraction of fifth roots it would have been quite a different matter.

Replying to our correspondent's direct inquiry, we have figured out the flow of water in the pipe he describes, according to the formula given in the article referred to, which is:

$$\int_{-L}^{\frac{1}{d^2-4}} \times 4.71.$$

The volume of water per hour according to this rule is found to be 444 gallons. It must be borne in mlud, however, that these are United States gallons, containing 231 cubic inches. The imperial gallon contains 277 274 cubic lnehes. Working out the same problem by means of tables in the book "Practical Hydraulics," by Thos. Box, we find the volume of water is about 408 gallens per hour. The tables alluded to cover a number of pages in the book, and were worked out by difficult equations involving the use of logarithms. Even with the table, moreover, formulas have to be used.

#### Cleaning Solder.

From R. Cambridge, Mass.—In the Letter Box of The Metal Worker of November 24 is an inquiry from "W. D. V.," Southampton, N. Y., who writes about solder which is supposed to have zinc in it, but which does not become purified by the use of sulphur. Probably the trouble is not zlue, but the solder is impregnated with iron. Who can give any suggestions as to moving the iron?

#### is it a Leak?

From I. N. PHILLIPS, Nashville, Tenn.—Referring to the inquiry in the Letter Box of December 1 from "Subscriber," I would suggest, in addition to what you say, a possible leak in the stop cock at the pump. I had the same trouble once and found it there.

The November foreign trade returns of the port of New York show a slight decrease in exports as compared with November of last year. As given in the Journal of Commerce during the eleven months since January the aggregate movement (specie excepted) amounts to \$709,269,457, against \$831,840,108 last year, a decrease of \$122,570,651. This decrease is shared in by both imports and exports, the latter being \$14,756,934 less than last year; and imports \$107,813,717. The decrease in imports is mainly due to the large falling off of free goods, which are \$218,852,163, against \$276,361,049 a year ago. The specie movements show imports \$19,705,514, against \$65,467,944 last year, and exports \$116,628,756, against \$99,768,759 Customs receipts have reached \$80,932,299, against \$109,788,303 for the corresponding 11 months in 1893.

Natural gas is reported to have been struck in Lincoln County, Oklahoma Territory.

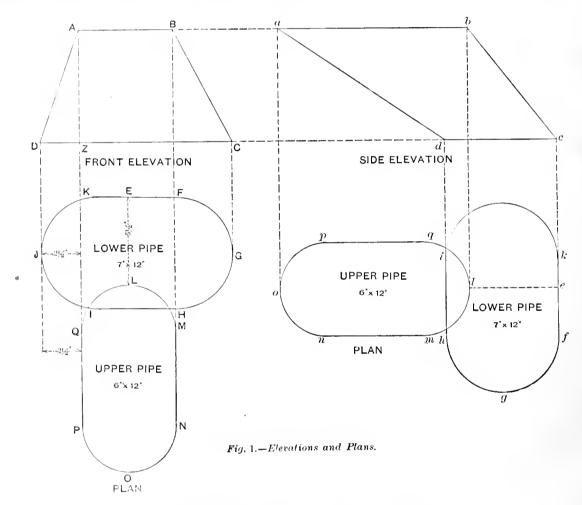

# THE TIN SHOP.

Pattern for Offset, Oblong to Oblong.

From G. F. M., Brooklyn, N. Y.—Will The Metal Worker publish a method of obtaining the pattern for an article which I would call a combination reverse offset? I wish to connect two hot air pipes which are oblong with semicircular ends. The lower pipe is 7 x 12 inches and the upper 6 x 12 inches. The offset is to go in a very tight place, so in order to make a good job I would like to have the pattern in

lower pipe is shown to be  $5\frac{1}{2}$  inches. The side elevation of article is represented by a b c d, the plan of upper pipe by l m n o p q and the plan of lower pipe by f g h i k. The method we shall use for obtaining the pattern will be that of triangulation, and to prevent a confusion of lines duplicate plans are shown in Flgs. 2 and 3. The upper and lower profiles have been divided into parts and connecting lines drawn, as shown by F L, G M, G N, H O, I O,

as shown by the solid lines 1 2, 3 4, &c. Connect points as shown by the dotted lines drawn between 1 4, 3 6, &c. In Fig. 3, divide N O P and G II, I J in a similar manner, and connect the points, as shown by the solid and dotted lines. To draw a diagram of triangles representing the solid lines in F G M L of Fig. 2 proceed as follows: Draw a right angle, as shown by R S T in Flg. 4, making R S equal to the straight hight of the article, as indi-

PATTERN FOR OFFSET, OBLONG TO OBLONG.

one picce. As shown in the plan, the side of the lower pipe faces the same way as the end of the upper pipe. The end of the upper pipe is  $5\frac{1}{2}$  inches from the side of the lower and the side of the upper pipe is  $2\frac{1}{2}$  inches from the end of the lower.

Answer.—In Fig. 1, let A B C D represent the front elevation of the article, F G H I J K the plan of the lower pipe and L M N O P Q the plan of the upper pipe. The horizontal distance from the side Q P of upper plpe to the end of lower pipe is shown to be 2½ inches. Also the horizontal distance from the end L of upper pipe to the side K F of

PJ, JQ and KL. The connecting seam or joint is shown by EL. Then the article is composed in part of the triangles KLF, MGN, HOI and JQP. The triangle KLF is divided into two right angled triangles by the joint line LE. The article also contains the sections LFGM and KLQJ of Fig. 2 and HGNO and IOPJ of Fig. 3.

As the pattern is to be obtained by triangulation, divide Q L M and J K, F G of Flg. 2 into any convenient number of equal parts, as indicated by the small figures. Connect these points

cated by A Z of front elevation. Measuring from S, act off on S T the lengths of solid lines in F G M L, Fig. 2, including L E, which will give the slant hight corresponding with b c of the side elevation. Connect the points in S T, Fig. 4, with R, as shown by the solid lines. We have thus obtained a number of triangles, the hypotenuses or longest sides of which represent the distances from points F and G in the lower pipe to corresponding points between M and L of upper pipe, as indicated by the solid lines in plan. For the diagram of triangles representing

the 'dotted lines in F G M L, Fig. 2, draw the right angle R<sup>1</sup> S<sup>1</sup> T<sup>1</sup>, as shown in Fig. 5, making R<sup>1</sup> S<sup>1</sup> equal to the straight hight of the article, as derived from A Z of front elevation. Measuring in each instance from S<sup>1</sup>, set off on

The diagrams of triangles in Figs. 8 and 9 are derived from the solid and dotted lines in I O P J of Fig. 3. In Figs. 10 and 11 are shown the diagrams of triangles derived from the solid and dotted lines in J Q L K of Fig. 2.

of triangles in Figs. 4 and 5. The stretchout of pattern from E to E is derived from the plans of lower pipe in Figs. 2 and 3, as the stretchout of pattern from L to L' is derived from the plans of upper pipe in Figs. 2 and 3.

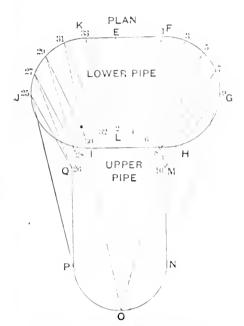

Fig. 2.-Plan Divided for Triangles.

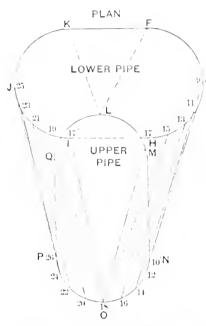

Fig. 3 -Plan Divided for Triangles.

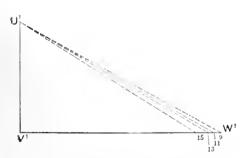

Fig. 7.—Triangles Corresponging to Dolled Lines in G N O H of Fig. 3.

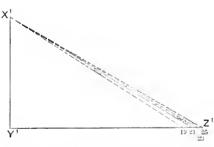

Fig. 9.—Triangles Corresponding to Dotted Lines in I O P J of Fig. 3.

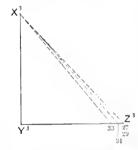

Fig. tt.—Triangles Corresponding to Dotted Lines in JQ L K of Fig. 2.

PATTERN FOR OFFSET, OBLONG TO OBLONG.

8' T' the lengths of dotted lines in F G M L of Fig. 2, and from the points thus obtained draw lines to R'. The diagrams of triangles shown in Flgs. 6 and 7 are constructed in a similar manner. Those in Fig. 6 correspond with the solid lines and those in Fig. 7 with the dotted lines in G N O H of Fig. 3.

In Fig. 12 is shown the pattern of article derived from the plans in Figs. 2 and 3, and the diagrams of triangles in Figs. 4 to 11. The attetchout of F G and L M of pattern is derived from F G, L M of plan, Fig. 2. The distances between points in F G and M L of pattern are derived from the hypotenuses

As previously stated, two plans were employed in order to avoid a confusion of lines. Then for the pattern shown in Fig. 12 proceed as follows: Draw any line, as E L of pattern, in length equal to R E of Fig. 4, which gives the actual distance from E in the base to L in the top, as also shown by b c of side ele-

vation and indicated in corresponding plan by l  $\epsilon$ . With E of pattern as center, and E F of plan as radius, atrike a small arc, F, which intersect with one struck from L of, pattern as center, and R T of Fig. 4 as radius, thus establishing point F of pattern. With point F

one size and fit; there are no edges or joints to rust; no bowl to work loose; strengthens the weakest part of a can; is perfectly smooth inside and out. This neck is made of heavier material than pieced necks, and open hearth ateel is used exclusively, in order to secure can stock that is proof against

the country's wage workers. In regard to the question of arbitration, Mr. Gompers remarked that disputes between the workers and employers might generally be adjusted by that method; but if they were it would only come when the workers were better organized, when their power and their rights had

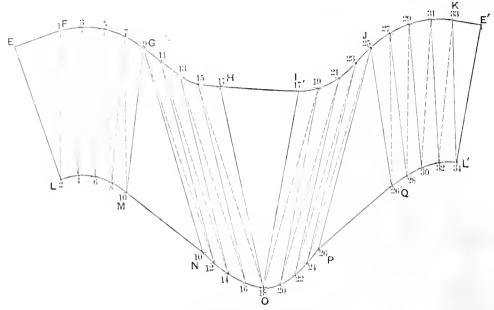

Fig. 12.-The Pattern Shape.

PATTERN FOR OFFSET, OBLONG TO OBLONG.

of pattern as center, and R11 of Fig. 5 as radius, strike a small arc, 4, which intersect with one struck from point L of pattern as center, and L 4 of Flg. 2 of radius, thus establishing point 4 of pattern. With point 4 of pattern as center, and R 4 of Fig. 4 as radius, atrike a small arc, 3, which intersect with one struck from point F of pattern as center, and F 3 of Fig. 2 as radius, thus establishing point 3 of pattern. Proceed in this manner, as above described, and as indicated by the solid and dotted lines, until the points G M of pattern are located. With M of pattern as center, and M N of Fig. 2 as radius, atrike a small arc, N, which intersect with one atruck from G of pattern as center, and U W of Fig. 6 as radius, thus establishing point N of pattern. Proceed in the manner indicated until the remaining points in the pattern are located. It will be observed that the letters and figures in pattern designate points similarly indicated in Flgs. 2 and 3. Lines traced through the points obtained as directed, and as shown from E to E' to and L' to L, will produce the desired pattern.

New Seamless Milk Can Neck.

The Chicago Stamping Company, Congress and Green streets, Chicago, have made a new departure in the milk can line, and are now manufacturing a seamless neck, which is herewith illustrated. In offering it to the trade the manufacturers enumerate a number of advantages, among which are the following: There are no seams to solder or to come unsoldered; it is always of

cracking. The company have just issued catalogue E, which covers their milk cans and milk can stock.

The fourteenth annual convention of the American Federation of Labor was opened at Denver, Col., on Monday, under the presidency of Samuel Gompera. The tone of the opening speeches, according to the telegraphic press reports, was of a more hopeful and moderate character than is usually looked for at the annual gatherings of the Federation. Mr. Gompera, in his presiden-

received greater recognition. The first atep must, he said, be organization, the second conciliation; the next, possibly, arbitration; but compulsory arbitration, never.

At the annual meeting in Chicago, last week, of the trustees of the great drainage canal now under construction, connecting Lake Michigan with the tributaries of the Misaissippi, President Winter of the board announced that the entire work will be completed by the end of 1896. The total expenditures since the inception of the work

New Seamless Milk Can Neck.

tial address, said that he believed this country was within a year of an induatrial revival which, in activity and intensity, would surpass that of any previous period. With this turn in industry would come, he thought, the opportunity for the laboring man to reap the harvest for the wage workers; and he urged them to concentrate their efforts, and, by means of better organization and united effort, secure the improvements so necessary for the wellbeing of

have been \$10,193,130, and the trustees have on hand \$2,466,000, cash. It is estimated that \$27,000,000 will be required for the whole enterprise. Over 6000 men are at present employed on the work.

Purdue University has received, as a gift from the Baldwin Locomotive Works, a pair of beautifully finished model Vauclain compound locomotive engines.

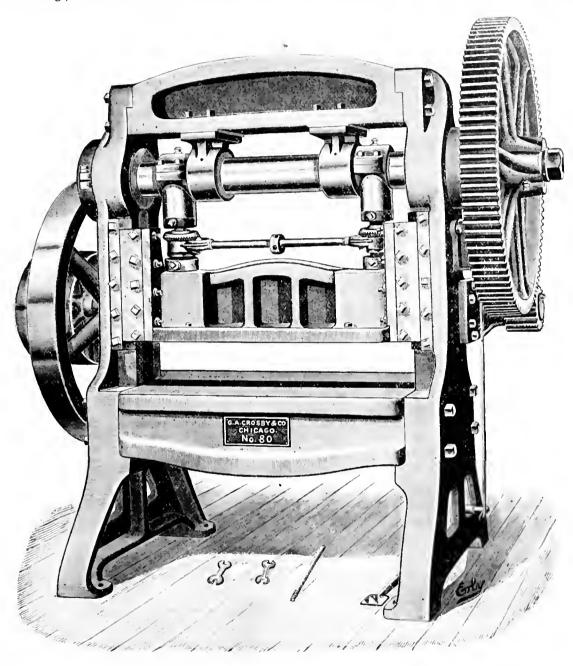

#### The Crosby Power Press.

A new back geared, straight lined power press adapted for cutting out large articles in tin, brass, copper, sheet iron, steel, &c., has been brought out by G. A. Crosby & Co. of Chleago. The shaft is made of steel and has journals each side of the crank to prevent springing. The gears are all cut and have broad and large teeth. The cross head runs in V bearings, which are made ad-

the pressure of the downward stroke, would be driven up so forcibly as to oftentimes break or derange the mechanism of the clutch, or, carrying it past the highest point before the clutch had caught on, allow it to deseend again by its own weight, making accidents much more liable to occur. This brake acts only at the time required to prevent a sudden acceleration in the motion of the cross head—that is, from the time the punch

slide (as desired), 3 inches; adjustment of slide, 4 inches; weight complete, about 18,500 pounds.

The Department of State has received programmes of the international exhibition of hotel and traveling accommodations to be held in Amsterdam next summer. The scope of the exhibits will embrace a very wide field, including architecture, shipbuilding, rail-

THE CROSBY POWER PRESS.

justable for wear. The pitmans are made, with broad bearing surfaces and are adjusted by means of a cross shaft, which is provided with a gear and pinlon at each end that are closely fitted, so there is no back lash. This permits of adjusting both pitmans exactly alike. The press is provided with an automatic brake designed to prevent the sudden reverse motion, which would otherwise be communicated to the cross head! when operating dies which are constructed with powerful steel or rubber springs under the lower die. Unless overcome or balanced in some manner, the cross head, after being released from

and cross head start upward until the punch leaves the drawing ring, which is usually about one-quarter of a revolution of the shaft, thus leaving about three quarters of the revolution of the shaft open or free from friction or use of power. The press is so arranged that it may be taken apart to facilitate transportation, handling and setting up. The main dimensions of the press, which is built by G. A. Crosby & Co. of Chicago, are: Opening in bed (varied as desired), 20 x 43 inches; distance between uprights, 53 inches; distance from bed to bottom of slide, when latter is up, 9½ inches; motion of

way construction and equipment, aerostatics, furniture, china and pottery, tableware, paper, blankets, and liquora, food, confectionery, fisheries, plumbing, medicine, machinery, electric lighting and signaling, gas and oil lighting, heating, art industries, geography, appliances, gardening, insurance and many other branches.

British Board of Trade returns for November show an increase of \$2,785,000 in imports and a decrease of \$2,064,000 in exports, as compared with the corresponding month of last year.

### STEAM AND HOT WATER.

#### Combination Heating.-II.

BY J. W. HUGHES.

One of the first forms of heaters fitted in the hot air furnace was the simple spiral coil, modified to suit the requirements of the furnace in which it was to be employed. Then followed various combinations of pipes and fittings, as the fancy of the designer and the requirements of the case demanded, and the furnace casing F; B came out at the top, and the coil was fitted in the dome of the heater above the fire door. This kind of coil was further modified by having one or two turns taken around the inside of the fire pot, as shown in Fig. 2. This was done when it was desired to increase the efficiency of the heater, or rather give it greater power, as the furnace was very efficient, but had its limitations. These engravings will give a correct idea of the simple apiral coil. welding seam had opened. It is best in making these coils to use lap welded pipe, but most of them were made of the ordinary butt welded article. The seam of the pipe must be kept to the inside, not directly in the center, but more toward the top or bottom so as to divide the strain. While the workman divide the strain. While the workman was bending the heated part of the pipe his helper was employed in pour-ing water on such portions as had assumed the proper shape or showed a

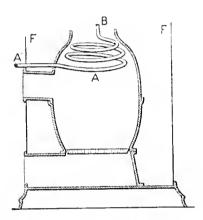

Fig. 1 .- Coil Heater.

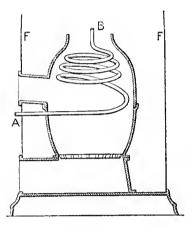

Fig. 2.-Coil Healer.

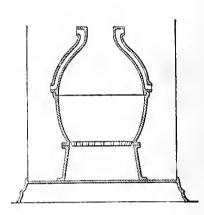

Fig. 3.-Hollow Dome Healer.

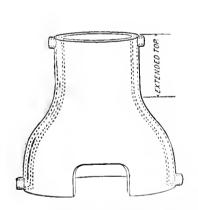

Fig. 4.—Hollow Dome with Extended Top.

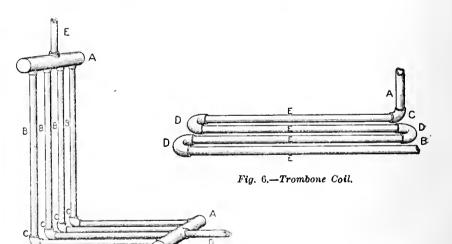

Fig. 5 .- Pipe Coil for Healer.

#### COMBINATION HEATING.

finally came east iron heaters of different designa. A manufacturer, M. C. Ryan, had made in England a wrought iron hollow dome that fitted on the fire pot of his furnace, proving a most effective heater and carrying as much as 1300 to 2000 feet of pipe in coils and radiators. These domes were welded together, being very handaome pieces of work. The illustrations pre-sented give a better idea than could be conveyed by descriptions of the appearance of some of the heaters referred to. Fig. 1 shows a plain apiral coil made of 1-inch or 11 inch pipe, the part A extending through the side of

The coils were bent by heating about a foot of the pipe over a forge fire, a piece of pipe having previously been buckled on to the end to aerve as a lever and give a cool bandle to the workman at the beginning of the operation. What would be the finished ond of the coil, being simply a long straight pipe, also served both as a lever and handle. As the coil neared completion a piece of pipe had to be acrewed on the other end, being removed when the work was done. Great care had to be exercised in selecting a perfectly sound piece of pipe, as it was very annoying to find, after spending time on the coil, that the

tendency to flatten or bend in the wrong place. Care was also necessary to get an even heat. A piece of 1-inch rod wire was ordinarily used by the work-man as a guide or pattern The pipe was generally bent on the anvil, a pin inserted in the hole serving as a fulcrum to assist in the operation. Many attempts were made to bend the pipe cold, also to make the coils on an iron plate or wheel, but after a short experience the workman became so expert in handling the pipe in the simple way described that the more elaborate appliances were discarded.

Care must be taken to have the plpe

of which the coil is made cut to the right length, as it is an awkward job to cut the pipe when the coil is nearly completed. For making extra long coils it was sometimes necessary to lengthen the pipe by screwing on another piece with a buckle, but the bending and heating at the point where the buckle was attached was an ugly job, the coil having to be left nearly straight at that point, the heat furthermore causing the buckle to slacken and leak. This difficulty was overcome, however, when the coil was finished by filling it with a weak solution of sal ammoniac water. After standing for a few hours the coil was emptied of water and the joint allowed to rust tight, care being taken to have the two parts held securely in

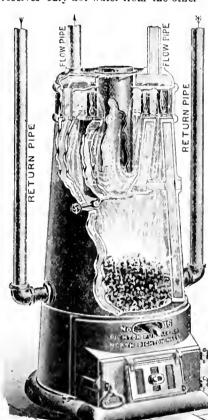

inch pipe and fittings. It was aug pended over the fire and the pipes canted so as to drive the air out of the flow pipe A as the coil was being filled with water. Fig. 7 shows another form of coil, which was only used when nothing simpler would answer the purpose, as it was difficult to make and invariably had to be rusted up in order to make it tight. It was bent one pipe at a time by the process already alluded to, and was usually constructed of 1inch pipe and ordinary ells and return bends.

Enough has been written to make the reader familiar with the different forms of coils used, but the subject is hy no means exhausted, as the coil heaters were as numerous as the different

Brown's hot water heaters. These included heaters for D. A. January, Giles F. Filley, Col. I. B. Brandt, John Finney, William Finney and Captain Some of the original plants Stetmins. are still in operation and giving good satisfaction. In other eases the buildings have been torn down or remodeled. Mr. Cezzens would be glad to hear from anybody in the West who had creeted indirect hot water heating systems previous to the dates mentioned.

#### The Winthrop Hot Water Heater.

In the accompanying illustration we show a broken view of the Winthrop hot water heater, just brought out by the Dighton Furnace Company, North Dighton, Mass. Referring to the illustration, it will be seen that no bolts, gaskets or calked joints are used in its construction, each water jacket being connected with the dome by wrought iron nipples and lock nuts. This style of construction, it is pointed out, reduces the chances of leakage to a minimum. By connecting each water jacket to the dome it is thus made the distributing reservoir, the whole bottom side of which is subjected to the direct heat of the fire, and at the same time it receives only hot water from the other

Winthrop Hot Water Heater,-Broken View.

portions. This, it is stated, permits the discharge of hot water almost immediately without walting to heat the entire system gradually. Another feature alluded to is the central draft.

The Winthrop has a return flue and vertical circulation, and the angle at which the interior of the apparatus is exposed to the fire, it is pointed out, makes it virtually self-cleaning. At present only one size of the heater is manufactured. The diameter of fire pot is 16 loches; hight of heater, 47 loches, and adapted to supply 350 square feet of heating surface. Larger sizes are in course of construction.

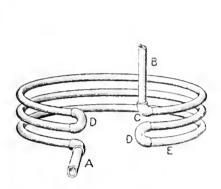

Fig. 7.—Cylindrical Coil.

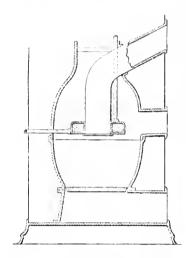

Fig. 8.—Heater with Feed Chamber Water Ring.

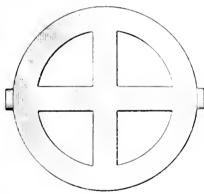

Fig. 9.—Cast Water Chamber for Dome.

#### COMBINATION HEATING.

the proper position, as once the joint had rusted it was impossible to turn the pipe in the buckle.

Fig. 3 shows the appearance of the hollow wrought iron furnace dome above referred to. Fig. 4 is a similar heater, with the top part extended higher, to increase the heating surface. Fig. 5 shows a form of pipe coil set up over the fire, care being taken in fitting this and other forms of heaters not to block the firing door or interfere with the working parts of the furnace. The heater, Fig. 5, was usually made with ordinary fittings, the flow and return pipes being 1\(\frac{1}{4}\) inches and the pipes B B 1 inch. Of course there was no objection to larger pipe being used when the circumstances demanded it. Fig. 6 presents a view of an ordinary trombone coil, being generally made of 12-

kinds of hot air furnaces. The in-genuity of the foundrymen early brought into the field various kinds of cast iron heaters, one of these being a hollow ring forming the end of the feed chamber, as shown in Fig. 8. Figs. 9 and 10 present other forms of simple castings made to go into the dome of furnaces over the fire place of a coil. Still other forms were in use, but for the purpose of illustrating the general principles the sketches presented serve the purpose.

WILLIAM F. COZZENS, St. Louis, Mo., writes that he is still in the trade with the Royal hot water heater at the masthead. He also calls attention to the fact that in the years 1858-9 he erected in his city a number of hot water indirect heating plants, using

to work together. Referring to Fig. 1,

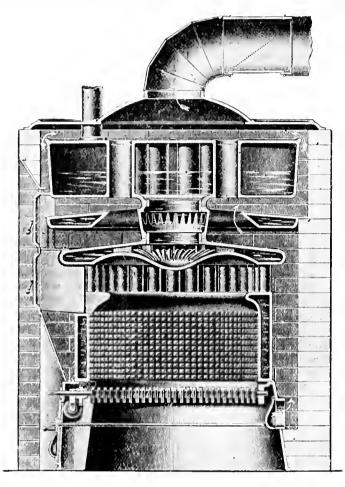

which shows the internal construction

#### All Right and Volunteer Bollers.

The accompanying illustrations show sectional views of the All Right and Volunteer boilers, made by the William

Fig. 1 is a sectional view through the All Right boiler, Fig. 2 being a separate view of the fire pot, while Fig. 3 is a section of the Volunteer boiler, showing the hot water regulation tank. The All Right boiler is for brick setting, as indicated in the engraving, while the Volunteer is of

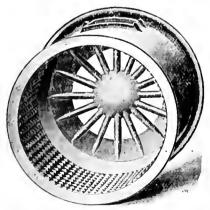

Fig. 2.—General View of Fire Pot.

the portable type. Both of the boilers are made for either steam or hot water. They are made entirely of cast iron, comprising a circular ash pit and fire pot which is east in a single piece, open and close sections, the open sections allowing the products of com-bustion to pass through the section and the close sections forcing them out to the edge and over the section, the of the All Right boiler, the new dust damper arrangement will be seen. This arrangement, which is a patented device, is referred to as a simple but effective way of getting rid of the dust when shaking the grate. The damper is located at the back part of the base and is operated from the front by a rod. In the brick set form this damper opens into the flue around the boiler between the base and bricking, and the dust is carried into the chimney. In the portable boiler a piece of smoke pipe can be run direct from the damper in the base to the chimney or up into the reg-ular amoke pipe. When the dust damper is opened, no matter whether the ash pit door is open or closed, the dust, owing to the draft, is carried into the chimney rather than into the cellar. The inner surface of the fire pot, as shown in Fig. 2, is covered with fine points projecting into the fire, which, it is atated, prevents all possibility of the water chilling the fire and thus secures a very perfect combustion and maintains. perfect combustion and maintains a uniform fire at the edges as well as in the center of the pot. The grate is of the Smyth patent triangular pattern operated with a shaker. The grate bars fit into slots in the back of the base and rest in grooves on a supporting bar across the front, held in place by the ash plt front. By taking off this front, which can be done by removing four screws, the supporting bar falls forward and the entire grate, or any part of it, can be removed and replaced and new bara put in if necessary. feature is also referred to as patented. Fig. 3 is a sectional view of the No. 12 Volunteer hot water boiler, showing waterways and flue spaces; also the hot water regulation tank, which is immeraed in the water continually within the boiler, receiving its heat from the surrounding water. It expands against a rubber diaphragm and closes the draft

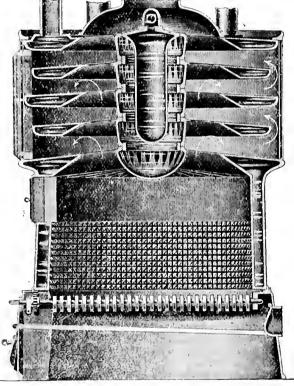

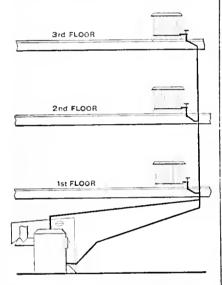

Fig. 3.—Sectional View of Volunteer Boiler.

to the piping before the mason starts with the brick work. This does away with the loss of time and interference where the mason and steam fitter have at any desired temperature. It is pointed out that there are only three or four joints in the entire boller and these are lathe turned screw joints.

### Dispute about Radiator Connections.

From Samuel A. Heins, Rondout, N. Y.—In reply to the question that was asked by "W. W. K." in The Metal asked by Worker of November 17 on connecting radiators, the sketches seem to show a one-pipe system. I do not think very much of such a system, although I have put in a great many which worked sat-isfactorily, and I have also taken out a good many that did not work. Give me the two-pipe system, for you can always rely on that system to work well. I do not think much of the way the pipe is run from the boiler and the way the radiators are connected in the sketches shown. The pipe from the boiler pitches the wrong way and should rise from the top of the boiler and the condensation in the flow main should run back to the boiler. From the sketches it looks as if square elbows were used on the return pipes, which should be avoided. An elbow should never be used unless unavoidable, as the friction to so great. By using 45° ello there is much less friction. By using

Dispute About Radiator Connections.

Y fittings it would be difficult to connect the radiator valves. There would be less hammering in a system like that shown in the first illustration, which would also give the drier steam of the two, but neither of them is perfect. I have been in the steam and hot water business for a good many years and give a sketch of what I would consider a perfect system. Of course it is open to criticism and I always like to get the views of my fellow workmen on a subject of this kind. I would use on my risers, tees, with a nipple and a 45° ell to run up to the radiator. This would not make such a tedious job in connecting the radiator valves. There would be less friction and better results from a job fitted up this way. A two-pipe system always pitches toward the end and bleeding pipes may be put in to relieve the upright pipes from rattling and banging. In my experi-ence I find wherever a Y-joint or 45° elbow can be used it gives better results and less friction in the pipes, and the distribution of steam is better than where tees and square ells are used. I think the job shown in the second figure would fail to work right. I know it would not work as well as that shown in the first, though I never put up a job like that shown in the second, which would require the use of globe or straight valves instead of radiator

valves, and no radiator should be connected with any valve except an angle valve. If "W. W. K." wants to know which will give the driest steam and be freest from water hammer, I would recommend the first, and hope to see the views of my fellow workmen in The Metal Worker on this subject.

#### Heating a Barber Shop.

From W. F. S., Bayñeld, Wis.—I would like to ask another question in reference to heating the barber shop that was given in The Metal Worker of December 1. Would a quicker and better circulation result if the pipe shown in Fig. 2 was highest at the right angle turn just above the heating coil and at a pitch from the air valve to that point where it now has a fall? This would make the air valve lower than the elbow above the coll and would necessitate the air valve being changed to that point.

Answer.—It is quite possible that very little difference would result from changing the pitch of the pipe in the plant discussed. The idea of having a fall from the point where the air valve is located is based on the fact that the water will be hottest when it reaches this point, and from there it will cool and consequently have a tendency to fall away, inducing a better circulation than if the cooling water had to flow up hill. In larger plants, with a longer run of pipe, it is the general opinion that it is best to have a fall from some high point.

#### HEATING NOTES.

J. A. GOODRICH of the American Radintor Company, 92 Centre street, New York, spent last week in Chicago. The business of the company shows an increase this year and keeps their experienced corps of men busily engaged in attending to it in the manner that has won popularity for the house.

Samuel Burns of Thomas Weathered's Sons, 244 Canal street, New York, recently read a paper on the "Improvements in Greenhouse Heating" before the New York Florist Club. As a pipe fitter, manufacturer and engineer, with an experience of a quarter of a century, nothing was lacking in the reader to make the paper interesting, as was shown by the close attention and questions of the audience.

M. KENNEDY of Troy, N. Y., recently completed the installation and satisfactory use of two Humber boilers in a new school building and was startled a day or two after by learning that the building was destroyed by fire and that it was reported that an explosion of the boilers had started the fire. With commendable enterprise he immediately had the debris removed from where the boilers stood and had a photograph taken of them and a part of the piping, which showed all to be in perfectly the piping, good order, as the fire did not destroy that part of the building. The photograph was reproduced in a local paper and all disagreeable reports about the heating apparatus were promptly stopped. His worthy enterprise has given him no little publicity of a pleasing and we trust profitable character.

M. Mahony, Troy, N. Y., distinguishes the festival month of the year with a calendar, decorated with the worthy St. Nicholas carrying playthings

to his worshipers. The card also tells the people that comfort and satisfaction are assured by the use of the Mahony boilers for steam and hot water heating.

The Southern Heating Company were incorporated last week at Louisville, Ky., by Walter E. Mellinger, David Gorman and Thomas D. Bedwell, with a capital of \$10,000, divided into shares of \$100 each. Mr. Mellinger was recently heating engineer for the Baker & Smith Company at Chicago.

M. J. Heatly, Mitchell, S. D., was in New York this week among the hardware trade and looking up steam and hot water heating apparatus.

James A. Harding writes from his home at Vineyard Haven, Mass, that although he has no connection with any house in the steam and hot water heating trade at the present time, he is preparing the plans and specifications for heating a new school building at Cottage City, Mass., for one of his numerous friends in the trade.

W. M. MACKAY, 211 Water street, New York, manager of the steam and hot water department of Hart & Crouse, Utica, N. Y., is sending out card pricelists of the new large size Royal water heaters and Safety sectional steam heaters. Since the season has opened, and the boiler has been tested, it has demonstrated a capacity to carry an increased amount of radiation over that which was estimated originally.

THE MARTIN HEATER COMPANY'S plant, Dunkirk, N. Y., will reopen at an early date with a full force of operatives. It is said the concern have been absorbed by a syndicate of Eastern capitalists who will manufacture specialties.

JOHN A. Scollay, Brooklyn, N. Y., has opened an office at 89 and 91 Centre atreet, New York, for the sale of hot water heating apparatus for greenhouses and residences.

The Lunkenheimer Company of Cincinnati, Ohio, nave recently opened a house at 51 John street, New York, under the management of Franklin Williams. They will carry a full assortment of their specialties for steam, water and gas in valvea, safety valves, injectors, water columns, lubricators, &c. They are presenting a high pressure gate valve, arranged so that new seats for the valves can be inserted, also a globe valve of extra strength in the partition, and designed so that the seat can be reground in a few minutes. E. H. Lunken, president of the company, has recently returned from England, where he eatablished a branch of the house at 35 Great Dover street, London.

THE BOARD OF MANAGERS of the American Society of Heating and Ventilating Engineers held a meeting last Monday in one of the rooms of the building of the American Society of Mechanical Engineers, 12 West Thirty-first street, New York. The object of the meeting was to perfect arrangements for the annual meeting, to be held on January 22, and to consider the subjects to be laid before the society. Those who wish to correspond with the society should address their communications to Post Office Box 1818, New York City.

A. C. EDGAR of the Model Heating Company, Philadelphia, Pa., was one of the visitors to *The Metal Worker* office this week.

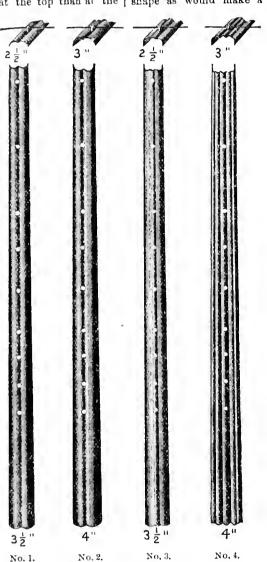

N. A. Boynton, president of the Boynton Furnace Company, has been spending a few days at the Chicago branch, 195-197 Lake street.

# THE RETAIL STORE.

#### Pressed Steel Fence Posts.

The Avery Stamping Company, Cleveland, Ohio, are introducing fence posts pressed from steel, as shown herewith. The posts are made from sheet steel pressed into shape and are then coated with a non-corrosive compound to prevent rust. The posts taper, being 1 inch narrower at the top than at the

at which they are sold is a noticeable feature of the goods. The posts are made in four sizes, Nos. 1, 2, 3 and 4, and are particularly adapted to use for railway, farm, lawn, park and cemetery fences, whether of smooth barbed or of woven wire. The company state that they have been experimenting for a long time to see if they could not distribute steel into auch shape as would make a light, at 1ff,

Pressed Steel Fence Posts.

bottom, as shown by the figures in the cut, their form being such, it is stated, as to give them great rigidity. The posts are designed to be driven into the ground, thus saving digging and filling. The point is made that frost does not raise them as may be the case with other kinds of posts. For fastening wires to the posts staples are inserted through the holes and bent as shown at the top of the cut, which is referred to as a simple mode of fastening and as allowing the wires to expand and contract. It is pointed out that the posts being light, and nested for shipping purposes, a great saving is made in freight, cartage and handling, and that the price

atrong, durable and low priced fence post. The manufacturers explain that the principal reason that ateel posts have not been more universally used heretofore has been that the metal was not properly distributed, thereby requiring considerable more material, which increased the weight and cost unnecessarily, and that these posts offer the same resistance to pressure in the ground as a wooden post of like size. It is further explained that bar iron and pipe and small angle iron have been used in order to make them cheaply, but they have been of such small size that they were easily pushed over and an extra plate and bracing had to be used, which made them expensive.

#### The America Refrigerator.

The Bowen Mfg. Company of Fond du Lac, Wis., manufacturers of the Bowen patent refrigerators, have recently brought out the America, which is herewith illustrated. This refrigerator has a removable ice receptacle, thus constructed for the purpose of securing one of the essential features of a perfect refrigerator—namely, cleanliness. All parts are easily removed for cleaning, the interior being constructed entirely of metal with no wood exposed to become sour of filthy. The drainage is a special feature also. As seen by means of the broken side of the

The America Refrigerator.

ice compartment, the tank walls are bent upward and inward at the lower ends, forming a continuous trough. This trough, having narrow channels, conveys the waste water out of the refrigerator with great rapidity. The ice rack, which is shown leaning against the refrigerator, is also constructed to attain this object. Dry air and saving of ice are the result. This method of construction also strengthens and atiffens the ice chamber. There is a large opening under the rack for the cold air to enter the provision chamber, and there are spaces on all sides of the tank for the warm air to rise and enter the ice chamber. The metal ice compartment further forms a large condensing surface, which assists in drying the air. A portable drip pan suspended from the bottom of the tank makes it impossible for the moisture of condensation to drip into the provision chamber. The bottom and drip pan slope toward the waste pipe, which is located at the side

of the refrigerator in a convenient place for observation and for the removal of the catch basin. On the right hand side of the ice chamber is seen the porcelain lined water cooler, which is hooked to a band of iron counecting the front and back walls and is easily removed for cleaning. The refrigerators are made of selected ash, finished in antique, trimmed with solid bronze hardware. Mineral wool is used for filling. The company also manufacture the Eclipse and Bowen refrigerators.

#### Walk and Street Scraper.

The Iowa Farming Tool Company, Fort Madison, Iowa, are introducing a seasonable tool, as shown in the accompanying cut, for scraping walks and streets. The scraper has a hardwood blade, 6 x 18 inches in size, secured to

the couplings are connected the cam is Inserted in the groove, and with one motion of the lever the two parts are brought together perfectly tight, the curved top of the male coupling being

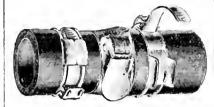

Fig. 3.—Coupling Applied to New Hose.

pressed against a rubber washer on the inside of the female coupling, Fig. 2. The lever then lies that on the side of the hose, as shown. Disconnecting is accomplished just as speedily and eas-

ple and well calculated to do away with much that is vexatious in handling garden hose. The company manufact-

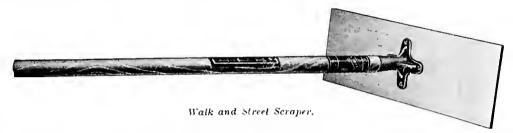

Fig. 7.—The A. & W. Hose Band.

ure five sizes—namely, for  $\frac{1}{2}$ ,  $\frac{1}{2}$ ,  $\frac{1}{2}$  and  $\frac{1}{2}$  inch hose,

#### MEMORANDA.

ETTE & HENOUR MFG. COMPANY, St. Louis, Mo., issue an illustrated catalogue which shows the Cactus, Japanese and Park lawn sprinklers, and the Imperial, National and Pacific, these three having revolving arms. The hose specialties illustrated include brass polished hose pipe, National and Gem spray nezzles, hose couplings and

a malleable iron socket and is provided with a strong 4½-foot ash handle. The manufacturers state that for removing mud, slush, snow, &c., it is an excellent and cheap tool.

### The Adams & Westlake Hose Coupler.

The Adams & Westlake Company, Chicago, have just brought out the Adams & Westlake Lightning hose coupler, which is herewith illustrated. The coupler possesses obvious and important advantages over the old screw coupling. It has been devised to meet

Fig. 1.—The Adams & Westlake Lightning Hose Coupling.

the demand for something better, for a coupling that can be used without bruising the fingers and without twisting the hose, that would be water tight and that could be instantaneously fastened. The inventor has cleverly devised special fittings to cover every re-

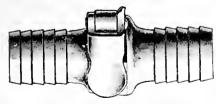

Fig. 2.—Couplings Connected.

quirement in connecting garden hose. As will be seen by the cuts there are no screws to get out of order. The end of the male coupling is fitted with a smoothly finished curved top, below which is a deep groove. The female coupling has a short lever terminating in a cam, as shown in Fig. 1. When

ily. Fittings are provided, as shown in the illustrations, for new hose, Fig. 3; for old hose without removing the

Fig. 4.—Coupling for Old Hose.

old couplings, Fig. 4, and for use on a faucet, Figs. 5 and 6, where it can be left permanently. The A. & W. hose band, shown in Fig. 7, is also an ingenious device, as it can be applied

Fig. 5 .- Coupling for Bibb Faucet.

without tools of any kind. It is formed with a body of wire, a brass strip at one end and a lever at the other. Teeth on the end of the lever engage in openings

Fig. 6.—Coupling Applied to Bibb Faucet.

on the end of the strip, and the band is then drawn tight by pressing the lever over. Ears on the strip are pressed down to lock the lever in place. It will be seen that with these bose bands the work of attaching couplings to hose to a very simple matter. In fact, the whole arrangement is wonderfully sim.

clamps, seamless hose valves, also Chicago and California patterns of hose valves.

THE ILLUSTRATED CATALOGUE and price list for 1895 of the Shirk refrigerstors, manufactured by the Shirk Re-frigerator Company, 254 East Madison atreet, Chicago, Ill., is a neat pamphlet of 50 pages, bound in enameled paper. In an introductory note addressed to the trade they mention that their business last year, in spite of the hard times, was better than during the previous year. They also allude to the excellent grade of their goods, and then give 15 reasons for buying the Shirk refriger. ators. Following this is a notice of some special features of the refrigerators, and then come the articles themselves. Refrigerators of all sorts are shown in general and sectional views, descriptive particulars being given where necessary, and tables of sizes and prices presented. Grocers' chests, sideboard refrigerators, nursery refrigerators and special designs for large work are shown in great variety. Two points upon which emphasis is put are cork filling and dry air.

The Rochester Lamp Company, 42 Park place and 37 Barclay street, New York, have just issued an illustrated catalogue and price-list of their new Rochester Lamp, including artistic designs in banquet, table, piano, library and hall Lamps, onyx and brass Tables, Parlor Heaters and Oil Stoves. This is known as Wholesale Catalogue 49, and is intended for the home trade, their export catalogue having been previously issued. This, it is announced, will shortly be followed by a supplement. In addition to the above goods are shown silk and linen Shades, Shade Frames and a variety of miscellaneous Lamp goods and trimmings in brass, bronze and tin. A large variety of new Rochester Lamps are illustrated and described, and other patterns are continually being added. Aside from the admirable lighting features of the new Lamp the die work in the metal goods is exceptionally fine, some 40 odd watch die makers having long been employed in this department at the extensive plant in Bridgeport, Conn., where the new Rochester is now made.

#### L. & G. Improved Milk Can Stock.

The accompanying illustrations show the improved L. & G. patented milk can stock, for shipping purposes, just placed on the market by the Lalance & Gros-

coated and re-coated with pure block tin. The interior is consequently per-fectly smooth, instead of having the three soldered seams found in the older atyles-a great recommendation, it is remarked, in point of easy cleansing. Further, to protect the cans in transit,

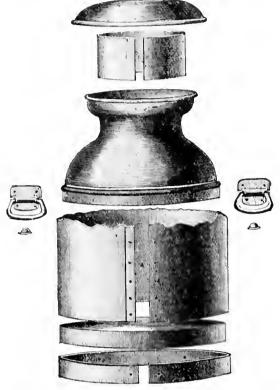

Fig. 1.-L. & G. Improved Milk Can Stock.

jean Mfg. Company, 19 Cliff street, New York. The style here shown rep-resents the pattern of can in use in New York State, but the articles are also made in all the leading sizes and patterns adopted in other parts of the country,

Fig. 2 .- Milk Can Made from L. & G. Improved Stock.

some 20 different styles being manufactured. The particular feature of this stock, which has been secured by a recent patent, is the fact that the bowl, neck and breast, and also the neck and breast only, are made in one seamless piece of heavy steel, thickly

a strong iron hoop is firmly tinned on the breast rims. It is pointed out that the cylinder, or body sheet, has a close bearing of 11 inches, the full inside circumference of the can breast, and this apace, between the cylinder and breast rim, is floated with solder, obviating the weakness and subsequent leakage which has so often been found to be the fault of milk cans made with other than the straight form of breast rims. There are, as wil be seen in Fig. 1, three thicknesses of metal solidly united as one by two additional layers of pure block tin and solder, with the stiff iron hoop on the outside, at the point where strength and durability are most essential.

#### Domestic Gas Light Heater and Illuminator.

Hamsley Metal Roofing Company, 18 Cliff street, New York, are marketing a modification of a heater formerly brought out by them, as shown in the accompanying cuts. It is known as the Domestic Gas Light Heater and is specially adapted for heating bath and bed rooms, offices, &c., affording both light and heat from one flame. dome has an inside shell to retain any gas which may have cecaped com-bustion at the burner and are consumed by the intense heat without fouling the atmosphere of the room. The sides of the lower half of the dome are fitted with white mica for illuminating purposes. This heater is 7 inches in diameter and 10 inches long over all. When desired a hood or deflector is sent which covers the dome, its object being to shower the heat downward. Water and other liquids can be quickly heated or light cooking accomplished over these heaters, a number of utensils fitting the too exactly being furnished for this purpose. Fig. 2 shows a

double burner with air mixer, which, it is explained, gives a more intense heat, increasing the volume twofold for in-

Fig. 1.-Domestic Heater with Single Burner.

creased area or apace. Fig. 3 represents the heater with double burner, the whole covered with an embossed

Fig. 2.—Heater with Double Burner.

Russia iron inclosure 10 x 10 inches for radiating a greater supply of heat. One of the economies of the heater over a atove consists in the fact that it can be

Fig. 3.-Heater with Double Burner and Inclosure.

used or discontinued instantly, and the intensity of heat quickly regulated by the key.

#### Aluminum Coffee Pot.

Sidney Shepard & Co., 23 Randolph atreet, Chicago, have brought out an addition to their line of aluminum ware in the form of a coffee pot. It is a beautiful piece of work, the entire body being apun from one piece of metal so that it is without a seam, except at the spout. The design is artistic, in no way resembling coffee pots made of ordinary tin plate. The samples of aluminum ware now shown in the salesroom of this firm make an exceedingly attractive display.

## ROOFING AND CORNICE.

## The Penn Iron Roofing & Corrugating Company,

Philadelphia, have just issued a supplement to their general catalogue of steel coverings for coilings and side walls. A feature of the book is a series of colored photographic reproductions of ceilings and side walls in which the effect of the decorator's art is admirably shown. The colors in these illustrations are arranged and blended with much taste, and a good idea of the opportunities for lavish or even plain decoration afforded by the use of the company's products is obtained. The supplement consists of 44 pages 9½ x 13½ inches. Medium deep molding plates are first shown in a combination of the plates shown in Department No. 7 in the original catalogue, the coloring in the combination bringing out the full beauty of the design. Columbian extra deep plates in a ceiling combination artistically decorated follow. Next is a ceiling combination of deep molding plates, followed by a combination of bead mold plates adapted to a side wall finish for a dining room, café or restaurant, and a ceiling combination of the same class of plates for a similar purpose. A side wall of enriched steel work suitable for parlors or bedrooms, and two side wall finishings with coves are then shown. Next is seen a ceiling of ornate design with corner finish of enriched plates, and a ceiling combination of deep molding plates with enriched cove and styling. Basket em-bossed body plates in combination with enriched coves follow, with additions to the tenth department of the original catalogue in the way of special shallow panel ceiling plates and combinations of molding plates. Two plain ceilings with stenciled decoration then appear, followed by plain illustrations of new atyles of zinc centers and a large illustration of a combination in body and cove plates. Two decorated side walls in delicate tints with silver bronze trimmings come next, and are succeeded by a page devoted to stencil designs.

The remainder of the book is devoted to the illustration of many new designs covering friezes, molding strips, body plates, rosettes, panels, centers and plate combinations. Many of the engravings are of large size and include interior views of cafés and offices where the materials have been used.

The company have also issued a 12-page catalogue in supplement form descriptive of their line of rock faced metal coverings. The many styles of plates shown demonstrate how closely the imitation of a stone building may be effected. Some brick facings are also shown, and there are several illustrations of buildings on which the plates have been used. The concluding pages are devoted to roofing tiles, for the manufacture of which the company state they have exceptional facilities. They also claim that they are especially equipped for export trade, having the latest patterns of machines for producing the several styles of tiles in use in foreign countries.

FLASHINGS.

WALTER EGGLESTON AND WARREN PEALER will open a tin shop in Bronson, Mich., January 1, and will be prepared to do all kinds of tin work, roofing, spouting, &c. The firm name will be Eggleston & Pealer.

THE BAY STATE ROOFING COMPANY are putting a composition roof on the Smith Block, at Torrington, Conn.

KNORR & BLOCKS, 165 Wells street, Chicago, are to furnish the cornices, skylights and tinning work for the flat building of P. W. Loftus, Austin and Ashland avenues.

#### Progress in Gas Making.

As the result probably of sharp competition in one form and another, says the Pittsburgh Dispatch, gas making and consumption have undergone many improvements in recent years; indeed, at least one gas expert has claimed that the gas art has made greater advances than the electric lighting art in the same period. Of course the great objection remains that there is a naked flame using up a certain proportion of the necessary constituents of a healthy atmosphere, but the vast majority of people are still very indifferent to this, provided their illumination is cheap. A new process is said to be creating a sensation in lighting circles, and its origin is very curious. In prosecuting work for electrolytic reduction of refractory oxides to yield aluminum, T. L. Willson found that large quantities of calcium carbide were producible, from which acetylene is readily obtained. Now acetylene has remarkable illuminating power, but no method has hitherto been known for its cheap production. It is stated that a burner taking 1 to 1½ cubic feet of acetylene per hour affords a beautiful, clear white light, fully equal to 50 candle power, while the cost puts it on more than a parity with that of existing methods. It will be seen that there is here the promise of much cheaper lighting of a better kind. The only objection to the new gas of any importance noted thus far has been a tendency to smoke a little when turned down low.

After 18 months of steady boring for artesian water, the city authorities of Princeton, Iowa, have at last struck a sufficient supply, of high quality, at a depth of 2275 feet.

A branch of the British National Health Society, which seeks to diffuse sanitary knowledge among the people, has been formed in India. Sanitation, as such, among the natives of that ceuntry is of an exceedingly elementary kind, and is generally conspicuous by its absence in the homes of the poor. The society proposes employing women workers to go among the native women and teach them how to render their houses more sanitary, employing for this purpose public apeeches, simple literature and personal lessons. That

this is a sufficiently herculean undertaking, those who have any knowledge of the various manners, customs and religious prejudices of the people of India will readily acknowledge.

#### Test of Fire Proof Construction.

A demonstration which was given on October 26, at the St. Pancras Iron Works, London, of a system of fire proof construction patented by T. L. Banks is thus described in the Plumber and Decorator: Mr. Banks has proceeded on the principle that if a building is to withstand the effects of a big fire within its walls it must not only be built of unioflammable materials, but must also be heat proof. A brick building had been erected, its lower story being filled with inflammable material, being filled with inflammable material, which was set fire to and allowed to burn for half an hour. The strength of the flames was very great. The fire was finally drowned out and the party then examined its effects. The room had been ceilinged on the new system, and it was found that beyond slightly cracking the plaster no harm had been done. Nor had the heat penetrated the room above, where a block of ice remained unmelted. The fire proofing consists of helical metal lathing covered with plaster, and so fixed that a small chamber, through which passes a current of air, is left between the floor above and the ceiling below. It is impossible for the heat to reach the joist ends, so that no twisting of these from the heat of the flamca results.

Dr. Siemens, the Berlin electrician, dwells in a house which is known throughout Germany as "the Wonder of Wansee." It is fitted from roof to ceiling with electricity. Report has it that the dining room, kltchen, and wine cellar are all connected by means of a miniature electric railway. In order to convey things from one room to another, the article required has only to be placed on a little car, a button pressed, and the car is almost instantly where it ought to be.

A. R. Whitehill, professor of chemistry and physics at the West Virginia University, after exhaustive experiments, is said to have succeeded in liquefying and solidifying natural gas. The result of his experiment is described as presenting the appearance of a lump of snow, which evaporates rapidly and disintegrates when brought in contact with the air, giving off a smoke like phosphorus.

The latest hygienic notion in Paris is the use of "perous" glass for windows. This is declared to possess all the advantages of the ordinary window filling, and while light is as freely admitted as through the medium of common glass, glass of the "perous" description further admits air as well. The minute holes with which it is pierced are, however, too fine to permit of any draft, while they are said to furnish a healthful, continuous ventilation.

## TIN PLATES.

The Tin Plate Wages Dispute.

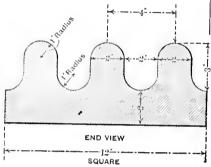

On Monday and Tuesday of this week conferences were held in Pitts-burgh between the Association of Tinned Plate Manufacturers and committees of the Amalgamated Association for the purpose of arranging a wage scale which would be satisfactory to both sides and terminate the strike among the tin plate mills, some of which have not been in operation for nearly three months. Exhaustive arguments were made by both sides in support of their respective positions, the manufacturers claiming that it would be utterly impossible to operate their plants at a profit and pay the old scale of wages. On the other hand, the employees argued that on account of the great reduction in the price of steel and the introduction of labor saving devices, the heavy reduction in wages asked by the manufacturers was not justified and could not be accepted. Near the close of the sessions the manufacturers agreed to withdraw the demand for a reduction of 20 per cent. in heaters' wages, but insisted that the other reductions must be made. To this the committee, representing the Amalgamated Association would not agree, and on Tuesday evening the conference adjourned and nothing was accomplished.

It is now certain that those tin plate manufacturers who have not already started with non-union men will shortly do so. The Ellwood Tin Plate Company, Ellwood City, Pa., immediately inserted advertisements in the Pittaburgh papers for non-union competent workmen, and will start up as soon as men can be secured. The United States Iron & Tin Plate Mfg. Company, Wallace, Banfield & Company, Limited, and other concerns who started up with non-union men some time ago were not represented at the conference, for the reason that they are no longer members of the Manufacturers' Association. The failure to bring about a settlement of the trouble between the tin plate manufacturers and their workmen will, it is believed, cause a disruption of the Manufacturera' Association, a number of firms having already severed their connection with it.

#### The Beard Furnace Tile.

Ambrose Beard, Jr., Cambridge, Ohio, has invented a fire clay furnace tile for bottoms of tin mill and sheetheating furnaces, which, it is claimed, is superior to others now in use. The tile, which is illustrated below, is made to cover I square foot of surface and, when properly laid, the furnace bottom becomes very much like the shape of a sheet of corrugated iron. The corrugations are, however, made deep, so as to allow of the radiation of heat and expansion of gases underneath the packs of sheets which are placed on the top of the corrugation. In old methods a bottom made of broken flue cinder is used, or, more commonly, coke is placed on the furnace bottom, to make the heat of packs more uniform. By use of this tile the expense of burning coke is

avoided and cleaner, better results are obtained. The tiles are used for pair furnaces or heating furnaces. In furnaces for heating bars they are placed crosswise of the furnace, and for heating sheet packs they are placed exgthwise, making a clean bottom, which retains a large amount of heat and secures excellent results. The

The Beard Furnace Tile.

American Fire Brick & Clay Company, Mineral Point, Ohio, are the manufacturers.

#### SCRAP.

THE TIN PLATE PLANT of the Old Dominion Nail & Iron Works, Richmond, Va., was slightly damaged by fire last week. The accident only delayed operations for a few days.

Anderson, Ind., advices report that the buildings of the new National Tin Plate Works are progressing rapidly. The roof of the tin house was to have been put on by the end of this week.

British Board of Trade returns for November show the total exports of tin and terne plates from British ports during that month to have been 32,000 tons, against 26,000 tons in November, 1893. Of this amount, 22,000 tons were shipped to the United States, as compared with 24,800 tons in the previous month, and 15,500 tons in November of last year.

THE WORCESTER AND UPPER FOREST TIN PLATE WORKS, at Morriston, South Wales, were closed down last week, owing to the inability of the proprietora to obtain orders except at prices which would entail a substantial loss. Two thousand workpeople were thus forced into idleness.

THE LEECHBURG FOUNDRY & MACHINE COMPANY, Pittsburgh, have secured a contract for four hot and four cold mills, one Mesta pickling machine, four sets of doubling shears, two sets of trimming shears and one roll lathe for the new tin plate plant of the La Belle Iron & Steel Works, Wheeling, W. Va.

It is stated, in a recent press diapatch from Newark, Ohio, that a company of Pittsburgh capitalists have definitely decided to build a 4-mill tin plate plant at that place. Citizens of the town have subscribed for a number

of sharea in the new enterprise, and other inducements were offered, which, after more or less lengthy negotiations, determined the promoters to locate at Newark. Under the terms of contract the new works are to be built within the next ten months. The proposed plant will, it is said, employ about 300 operatives.

THE ANNUAL REPORT of F. A. Swel tenham on tin mining in the State of Perak in the Malay Peninsula, shows that the tin and tin ore exported from the State during the year amounted to 316,201 pikula, or 18,821 tons, against 278,254 pikuls in 1892. Of this quantity the Kinta district produced 230,725 pikula, Larut coming next with 69,892 pikula. The highest export for any one month was 32,301 pikula in July, and the lowest 20,253 in March.

ALL THE CONTRACTS for the equipment and buildings for the new tin plate plant to be erected by the Hyde Park Iron & Steel Company, Hyde Park, Pa., on the line of the West Penn Railroad, about 35 miles from Pittsburgh, have been awarded, and the erection of the plant will be pushed as rapidly as possible. The contract for the buildings, all of which will be of iron, has been awarded to the Shiffler Bridge Company of Pittsburgh, and they are now under way. The main rolling mill building will be 113 feet wide and 175 feet long. The contract for the engine was given to the Rankin-Fritache Engine Company of St. Louis, and it will be 13 x 60 inches in size, geared two to one, and will drive both the hot and cold mills. The contract for the rolling mill machinery has been placed with the Leechburg Foundry & Machine Company of Pittsburgh, and consists of two 24 x 44 inch finishing mills and one 24 x 44 inch roughing mill. One train will consist of a 24 x 54 inch finishing mill and the other of a 24 x 52 inch bal-anced roughing mill. There will also be a 24 x 78 inch two-high bar mill, shears and roll lathe. The boilers will have 800 horse-power capacity, and will be of the return tubular type, the contract having been placed with the Eric City Iron Works, Eric, Pa. The new plant is expected to be ready for operation about April 1, 1895, and the product will at first consist of black plates only, although a tinning depart. plates only, although a tinning department is expected to be added after the black plate mills have been started up.

THE PITTEBUROU TIN PLATE WORKS, INCORPORATED, New Kensington, Pa., have recently completed the erection of mills for rolling black plate, and the plant of this concern, which has been tidle for some time, has been put in operation with non-union men. At this time one black plate mill is in operation, but another was to be started during this week. As soon as a sufficient stock of black plates is secured the tinning department of the plant will be started up.

DURING LAST WEEK the Lecchburg Foundry & Machine Company of Pittsburgh shipped a Meata patent pickling machine to Goldsmith & Lowenberg, at New Kensington, Pa.; one machine to Monongahela Tin Plate Company, Pittaburgh, Pa., and a third to the New Castle Steel & Tin Plate Company, New Castle, Pa. The new tin plate plant now under erection by Goldsmith & Lowenberg, at New Kensington, Pa., is well under way, the iron buildings being nearly completed and foundations are being laid for the machinery.

ROBERT CROOKS & Co., New York City, importers of tin plates and metals, give notice of the removal of their offices, on December 15, from the location which they have long occupled at 64 John street, to more commodious quarters at 138 Front street, corner of Pine street, where they have secured a handsome suite of offices. Messrs. Crooks & Co. are among the most prominent houses in the tin plate trade in the East.

LATEST ENGLISH ADVICES indicate that a number of the South Wales tin plate works are shut down pending a readjustment of the wage scale. Those named as now idle include the Old Lodge and Western, at Llanelly; [the Worcester and Upper Forest, at Swansea; the Ashburnham, at Burry Port; the Morlais, at Llangennech, and the Hendy Works, at Pontardulais. These works aggregate 50 tin plate mills.

THE Welsh Tin Platers' Union is, it is stated, to be thoroughly reorganized and strengthened with a view to again restoring a uniform rate of wages throughout the trade.

THE TOTTEN & HOGG IRON & STEEL FOUNDRY COMPANY of Pittsburgh, manufacturers of rolling mill and tin plate machinery and engines, have secured a contract from the Baltimore Iron, Steel & Tin Plate Company of Baltimore, Md., for the entire machinery for their new tin plate plant to be erected at Locust Point, Md.

## The South Wales Tin Plate Situation.

On Tuesday, December 3, an agreement was arrived at between the proprietors of the Morewood Tin Plate Works, Llanelly, South Wales, and their workmen, after prolonged discussion and negotietions, whereby the men agreed to accept a reduction of 10 per cent. in their wages. This, it is believed, will lead to a termination of the crisis at Llanelly; as it is understood that other manufacturers in the Llanelly district will follow the example of the Morewoods, although they had previously refused to curtail their demands to this extent.

Outside the Llanelly district, the wage question is still a burning and unsettled one. The tin plate manufacturers of South Wales, exclusive of the Llanelly makera, met on the same day at Swansea, and decided to endeavor to obtain from their men a concession beyond that accepted by the Morewoods.

According to accounts of the Llan elly meeting published in the English morning papers of December 5, J. H. Rogers, the head of the Morewood interests, in addressing the deputation of workmen made some statements which seem open to criticism by those who have a knowledge of the condition of the tin plate trade and industry in this country. He is credited with saying that the idea of the present depressed atate of the tin plate trade being due to American competition was entirely without foundation, and he informed the men in corroboration that "when he left America a few weeks ago, as far as he knew, the only tin plate works that

were running were Messts. Morewood's. at Gas City, the American works, at Elwood, and a small concern near them. The output of these works," he said, "would practically make no difference in the demand for plates from America." He told the men, however, that "glass and crockery were now very serious competitors with tin plates for the packing of fruits, vegetables and corn, and that many of the storckeepers in America were using eardboard and thin wooden boxes in which to pack goods instead of using tin boxes as formerly. This, coupled with the general bad trade throughout the world and the competition of Continental nations, was the real cause of the present deplorable condition of the tin plate trade.

Neither Mr. Rogers nor his hearers had, of course, seen the last published report of American tin plate production, which showed that the works in the United States had put out in the first half of this year no less than 85,000,000 pounds of tin and terne plates. Had they done so the alleged statement of the head of the Morewood interests, which amounts to a declaration that American competition was not a factor to be reckoned with, would probably have been modified. The tin plate news published from week to week in this paper should convince our readers both nt home and abroad that the American industry, although checked in some quarters by the present wage controversy, has not yet been relegated to obscurity. It is the general opinion among well informed authorities in the trade that American competition is largely accountable for the present drop in the prices of tin plates on the other aide of the water.

THE LA BELLE IRON WORKS, Wheeling, W. Va., manufacturers of muck bars and steel cut nails, have, as previously announced, decided to engage in the manufacture of tin and terne plate. A force of men have been put to work tearing down someold puddling furnaces to make room for the new machinery. The contract for the equipment of the plant has been given to the Leechburg Foundry & Machine Company of Pittsburgh, and consists of four hot mills 24 x 32 inches, four 22 x 34 inch cold roll mills, four 36 inch doubling shears, with engines attached, and two 36-inch squaring shears. The new plant is expected to be ready for operation on April 1, 1895, and will have a capacity of about 500 boxes per day.

FURNACE WORK MANUAL. An Exposition of Furnace Work in all its Branches. Compiled from the files of *The American Artisan*. By Sidney P. Johnston. Published by *The American Artisan*, Chicago.

The aubject treated of in this work is a very important one, and the information which has been carefully selected and worked up for the benefit of the furnaceman will undoubtedly prove of much interest and value. The compiler mentions that the present volume may not commend Itself to those looking for any new theories on combustion and the deflection of heat, as it deals with the practical problems arising from furnace work and with them alone. In an introductory section reference is made to the advantages of the hot air furnace and its extensive application; then the book proper begins with hints

on reading plans. This is followed with rules and tables for measuring pipes, and attention is given to tools for bending pipes and machines for the same purpose. Tables of plpes are presented, and later on the subjects of register boxes, furnace hoods and collars, dampers, furnace easings, furnace pipe connection, chimneys and cold air supply are taken up. The book is profusely illustrated.

### Warehouse Facilities in Large Cities.

The necessity for retrenchment of expenses during the recent business depression caused a number of Eastern manufacturers to close up their warehouses in Western cities. not intend to withdraw from that field. but resolved to try the experiment of selling through agencies and making shipments direct from factories to the buyers. It has been found that this is in many lines such an unsatisfactory method of transacting business that a tendency is now being manifested to again stock warehouses in the great Western distributing cities. As usual when drastic economies are put in effect, what seemed to be a sound policy was instituted at the wrong time. very depression in trade which made such economy desirable caused buyers to restrict their purchases to much they have been obliged to order more frequently, and when they ordered it was almost invariably because the merchandise was needed at once. Long delays were inevitable if shipments were awaited from Eastern factories, hence stocks at hand were almost invariably drawn upon, and those who had warehouses were duly favored. For some time no warehouse has meant practically no trade.

Another peculiarity of this phase of business has also presented itself. Not-withstanding the cheapness of railroad transportation over teaming as a general proposition, teaming takes the lead in handling the suburban business of a large city. In Chicago, for instance, with its innumerable suburbs scattered along its 30 railroad lines for 12 or 15 miles from the heart of the city, coal and lumber are about the only classes of freight delivered by rail from city stocks to suburban buyers. Almost everything else is transported by teams. City merchants run their own delivery wagons to the suburbs or patronize local express companies making daily or tri-weekly collections and deliveries. The complexities of the railroad service, which are necessary for the transaction of their great business, are too cumbersome for rapid suburban freight service. To use a railroad line also involves hauling to a distant freight depot in the city, and hauling from the rural station to the buyer's place, necessitating probably three sets of charges. Hence time and money are saved in the use of the an-tiquated freight wagon as compared with the modern railroad, because the former collects the parcels at the sell-er's store or warehouse and delivers er's store or warehouse and delivers them perhaps the same day on the premises of the buyer. The suburban patronage thus falls very naturally into the hands of the manager of a house carrying stocks of goods, the delivery by rail from a disadvantage car being and the great disadvantage of being put to great disadvantage, especially when freight must be transferred from one railroad to another to reach a suburb on the latter line. These inconveniences and disadvantages are only realized through experience, and the lesson has thus been taught that stocks of many classes of goods must be carried in local warehouses to capture local trade.

## PLUMBING and GAS FITTING.

### Sanitation and Smoke Prevention in Chlcago.

In the recently issued annual report of the Chleago Department of Health for 1893, Andrew Young, Chief Tene-ment. Factory and Smoke Inspector, presents an interesting and instructive account of the work of his department. We quote from Mr. Young's report as follows: "The wholesome spread of sanltary knowledge through boards of health and the press brings to communities the cold and naked truth that they are as communities reaponsible for much of the sickness and death in and about them. The evils arising from neglect of proper sanitary measures are as old as the history of cities. As the population multiplies the effect of such neglect is found in high death rates or marked by epidemics. Each case of sickness in a community is a menace to those in health. That the imperfec-tions of your neighbor's premises should remain a menace to the health of you and your family is no longer conceded, for legislators have awakened to the fact that health means wealth to a city, and is as beneficial for the city as for the individual, it being important for all that each be made to live cleanly. The question of plumbing and draining is one in which the whole public is concerned, and which should be decided and carried out by public authority and the work held under strict super-vision of competent inspectors. The rules and regulations governing plumbing and drainage of buildings, put in force in 1889, have proven beneficial to the city as well as to the citizen building a home, as every new building must be reported by the plumber for inspection and passed upon by this depart-The value of the work carried on in this line can readily be seen. The records of the department prove that of the buildings where plumbing and drainage were done under the rules adopted in 1889, not one case of sewer air or gas has been established in con nection with such building, nor one case where the system has proven 

important part in the cause of disease lies at the foundation of very much nes at the foundation of very much of the sanitary administration of cities and towns throughout all civilized countries. The popular impression, however, and undoubtedly the belief among a very large part of the medical profession, as well as among many of the officials who have charge of the sanitary administration, is that filth in the ordinary sense of the word is in itself the active cause of disease, and that little else is essential to the production of certain infectious diseases than to deposit a certain amount of filth, or to allow such filth to accumulate within the premises occupied by a given population in order to generate a pestilence. For the purpose of clear and lucid evidence on this important aubject I had a bright young physician of the department, whose medical education had been supplemented with a knowledge of plumbing and drainage and the requirements of

a sanitary dwelling, take from the records the daily reports of diphtheria, scarlet and typhoid fever, and make careful inspection of the premises and surroundings."

The results of this investigation showed with startling emphasis the relationship that exists between unsanitary conditions and sickness.

The following table is a record of the work of the department for the year.

New bnildings examined	5.847
Houses examined on complaint	17,177
Work places examined	17.649
Number employed	306,432
Notices served	13,708
Abatements	10,788
Defective plumbing	2,511
Defective drainage	1,104
Offensive catch basins	1,085
New sewers constructed	857
Traps applied	1,029
Plumbing work ventilated	578
Leaky roofs repaired	154
Privies cleaned	4,350
Privy vaults abolished	302
New water closets constructed	220
Yards and premises cleaned	1,754
	978
Miscellaneous	7.050
Plans examined, approved and filed	1,000

Particular interest attaches to that section of the report dealing with smoke abatement, to which work Mr. Young has devoted so much attention. The

report is in part as follows:

"The work of the Department in the enforcement of the amoke ordinance during the past year has been productive of the best results. In view of the fact that many lines of business would be stimulated by reason of the World's Columbian Exposition, and that many plants would be taxed to their utmest capacity during the continuance of the fair, after careful consideration of the subject a policy of correction was decided upon and proved to be the best

under the circumstances.

"Violators of the ordinance were promptly notified by letter, close watch being maintained for violation at all times, with the result of keeping the city comparatively free from smoke. The enforcement of the ordinance for the past few years has brought about a change of feeling on the part of those operating and owning steam plants. Contracts for the erection of new plants are now so drawn that in the operation of the plants the city ordinances shall be observed before their acceptance by architect or owner.

"Three thousand six hundred and forty seven violations of the smoke ordinance have been abated, some by devices to aid combustion, some by the use of hard coal, and quite a number by the use of natural gas. Two thousand seven hundred and four railroad engines entering the city have smoke consuming devices. The total cost to the city to bring about this large number of abate-

menta was less than \$4000

"In considering the subject of smoke abatement it is but just to take into consideration the immense amount of coal consumed in this city. In the year 1893, up to November 20, the total of soft coal used amounted to 4,247,174 tons. From Pennsylvania, 394,444 tons; from Ohlo. 659,901 tons; from W. Virginla and Kentucky, 164,271 tons; from Illinoia, 1,822,380 tons, and from In-

diana, 1,586,171 tons, thus showing the two last named States to have furnished 3,408,551 tons of the total for 1892."

#### How Swiped Joint Becomes a Shriner—His Miraculous Escape.

Beguiled by supposed friends, our old correspondent has been induced to join The Ancient Arabic Order. In a letter, which we copy in part below, he tells how the members of this noble order got even with the plumber. He writes:

After being admitted to the Temple and honored with the degree in full (I think I got all that was coming to me) I was, with numerous other novices, invited to the banqueting room, where about 200 Nobles were feasted with everything to make the heart glad, test the digestive organs and promote nightmare. Supper ended, felicitous speech and jolly song shortened the hour and drove dull care away. Good fellowship prevailed and Peace hung her banner on the wall. But what had begun so pleasantly came dangerously near ending in tragedy.

Some Son of a Camel Driver, without the fear of Allah in his heart, secretly suggested to the toast master to call on Swiped Joint for a speech. As no such number was down on the programme the request amazed me. with fear I slowly unwound myself and still more slowly raised my body to a standing posture. Gazing around the room, I beheld ten score faces smiling at me. The joy of a gratified victor seemed to spread over all. No kindly eye greeted mine, but rather a look of derision lit every face. When at length I regained my shattered mind and insisted that a horrible mistake had been made, a hundred voices exclaimed "No!" I begged that I might be permitted to select a substitute, but to no avail. Nor would they hearken to the fairy tales I told them my nearest Noble had related to me while we partook of salt and camel's milk together—all most beautiful legends of Arabia. "No! We want no substitute. A speech ! A speech!" they eried.

Then I described the dreadful doom that awaited the author of my misery. How the Nemesia of Fate would follow his footsteps across the burning sands of the desert, lurk about his tent when the shades of night had fallen and my cimeter should surely cleave his skull, divide his smile and split his chin and chine. But in vain was this dreadful threat. Not a smile did cease nor fear in any form rest on a single visage.

Then, in a moment of forgetfulness, I told them that I was not an Arablan story teller but only a plumber, one who did not delight in speech, but in making bills—bills with extra charges attached. Then pandemonium broke loose, and I realized that their day of vengeance was come, and mine to suffer for all the sins of the whole plumbing craft had fallen. They put the Kibosh on me, and forced me to confess how one so disreputable had gained entrance

to the Temple. In explanation I stated that instead of writing "plumber" in my application I wrote "contractor." With fearful yells, that would frighten a Bedouin shiek, a hundred strong arms and hands stretched forth to grapple me. Realizing the peril, and alert to save myself from a terrible fate, a happy thought occurred. I told them would they but grant me peaceful exit I would instruct them how ever hereafter to avoid paying plumbers' extra charges. Down went those threatening hands, smiles of joy and gladness drove away vengeful looks, and with one accord they cried "Agreed! Agreed! Tell us the secret and we will spare your miserable life!"

So hope once more filled my heart and swelled my breast. Pictures of my peaceful home came and hung them-selves on the walls. My aged wife smoothed the few locks that are left me, and my grandchildren came and climbed upon my knees. I hesitated, doubtful of the result, but not for long. The cry "Tell us the secret!" did not cease for an instant. So I told them to have their plumbing work done by the day.

Alas I this only served to arouse the multitude to greater frenzy. A howl of vengeance arose. A hundred spears pointed toward my breast; flashing cimeters aplit the air, while they shouted "Make a crescent of the cowardly son of a Dervish!" "Turn loose the royal Bengal tigers and let them feast on his carcass and extras!" With the rush of a whirlwind they fell upon me and applied the Kibosh afresh and stripped me of my raiment. They stepped on my neck, and stood me on my head. Had not the Grand Vizier interposed at this juncture and succeeded in restor ing order and quiet, my fate was indeed sealed. He told them that I was old and feeble, to look upon my lean body, that my carcasa would scarce make a meal for a buzzard, and he would see that I paid for my temerity and never again darken the door of their asylum. While he held their attention I deemed it a good chance to sneak, and should doubtless have got safely away or been alain had I slept a single moment longer.

#### Montreal Master Plumbers.

The annual meeting of the Montreal Master Plumbers' Association was held last week in the hall of St. Joseph's Society, corner of St. Catherine and St. Elizabeth streets. Routine business having been disposed of, the meeting proceeded to the election of officers for the ensuing year, which resulted as follows:

President, J. Lamarche.

Vice-presidents, J. Date, A. Cham-

pagne and H. Paddon.

Secretary, W. Briggs.
English corresponding secretary, J. W. Hughes.

French corresponding secretary, J. Thibeau.

Financial secretary, J. C. Jocatel.

Treasurer, W. A. Stephenson.
Sanitary Committee, J. W. Hughes,
John Date, Jas. Mattinson, A. Sigouin
and J. C. Jocatel.

Arbitration Committee, P. Carroll, A. Demers, G. Yon, G. Rosser and H. Baillie.

Auditing Committee, J. Watson, A.

Rousseau and Theo. Jocatel.

Legislation Committee, F. Brunet,
D. Gordon, J. Burna, T. Leclaire and W. Britton.

Apprenticeship Committee, A. Demers, E. C. Mount, T. Jocatel, J. Bonhomme and J. Sadler.

The first named on each committee will act as chairman. The speech of the newly elected president stated that the association had already taken steps to secure incorporation, and that this being done they promised to give their attention to some of the by-laws of the city relating to sanitary affairs. A long discussion ensued upon the movement now on foot to repeal the Augé law, which provides for the protection of workmen and contractors, and upon the motion of A. Champagne, seconded by J. W. Hughes, the society placed itself on record as being in favor of the principle of the law as it now stands, and against any movement to repeal it, but at the same time recognized that it could be amended in regard to details. and a committee will walt upon Mr. Auge to talk over the matter with him. Before the meeting was brought to a close six new members were declared

#### Brass Pumps.

The cuts here shown represent pumps recently put on the market by the Goulds Mfg. Company, Seneca Falls, N. Y. TRAPS AND VENTS.

THE MASTER PLUMBERS' ASSOCIA-TION of Albany, N. Y., last week elected the following officers: President, Horace F. Westcott; vice-president, John H. Moran; recording secretary, John C. Dugan; financial secretary, Frank Schimp; treasurer, Timothy E. Kerwin. Trustees, Allen Gilmore, Frederick W. Ridgeway and John J.

According to a daily paper the average wages of plumbers in Russia arc \$12 per month; lu Peru au ordinary teamster earns as much in a week, from which it is inferred that it is better to he a teamster in Peru than a plumber in

B. D. WASHBURN has leased the building situated on the corner of Pearl and Franklin streets, Boston, Mass., to the Barrett Sanitary Depot for a term of ten years.

THE CHICAGO MASTER PLUMBERS' ASSOCIATION will hold their annual election of officers on the evening of the 24th inst. Nominations were made at the regular meeting on the evening of

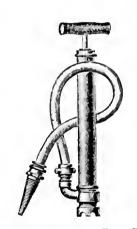

Fig. 1.—Plumbers' Brass Force Pump.

Fig. 1 represents a plumbers' brass force pump, having a 1-inch cylinder and 16-inch atroke. The pump is furnished with 3 feet of hose and a conical tip, so that it may readily be connected to any ordinary sized pipe. The pump is designed for removing obstructions in waste or water pipes, and for this purpose the pump is placed in a vessel of water and the pipe to be cleaned is connected to the pump by the hose. It is stated that the pump is compact and that it may easily be carried in a sack of plumbers' tools. A brass lift and force pump is shown in Fig. 2, on an iron frame with a revolving lever, which can be moved at will to any desired position most convenient to operate the pump. The point is made that the change of the position of the lever involves no removal of nuts and bolts, and that it is as easily effected as the pump is to operate. It is remarked that where the head of water works is not sufficient to force the water above the first atories, the pump will be fully appreciated; also that the pump is small and compact and that but little space is required for its accommodation. cylinder is 11% inches in diameter, with a stroke of 31 inches. The manufacturers state that they can fit both the suction and discharge for either hose or wrought iron pipe, if so ordered, but that the anction is regularly fitted for 1-inch lead pipe and the discharge for 4 inch lead pipe.

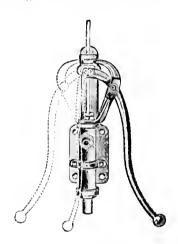

Fig. 2.—Brass Lift and Force Pump.

the 10th inst. As the regular meeting night this year falls on Christmas eve, it is, however, likely that the Execu-tive Committee may call a special meeting for the election on some other date, probably on Friday, the 21st.

WALTER BUSEY, George W. Goodall, J. S. Lanshan and William T. Sweet, Washington, D. C., having each passed a satisfactory examination, will become registered and licensed as master plumbers upon the filing of the requisite bond.

ONE OF THE ATTRACTIONS to the passerby down Beekman atreet, this city, is a full sized bathtub suspended over the door of No. 56. The bathtub is painted blue with gilt trimmings, and is one of the Ward steel cased asbestos lined tubs for which S. Davison is New York agent.

INSPECTOR DEAN WILSON of Buffalo, N. Y., is waging war against all plumbers who do not comply with the law in that city.

PETITIONS are being circulated in Decatur, Ill., says a local paper, addressed to the Legislature and asking for the passage of a bill regulating the plumbing in cities. Physicians cape-cially are now asked to sign the petition. The bill proposed provides for a commission including the chairman of the Board of Health, the Inspector of Public Buildings and a master of plumbing. They are to examine and license all who wish to engage in the business of plumb-Inspectors of plumbing are to be appointed to see that the plumbing in the city is safe and in good sanitary condition. Physicians say the bill is a good one and should become a law and then be enforced.

JAMES F. TRAYNOR of Wilmington, Del., has been appointed by the National Association of Master Plumbers of the United States to be organizer of local associations. With this end in view he will shortly visit a number of cities and towns in Pennsylvania for the purpose of organizing associations of master plumbers.

THE JAMES McDonald & Sons Com THE JAMES McDONALD & SONS COM-PANY of Cincinnati were incorporated last week by James McDonald, James M. McDonald, Edward McDonald, John Dooley and George F. Ender. They have a capital stock of \$75,000, and will manufacture and deal in tin plate, lead pipe, type metal, pig lead and plumbers' supplies.

ALBERT G. and C. EDWARD BUSH-NELL and J. NEWTON MEANS have formed a partnership for the sale of tubings, gas and plumbers' supplies in Buffalo, N. Y.

THE STATE SANITARY ASSOCIATION of New Jersey concluded its annual meeting at Trenton last week with the election of the following officers: President, David C. English, M.D., New Brunswick; first vice-president, Shippen Wallac, Ph.D., Burlington; second vlce-president, James Owen, C.E., Montelair; recording secretary, Daniel Strock, M.D., Camden; corresponding secretary, Prof. J. M. Watson, Elizabeth; treasurer, George W. Howell, C.E., Morristown.

THROUGH THE COURTESY Of David Smith, chairman of the Entertainment Committee, The Metal Worker is in recommittee, The Metal Worker is in receipt of an invitation and ticket to attend the annual ball of the master plumbers of Boston and vicinity at Odd Fellows' Hall, 545 Tremont street, Boston, on Tuesday evening, January 1 1895. The early part of the evening will be devoted to a concert, and the card announces that dancing will be the feature from 9 to 2 o'clock. Music will be furnished by the Howard Richardson Orchestra.

J. F. BLACKSHAW of Jersey City, one of the plumbers who were elected to the New Jersey Legislature, is prepar-ing a sanitary bill to offer to the Legis-lature when it convenes in January.

A MASTER PLUMBERS' ASSOCIATION will be organized in Jersey City, N. J., for the near future, plans for accomplishing that result having been perfected and a notice for the final meeting will be issued soon.

THE MASTER PLUMBERS of Newark, N. J., held their annual election last N. J., held their annual election last Tuesday night, when the following officers were selected: President, Elias Berla; vice-president, Walter P. Dunn; secretary, Ira T. Budd; financial secretary, William Jacobi; treasurer, F. J. Stern; Sergeant-at-arms, E. J. Leonard.

THE FIRM OF BOWEN & BEACH, manufacturers of Patent Corrugated and Standard Soil Pipe, Fittings and Plumbers' Castings, Medina, N. Y., have been succeeded by Beach & Co., Mrs E. A. Bowen having disposed of her interest to the other partners, Geo. A. Beach and Chas. J. Beach. The business will be continued as heretofore under the management of Geo. A. Ropph Geo. A. Beach.

EDMUND F. BUTLER, formerly with Dalton-Ingersoll Company, is now with Peck Bros. & Co., 65 Oliver street, Boston, Mass.

F. D. MILLER of the Trenton Pottery Company, Trenton, N. J., was a visitor among the New York Plumbing Supply houses this week.

THE PARTNERSHIP heretofore existing between John R. Cummings and Jeremiah J. McCarthy, doing business as plumbers under the firm name of J. R. Cummings & Co., at Norfolk Downs, Mass., is dissolved by mutual consent, and the business will hereafter be carried on by John R. Cummings.

DAVID YEAGER has moved his plumbing shop under Thobro's drug store at Laramie, Wyo.

Some of the plumbing inspectors of Chicago have been disciplined by the Health Department for neglecting their duties.

THE SOCIETY FOR POLITICAL STUDY THE SOCIETY FOR POLITICAL STUDY met last Tuesday afternoon at No. 144 Madison avenue, New York. The programme for the day was a paper on "Sanitary Conditions and Laws of New York City," which was to have been read by Dr. Mary Brinkman, but as she was unable to be present there was merely a general discussion on the submerely a general discussion on the sub-A large number of women was present, many of whom had some idea to advance in regard to sanitary reform and the improvements which they considered might be made.

### Drawback Rates.-II.

The Treasury Department has issued a synopsis of all the decisions rendered during the past few years in regard to drawback rates. We print below those likely to be of interest to the readers of The Metal Worker:

oofing, galvanized corrugated sheet iron, from sheet iron and spelter, same as duty paid. Propertion of spelter and iron to be stated in manufacturer's affidavit in each order.

each entry.
Sad Iron: manufactured by Bliss & Drake
of Newark, N. J., at following rates per

each entry.

Sad Iron: manufactured by Bliss & Drake of Newark, N. J., at following rates per dozen:

For No. 1, weighing not less than 39 pounds to the dozen, 16 6 per cent.

For No. 2, weighing not less than 48 pounds to the dozen, 19.6 per cent.

For No. 3, weighing not less than 58 pounds to the dozen, 23.6 per cent.

For No. 4, weighing not less than 47 pounds to the dozen, 19.6 per cent.

For No. 5, weighing not less than 55 pounds to the dozen, 23.6 per cent.

For No. 6, weighing not less than 67 pounds to the dozen, 23.6 per cent.

For No. 7, weighing not less than 77 pounds to the dozen, 29.6 per cent.

For No. 7, weighing not less than 89 pounds to the dozen, 33.6 per cent.

For No. 9, weighing not less than 97 pounds to the dozen, 33.6 per cent.

For No. 9, weighing not less than 113 pounds to the dozen, 36.6 per cent.

For No. 10, weighing not less than 113 pounds to the dozen, 42.6 per cent.

Smoothing Irons, self heating or charcoal: manufactured by Bliss & Drake of Newark, N. J., at the following rates per dozen:

For No. 1, weighing not less than 59 pounds to the dozen, 20 cents.

For No. 2, weighing not less than 77 pounds to the dozen, 20 cents.

For No. 2, weighing not less than 78 pounds to the dozen, 26 cents.

For No. 3, weighing not less than 78 pounds to the dozen, 26 cents.

For No. 4, weighing not less than 87 pounds to the dozen, 26 cents.

For No. 4, weighing not less than 87 pounds to the dozen, 29.6 cents.

Solder used in cans on imported lead used, 2,465 pounds per 100 cans.

Solder used in soldering tin cans, composed of lead and imported plg tin, same as duty paid. Limited 1.449 pounds pig tin per 100 cans.

Solder used in soldering tin cans, other than 5-gallon square cans, 1 cent for each 1000 running inches of the soldered seams.

Strel Pipes, galvanized or asphaltum, and tar-coated steel pipes: manufactured by

steel Pipes, galvanized or asphaltum, and tar-coated steel pipes: manufactured by Francis Smith & Co., San Francisco, Cal., from steel sheets, same as duty paid. Deduct from net weight of galvanized pipes 9 per cent.; asphaltum and tar-coated pipes, 6½ per cent.

Tin Cans, 1-pound salmon; samples of blanks and scrap to be weighed and allowance made for wastage equal to weight of scrap, not to exceed 25 per cent. of weight of blanks.

Tin Cans filled with domestic tobacco, 90 per cent. of duty paid on tin plates.

Tin Cans, 5-gallon rectangular, made from a combination of two plates 14 x 18% inches, with one plate 10 x 20 inches. Allow for each 100 cans 52,460 square inches of 14 x 18% plates, or 1.6117 boxes of 124 sheets each, and 19,944 square inches of 10 x 20 plates, or 0.4432 of a box of 225 sheets each.

Tin Cans. blain: manufactured by the

low for each 100 cans 52,460 square inches of 14 x 185/ plates, or 1.6117 boxes of 124 sheets each, and 19,914 square inches of 10 x 20 plates, or 0.4432 of a box of 225 sheets each.

Tin Caps. plain: manufactured by the Devoe Mfg. Company of New York City from imported taggers tin plates, same as duty paid. Allow 7 pounds plates for each 1000 plain tin caps.

Tin Caps. plain: made by the Standard Oil Company of New York, Devoe Works, New York City, from imported 14 x 183/ coke tin plates, each box averaging 110 pounds and containing 124 sheets, and attached to 5-gallon tin cans, same as duty paid on 13.7 pounds of tin plates for each 1000 plain tin caps.

Tin Caps. made by Standard Oil Company of New York at their works at Constable Hook, N. J., from imported 14 x 183/ IC coke tin plate (each box weighing from 109 to 110 pounds and containing 124 sheets), and attached to 5-gallon cans exported, same as duty paid on 15.6 pounds of tin plate for each 1000 tin caps.

Tin Caps. plain: made by the Standard Oil Company of New York, Some & Fleming Works of New York, From imported 14 x 183/4 tin plates, each box weighing not less than 109 pounds and containing 124 sheets, and attached to 5-gallon tin cans, same as duty paid on 12.7 pounds of tin plate for each 1000 tin caps.

Tin Laps plain: made by the Standard Oil Company of New York, From imported 14 x 183/4 tin plates, each box weighing not less than 109 pounds and containing 124 sheets, and attached to 5-gallon tin cans, same as duty paid on 12.7 pounds of tin plate for each 1000 plain tin caps.

Tin Handle Blanks made from imported IV tin plate for each 1000 plain tin caps.

Tin Handle Blanks made from imported tin plate or 8.3 pounds of 14 x 194/4 IC tin plate or 8.3 pounds of 14 x 194/4 IC tin plate for each 1000 Allantic handle blanks, and 6.71 pounds of 14 x 194/4 IC tin plate for each 1000 Allantic handle blanks, and 6.71 pounds of 14 x 194/4 IC tin plate for each 1000 Allantic handle blanks, and 6.71 pounds of 14 x 194/4 IC tin plate for each 1000 Allantic

Allow 96% pounds the to each to peach shingles.

Tin Taps, stamped, plaiu and decorated: manufactured by Somers Bros. of Brooklyn, N. Y., from imported tin plates, same as duty paid. Plain tags, add to net weight of tags 15 per cent. of such weight, decorated tags allow only for such net weight, provided that no scraptin was used in the manufacture of such tags.

The city of Copenhagen, Deumark, has been declared a free port. This action marks the beginning of an aggressive commercial policy by the Danish Government. All tonnage dues on vessels arriving in the port are abolished and extensive warehouse accomlshed, and extensive warehouse accommodations are provided to enable shippers to store their goods economically for reshipment and distribution among the other Baltic ports without paying any duty.

### HEATING & PLUMBING.

#### NEW WORK AND CONTRACTS.

THE COMMITTEE ON HEATING AND VENTILATING of the Board of Educa-tion of Brooklyn, N. Y., have accepted the bid of Donegan & Swift at their price, \$3195, for supplying four tubular boilers and tanks for schools Nos. 106 and 107.

Bids for heating and ventilating the new High School Building, at Scranton, Pa., are being advertised for.

P. H. DONAHOE, New Rochelle, N. Y., plumber, ateam, gas and water fitter, has added slate roofing to his line of business and has already several joba on hand.

M. Gallert is having his atore on Main atreet, Ellaworth, Maine, fitted with a hot water heater. J. P. Eldridge is a No. 10 Volunteer. The pipes are being placed along the front of the counters and behind them, and large radiators will be set in the center of the radiators will be set in the center of the floor and in the office. The second floor will be heated also. When completed, will be heated also. there will be about 700 feet of radiation in the building.

8. A. PHILLIPS, Amherst, Mass., has the contract to do the plumbing on the High School and Public Library Building in Holden.

W. M. FORWARD & Co., Sycamore, Ill., have been putting in the heating apparatus and plumbing for the new hotel at Elburn.

GRAHAM WATTS, Honesdale, Pa., has secured the contract for heating by steam the sheriff's house and jail at that city, using the No. 3 Standard ateam boiler manufactured by Giblin & Co., U:ica, N. Y.

Amono the many recent contracts received by the Canfield Stove Company, Kingaton, N. Y., is the plumbing, hot air heating and tin work on the large new residence being erected in Rhine. beck village for F. Snyder of Brooklyn, N. Y.; they also have the contract for similar mechanical work on the new residence being erected at Big Indian, N. Y., for T. J. Bravant, likewise the contract for ateam heating in School District No. 2 (Ulater Academy).

FOSTER & GLIDDEN, 53 Dearborn street, Chicago, are to install a Farqubar hot water heater in the residence of H Henderson, Madison and Fiftyfirst streets.

THE ALBERENE STONE COMPANY, agents for the Smith & Anthony Company, 219 Lake street, Chicago, bave the contract for placing two Hub warm air furnaces in St. Peter's Church.

B. D. DUGGAN, 207-209 Lake atreet, Chicago, has contracts for the placing of Richmond warm air furnaces as followa: Residence of James I. Ennis, Rogers Park, one No. 240; residence of James L. Mason, Linden Park, one No 624; flat building of Charles Wag. ner, 1213 Fifteenth atreet, two No. 621.

J. J. WADE & Son, 276 Dearborn street, Chicago, have the contract for the plumbing, gas fitting and sewerage in the two residences of White & Bennett, 4610-4612 Woodlawn avenue.

E. BAGGOT, 169-171 Adams street, Chicago, is to do the plumbing, gas itting and sewerage in the Chicago Horae and Carriage Repository, Wabash avenue and Sixteenth street. Another radiators in the same building.

firm had previously been awarded this contract, but they had made an error in their bid, which caused it to be withdrawn.

THE JOHN DAVIS COMPANY, 69-79 Michigan street, Chlcago, are to install a steam heating plant for the Sunnyside Restaurant Company, 3110 North Člark

THE KEWANEE BOILER COMPANY, 96 Lake street, Chicago, report the follow-ing sales of Haxtun bollers: Residence of Reed & Law, one No. 10; residence of F. A. Hill, one No. 41; flat building of B. Token, one No. 6½; residence of Mrs. Joseph Asron, one No. 7½; flat building of I. Ralph, one No. 10; store building of Carson & Co., one No. 10; residence of Rev. Father Hearn, one No. 9; flat building of Inspector Hunt, one No. 101; Dr. Harper's residence, University of Chicago, one No. 101; that building of Walter Nelson, one No. 101; flat building of Robert Johns, one No. 61; flat building of J. C. West, one No. 61: Frank Barclay, for United States Government Building, Beatrice, Neb., one No. 10.

THE CITY COUNCIL COMMITTEE OR Education of Baltimore, Md., has decided to report favorably on a proposed appropriation of \$6000 for heating and ventilating apparatua in English German School No. 6, to be erected at the corner of Smallwood and Ramsay

W. F. PORTER & Co., 210 Third atreet South, Minneapolis, Minn., aecured the contract for the heating and ventilating plant in the Minneapolis Hospital for the Insane at Fergus Falls, and have now commenced the work. The apparatus to be used will be the Hot Blast, with direct radiators and fan ventilator avatem, all run by electricity.

JOHN T. MAHER, Nebraska City, Neb., has the contract for the plumbing in the new G. A. R. Memorial Building.

THE BARCOCK PLUMBING & HEATING COMPANY, Hornellsville, N. Y., have been awarded the contract for the fittings in the Sherwood. Their bid was \$1060.

M. ABBOTT'S SONS, 137 Eighth avenue, New York, have just completed the installation of hot air apparatus for heating a building at 45 Eighth

EDWARD E. PARKER, Woburn, Masa., has contracts for heating the residence of William O'Reilley, Frank Menchen, Charles Menchen and two houses for Mra. S. E. Cotton. Gurney hot water boilers and Richmond steam heaters are used in these contracts.

John N. Page & Co, Naugatuck, Conn., have a contract for the heating and plumbing of the new house of F. W. Towles, on Beecher Highta.

P. II. DONAHOE, New Rochelle, N. Y., is at present doing the plumbing and heating of four houses, besides having the contract for the tinning work.

RICHARD PARRISEN, Asbury Park, N. J., has purchased from Dublia & Darragh, New York, Volunteer steam heating apparatus, which he is installing in the Commercial Hotel and Angels house of his city. gola house of his city.

F. B. Robertson, Bayslde, L. I. has recently completed a fine job of plumbing in the residence of Mr. Gillis, at Flushing, L I, and is now installing a Royal hot water heater and Corry

BAKER & Son, Chester, Pa., are using four No. 21 All Right boilers in heating contracts which they have in

A. B. Spropt of New Haven, Conn., is using a Humber hot water heater for heating his store; also in the house and greenhouse of James Bruce, In the Ilumboldt Billiard Hall and Café and in the residence of 11 D. Hotchkiss, at Westville, Conn.

THE TUEO JACOBS COMPANY, 72-74 Market street, Chicago, are to install a hot water heating plant in the realdence of Phillip Stein, 4620 Grand Boule-

METZ Bnos, 107 Twenty second street, Chicago, are to install an overhead system of hot water heating in the apartment building of J. R. Iloxie, Michigan avenue and Forty-fifth street.

WM. A. EIGHLER, 75 Twenty-second street, Chicago, is to overhaul the plumbing in the building of W. Terry, Jackson street and Plymouth place.

Conlon & Montgomeny, 33 Dearborn street, Chicago, are to furnish a steam heating and ventilating plant for the Home for Juvenile Female Offenders, Geneva, 111.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until January 8, for work, including the plumbing, for the United States Post Office Building at Rockford, Ill. Drawings and specifications may be obtained from the superintendent, at Rockford, or from the Supervising Architect, at Washington.

Соок & Сикк, 253-255 Kinzie atreet, Chicago, are to install a steam heating and power plant in the fur-niture store of Mrs. A. A. Cheney, 359-361 West Madison street.

The Gordon disappearing gun carriage for a 10-inch rifle was teated for time and rapidity on December 3, at the Sandy Hook proving ground, in the presence of the Assistant Secretary of War, the Ordnance Board officials, and representatives of the builders, the Morgan Engineering Company of Alliance, Ohio. Thirty-two shots were fired within an hour, and the trial was regarded as an entire auccess. This carriage is slightly different in its equipment from the one tested some time ago. It is worked by electric motors, one for the air compressor and one for moving the carriage. The total weight of the car-riage is 325 tons, while the gun weight 27 tons. The contract price was \$48,-000, and according to the terms ten ahots were to be fired in an hour, with a bonus of \$2000 for each additional shot fired. Monday's performance, therefore, secures to the builders a bonus of \$14,000.

Johnson & Morris, 239 South Fifth avenue, New York, made an assignment this week to George Vassar, Jr., with-out preference. Wm. J. Underwood, out preference. the attorney for the assignee, said that the assignment would probably be only temporary, and that the firm would be able to pay all the creditors in full in time and have considerable surplus. It was brought about by the depression in their line of business, the amount of business done in the past year having greatly decreased, while the expenses ran on about the same. There are no creditors pressing them, but they thought it best for all concerned to make an assignment.

## STOVE TRADE NOTES.

#### Norman H. Galusha.

The many friends of Norman H. Galusha will regret to learn of his death, which occurred a few days ago at his residence on Court street, Rochester, N. Y. He had been in poor health for some time, and while a trip abroad proved of temporary benefit it was not fasting, and during the past month he was confined to his room. Mr. Galusha was born January 23, 1830, in Rome, N. Y., whence he removed with his parents to Rochester in 1835. He attended the city schools, graduating at the high school, and then went with the late John M. French to learn the foundry business. In 1853, at the age of 23, he established the Galusha Foundry, recently incorporated as the Galusha Stove Company, and of which he has always been the manager and principal atockholder. He was connected with many other business enterprises, being a director of the Commercial Bank and a large stockholder in the Charlotte Iron Company. He was for many years president of the Rochester & Lake Ontario Railway, now known as the Rocheater & Irondequoit Rallway, and possessed large landed interests in Dakota and the State of Washington. He was a member of the Chamber of Commerce and the Rochester Club. Mr. Galusha was very successful in business, a man of strict integrity, of a modest disposi-tion, never seeking or accepting public office, and withal a wise counselor. The funeral services were held from the residence of his sister, Mrs. John Van Voorhis, on East avenue.

#### Illinois Freight Rates.

The dissatisfaction with Illinois freight rates, which has been increasing for several years, culminated in an appeal to the State Railroad and Warehouse Commission in Chicago, en Wednesday last, for official action without further delay. Representatives of wholesale hardware, grocery, atove and other houses, exceeding 150 firms in all, made a strong effort to accure a reduction in the achedule of maximum freight rates per-missible on the transportation of merchandise locally in Illinoia. Chicago merchants and manufacturers claim that they are specially discriminated against in endeavoring to transact business in their own State. The consequence is that Central and Southern Illinois are almost beyond the pale of Chicago's influence Merchandise is hauled into this territory from other and more distant localities at a lower freight charge than if it originates in the State. Reference was made to this matter in our columns a short time since in connection with the Chleago stove trade to show how this important interest was suffering from unjust treatment by rail-Now that other great branches of trade have joined hands to accure fair rates, some hope exists of relief being secured.

HENRY GLEASON, 10-1 Beekman street,

some houses who contemplate the manufacture of gas stoves, in the interest of his line of brasa goods in ornamenta, stop cocks and air mixers for gas gooda.

#### The Open Fire Place.

The paper of John Ward on the open fire place, past and present, has evidently been regarded with no little interest by American readers, one of whom takes the opportunity of showing what seems to him to be erroneous conclusions, and more especially the difference between American and English open fire places. This writer, Will Walter Jackson, whose criticism appeared in Architecture and Building, is well informed on the subject of fire place construction and his views are therefore entitled to consideration. He 88 78 :

In the article mentioned the open grate is treated in its simplest form, radiation being considered wholly as the heat to be gained. "Heating by radiation." Mr. Ward atates, "is taught by the solar aystem itself. By the rays of the sun the whole earth is warmed and nourished, and all nature made joyous and healthy." Radiant heat is undeniably the most invigorating and healthful means of warming oneself and one's surroundings, but the open fire in the side of a room is quite different in its distribution from the heat of the sun with ita impartial rays. If, in a room heated by a single source of radiation, the north walls were equally as warm as those on the south, and the floor was no colder than the ceiling, the open fire could be compared with the aun, and could be looked upon as the best form of heating apparatua.

#### Distribution of Heat.

Unfortunately the ordinary open fire place does not distribute its heat equally in the room it is supposed to warm, and the floors are most unbearably cold, due to the current of chilling air that supplies the draft of the grate. J. P. Putnam, architect, speaking of this cold current, states: "It has even been found possible to roast a goose in front of such a fire, while the air flowing by it into the chimney was freezing cold."

But this cold air, Mr. Ward tells us, is especially to be desired. "By direct

radiated heat from the open fire place, he writes, "we get warmth for bodily comfort, while the air we breathe may remain cool." Why should this be desired when, depending on the ideal solar heat, the air is so nearly the temperature of surrounding objects? It is both unreasonable and untrue that our homes should be filled with air little warmer than the wintry winds without. Count Rumford said: "I have no doubt that thousands die in this country (England, 1800) every year of consumption occasioned solely by this

#### Size of Fire Place.

It was to decrease these drafts, which, by the way, could not be supplied in New York, spent a portion of the week in Baltimore and Philadelphia, visiting exterior walls, that the fire places were cans.

made smaller, being now only one-fourth the size of those in the days of Elizabeth; and to prevent the cold drafts altogether, English, French and, later. American experimenters have adopted schemes by which the grate brings the air in warm.

This last is important in the hlatory of fire places, as not only is the heat more evenly distributed and the ventilation made more nearly perfect, but an enormous saving of heat is secured. That which was formerly lost through the back and sides is by this arrange-ment saved in the form of convected heat, while in no way is the radiant heat decreased.

The advantage, purely from the heating standpoint, is seen in comparing the best grates of each country. The Marlborough, Mr. Ward says, is the best English grate, this having warmed a room of 2000 cubic feet of space for 36 hours to a temperature of 75°, the thermometer hanging in the direct rays of mometer hanging in the direct rays of the fire. The fuel consumed was 70 pounds of coal, and the external temperature was below freezing. The best American grate will heat a room of 5000 cubic feet of space to the same temperature with the thermometer shielded from the direct rays of the fire (and of course to a higher degree if directly in the rays), using the same fuel, in the same length of time, with the external temperature 20° below freezing.

#### The Primitive Grate.

But as Mr. Ward confines his remarks to "the open fire place, pure and simple," it is but fair to compare those he describes with the primitive, i. e., pure and simple, grate of our country. The typical English grate is very narrow not over 18 inches wide—and has a very shallow basket. This means a small fire, and, as every one knows, a small is an expensive one to run, compared with a larger body of coals. Thus, in the experiment Mr. Ward describes, the fire is replenished "only six times in 36 hours," while no American housekeeper with the most undeveloped form of creats would somewhat for most an experiment to the company of the company has been presented. form of grate would renew her fire more than three times a day, or four times in the 36 hours. In the writer's office the grate burns this long with no intermediste attention, going from Saturday until Monday without renewal of fuel. This can be done with any good American grate, and a fire may and should be kept continuoualy from fall until spring.

#### Banket Graten.

Here the haskets are 18 inches deep Instead of, as in the English, 6. They are 22 or more inches long instead of only 12 or 15. Width and depth are secured rather than hight. The English scheme of setting the grate back in the fire place, with splays on either side, is neither beautiful nor wise. Our grates are set out as far as possible without causing them to smoke, and every wood mantel is "boxed out" 8 or more inches, adding materially to the amount of heat sent into the room. The English "hob" and "dog" grates are both far from successful and, after a trial, have been discarded by Ameri-The movable or "portable"

grates are equally lacking in heating power in both countries.

#### Ventilation.

For ventilation, Mr. Ward says the grate, pure and simple, is "better than other methods," but wishes the fire place still larger, and, more especially, with the opening still higher from the floor. That with an opening 4 feet 6 inches high "we may sit, if not stand, in an atmosphere that does not become atagnant and vitiated." If, as one is led to suppose, an open fire place ventilates only to the level at which its opening ceases it must be a very poor system. And if above this level one has warm but foul air, while below that hight one has pure but cold air, English houses have little comfort in winter. Mr. Ward is correct as to the limits of the ordinary grate as a ventilator, and why this is "better than other systems." is hard to see. Fortunately, here a grate is seldom used except it itself introduces the air supply, warm and pure, or some indirect heater meets the demand. Then the grate, besides giving off the radiant heat, causes a thorough circulation of air in the room, the downward system of ventilation being secured. All parts are practically at the same temperature, and, in contrast to Mr. Ward's scheme, the lower the opening of the grate the better will be the results, both of heating and ventilation.

With a strange love for the unde-

With a strange love for the undeveloped, Mr. Ward admires the Indian's tent, with the fire in the middle, while the smoke escapes from a hole in the top. True, all radiant heat, as well as some of that from the hot gases, is retained, but can this be "far ahead of the low openings of modern times," in our grates, "as a means of ventilation?" With the atmosphere at times "somewhat cloudy" surely it cannot be called good ventilation. Adding smoke to the foul air of the room is a strange way of supplying the much desired oxygen.

Although the open grate is used to a much larger extent in England than it is here—and we can hardly compare the two, for there it is used almost exclusively, while here it is used only as a luxury—English fire places are far inferior to those of American make.

#### An East Side Stove Dealer.

ny JEEMS,

Heinne Schnitz, whose picture I show here, is one of the numerous New York east side stove dealers. He is located not far from that busy mart of Ludlow and Hester streets, and is as sharp as they make 'em where money matters are concerned. If you sell Heinne anything you can be sure you will get your money, but he is not particular if he pays on time. Heinne arrived here one cold winter morning not many years ago and went to work for an Essex street tinker. In the afternoon he was sent down to Water street in tow of a nine year old daughter of the boss, who did the ordering, and Heinne did the lugging, and this was his start. It is surprising how bright many of these little ones are, and how much they will remember about repairs and run to get them. It shows, too, that business ways and habits are early acquired by the east siders. As soon as Heinne could understand English a little he started business for himself in a basement, without much more than a hammer and snips, and when he cleared "twelf dollar" the first week he was a made man. A few weeks afterward he went one day down to Castle Garden met a platt-

deutsch girl just arrived; proposed to her; took her up in an express wagon, with her box; married her the same night, and the next morning Lena was in the business for fair. That was ten vears ago and there are now ten little Lenas and Heinnes mixed up with the stoves, po's, &c., in his store. Lena weighs a ton and is as keen as a razor in buying or selling. She can beat Heinne at the former—in fact he don't buy anything unless she says so. She is the boss and no mistake.

As soon as these people begin to save money they want to huy a house, and they don't seem to mind how big the mortgage is. They pay prices that native New Yorkers would deem absurd "because it was not in an improving section."

Heine bought an old tumble down place in the vicinity of Ludlow street

Heinne Schnitz.

for \$7000; paid \$1000 down and took a mortgage for the remainder. His neighbors said he "was crazy, was sthuck," &c. And it did seem so. For two or three years Heinne had a hard time of it. One day a man came in the store to see if Heinne would sell the place and get a price on it. Much to his surprise Heinne wouldn't sell, and would give no price, and no inducement could make him talk; but later on he told the man he would sell "for 12.000 tollar. Not one dime cend less." It made the would be Israelite buyer fairly screech, "Twelve toosand tollar! Your a tamed loonatic!" and he bolted out of the store. The neighbors heard of it, and they also thought he was crazy. People are so crowded over there that you couldn't whisper without it being heard by 50 persons. All sorts of tricks were tried to get Heinne to sell, as his place was needed to complete a double decker tenement, though he didn't know it, but Heinne wouldn't budge. The would be buyer thought he could buy Heinne out any time for a "gupple hunderd tollar," so he said, hut "twelve toosand tollar—der mans is loonatics asylums krazy." Without going into all the particulars, Heinne got

\$10,000 for the place and \$1,000,000 in curses from the buyer. Heinne bought another house for \$16,000 and got "athuck bad," so they said, but sold it out in some months for \$1500 advance, and Heinne is now good for \$17,000 or \$18,000 in solid paying property. People all know too much, and predict losing results on all deals made by greenhorns, but the facts are they turn out pretty successful, and there is such a thing as knowing too much. They know nothing about how the city was, but pitch in, and it would surprise people to know how prosperous these greenhorns become.

Hardly one of them who started as Schnitz did and bought property has failed to become well to do and independent, and is steadlly accumulating. Their expenditures never ereep up as fast as their incomes. The latter are way ahead and are kept so. Heinne has got an "oppersition" across the street, and his name is Schpltz, and they both stay out in the street watching each other like cats. They will pull a customer clear across the street if they get a chance. A drummer said he was in Helnne's store some time ago, and a woman came in to buy a tin pan, and he asked her 20 cents for it. She said "it was too tear, she gld him across the streeds for swelve cend." This made Heinne mad, and he and her jawed about the matter until you would think a thousand-dollar sale was involved. Heinne said to his wife, who was back in the room off the shop, which is used for parlor, kitchen, bedroom, and storage for stoves, tin and other bric a-brac connected with the "profeshion," "Lena, you hear vat der lady says. She says she git der

twenty-cent pans for swelve cent across the streed." "She is a liar," said Lena.

"Here dot, my vife says you are a liar.
She knows dot feller is a stinker; he
don't pay for his goots," and Heinne
called him everything he could think

of. I guess they skirmished about that pan over a half hour, and just as the

customer was going aeross the street Heinne followed her to the gutter and

sold her the pau for 12 cents. Schpitz was watching the proceedings from the opposite side of the street, and he screeched like a big baboon because Ileinne had captured his "kostemer."

I asked Heinne how much he made on the sale. "A kopple of cend," he replied, and he paced up and down the walk watching for customers, serene as a summer day.

## The Michigan Vapor Stove Company

of Grand Rapids, Mich., have issued a very attractive catalogue for the season of 1895. It comprises 40 pages, bound in richly embossed paper covers. The company's trade-mark is conspicuously used. This is a representation of their jet cone burner, which is alluded to throughout the catalogue as a specially valuable feature of Michigan vapor stoves. Small cones are formed on the surface of a flat plate, and each cone has a slot in it. These cones are placed very close together, and consequently the burner in operation has a large number of jets of blue flame which give an intense heat. Stationary tanks are used on these stoves, but they cannot be filled while in position. They are constructed on the same principle as the reservoir of a student's lamp. Thus the tank is easily lifted out when empty or nearly so, and carried to the place in which the supply of gasoline is kept. The illustrations in the catalogue cover

a number of rew styles of stoves which have been brought out this season. The leading stoves are made with a single generator and with two or three burners and a step. The generator has burners and a step. The generator has a sub-light, so that the burner can be lighted quickly, with very little smoke or odor, and the step burner can be used without running the generator, thus effecting a considerable saving when a fire for ironing or baking is wanted. Stoves of the same size and style are also made with individual generators.
This generator has a sub-light which will ignite the burner without relight-ing. Individual and single burner stoves are also made with three and two buiners, but without the step. High junior stoves, in the same way, are made with either single or individual burners, and with two or three burners, with and without step. High special juniors are made with three and two burners, and low special juniors with one, two and three burners. The line is thus seen to be comprehensive, covering stoves suited to every requirement. The catalogue also illustrates gasoline and oil torches for outdoor lighting and for use in foundries, rolling mills, warehouses, &c., and the Boss gasoline blow pipe. The blow pipe has a patent handle, adjustable to any angle, enabling the operator to get it in any desired position.

#### German Tile Ranges.

H. Rendtoiff & Co., 16 Lake street, Chicago, have just received from Germany a shipment of tile ranges made to their order by Hermann Koloseus, Aschaffenburg, Bavaria. This manufacturer exhibited at the Chicago World's Fair a line of stoves richly decorated with tile work, which attracted much atten-tion, and Mr. Rendtorff secured the agency for their sale in the United It was necessary, however, to adapt them to the American trade, and therefore patterns were sent from here to Germany for the proper construction of oven, fire hox, &c. Consequently, they are American stoves in design, although built in Germany to secure the peculiar tile finish of the German manufacturer. Two sizes are shown, namely, 8-18 and 8-20, each size being finished in both majolica and porcelain tiles. They have high shelves and water fronts, and are built after the pattern of wrought iron or steel ranges. They are named Grand Ideal, this name, together with that of H. Rendtorff & Co., being placed on an ornamental plate on the oven door.

The workmanship is of a superior character. Small tiles are riveted to the front and sides and to the upright supporting the high shelf, covering all iron parts in those sections of the The dcors and the upper porrange. tion of the high shelf are enameled in white to correspond with the tiles. The tiles are protected from crazing by the heat through the peculiar arrangement of the walls of the range. These are constructed of cast iron open work riveted to the frame and then filled with cement. The entire top, including the lids, is ground and polished. A nickeled towel rail surrounds the top, except the back. The knobs are cast and nickeled. The fire pot is oval shaped, with a draw center grate. The oven door is poised, being hung with a counter balance. A warming closet is placed below the oven. Import orders only are taken for these ranges, as the goods shown in the establishment of Rendtorff & Co. are to be used as samples. They

are of the opinion that in a short time some American manufacturer will take up this style of finish, as it will be preferable for many reasons to obtain such ranges from home makers.

#### ODD PLATES.

WE ARE INDEBTED to A. Weiskittel & Son, Baltimore, Md., for an exceedingly attractive circular illustrating ingly their Fire King oil heater. The castings of this stove are beautifully finished in nickel or brass plate, as may be desired, while the frame is set with jewels, the drum being of Russia iron. base and middle ring are connected by arms or supports, thereby taking the weight and strain from the oil reservoir and making at the same time a substantial piece of work. The drum is hinged tips back for lighting the burner and filling the tank. The top swings off so that cooking can be done if desired. The oil reservoir holds about 1 gallon, which is sufficient, it is said, to burn from 10 to 12 hours. The diameter of the drum of the stove is 8 inches and the hight 37 inches.

NEW PROCESS VAPOR STOVES" IS the title of a handsomely printed catalogue of 32 pages which reaches us from the Standard Lighting Company of Cleveland Ohio. The pages are very nearly square in shape and printed in two colors upon a good quality of pa-per. The binding is in paper with a side title embossed in silver letters. An introduction consists of a description of the New Process stove and the statement that it is entering upon its sixth year with a record of which the makers are justly proud. The goods shown are varied in character, running from the No. 1 Globe Junior with safety tank up to the most elaborate style of New Process cabinet range. Kerosene oil heaters are also shown, as well as ovens, lamps, torches, toasters, broilers, &c. A valuable feature of the pamphlet is a cut showing the correct names of all the parts of which a stove is composed. The company state that as the patterns are changed from year to year, it is necessary that they which the year the stove is made for which the dealer wants repairs and whether it is a No. 1, 2, 3 or 4.

The Ryus Hot Air Heatino Company of Kansas City, Kan., have just commenced the manufacture of what is known as the Ryus hot air heater. Numerous patterns of this stove are being made for the purpose of sending them to agents in different States, the intention being to establish a plant in every Northern and Western State. The heater proper is lined inside with rolled steel, the outside covering being of Russia iron. Between the two is an inch space extending all around and open at the top and bottom, which permits cold air passing upward from the floor being heated in its passage. There are nine flues passing through the stove and carrying cold air upward, the flues being enveloped by the fire within the stove.

The stove Men who were in Cincinnati last week attending a meeting of two districts of the National Association of Stove Mauufacturers were tendered a lunch at the Grand Hotel by Matthew Addy & Co., dealers in pig iron, of the city named. There were about 60 guests present and it was a thoroughly enjoyable sflair. While it was informal it was elegant in every way and after it was over George H. Barbour presented Mr. Addy to the

guests. Mr. Addy spoke in a happy vein and was followed in a witty speech by Lazard Kahn of Hamilton, Ohio, after which came Grange Sard of Rathbone, Sard & Co., Mr. Van Cleave of Buck's Stove & Range Company, George E. Dana of St. Louis, Fred. Gardner of Chicago and W. W. Baldwin of Cleveland.

THE TRADE will be glad to discover that their old friend "Jeems" has again entered into print. A few weeks ago he told about the Bowery and this week presents a biographical sketch of one of the well known characters of the east side.

AN ERROR WAS MADE OR page 52 in our last issue in referring to the improvements being made by the "Grand Rapids Stove Company" of Grand Rapids, Mich. This should have read the "Michigan Vapor Stove Company." A Grand Rapids paper, from which the item was taken, was responsible for the error.

A COMPLETE EQUIPMENT of electrical culinary appliances has been fitted in the kitchen of Queen Victoria's Scottish palace, Balmoral.

THE QUICK MEAL STOVE COMPANY, St. Louis, Mo., report an excellent demand for their Quick Meal gasoline stoves, one day's mail bringing them nine carloads—two for Indiana, four for Pennsylvania, two for California and one for Massachusetts. This company are preparing their annual catalogue, which will be ready for distribution on January 1.

THE PROVIDENTIAL TILE WORKS, Trenton, N. J., are bringing out some new designs in fire place tiles. One of the new designs is a moose head with spreading antlers amid pine boughs and cones. This is designed to reach across a wide fire place. The side pieces which go with this head piece show guns, hunting horns, hatchets, pipes and other implements of the sport. Another of their new tiles is a cap piece for wainscoting, arranged to pass both recess and projecting corners. This does away with the mitering of tile and enables the workman to make a much neater finish. These are but two new specialties, the company having an almost endless variety of tiles in all sizes of exceptionally handsome finish and design, some being so finished as to have the effect of hand painting.

THE DANVILLE STOVE COMPANY of Danville, Pa., and 284–286 Pearl street, New York, will look after the interests of the Monarch line of gasoline and gas stoves made by the Monarch Stove Company, Mansfield, Ohio, for the season of 1895, representing them in the States of New York, Pennsylvania, New Jersey and the New England States. The Monarch line will, we are advised, contain a number of new and striking features the coming season and samples of same are now ready for shipment.

THE RINGEN STOVE COMPANY, St. Louis, Mo., whose graphical representation of the increased sales of Quick Meal gasoline stoves by means of sectors of a disk is so well known to the trade throughout the country, have devised another diagram, or rather picture, illustrating in a most impressive way the multitude of Quick Meal stoves that were sold up to the close of the season of 1894. The picture (not full siz) is of a column 250 feet in width and 7043 feet high, which is supposed to be huilt up out of the 352,122 Quick Meal stoves that were sold up to the end of 1894. One is not surprised, therefore,

if the top of the column pierces the clouds, and that the representations of the Eiffel Tower, the Big Pyramid, the Ferris Wheel and St. Peter's Cathedral, placed alongside of it, seem insignificant in comparison. The stoves are supposed to be placed 100 side by side, making the column 250 feet wide. A shaft like this piercing the heavens is a worthy symbol of the aspirations of so progressive a manufacturing concern.

GEORGE M. CLARK & Co., 157 Superior street, Chicago, will have their new gasoline stove catalogue out about January 1. It will show some new features, but in the main the Jewel line of stoves will vary but little as compared with previous seasons. The company's experience has been so satisfactory that they have seen no reason to make extensive changes. Their process atoves will have an improved sub flame chamber, made more accessible and easy to clean, and the shelf below the tank will be made a little more ornsmental, but in other respects the construction and finish of previous sea-sons will be preserved. A new single generator stove will be brought out specially for the Eastern trade. It is a high atove with a broad top, so that at one end two cooking holes are arranged front and rear, and at the other end there will be a double burner for a portable oven or for heating a wash boiler, &c. The Jewel junior stoves will be listed at last year's Jewel Acme prices. Eight traveling men will cover the country in which sales are made direct by the company to retailers, comprising the Central West and running southwest to the Gulf of Mexico. The other parts of the country will be reached through jobbing houses. A large order for Jewel gasoline atoves, received from Turkey, was recently filled.

HORTON, GILMORE, McWILLIAMS & Co., 172 to 176 Lake street, Chicago, have recently taken the exclusive jobbers' agency for the sale of Cole's air tight heater in the States of Indiana, Illinois, Michigan and Wisconsin, but they have already established over 200 local agents in these States. mand is remarkable, in view of the generally quiet business in stoves. claim, however, that these stoves do not interfere with the sale of the standard type of stoves, because they are adapted to the burning of chips, bark, &c., as well as cord wood, thus enabling bedrocms in country houses to be heated at small expense which would otherwise not be warmed at all. This seems to be a natural inference from the volume of business now in progress. The heater is furnished in three sizes in Russia iron—22, 24 and 28 inches; and four sizes in smooth steel—22, 24, 28 and 36 inches.

According to the daily press in Louisville, Ky., the stove manufacturers in that city are very much pleased with the lower freight rate to the South, which went into effect on December 1. Efforts have been made for some little time by the stove manufacturers to secure a lower rate, and as a result of their endeavors a considerable concession was secured.

THE CLARK STOVE COMPANY filed on November 28 articles of incorporation with the Recorder of Deeds, at Kansas City, Mo. The capital stock is \$100,000, half of which, we understand, has been paid up. The stockholders, who live in Kansas City, are as follows: R. M. Clark, H. N. R. Umbach, A. M. Clark, G. A. Clark and B. O. Clark.

THE DAYTON MEG. COMPANY, Dayton, Ohio, favor us with a copy of a 20 page catalogue illustrating the Insurauce gasoline stove, which they manufacture in several varieties. This stove is fully illustrated and described in a way to interest the dealer, while directions are presented telling how to set up and operate the stove. Attention is also given in the catalogue to ovens, repair parts for the Insurance gasoliue stove, lanterns, and a list of code words for use in ordering goods The company are behind with by wire. their orders for the stove and will be compelled to increase their manufacturing facilities in order to meet the growing demand. To this end they are erecting a four-story structure, which when completed will be equipped with the necessary machinery for such an increase in their output as will enable them to promptly fill orders.

THE FIRST CALENDAR for the new year to reach our desk is that issued by the Fuller & Warren Company of Troy, N. Y. In its general appearance and

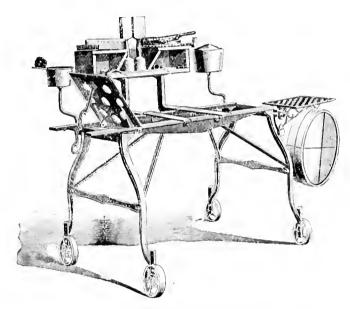

in a comprehensive manner the goods which they manufacture. We understand that the company are now engaged on a large order for their Champion steam and hot water heaters.

The Galusha Stove Company of Rochester, N. Y., recently filed articles of incorporation with the Secretary of State, at Albany. The capital stock is \$100,000; the directors being Norman H. Galusha, Hiram H. Edgerton and Michael H. Shea.

The Lebanon Stove Works of Lebanon, Pa., resumed operations on Wednesday, December 5, after a shut down for the purpose of making repairs.

## Rowland's Movable Molders' Bench.

The molders' movable beach here illustrated is introduced by the S. Obermayer Company of Cincinnati, Ohio. With its aid the molder need not carry heavy molds back and forth, inasmuch

ROWLAND'S MOVABLE MOLDERS' BENCH.

make up it is in keeping with those issued in previous years by this enterprising house, and is of a character to meet with a welcome wherever it goes. The leaves for the 12 months of the year are mounted upon a heavy card measuring about 11 x 14 inches, and are so placed as to display a border at the sides, top and bottom of about 1½ inches. This border is used for the name and address of the company, together with brief reference to their goods. The leaves of the months of the year are of variously tinted paper, with the figures in a deep brown or chocolate, which form a sharp contrast with the ground upon which they appear. A thirteenth sheet is devoted to a counting house calendar, which gives not only the days of the week and month, but also numbers the days of the calendar is a bird's eye view of the company's works at Troy, with mention of some of the leading lines manufactured.

THE THATCHER FURNACE COMPANY of 240 Water street, New York, are running their foundry in Newark, N. J., with a complement of 150 men, and the statement is made that their sales for 1894 are 25 per cent. in excess of those for 1893. They have recently issued an illustrated catalogue showing

as he requires only enough floor room to perform his labor, and, after pouring his work, he need not lift it more than to simply dump it where it lies, on the floor. It is claimed that more and heavier work can be handled on and from this bench than from one that is The bench is constructed stationary. The bench is constructed entirely of iron except the tool box, which is made of wood. It is culliciently large to allow the molder ample room to work and yet is so arranged as to be very convenient. The tool box, eponge pot and parting sand pot are so adjusted that the molder can have them as near to him as he desires. The tilt-ing shelf on the left of the bench is so arranged that he can lay his cope down with ease. The swing shelf on the right may be utilized to lay matches and The bench may be raised patterns on. or lowered, for the convenience of short or tall molders, it being adjustable from 2 feet 8 inches to 3 feet in hight.

Canadian natural gas was turned into Detroit on December 1 through the new main laid under the Detroit River. Fully half the consumers of natural gas in the city are now using the Canadian product. The company are at work laying a second pipe.

## TRADE REPORT.

#### The Iron Market.

The prospect of the early passage of the Patterson bill, amending the Interstate Commerce act so as to permit of pooling under certain restrictions, ought to reflect favorably upon the Iron trade. As soon as the principal customer of our industry is as able as he is willing to buy the goods he needs, the better days have come.

In Foundry Iron the attitude of the local producers in the Chicago district can only be tested by time. In other sections some of the large makers show a disposition to refrain from cutting. But there is ample evidence that the smaller producers are powerful enough to set a pretty uncomfortable pace.

Tin has had a little breathing spell, and has again crossed the 14¢ line. Copper has undergone a sharp turn and rumors to account for the change are numerous. Lead and Spelter drag wearily and there is little animation in the Tin Plate market.

Plg Iron.—The New York market is quiet and sales are limited. A sale of a round lot of Southern Iron for delivery at Sing Sing has led to some erroneous inferences as to the equivalent price at furnace. It is higher than is figured, because special freight arrangements were made. We quote \$12 @ \$12.50 for No. 1: \$11 @ \$12 for No. 2, and \$10.50 @ \$11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

Business is very light in the Philadelphia market, and although prices are almost as low as they have been at any time on record, buyers seem unwilling to negotiste for any but moderate sized lots, and even then prices have to be made to suit. Sellers are anxious for business, but have to wait until buyers are ready to put in their bids. Deliverles are still somewhat delayed, from which it may be supposed that furnaces will not be hampered very much, even if there is a falling off in demand, which in any event cannot continue for any length of time. General quotations are about as follows for Philadelphia and vicinity, with the usual 20\$\psi\$ \$\text{@}\$ 30\$\psi\$ less at points within a radius of 100 miles South or West:

Bessemer	\$12.25	(et)	\$12.50
Standard No. 1 Foundry X	12.50	63	\$13,00
Standard No. 2 Foundry X	11,50	a	11.75
No. 2 Plain	10.75	0	11.00
No. 1 Soft	11.50	Cta	11.75
No. 2 Soft	10.75	0	11.00

Chicago advices intimate that the advance made in local Coke Iron last week in that market had a double effect. It caused the closing of a considerable number of contracts which had been pending, and checked the demand from other concerns to some extent. The early part of the week was thus somewhat active and the close of the week quite the reverse, although a few sales were then made at the advanced price. If the advance is

maintained the general opinion is that it will have a good effect in putting related lines on a substantial basis of value. The quiet condition of trade now prevailing is expected to continue for the remainder of the year, but heavy business is anticipated in January. Southern Coke Iron has been quiet, with the same conditions prevailing as before with regard to prices. A few inquiries are reported for scattered deliveries. The leading companies firmly maintain quotations, but less known brands are offered at concessions. Lake Superior Charcoal Iron has been moving in fair volume, with few sales running above 50 tons. Quotations are given as follows for cash.

Lake Superior Charcosi	<b>\$13.00</b>	0	\$14.00
Local Coke Foundry, No. 1.	10.25	Õ	10.50
Local Coke Foundry, No. 2	9.75	0	10 00
Local Coke Foundry No. 8.	9.50	0	9.75
Local Scotch	16.50	0	-11.00
Obio Strong Softeners No. 1	12.50	0	13,00
Southern Silvery, No. 1	11.50	Ø	11.75
Southern Silvery, No. 2	11.25	0	-11.50
Southern Coke, No. 2	10.25	0	10.50
Southern Coke, No. 3	9.75	œ.	10.25
Southern, No. 1. Soft	10.25	0	10.50

Alabama Car Wheel	17.50	0	18.00
Jackson County Silvery	<b>15.</b> 50	a	16.00
Other Ohio Silvery	14.25	0	14.50

There is no improvement in demand worth mentioning for Foundry Iron in the Pittsburgh market, and prices are weak. A sale is noted of 200 tons of No. 1 Foundry at \$11, Pittsburgh. Quotations are given as follows:

No. 1 Foundry.......\$11.00 @\$11.25, eash.
No. 2 Foundry........... 10.60 @ 10.65

Dullness has been the most prominent feature in the Cincinnati market for Pig Iron during the past week. There have been a few sales of 500 and 600 ton lota, but the majority of the transactions have been small. There has been no change in the general tenor of the market. was developed through the convention of stove manufacturers, held in this city on the 4th and 5th inst., that the stove foundries have been large purchasers of Pig metal recently, some of the large transactions already noted in these columns having been with stove founders in the North and Northwest. There continues to be some urgency for the delivery of Iron already purchased to cover contracts placed, but less so than a few weeks ago. The printhan a few weeks ago. The principal salesmen of the largest local firms have returned home with the information that buyers show no disposition to purchase Iron now except for contracts already obtained, and the prospect is that the present bill will continue until the first of the year at least and possibly longer, but encouragement is held out for renewed activity during January and February, especially the latter month, when it is expected that the car shops, malleable works and axle manufacturers will begin operations. Quotations are given as follows:

Southern Coke, No. 1		
Southern Coke, No. 2	9.25 @	
Southern Coke, No. 3	8.75 @	9.00
Obio Soft Stone Coal, No. 1	14.50 @	15.00

Tennessee Charcoal, No. 2		12.60
standard Southern Car Wheel	15.75	16.75
Lake Superior Car Wheel and		
Malloable	14.25 @	14.75

The tenor of our reports of the St. Louis Pig Iron market is that, as usual at this period of the year, consumers are allowing their stocks to run down and are holding off shipments until after the turn of the year. Prices continue very low and No. 2 Foundry, which is the favorite grade among foundries, is quoted at \$9.75, f.o.b. cara St. Louis. There is some talk of No. 2 Foundry having been sold at \$9.50, but investigation has proved this to be incorrect. Furnacemen are looking for a revival of business early in the new year, and the general indications point to an increased consumption very shortly. It is doubtful if prices can go any lower, and it is pretty generally agreed that a few sales of good round lots would go far toward advancing the present low quotations. Sales during the week have been extremely quiet. We quote as follows for cash, f.o.b. cara St. Louis:

 Southern Coke, No. 1 Foundry
 \$10.50
 \$3.75

 Southern Coke, No. 2 Foundry
 9.75
 10.00

 Southern Coke, No. 3 Foundry
 9.25
 9.50

 Southern Car Wheel
 16.50
 17.00

#### Metal Market.

Pig Tin.—Early in the week the market reacted from its condition of depression, wholesale prices advancing about 0.70\$\psi\$ from the lowest point touched last week. Later, however, prices dropped again about \$\psi\$ \$\psi\$ lb on London decline and the pressure of heavy supplies, while the market lost its temporary firmness. Trade and consumptive buying has meanwhile gone on in about the usual way, with prices for small lots unchanged from last week's quotatiors—namely, a basis of \$15\psi\$ \$\phi\$ 16\$ for Straits Pig.

Copper.—The market has assumed a tone of firmness during the week, which is in strong contrast to its condition last week. Sales agents do not confirm reports of a producers' agreement, neither do they report unusually heavy business. In fact, the sudden and sharp turn in the market is somewhat mysterious, but rather suggestive of manipulation to clinch orders for next year's delivery at good rates. It is suggestive also that speculation in futures in the London market has been unusually lively during the week. The periodical December rumors of large sales for 1895 delivery have circulation, as have also the rumors of reduction in output. For small lots of Lake Ingots from store the price quoted is 10½¢ ? lb.

Plg Lead.—No change of importance has taken place during the week. As far as can be ascertained, the wholesale buying has been commonplace and merely fair in the aggregate amount, while a small fraction will measure the fluctuations in prices. Jobbing business has been tame, and the market closes acft in tone. American Pig in small quantities fetches about 3\$\psi\$ \$\phi\$ 3\psi\$ \$\psi\$ lb.

Lead Pipe and Sheet.—The demand for Manufactured Lead has shown no

improvement. It continues very meager in this section. No better trade is looked for by dealers in plumbers' supplies this side of New Year's Day. Prices are satisfactorily maintained, however, on the list basis of 5\partial \phi\$ for Pipe and 6\partial \phi\$ for Sheet, with 20 \partial \phi\$ discount.

Spelter.—Transactions in this quarter have been on a very moderate scale. Low prices have been made on Western brands, but failed to enliven the buying interest, and sales, both wholesale and retail, have been of the narrowest. Jobbers quote Western in small parcels at  $4 \notin \emptyset$   $4 \nmid \ell \mid \ell$  lb

Antimony.—Aside from ordinary jobbing business little has been done. Small lots of Cookson's rule 9\forall \phi, and of Hallett's at 8\phi \forall \text{?} lb.

Nickel.—Prices remain at about 35¢ @ 40¢, according to quantity and delivery.

Tin Plate.—The approach of the holidays and the dullness which usually settles on the market toward the close of the year have been felt in full force during the past week. On both sides of the Atlantic the manufacturers are still engaged in the wage scale controversy with their workmen. The shutting down of so many Welsh and American works will soon be felt in a reduction in stocks; and this is the only consideration which appears to keep the market from tumbling to pleces. As it is, values have experienced a further decline, and Plates can be bought here cheaper than ever. Still no class of buyers seems to have sufficient confidence to purchase except as imperative wants dictate. The except as imperative wants dictate. The can makers, who in ordinary times are accustomed to place their contracts for January and February dellveries considerably earlier than the present time, are still holding off, apparently with the expectation of being able to secure their material at still cheaper rates than those now ruling. How this can be it is hard to say, for authorities declare that there can be no profit in the prices at which ordinary Cokes are at the moment being offered in this market. Genment being offered in this market. Generally the condition of business is flat, tame and disappointing. The only movement is in small retail purchases. Nothing is doing in spot or forward deliveries in larger lots. Prices are, if anything, rather weaker, and concessions from quoted rates are not uncom-

A special London cable dispatch to The Iron Age, dated December 11, reports on the British Tin Plate market as follows: Tin Plate market is without improvement. Only a moderate business is passing, chiefly at 9/6 for ordinary Cokes. Makers are willing to book well forward at present rates. Buyers seem uncertain and unwilling to commit themselves. There is more inquiry for Ternes for forward delivery, chiefly at 18/ for double boxes. Buyers' offers on Siemens Plates are three half-pence lower. Stock at shipping port, about 250,000 boxes. Sellera' quotations at Swansea are as follows:

Bessemer Cokes, IC 14 x 20. 9/8 @ 9/9 Siemens Cokes, IC 14 x 20. 9/9 @ 10/ J. B. steel Cokes, IC 14 x 20. 18/6 @ 21/ Charcoals, IC 14 x 20. 10/6 @ 12/6

A letter of December 5 from one of the most well-informed Tin Plate brokers on the other side to a leading importing house refers to the Tin Plate market in England as very slow and unsatisfactory, although not quite as demoralized as published reports would ndicate. The inquiry from America

was considerably smaller and prices a shade lower on that date, while limits received from this country were too low to admit of any chance of working them. He mentions that full weight BV grade 14 x 20 can be freely had at 9 73, and that 9/6 would be taken for these Plates in many cases.

#### Chicago Report.

Scrap.—The supply of Old Material is now running low, as compared with stocks ordinarily carried. Dealers quote their buying prices as follows, Chicago delivery:

Per net ton.	Per th

THE STANDARD BRASS WORKS, formerly of 39 Harvard street, Cambridge-port, Mass., have moved to 330 and 332 Main atreet, where they occupy a new foundry with facilities for handling a larger volume of business.

A commination of fire clay sewer pipe manufacturers is reported to have been effected, representing a capital of about \$2,000,000. The combination will have 25 firms in it, and will be named the Central Sewer Pipe Company, with offices at Pittsburgh, Pa. Frank H. Coleman, of the United States Fire Clay Company and the Ohio Sewer Pipe Company of New Liabon, has been elected president of the Central Company, and T. F. Anderson, of Knowles, Taylor & Anderson of East Liverpool, general manager.

#### CONDITION OF THE

### Hardware Trade.

WITH the near approach of the holiday season and the holiday season and the close of the year there is a perceptible falling off in the volume of business. especially as many of the travelers have returned home, and trade lacks the stimulus which their activity would give it. The smaller class of purchases are therefore limited to goods required for early sale and the replenishing of the assortment of fancy articles which are in demand during the holidays. Besides this class of business, however, there is a good deal of activity on the part of the larger buyers who are negotiating in regard to orders are negotiating in regard to orders for future delivery, a matter which calls for careful consideration and scrutiny of the market, and the fore-casting, if possible, of the course of business during the next few months. There is in many lines a disposition to defer purchases, buyers thinking that possibly the bottom has not yet been touched, and there being a very general impression that prices will hereafter rule low, as compared with those which have been current during past years. There has been little change in the tone of the market during the past the tone of the market during the past week, and prices on many goods con-tinue weak and somewhat irregular. In the course of the year there have been so many declines in price on staple Hardware, and especially in Heavy Hardware, that the annual in-ventory will show—it is to be appreventory will show—it is to be appre-hended—a shrinkage in the value of the stock which will, unless it is judicionsly turned over, tend to curtail the profits of the year, which has been, in any event, to most merchants a somewhat unsatisfactory one. The improved condition of things throughout the country and the hopeful views which are justified in regard to the future course of business are, however, encouraging features of the situation

Advices from Chicago.—The Shelf Hardware trade is more active than jobbers had expected. December seems to be unlike the usual closing month of the year. The fact that inventory season is approaching appears to have no effect upon the volume of business. A remarkable steadiness is shown in the character of the orders which have been received for several weeks past. It is gratifying to observe this feature of the trade. Considerable satisfaction is expressed with the careful buying of the past year or more, which has brought about such a condition of affairs. Retailers stocks are replemshed so frequently and so steadily that jobbers are like wise enabled to keep their stocks in much better condition. Instead of fluctuations in demand which cause stocks of some articles to be greatly increased and then held on hand for some time, all stocks have been kept under good control. The Tinware trade has been especially good, running very much longer thau usual in December. One case is noted in which orders received for the first week in December were larger than for any similar period in seven or eight years. Individual orders in this line are now running larger and calling for more whole packages. The mild weather of the past two or three weeks has kept up the demand for Roofing Plates. Retailers are also beginning to call for Bright Plates. The Heavy Hardware trade, on the contrary, is suffering considerably from the mild weather, as this is the season when all classes of winter goods such as Sleigh Shoes, Toe Calk Steel, &c., should be moving freely. The stocks laid in some time ago are lying in jobbers'

warehouses almost untouched. Meanwhile other classes of their trade are quiet, owing to the approach of the close of the year. Collections in all branches of the Hardware trade are reported better than usual.

#### Notes on Prices.

Wire Nalls.—There continues to be a very good degree of activity in the Wire Nail market, many orders being received, and the volume of shipments large considering the time of year. There is also a good deal of negotiation in regard to orders for delivery within the next few months, and some large purchases have been made. Buyers are, however, showing a disposition to held off a little. Prices continue without change on the basis referred to in our last report. Small lots from store in New York are held at \$1.20 to \$1.25, though these figures are sometimes shaded.

Adrices from Chicago.—Inquiries continue to be received for deliveries for the first quarter of 1895, and some factories have taken a great deal of business of this character. Others, however, are holding back in the hope that they may get better prices later, or if they fail in this they propose to diminish their output. Prices continue about the same as previously reported. Jobbers are quoting small lots from stock at \$1.10 or \$1.05 for shipment from factory, or \$1 for carload lots shipped direct from factory.

Cut Nails.—The Cut Nail market is rather sluggish and the volume of business moderate. Small lots from store are held at 95 cents to \$1.

Advices from Chicago.—The demand is confined entirely to small lots. Manufacturers express satisfaction with orders of this character, asserting that they would not be willing to name present prices for long delivery, owing to the fear that raw materials may advance materially in value. Some shading has recently taken place in Barrel Nails, but in a general way prices are unchanged. Small lots from stock are selling at \$i.

Barb Wire.—The Barb Wire market is not in an entirely satisfactory condition, notwithstanding the fact that the volume of business is large and most of the mills have booked orders which will occupy them for some time. The price is, however, somewhat uneven and represented by the quotation of \$1.85 to \$1.90 for Four Point Galvanized in carload lots at mill, but these figures are shaded more or less freely.

Advices from Chicago.—The contracts taken by manufacturers during the past week, so far as can be learned, were not so large or numerous as during the weeks immediately preceding, but the output of the factorics appears to be pretty well covered now for the winter months. Carload lots have latterly been moving quite freely. An encouraging feature of this trade is the orders to begin shipping which are already being received. Jobbers report a fairly good demand for mixed carloads and small lots from stock. Prices appear to be well sustained and are not as irregular as those prevailing in the Wire Nail trade. Jobbers quote Gaivanized at \$2 for carload shipments from factory, \$2.05 for shipments of small lots from factory, and \$2.10 for small lots from stocks. The plain Wire market is disturbed this week by extremely low prices being quoted on contracts which

are now coming up. Business is large, and the trade would be in good condition if it were not for the sharp competition for business.

Tacks.—The prices agreed upon by the leading manufacturers are pretty well maintained, but the market is somewhat uneven owing to the activity of outside competition.

Shovels and Spades.—The market for Shovels and Spades is not in a very settled or satisfactory condition, prices being low and rather uneven and weak.

Suction and Force Pump. — The Mosely Folding Bath Tub Company, 161 South Canal street, Chicago, Ill., are manufacturing the Mosely Suction and Force Pump, which was illustrated in The Metal Worker, November 24. The Pump is sold to the trade at \$8.50, list, subject to a discount of 33½ per cent.

Glass.-The variation in the prices made hy different manufacturers of American Window Glass is the principal feature of the Glass market at the present time. It is reported that some manufacturers have been carrying on a war among themselves, doing what injury to rivals they could, and that this state of affairs is largely responsible for the disturbance in prices which has existed for several weeks. Manufacturers are evidently tired of this unprefitable warfare, as it is understood that Indiana Glass makers have called a meeting for next week, at which time the disturbing conditions of the Glass trade will be discussed, and an effort will be made to advance prices. It is difficult to quote any fixed price, but Pittsburgh advices name from 88 to 88 and 20 per cent. discount for single and double strength Glass, as an average quotation for car lots at factory, except when unusually large quantities are wanted, in which cases better than 90 per cent. discount has been offered. Glass from New York jobbing houses is sold at from 85 and 10 and 5 to 85 and 20 per cent. discount for single and double strength. Trade is reported as not being up to that of last month.

White Lead.—At a recent meeting of the White Lead corroders with the efficials of the National Lead Company the agreement was reached to make the regular price of White Lead in lots of 500 fb and over, 5½¢, less ½¢ discount; lots of less than 500 fb, 5½¢ and ¼¢ discount. It is stated that the new prices, which are practically ½¢ a pound lower than the list put into effect January 1, 1894, have been practically current for some time. Their present action is taken to stop further cutting and furnish a basis of prices. On the new basis White Lead will sell cheaper than ever in the history of trade.

Old Rags, Paper, &c.—Demand is fair and prices practically unchanged. The following quotations represent the current rates paid by dealers in the city:

y

Rubber Shoes, carloads, de- livered at factory, \$16		_	

#### Trade Notes.

THE LEONARD CLEANABLE REFRIGERATOR is the subject of an announcement elsewhere by the Grand Rapids Refrigerator Company, Grand Rapids, Mich. The chief features of this refrigerator are alluded to in the advertisement and a view shows its general appearance. Particular emphasis is laid upon the price feature.

THE prominent announcement elsewhere in this issue of the Michigan Vapor Stove Company, Grand Rapids, Mich., will be read with interest by all who handle vapor stoves.

JUDGE BOOKSTAVER of the Court of Common Pieas has appointed Joseph Walker, Jr., receiver for the firm of Nichols & Granger, 582-588 Hudson street, New York City, manufacturers of gas tubing. The action is taken on account of disagreement between the partners. It is stated that the firm is perfectly solvent.

THE PENN YAN MFG. COMPANY, Penn Yan, N. Y., have been incorporated with a capital of \$10,000. The company will manufacture Washing Machines and novelties.

Hanson & Decker, stove dealers and tinsmiths, Gloversville, N. Y., have sold out their business to Miller & Russell of Blotsburg, Pa. The new firm will take possession January 1, and will continue business at the old stand on Church street.

A. S Kino, for the past year representing the Jones Hollow Ware Company and the Auburn Hollow Ware Company of Baltimore, will, after January 1, be identified with Matthai, Ingram & Co., Baltimore, Md., in connection with their New England trade.

Under date of December 4 the Ette & Henger Mfg. Company, St. Louis, Mo., announce that they have changed the name of their corporation to the Pleuger & Henger Mfg. Company. It is stated that this involves no change in the management of the company and that they are making the same line of goods as heretofore. The company are prepared to fill orders promptly, and cali attention especially to the quality and finish of their manufactures.

#### Improved Grooving Machine.

Jacob Brombacher's Sons, 30 Cliff street, New York, are marketing an improved groover for workers in tin, sheet iron and other metals, as here shown in Figs. 1 and 2. The work is grooved by moving the frame back and forth over the seam by means of the crank, the operator standing at the right hand end of the machine, in front of it. The upper and lower arms are made of bars of steel each 2\frac{4}{2} and 3 x \frac{1}{2} inches respectively, insuring great rigidity. The gear and rack teeth are all cut, affording a smooth movement. The seaming roll in the frame is followed by a flattening roll, thus completing the operation in one transit. A stop is placed on the top bar to prevent the frame running off the rack. The

a floor area of 9.330,000 square fect; a water front of 14,600 feet, or 24 miles; hulkheads of 25,913 feet; 35 covered piers of 1,160,000 square feet; 9 open piers of 17,896 square feet; storage yards with an aggregate area of 40 acres, and 16 grain elevators of a daily capacity of 1,000,000 bushels and a storage capacity of 20,000,000 bushels. The net earnings of these properties last year were about \$1,500,000, and by consolidating them, it is calculated that the amount could be increased to \$2,000,000.

It appears from the columns of our contemporary Die Natur that a German chemist has made the discovery of a new compound body, which is said to possess the peculiar quality of solidifying under the action of heat, and to

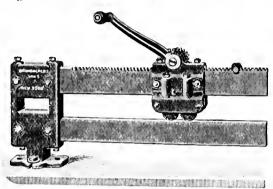

Fig. 1.-Improved Grooring Machine.

groover is so constructed that when lengths of 20 inches are to be grooved the lower bar can be built up with pieces of metal, regulated by an underneath set screw in the standard, so as to neutralize the inevitable apringing of the bar at the extreme end of the groover. The groover is made in 20 and 30 inch sizes. In the 30-inch size the ordinary mechanism is provided for locking the upper and lower bars together. In grooving short lengths of material by setting the lower bar at a proper point, as indicated in Fig. 2, the workman is not compelled to change his position, even though the work is

again revert to the liquid state at a temperature below 32° F. To this substance the name of crostase has been given, and it is stated to be obtained by mixing equal parts of phenol, camphor and saporine, with the addition of a smaller proportion of the essence of terebenthine. It is supposed that up to the present time no body possesses this remarkable property of liquefying when cold and solidifying when hot. It is true that certain substances, such as albumen, for example, harden when exposed to heat, but once they have attained this condition they cannot be made to resume the liquid state, al-

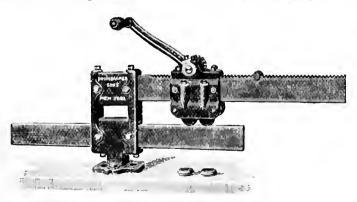

Fig. 2.-Showing Adjustment of Lower Bar.

but a fraction of the groover's capacity. Three seaming rolls of varying widths, together with a flattening roll, accompany each machine.

An effort is being made to organize a big warehouse trust to control all of the warehouses, elevators and dock facilities in Brooklyn. Although the plans of the promoters are not yet consummated, it is believed that the scheme will be carried out. The plant of the new company would, it is said, consist of 264 brick warehouses, having

though they may be subjected to exceedingly low temperatures.

The death of Ferdinand de Lesaepa, the great promoter, removes one of the most picturesque and unique figures. Twenty-five years ago M. de Lesaepa was at the hight of his glory, when his great work, the Sutz Canal, was opened to commerce. Since that time his great name and reputation have been dragged in the mire through his unfortunate connection with the dis-

astrous Panama Canal scheme. Few more pathetic terminations to a great career have been recorded in history.

#### Merry Christmas.

We cannot let this season go by without sending a Christmas greeting to our friends who have been so kind to us in many ways during the year, and to whom we wish all manner of happiness and prosperity. Trade may have been bad, profits may have fallen below the expectations of the early months, and many disappointments have perhaps been met, but we hope all displeasing memories will be laid aside for the week at least, and that the season of good cheer will make its influence felt; bringing the tired ones a time of rest, the worried ones a time of peace, and all a vacation for a little while from the auxieties and turmoil of the year.

#### Adding a Profit.

How shall a profit be calculated on a heating job after the cost has been estimated? Shall it simply be a lump addition, or should some other method be used? After a season when the shop has been busy and several men have been employed the employer often wears a long face because the profits expected fail to materialize. Has he considered rent, interest, insurance, light, heat, power, boy, horse and salesmen in the cost of every bid he has made, besides a generous allowance for the unexpected which is said to always happen? If he has not, it is quite probable that they have eaten up what he added for a profit. They must be counted in the cost, then a percentage added on for a profit, in preference to a lump which is largely guesswork. If a percentage plan is followed there is less probability of losing some jobs by the price being too high, and what is worse, losing money on others by the price being too low. The percentage to be put on will require some judgment in determining the amount, as a larger business will reduce the amount each job will have to bear of the fixed a dry summer and iail, oread will be considerably dearer next year and the epoch of low prices will pass away through the operation of one of the inexplicable processes of nature. to be put on will require some judg-

expenses. In some cases it may be good business policy to reduce the profit to keep the shop going, but they are rare; in other cases to raise the profit, so as to lose the work of a poor payer. Without the profit, however satisfactory the work and however popular the house, business failure must sooner or later be the outcome.

#### Economical Waste.

A very striking illustration of what the low cost of manufactures of iron and steel really means is furnished by a remark incidentally made by William Garrett of Joliet, the famous inventor of the rod mill which hears his name. In a lecture at Joliet he stated that " wire nails are sold so cheaply that it is estimated that if a carpenter drops a nail it is cheaper to let it lie than to consume the carpenter's time to lift and use it, and it is claimed by good authority that one keg out of five is never used but goes to waste." We have had the curiosity to do some figuring on the proposition made. Assuming that it takes a carpenter 10 seconds to pick up a nail which he has dropped, and that his time is worth 30 cents an hour, the recovery of the nail would cost 0.083 cent. There are 200 sixpenny nails in a pound, which is worth at 90 cents base and 65-cent average per keg 1.55 cents per pound. This would make the money value of the individual nail 0.0077 cent. Or in other words it would not pay to pick up ten nails, if it took ten seconds of time worth 30 cents an hour in which to do it.

#### Agricultural Conditions.

Reports from the great agricultural States are disquieting. The weather has been excessively dry throughout the entire fall, and winter wheat has suffered severely. It is stated that the season is the dryest in twenty years, and the outlook for next year is filling agriculturists with gloom. The sections that suffered most seriously from drouth last summer are still enclonded with misfortune. It seemed bad enough that crops should fail and the feeding of cattle be a matter of difficulty, but it is now necessary in many localities to drive stock for miles to pools or sloughs for a little water. The price of grain has kept remarkably low in view of the conditions prevailing, there heing almost a famine in a huge section of the West, but it is now predicted by careful observers free from speculative influence that consumption will so rapidly exceed receipts from farmers' stocks as to cause a steady appreciation in value. Should a dry winter succeed a dry summer and fall, bread will be

#### Fraudulent Shipments.

One feature of the l'atterson bill for the amendment of the Interstate Commerce Law, says The Iron Age, has escaped the general attention among business men which it deserves, because the provisions permitting pooling were seized upon as far reaching. The particular amendment alluded to reads as follows:

Section 10.-That any person, and any officer or agent of any corporation or com-pany, and any member of any firm or partnership, who shall deliver property for transportation to any common carrier, subject to the provisions of this act, or any person, corporation, company, firm or partnership for whom as consignor or consignee any such carrier shall transport property, who shall, knowingly and will-fully, by false billing, false classification, false weighing, false report of weight, false representation of the contents of any package, or by any other misrepresentation, deceit or device, obtain or seek to obtain transportation for such property at less than the regular rates then established and in force on the line of transportation of such carrier, shall be deemed guilty of a fraud, which is hereby declared to be a mis-demeanor, and shall, upon conviction thereof in any court of the United States of competent jurisdiction within the district in which such offense was committed, be subject for each offense to a fine of not more than \$5000.

The framers of this amendment aimed at a very serious abuse. The representative in charge of the bill, Mr. Patterson, made the statement that statistics show that in transporting freight from the cities of New York. Boston, Philadelphia and Baltimore alone to the city of Chicago, there were in a single year as many as 173,000 instances of false shipment. Mr. Patterson does not give his anthority for this stupendous figure, nor does he indicate in what manner his statishe indicate in what manner his statis-tician conducted his investigation. In the absence of data on these points the figures will be received with reserve Still it is the general impression among business men that frauds of this character are widespread, and that they are not alone connived at by the railroads, but are actually instigated in some cases. The fierce competition among the carriers has encouraged the practice and has made it impossible to practice and has made it impossible to bring false shippers to justice. The railroads have not dared to prosecute them, because they were afraid of losing the business. It is argued that if pooling be allowed under proper restrictions and under fair supervision, the railroads would soon learn to put a stop to the practices referred to. It would not take many convictions to would not take many convictions to purity our industries and our com-merce of this crying evil, and probably many of those who have been forced into the system of underbilling, or of false classification, would be the first to appland when it is abolished. Every honest merchant and manufacturer will be content when he is able to feel sure that no rival is undermining his trade because he is successfully cheating the railroads or is in collusion with

## THE LETTER BOX.

### The Compliments of the Season.

From A CONTRIBUTOR. -I have never seen anything in the Letter Box of the purely social character, nevertheless I am constrained to send my best wishes at this season for its continued prosperity and for the continued prosperity of all who are interested in it as contributors or readers. The Letter Box is an old and highly esteemed friend to many, and moreover it is composed of us. In it we do our acts of benevolence by sharing our good things and helping one another, which is always a source of pleasant reflection. To realize these best wishes, in which I am sure all the readers join me, we have only to continue to send our inquiries to it and to send our solution to such problems as we have mastered. I have made in-quiries occasionally and have one or two more that will be sent during the winter, for I want our mutual efforts to bring about what I desire. We shall all have more leisure in the near future, and, instead of rusting out, a personal benefit will be derived by an active interest in our department of The Metal Worker, which also has our best wishes, for without it we would have no opportunity to exchange the fruits of our experience.

Note.—We heartily return the compliments of "A Contributor," and invite the same free use of the Letter Box in the coming year as in the past. During 1894 the Letter Box has been remarkably prolific of good information on widely different subjects, and the contributors have our thanks as well as our beat wishes for the coming year.

#### Rusting of a Tin Roof.

From R. H. C., Grafton, 1ll.—I would like to receive some informatiou regarding the rusting of a tin roof. About two years ago we put a tin roof on the north side of a building, using IC terne plate. The building had a shingle roof, and the tin was put on with the usual seam, being laid over the old shingles. The main roof is one-third pitch, and the adjoining part one-fourth pitch, all in one roof. The part of roof having one-third pitch is all rusted out at the bottom, while the adjoining part, having one-fourth pitch, is as good as ever. The same kind of tin was used for the entire roof, and the upper surface was well painted, but no paint was used on the under side. How long should a tin roof last when IC tin is used and properly painted?

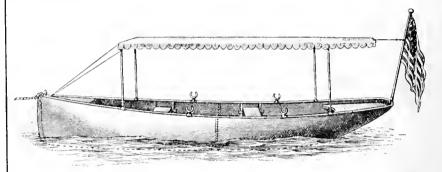

Note.—It is not considered a good plan to lay a tin roof over old shingles, on account of the rough aurface afforded for the tin to rest upon. While this may not account for the rusting of the tin, it may be that the shingles were somewhat leaky and allowed the moisture from below to strike against the tin, become condensed, and thus cause the tin to rust out. It would be

difficult to state how long a tin roof should last if well painted, as it must be evident that the tin could not corrode when thoroughly protected from moieture and gases by paint.

#### Sheet Metal Rowboat,

From F. F. FIELD, Lakewood, R. I.— I am constructing a round bottom rowboat of No 24 galvanized iron, and

I then trimmed the sheets to the proper shape, for they had drawn from the top edge. When stretched I removed them from the form and riveted them together where they had been lapped by 2 inches. I then got a wrought iron keel  $\frac{1}{4} \times 2$  inches in section and had it bent to fit the form, and punched two lines of holes in it  $1\frac{\pi}{4}$  inches between centers, and had it galvanized and riveted it between the sheets. Previous to putting on the gunwale I raised the

Sheet Metal Rowboat .- Fig. 1.- Finished Boat.

perhaps an account of its building would be of interest to some of the readers of The Metal Worker. I first got two sticks of timber 24 inches square and 15 feet long and marked out the lines of the boat, 14 feet long and 42 inches wide amidships and 28 inches wide at the stern. I then cut out the shape of the boat in the two pieces of timber, which gave me a form to work on. I next took four sheets of

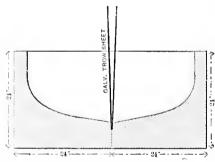

Fig. 2.—Section through Wooden Form.

No. 24 galvanized iron. 30 x 84 inches, stood them up edgewise between the forms, as in Fig. 2, with two sheets opposite to each other and lapped by about 2 inches, but not riveted. The bow ends of the sheets projected forward of the form 1½ inches. Having secured the two parts of the form together by means of clamps, to avoid them apringing apart, I bent two sheets to the right and two sheets to the left of the form as far as possible by hand power. Then two pieces of board  $\frac{\pi}{4}$  x 2 inches wide by 14 feet long, sprung to the shape of the form, were secured by clamps, leaving the metal between the two wood forms. Then taking a large round faced mallet I stretched the sheets to fit the form, which practically gave me the shell of the boat made of sheet iron.

section in the stern, which was a piece destined to tie the sheets together above the water line, and riveted and soldered it in place. For the gunwale I got 32 feet of \$\frac{3}\$ inch galvanized iron piping and had a slot sawed in it lengthwise, putting in \$\frac{3}{4}\$ tees where I wanted the rowlocks. I bent the pipe to the shape of the form, with the slot on the underside, and forced it over the top edge of the boat, riveting it with 12 inches between centers. Air chambers were provided in the bow and stern under the seats large enough to float the boat full of water. It is surprising to see how strong and rigid the boat is without any ribs whatever. I send a sketch, Fig. 1, that will show the appearance of the boat after it was finished, with the position of the seam.

#### Water Fails to Run Promptly.

From E. F., Dalton, Mass—I wish to ask through The Metal Worker the best plan for running water into a two-story house where the supply has a fall of but 25 feet. In running the pipe I have carried it to the second floor and then turned down with a circle of wide sweep to the sink on the lower floor. Before making the circular sweep I placed a faucet on the second floor a few feet from the highest point. The water does not come from this faucet for a few minutes after opening it. In explanation, however, I would say that the water runs on the lower floor all the time. How can I remedy it so that the water will come when the faucet is opened?

Note.—We would be glad to have our readers use The Metal Worker for giving their views on this subject. It would seem that the rise to the second floor of a house would diminish the head

so that there would be little pressure exerted at the faucet on the upper floor, which would account for the water running slowly, but not for its refusing to run for a few minutes. The open end of the pipe on the lower floor would act like a siphon and cause a better flow of water there than on the upper floor, and it is possible that this siphonic action would draw the water by the faucet for a time previous to its running out of the faucet on the upper floor.

#### Pressure Bursts Old Work.

From Subscriber.-I am having a great deal of trouble in my city with the plumbing in the houses of my customers. I have had a shop here but two years, and as none of my jobs are giving trouble I am called upon to rem edy the troubles in other work. I have found a very good system and character of work, but as light weight lead pipe and low pressure fixtures have been used, bursts and leaks are frequent. This is due to a new system of water works having recently been opened to the city carrying a pressure capable of supplying water to residences in the highest sections of the city. Where the pressure was formerly about 40 pounds, it is now always 75 pounds and at night higher. Is there any way of overcoming this trouble without putting in a new job of heavy material?

Answer. - The case presented is not an unusual one, and a very common method of overcoming the trouble is to have a tank for supplying the system at the top of the house. A sufficiently strong pipe is then run from the street main to the tank, with a ball cock at the end to shut off the supply when the tank is full. The pressure, however, can readily be reduced to the strength of the system by using any one of sev eral water pressure regulators on the market. By attaching one to the service pipe at the place where it enters the building and setting it at a pressure that will give a good flow of water from the highest fixtures in the building the trouble will be overcome. When a high pressure is put on the city mains, as in case of a fire, a very severe strain is often put on a plumbing system and as a result considerable repairing is necessary. With a pressure regulator set at 30 pounds the pressure on the mains may rise to over 100 pounds without affecting the house pressure or bringing any strain on its fixtures. If any of our readers have any other plan to recommend we shall be glad to hear from them.

#### Insufficent Air Supply.

From S., St. Louis.—Having read the letter of "A. II." in The Metal Worker, December 15, I would say that it is usual to have a cold air box three-quarters or at least two thirds the area of the heating pipes, and it may be that the cold air box was not of sufficient capacity to supply the pipes. Again, the cold air box may have been made wholly or in part of metal, and so placed that the air in it became heated, either from the warm air in the basement, the smoke pipe, or both, so the movement of air was retarded. A

remedy for this defect could have been found by running the box in such a manner that the air would be delivered to the furnace at its natural temperature. It would appear that the heating pipes were of ample size, if of sufficient number, to remove all the hot air from the furnace, unless the furnace was constructed in such a manner that there was not sufficient space for the air to psss through. The construction of some furnaces is defective in not having sufficiently large oponings through the radiator for the easy passage of the heated air. The area of the cold air box was 360 square inches, while the combined area of the 14 and 10 inch returns are only 232.47 square inches. Supposing the cold air box to have been of suitable size, it would appear the returns are not of sufficient capacity. For a remedy, there should be a suthcient space inside the casing for the air to pass up freely. It would appear that the supply of air was restricted in some manner, thus preventing the rooms above from receiving their proper supply. As each room is provided with a ventilator, and there are three grates on the two tloors, the warm air may escape before it mingles with the air in the rooms, thus preventing the house from becoming properly heated.

#### Heating from Kitchen Boiler.

From C. A. M, Hoboken, N J.—My wife calling my attention to the fact that the side connection to the boiler leaked again made me search for a remedy. I use a malleable iron water back in myrange so as to he sure of its strength being equal to the pressure where I am located. The water back made so much hot water that the boiler was always noisy, and the steam made caused the lead pipe to be overheated, and water hammer resulted by the steam condensing where the coupling reduced the size of the waterway and eventually made the leak. In doing hot air furnace work my attention had been attracted to the method of heating a radiator from a coil of pipe in the fire chamber by means of hot water circulation. I concluded that the surplus heat over what was re-quired in the boiler must be disposed of by some means, and decided to put a 60-foot radiator in the room above the kitchen and connect it with the boiler. I described my intention to a plumber, who discouraged the notion as being impracticable. I said, how-ever, that I would get all the material and would like him to do the work, as I do no pipe work either in lead or iron. I had him run a 1-inch brass pipe from the water back to the side of the boiler, and think this arrangement will stand, even in summer, when the radiator is not in use. The brass coupling at the top of the boiler for hot water was taken out and a 1-inch nipple was put in its place with a tee on it. A 4 inch connection is taken from the side of the tee to supply the house fixtures. From the top of the tee a 11 inch pipe runs up to the radiator, and a 1 inch pipe runs back from the radiator and connects with the pipe from the boiler to the water back. An angle valve is placed on the pipe to the radiator, and an air valve is placed at the top of the radiator. The room in which the radiator is located is 12 x 17 feet in size, with a ceiling 10 feet high. I know that this job is not piped just as an expert would lay it out so far as sizes of the pipes are concerned, but it works satisfactorily in every respect, and the boiler is no longer noisy.

Making the Discount.

BY EPBRAIM SMOOTH.

There is nothing that pleases a wholesale dealer more than to have his customers make the discount. This refers to the special discounts given for eash payments and is true though a reduction in the profit on the sale is one of the results. A case in which the discount was made recently, however, while very clever, has brought no comfort to the wholesaler. Two concerns whose wares are used by the same class of trade without conflict of interests have their office and salesroom together. A man came in one morning and asked to see the line of goods that occupies the greater portion of the showroom. salesman sold him quite a bill, for which he paid cash, showing a business eard from a business house in a nearby town, and as he had taken an interest in the construction, management and proper setting of the goods he gave the impression of a live dealer. He asked more questions than usual of a pertinent character and showed intelligence and enterprise in preparing to do a larger business in the line of goods being investigated, so an extra discount given him as an incentive to continue his dealings. While he was talking with the salesman the goods of the other eoneern were being shown to another buyer and attracted his attention. He was introduced to the nanager by the salesman and again his intelligence and interest secured him the discount, and paying his bill he stated he would send the local express for the goods the next day, which he did. In praising his intelligence to a third party the man whose card was presented heard of it and said he had never been in the place and knew nothing of the transaction. never had any use for such goods, as his work was not in that line. It was clearly evident that some one had impersonated him profitably, but as the bills had been paid he could not see where he had suffered. The impostor had made the discount with two bright business men and good salesmen. Efforts to secure trade prices by outsiders are not unusual but are seldom successful, and those in the trade are often unable to make the discount because of the long credit they ask for.

The Chester (Pa.), gas and water companies and the steam heating company at that place are said to be having a great deal of trouble from the waste electricity of the local traction company, which causes electrolysis, to the destruction of their pipes. Leaks are of every day occurrence. At the lower station of the steam heating company it is sverred that a considerable current of electricity can be taken from their pipes, being carried in from the street.

The adverse  $\epsilon$  ffect of the recent business depression as regards the embarkation of eapital in new enterprises is strikingly illustrated in the annual report of the Secretary of State of Ohio, just published. It shows that the capitalization of new corporations organized in the year 1894 was only \$79,760,300, or less than one third as much as those which began business in the previous year, the aggregate capital of which was \$267,481,500.

The city of San Antonio, Texas, willi expend \$500,000 on a new sewerage system.

## STEAM AND HOT WATER.

Buildings.

Plumbing Inspector Dunn having been requested by the Board of Health of Kingston, N. Y., to report some practical means of obtaining better ventilation in the school rooms, presented a report in which, after stating that to obtain the best ventilation the buildinga must be arranged for it when built, he makes the following recommenda-

In regard to the heating and ventilation I would recommend that the buildings he heated by an indirect system of steam. The air to be fresh forced by the means of a fan, through a channel or conduit with an area carrying at least 30 cubic feet of air per person per minute-the room to have equivalent exhaust of foul air—thence through a room or box containing pipes or radiators with a heating surface sufficient to supply the amount of heat required for each room, and deliver the pure warm air in rooms through flues and registers, so arranged that the same may be easily controlled, registers to be larger than the duct carrying the air to avold a strong current. There are many methods or systems of heating and ventilation. There is no one that is, under any and all circum-There is no stances, superior to every other. Any building which has a heating apparatus designed to be run in the best manner and requiring thorough and constant attention, will be more or less of a failure. To make a proper design for ventilation it is necessary to know or to assume: The number of persons who are to inhabit the building; the fresh air that should be allowed to each person (this is put down by some authors as (this is put down by some authors as high as 35 cubic feet per person per minute); the quantity of air necessary to provide for the vitiation of the air by gas or other lights. The air required for the vitiation by gas lights is given by Schumann as 1800 cubic feet per hour for each cubic foot of gas burned. As each burner may be taken to burn about 4 cubic feet of gas per hour, then each light would require 7200 cubic feet per hour. The leakage of air into a building is considerable. The more leakage there is the less area there will be required in the fresh air duct. In the very best built houses there is always some leakage. The fresh air duct should not be taken under the basement floor, but it should be kept above the ground and brought along the basement ceiling until it reaches the proper point. It is now generally admitted that no system of ventilation is complete that does not provide at the same time for the warming of the incoming air, and that the warming of our public buildings must form a part of any ventilation scheme; that, in short, in a well regulated system the ventilation and warming must be included in one scheme. It is quite true that any scheme of mechanical ventilation is more complicated than schemes of natural or so called automatic ventilation, but it is safer and more complete. To say that a natural scheme of ventilation is uninterruptedly at work the year round is, to say the least, very mislead-

Heating and Plumbing School | ing. It may be true that the atmosphere is always in motion, but then this motion may be so small at times as to cause no movement of air at all out of the buildings, a state of affairs well known to all those who have to rely on this kind of ventilation.

Now about the plumbing and drainage of the buildings, would advice that the fixtures be placed in well lighted and well ventilated apartments, in main building, or in a separate building attached to main building, so as said apartments may be warmed to avoid the danger of taking cold, as now, by pupils leaving a heated room, sometimes without their extra wraps on, and perhaps with a difference of temperature between the inside and outside atmosphere of from 50° to 70°, also that theplumbing fixtures, well arranged and properly constructed, are sanitary. The style of outdoor closets in most cases employed is not sanitary. The rules defined in the plumbing code of the city would be a fair guide, but I wish to add to said rules that where closets and urinals are used, the stalls and floor be composed of some non-absorbent, such as slate or tile; urinals to be composed of some non-absorbent and non-corrosive matcrial and supplied with flushing tanks.

#### HEATING NOTES.

THE WARDEN of the prison at Hartford, Conn., proposes to erect brick air flues, three on either side of the prison, and by means of a gas jet at the bottom of the shaft produce ventilation, forcing out the bad, heavy air that settles at the bottom of the room. There are 390 cells in this room and without being properly ventilated the air becomes very vitiated. The flues will be 12 x 8 inches in size.

THE KENNEDY VALVE MFG. COM-PANY are nicely fixed in their new quartera at 75 John atreet, New York, and have their sample line of gate valves very neatly arranged. They make a varied line of steam goods and have a special fire hydrant.

THE BUFFALO FORGE COMPANY, Buffalo, N. Y., have secured as representa-tives for the Southern States, the Southern Heating Company, headquarters at Louisville, Ky., who will give particular attention to fan heating and ventilation, handling the well-known Buffalo fans, blowers and exhausters, disk ventilat-ing fans, horizontal and vertical engines, &c.

THE EXETER MACHINE WORKS, Exeter. N. H., have published a reference supplement to their catalogue of Exeter sectional hoilers for power and heating purposes. The letters and references are from users of the Exeter boilers in the New England and middle Atlantic States, and in a prefatory note the publishers state that the list presents but a small portion of the Exeter bollers in use, very many having been sold through agenta without the purchasers' names coming to the manufacturers. These letters speak in flattering terms

of this apparatua, and will be read with interest by those who contemplate using Exeter heaters.

J. S. LINDLEY, Bennington, Vt., contracted to heat the Court House in that city in seven days, and by the aid of his steam fitter, Fred. Butler, he kept his contract, and installed the plant and started fire before the time expired.

THE ASSIGNED PLANT of the Robinson Company, located at Bellwood, Pa, was disposed of last Saturday to D. L. Wray and Ira Wentzell, of Bellwood, and C. M. Robinson, of Philadelphia, for \$4000. The new firm owns the right to manufacture a heating apparatus known as the Popular Hot Water Fire Place.

DURING the fore part of the week. Hart & Crouse, Utica, entertained W. M. Mackay of their New York house, and a general review of their business for the year in the ateam and hot water department aeems to have left an agreeable impression.

C. M. Norcom of the Mackay Valve Company, 66 James street, Newark, N. J., is a frequent visitor among the heating contractors in the vicinity of New York. Radiator valves of all kinds are embraced in their line.

W. A. Russell, 89 Centre atreet, New York, is proud of the array of sample Niagara radiatora he is now able to make. He announces that the indirect radiators, as well as the direct ra-diators made by the Niagara Radlator Company, Buffalo, N. Y., have proven very popular and satisfactory, and that orders can be filled promptly.

DISBROW & Co., Harrisburg, Ps., are using large quantities of the radiator valves made by the Detroit Lubricator Company, and for which W. A. Russell is the New York representative, with office and a well supplied stockroom at 89 Centre street.

With the Ideal sectional cast iron hoiler, the Electric pips construction hoiler and the ateam goods of the Van Auken Specialty Company, Richard D. Jackson, 89 Centre atreet, New York, has much to interest the heating trade.

E. R. Pierce, manager of the Boston office of the American Radlator Company, was a visitor at the New York office, at 92 Centre atreet, this week. In addition to the usual courteous greet-ing received at this busy office, a Merry Christmas and the heat wishes for the coming year are extended to all visitors.

THE UNITED STATES HEATER COMPANY, Detroit, Mich., have received all of the plans for the erection of a manufacturing plant on Campbell avenue, between Lauderdale avenue and the Wabash Railroad. One building is now in course of construction and will be 50 x 235 feet, 70 feet of which is two stories, the remainder one story. It will contain the machine shop, ware-house and offices. The foundry, which house and offices. The foundry, which is not to be built for the present, will be 100 x 175 feet.

#### Improvements In Greenhouse Heating.

The following extracts are from a paper read before the New York Florists' Club on December 10 by Samuel Burns of Thomas W. Weathered's Sons, and a member of the American Society of Heating and Ventilating Engineers:

#### Historical.

Webster's definition of the word "improvement" is as follows: "Advancement, a making or growing better, a valuable addition, excellence added, or a change for the better." Therefore, any improvements in greenhouse heating mean that we ought to have something better than we had before. This does not give us the degree of excellence or betterment; it only provides that there must be a change in the right direction. Taking this view of the case it would seem to me that the only true method of finding out what improvements have been made is to contrast the various systems of heating used at the present time with those used in the past.

The florist who has had experience with nothing but flues, cannot fully ap-preclate the value of hot water or steam heating, neither can those who have never run a flue begin to realize what fun they lost by not having attended to four or five old fashloned flues on a very coid night. To form a correct opinion on any subject it is necessary to carefully study both sides of the question, and even after this is done the case is sometimes so evenly balanced that it is very difficult to render a just decision. I do not think we shall in this case be at a loss for a decision, as it is only necessary to go back far enough to convince the most skeptical that we have made some improvements in heating greenhouses.

In "Chambers' Encylopedia," we find under the heading of "Greenhouse,"

the following: "The first greenhouse of which there is any record was erected about 1619, hy Solomon De Caus, at

Heidelberg, to shelter orange trees. The Chinese, however, are not unacquainted with greenhouses, and it is not known how long this has been the case. Heat was at first supplied when necessary by hot embers put in a hole in the floor, afterward by furnaces in the greenhouse. Flues, steam and hot water pipes are of more recent invention." Under the heading of "Hothouse," the same authority says: "The oldest mode of heating hothouses is by furnaces and flues; the other modes practiced are by steam or hot water, led through the house in tubes."

The only information that I can gather regarding the heating of the greenhouse built by Solomon De Caus is that it was warmed by means of four large furnaces. How these furnaces large furnaces. were constructed or in what manner the heat was conveyed to different parts of the building is simply a matter of conjecture, as history gives us no definite information on this point. However, as this greenhouse was used to shelter over 400 orange trees planted in the ground, it is reasonable to suppose that these furnaces were connected to a system of flues. Taking into consideration the information we have at our dispossl, I do not think we shall be much out of the way if we assume that the first method generally adopted for heating greenhouses was the ordinary furnace and smoke flue. We certainly have good reasons on which to base such a conclusion, for while we find that the Romans understood the circulation of hot water to some extent, they knew more about heating by flues. The Hypocaust was a form of furnace much used by the Romans for the purpose of hesting baths and apartments. The fuel was placed in a chamber under the floor, and the smoke and heated sir were made to circulate around the walls and under the floor by means of hollow tubes or a hollow lining. The full benefit of the fire was thus obtained, in place of a large portion of the heat being allowed to escape as it does in the case of the open fire place. The Romans invariably used this form of furnace for heating their dwelling houses. We also find that the Chinese have for a long time used a very elab-orste system of flues, and by which the floors of rooms are heated by a furnace constructed below, with a moderate expenditure of fuel. We find this mode of heating described in "Philosophical Transactions, 177I," but the date of its introduction does not appear to be known.

There is not the slightest doubt that the smoke flue answered a very useful purpose in the early days of horticulture, and was at one time the most economical way in which the desired result could be obtained. This system of heating had many objections, such as unequal temperature in different parts of the house, as it was necessary to produce an excessive amount of heat at the furnace end in order to obtain any appreciable effect at the extreme end. This invariably produced a dryness in the air, which had to be corrected to a certain degree by putting psns of water on the flue at various points. There was slways great danger of the flue bursting at some point during heavy firing, which would allow the gases to escape and thus destroy many plants. The limited scope of the flue also necessitated a number of fires in large establishments, which was both inconvenient and costly. As floriculture assumed greater proportions, there would naturally he a desire on the part of those engaged in it for some better

method of heating, for notwithstanding our improvements of to-day, we are crying for more.

#### Early Hot Water Heaters.

The origin of the invention of employing hot water for diffusing artificial heat appears to be hid in considerable obscurity. It is not improbable that, like many other discoveries, it has been reproduced at various periods. The same observations may be made regard. ing steam, for in searching through the various books of reference at my disposal I find that although hot water heating has been most generally used for greenhouse work, the application of steam was fully understood long before we had a correct idea of hot water circulation. In a work written by Thos. Tredgold and published in 1824, I find the following: "Col. William Cook first suggested the ides of employing steam as a means of distributing heat in 1745; it has since been applied in various ways, most of which have repeatedly been secured by patents. The first of these was granted to John Hoyle, of Halifax, England, in 1791, for a method of communicating heat to greenbouses, churches, &c. His plan consisted in conveying steam in pipes or tubes into or through the place to be warmed, the pipes being first raised to their highest elevation and then descending with a gentle declivity to a cistern for the condensed steam, the supply of water to the boiler to be regulated by a ball cock." This scarcely differs from Col. Cook's plan, which had been known 46 years before, and what better can you do at the present time? I find also in the same work the following in an article on forcing houses and stoves, written by Mr. Neill. He says: "Of recent improvements in this branch of gardening, however, the most important is the use of steam for communicating the artificial heat, in place of depending as formerly on the passage of amoke and heated air through flues. Steam is employed on the largest scale by Messrs. Loddiges, at Hackney, and I have nowhere seen stove plants in greater perfection and vigor. They have now (1824) used steam about five years and with success."

It was somewhere about this time that hot water circulation began to be better understood, and the moment it was steam took a back seat for greenhouse purposes, and remained so until about eight or ten years ago, when it came up again almost in the same form as that described by Tredgold. Hot water heating seems to have been used in France in the year 1777 by M. Bonnemain, and was employed by him for hatching chickens by artificial hest. About the year 1817, the Marquia De Chabannes introduced a similar apparatus into England for heating a conservatory and also heating some rooms in a private house by pipes leading from the kitchen boiler. In 1822 Mr. Bacon, a gentleman of fortune, intro duced the use of hot water into his forcing houses, using for the purpose a single pipe of large dismeter, communicating with the boiler; and by giving a slight elevation to the pipes from the horizontal line he was thus enabled to produce a circulation of the water, the hot water passing slowly along the upper part of the pipe and the colder water returning to the boiler along the lower part of the same pipe. The circulation in this apparatus was very imperfect, and Mr. Atkinson, an architect, almost immediately afterward suggested the addition of a second pipe

to bring back the colder water to the boiler, and thus at once the apparatus assumed the form which it has ever since retained. By this alteration the apparatus was brought very nearly to the same form as that contrived by M. Bonnemain more than 40 years before, the principal difference being that M. Bonnemain used only very small pipes of gun barrel size, while Mr. Atkinson used pipes of 4 or 5 inches diameter.

The boilers used in the early stage of hot water heating were very simple in construction, in fact nothing more than an open vessel somewhat similar to a common wash boiler. I saw one of these in 1874 at Mr. Durfee's greenhouse in Fall River, Mass. This apparatus consisted of an open copper botler having a flow pipe leading out near the top and a return pipe entering the bottom. The pipes were 4 inches in diameter, also made of copper, and carrried around the greenhouse to an expansion tank. Of course, with this form of boiler the pipes would necessarily have to be carried on a dead level, otherwise the water would over-This being the case and finding that the pipes must in many cases be carried on different levels would naturally suggest to the inventive genius of the age the close topped boiler such asis used at the present time.

#### Principles of Heating.

The improvements that we enjoy both in steam and hot water for heating greenhouses cannot be said to be in methods, but are due rather to a bet-ter knowledge of the laws which govern their application. There is no art, however humble, in which a knowledge of the laws that regulate matters does not open a wide and extensive field of useful improvement. It is only by a careful study of the principles which govern natural phenomena that we are enabled to profit by their practical ap-plication. Such has been the case with the heating of greenhouses. The day of the brick or tile flue with its dry heat, constant leakage of gas and other disagreeable features is past. No progressive florist would at the present time think for a moment of heating a new greenhouse by this method, and while in many cases he allows the flues to remain in his old houses it is generally because the times do not warrant. him in spending the money necessary for a change.

#### Methods of Heating.

The methods employed for heating our modern greenhouses at the present time are the same as have been previously described—namely, hot water and steam. We have, however, many different ways of applying them to our use. We have the gravity system, the low pressure system, the high pressure system, the overhead system, the combination overhead and under bench system, the up hill system, the down hill system, and, as if these were not enough, there are some manufacturers of boilers who claim to have a special system of their own. All these various systems are described by Chae. Hood in a work entitled "A Practical Treatise on Warming Buildings," published in 1836. After very careful consideration I have arrived at the conclusion that most of these so called new ideas are old ones warmed over.

I will now give you a brief description of the various systems of heating greenhouses, confining myself to those previously mentioned: First, the gravity system, which in hot water refers to all cases where an open tank is used and

the tank not elevated any more than sufficient to fill the pipes with water. In steam the gravity system refers to all cases where the water returns to the boiler by its own specific gravity without the aid of a steam trap. The low pressure system in hot water refers to any case where a tank is attached to the apparatua at a reasonable elevation above the heating pipes. The tank may be closed in this system, but must be supplied with a low pressure safety valve. In ateam this would be the same as the gravity system. The high pressure system is not much used either in steam or water heating, owing to its dangerous qualities. In hot water this system calla for a small coil of pipe built in a furnace, the pipes being continued from the uppper part of the coll and then around the room to be heated, forming a continuous pipe, when again joined to the bottom of the coil, a large pipe being placed at the highest point in the apparatus for expansion. This pipe should have an opening near its lower extremity by which the apparatus is filled with water, the opening being then closed by a screw or valve; the apparatus thus becomes hermetically sealed. The expansion pipe thus left empty is calculated to hold about onetwelfth as much water as the whole of the small pipes, this being necessary to allow for the expansion that takes place in the volume of water when heated. The overhead system refers to those cases in water or steam where the heating pipes are overhead and can be either high or low pressure as desired. The combination system can be either water or steam, and refers to those cases where the flow pipes are carried overhead and the returns carried under the benches and thus back to boiler. The up hill system refers to water and applies to those cases where the water flows up gradually to the end of the greenhouse, which is the highest point, and then returns to boiler. The down hill plan is the reverse of this, the hot water rising at once to the highest point and then dropping back through the greenhouse to the boiler. The gravity system is an old standby and has done good service for us in the past and is still doing good for us to day. The low pressure systems, both steam and hot water, are good according to conditions.

The overhead system is undoubtedly good to keep the snow off the roof, but is very unkind to the plants on lower benches. The combination overhead and under bench system is my favorite system. The up hill and down hill systems both refer to gravity, and are good in their way. In fact, of any system that has been mentioned, the combination overhead and under bench system, either in steam or water, has, in my opinion, thus far proved itself to be

the most effective.

#### Boilers and Piping.

Florists generally are at the present time taking greater interest in the subject of heating than they did some years ago, and as a result of this are better informed on this vital point. The more they study this question and consider it a part of their own business the better will they be enabled to select the best the market afforda in the way of heating apparatus. The number of new boilers that have been manufactured during the past few years for ateam and hot water heating would go to show that the demand is increasing. I was informed a few months ago by the representative of a trade paper in this city that a new style of boiler was placed on the market every 28 days,

making a total of 13 per year; this being the ease, considerable care is required to make a proper selection. These new boilers are always advertised to do something wonderful—in fact, there is no limit to the extravagant assertions that are made in their behalf; they remind me in their general style of aome of the testimonials we read extolling some patent meticine.

The vast amount of fuel used for heating greenhouses and the cost of same forms a very serious item to the florist; therefore, when a boiler manufacturer comes to him and says: "I will guarantee my boiler to do twice as much work as some other boiler and not use more than half the amount of coal, or, my boller will send the water through the pipes so hot that a 2 inch pipe will do as much work as a i inch," he naturally thinks what a blessing this would be, if true. On such representations, however, many boilers are sold, and after a hard winter we find that while we may have been fortunate enough to get a very fair heater, our coal bill has not reduced its proportions in any marked degree; we must, however, admit that whether we use hot water or steam we are to-day better able to determine what will be the result of a certain combination of boiler and piping as applied to greenhouse work. We find also that with the advent of 2-inch pipe many florists have been able to do their own piping, using ordinary laborers for this purpose during the slack part of the season. This will naturally be a saving to them of many dollars in first cost when they compare it with the prices paid to New York mechanics, which must also include railway fares and board while doing the work. While I must commend any business man for trying to reasonably reduce his expenses, and while I feel that it is wise for a florist to fully understand how to put in a system of heating, I would simply say: "Don't attempt the job unless you fully understand what you are going to I can safely say from my experience cf over 26 years that a large majority of the failures in greenhouse heating are due to imperfect systems of piping.

Remember at all times, whether you are putting in hot water or steam, that there is no such phrase as good enough in the business; you must proceed care. fully at all times with the pipe tongs in one hand, the spirit level in the other. Of course an indifferent job of piping may work; were such not the case, I am afraid quite a number of our florists and private gardeners would have to call in the services of an expert. Where the piping is not put in properly the circulation of the water or steam, if it circulates at all, will be slugglah, thus necessitating a greater force at the boiler, which means a greater expenditure of fuel than would be required under proper conditions. In all cases where a florist finds it necessary or advantageous to do his own piping, I should advise him to consult with the parties from whom he purchased the boiler, telling them plainly what he proposes doing, and ask them to furnish a plan of the work; this they will no doubt cheerfully do, for it is to their interest to have the work done well. With our modern boilers and systems of piping the florist can regulate the temperature of various houses to suit the conditions required by different kinds of plants. The improvements in this direction are shown by the magnificent specimens exhibited at our flower shows.

The use of 2-inch pipes in conjunction with a proper arrangement of valves gives us an opportunity for subdivid-

ing the heat such as was not possible with pipes of larger size.

Overhead and Inder Bench Plan.

What I call the combination over head and under bench system has five good points to recommend it; this is where the flow pipes go overhead and the returns under benches, as previously described.

1. It can be adapted to the pressure system by placing a safety valve on the expansion tank, or it can be used with an open tank having no pressure but what is due to the column of water.

2. The heat is carried to the extreme end of the greenhouse in the shortest possible time, and returning under the benches on either side heats back to boiler from the extreme end, which can be kept at the same temperature as the end nearest the boiler.

3. It can be used on the up hill or down hill plan to suit the grade of the greenhouse; this is very convenient when the house grades the wrong way.

4. An increase in the vertical hight of the flow pipes is always followed by increased velocity, therefore we get a quick circulation.

5. Last, but not least, should your greenhouse be situated in a place where you would strike water by digging down from 6 to 8 feet, or should you strike rock, this is the system that will help you out of your difficulty. I have carried out some work on this system where the base of boiler was on a level with the heating pipes and the water had to rise up to the return about 20 inches. We have a little boiler heating our office on this plan where the main return pipe travels about 50 feet along the floor and about 18 inches below return pipe entering boiler; after traveling 50 feet this return pipe drops under the floor about 10 inches, travels between two beams for about 17 feet, then rises up into boiler; in both these cases the circulation is perfect. In greenhouse work I prefer to have a boiler pit at least 18 inches deep, so as to bring the return water back on a level.

I have great faith in this system, for where I have used it the circulation has been very rapid and the results more than I expected.

J. H. COLEMAN, JR., has recently returned from a trip to Boston in the interest of the Humber & Cambridge bollers for the J. H. McLain Company, 69 Centre street, New York.

The report of the trustees of the New York and Brooklyn Bridge for the year ending December 1 shows the receipts for the 12 months to have been \$1,199,-084, of which \$1,111,816 was from the cars and \$87,268 from the carriageway. The total receipts were \$53,823 less than last year. During the year 41,714,000 passengers were carried by the bridge cars, an average of more than 114,000 a day.

A new and formidable competitor to the Standard Oll Company has arisen in Ohio by the combination of three of the largeat independent oil corporations of that State. Two others are also expected to be added to the new combine. The deal, which involves between \$6,000,000 and \$3,000,000, was consummated last week. The new combination will refine by the Berg process, which, it is claimed, removes the sulphur from the Ohio oll, making it superior to the Pennsylvania product.

### THE RETAIL STORE.

#### Store Arrangement.

The accompanying cuts relate to fixtures and methods in use in the Hardware house of Scofield & Co., Sturgeon Bay, Wis., and will consturgeon bay, wis, and will col-vey suggestions which will prob-ably be new to many of our read-ers. The rack for Paint, Varnish and Oil, shown in Fig. 1, has been in use by them for over three years, and has proved very satisfactory. The com-

carriage paint and neatly lettered. pan is used underneath to catch the drip and to hold measures and finnel. One can is used for each Raw and Boiled Oil and Turpentine for small trade, saving many steps to and from the back room or basement for 5 or 10 cents' worth of the goods. Dry Colors are kept at the left of the caus. The bins at the bottom have lift covers similar to grocers' bins, while the small drawers above are used for finer store. One of these is for Guns, another for Stoves, and the one shown in Fig. 5 is used for various lines of goods, such as Bicycles, Refrigerators, &c. The tags are found very convenient, as from the information given

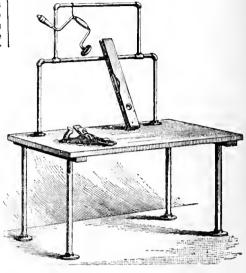

Fig. 2.—Display Stand.

on them a salesman can talk intelligently of what he is selling. On the back of each tag the following is printed with a rubber stamp:

#### **FROM** SCOFIELD & CO., HEAVY AND SHELF HARDWARE, STURGEON BAY,

WISCONSIN. The tags are made of linen, so that they do not come off the goods.

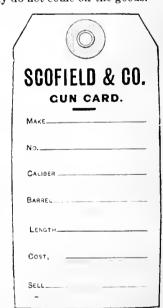

Fig. 3.—Gun Tag.

Another interesting feature in this establishment is a system of electric

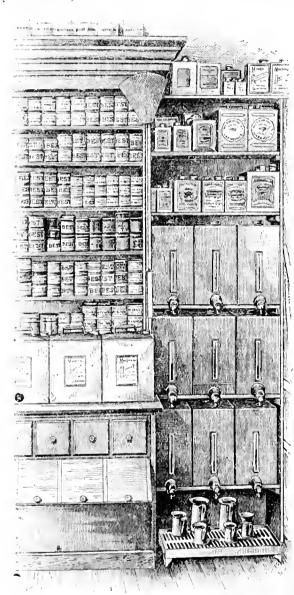

Fig. 1.-Paint, Varnish and Oil Case.

pany refer to the arrangement as a great improvement on keeping the goods in cans, papers and boxes, in which case the contents dry up and evaporate, or spill and get mixed, besides being inconvenient to get at. The Varnish and Oil cans-were made in the company's shop by their workmen, of good heavy tin, using Perfection fancets, 3-inch screw caps and glass cream car gauges soldered in front, so that the contents of the cans may be seen at a glance. The cans are 9 inches wide, 12 inches deep and 17 inches high. They are painted with green Colors. Above the Oil cans Varnishes are kept in original packages. The case is an extension of the shelving and is located at the rear of the store room.

room.

The display stand in Fig. 2 is used in one of the show windows for exhibiting tools and other small goods, the illustration representing the stand as it would appear to a person on the sidewalk. It is made largely of gas pipe and fittings, with a board platform resting on the lower standards. Figs. 3, 4 and 5 represent price tags used in several departments of the

used in several departments of the | bells, which are used to good purpose.

A push button is located near the center of the shelving on one side of the store, so that in case of a rush of customers, employees from the shop, basement or warehouse are called as they are wanted, each answering to a certain number of rings. Push but-

effective and successful window dis-

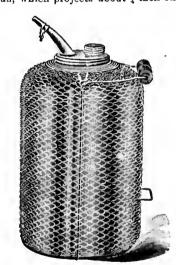

#### Hero Double Action Ice Cream Freezer.

The cut herewith shows a new ice cream freezer which Clement & Dunbar, 1129 Beach street, Philadelphia, are putting on the market as an addition to their line. The freezer is similar in construction to their well-known Home freezer, the exception being that it has freezer, the exception being that it has a double action, one turn of the crank making an equal rotation of can and beater. The gearings are entirely covered, the cover being easily detached from the gear frame, as it is fastened by two bolta secured by two nuts. The gears are of uniform diameter, which makes the speed greater than can be atmakes the speed greater than can be attained by freezera having gears of un-

Hero Double Action Ice Cream Freezer.

equal size. The tub is of white cedar, bound with galvanized flat hoops, the lower hoop affording ample protection to the bottom of the tub. All iron parts coming in contact with cream are tinned, and the can is made of heavy tin plate with iron top and bottom. The freezer is made in sizes from 2pally for kerosene. The body is of crystal glass, enabling the user to determine instantly the quantity of oil in the can. The glass is covered with a tight wire netting, woven around the can, which projects about } inch on all

Glass Oil Can with Woven Wire Cushion.

aides, forming an admirable protective cushion. There is a tin disk on the bottom, joined to the wire work, and an iron rod on each side running vertically, to which the bail is sastened. The top, apout, nozzle, &c., are of tin. The cans have a capacity of 1 gallon. W. W. Pryor & Co., 81 Chambera street, New York are the Eastern agents and carry the goods in stock

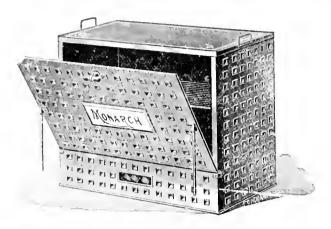

EUGBNE M. AKELEY of Akeley & Wilson, stove dealers in Portland, Maine, died of pneumonla on the morning of December 10. Mr. Akeley went

to Portland when a young man, learned his trade there and, later, engaged in business for himself. For the past five years, however, he was associated with Mr. Wilson, the business being conducted under the style given above.

#### The Monarch Oven.

The Monarch Stove Company of Mansfield, Ohio, have brought out for the season of 1895 an improved form of

is to decrease the time required for freezing cream, and the manufacturers claim that cream can now be frezen in four minutes. To obviate the quality of cream being impaired, which might result from reducing the time of freez-ing, a double set of floats are used on the inside of the beater red, in place of a single set, as heretefore. The manufacturers state that this increases the agitating capacity of the beaters and that it produces fine, smooth cream.

The Monarch Oven for Gas and Vapor Stoves.

even designed for use in connection with gas and vapor atoves. The device is mounted on four casters which run on greeves on the top of the step at the side of the stove, so that the oven can be run back out of the way of the burner when not required for use. This leaves the burner free for other cooking operations and at the same time obviates the necessity of con-atantly lifting the oven on and off the stove. The material employed in the construction of the oven shown in the accompanying illustration is Russia iron, handsomely embossed by a press especially adapted for the purpose. The oven door drops a certain distance and is supported by automatic swinging arms which hold it securely in position and on a level with the bottom of the rack in the oven. The cut which we present shows the door partially open. The ovens are shipped knocked down and nicely packed in atraw hoard boxes, the whole occupying one quarter the space of the ordinary oven. This arrangement enables the dealer to carry an extensive stock without inconven-ience and at the same time have the ovens clean and fresh. The company inform us that the even will also be made with an end drop door similar to the side door. The interior construction of the oven consists of a wide sheet flue at the back which discharges het air at the top, whence it passes over the entire even and escapes through the ventilating heles below the oven door. This system, or principle, it is claimed, insures the baking of biscults within ten minutes from the time of starting the

#### Improved White Mountain Freezer.

The White Mountain Freezer Company, Nashau, N. H., and 105 Chambers street, New York, have introduced im provements in their freezers as presented herewith. The illustration is cut away to show the working parts inside the can. One of the improvements consists of a double self adjusting wood scraping bar, used in connection with the company's duplex dasher. The design of this improved form of scraping bar Other features of the freezer are referred to as follows: A strong water proof tub, bound with heavy galvanized iron heeps, which, it is claimed, do not fall off; gearing completely covered, so that nothing can get between the cogs: cans full size, made of the best quality of charcoal tin plate; beaters of tinned malleable iron; all castings attached to the tub galvanized, and the triple

#### Inventory Taking.

BY E. B. COLE.

Inveicing will seen be the order of the day, and a dirtier, more unpleasant job the Hardwareman rarely has on his hands.

All retail dealers do not take stock annually, and many never take a thorough or proper inventory. If the only feature to be considered were that of knowing the exact amount we have invested in stock and how much profit wo are making each year there would be some excuse for guessing at the stock as long as there are no silent partners to object.

#### GUESSING AT.

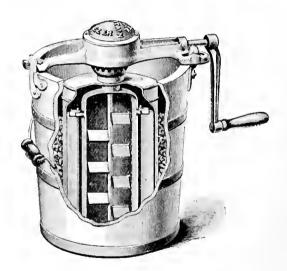

A stock of goods which invoices at about the same figures year after year can be guessed with a surprising degree of accuracy by a competent person thoroughly familiar with the goods in question. But the mere knowledge of the exact amount we have is only one of the considerations in taking the

annual inventory.

First and probably the most important is that of

#### INSURANCE.

He is a shrewd and well posted merchant that knows just how well he is insured. You may never look at your inventory unless you have a fire. There are many ways of adjusting fire losses and figuring the value of merchandise. You can rely on one fact, however-You can rely on one fact, however—that is, the insurance companies will pay no more than they are compelled to by the conditions, and in all cases a thorough inventory as a basis to figure on is the merchant's safeguard, as the burden of proof of the value of stock destroyed lies with him. His inventory and books are the only things left tory and books are the only things left to show in many cases.

Improved White Mountain Freezer.

motion which, it is stated, is peculiar to this freezer.

#### MEMORANDA.

W. A. T. SMITH, whose shop is located in the rear of the New Haven Savings Bank on Orange atreet, New Haven, Conn., has put in no less than 28 of the well known Kelsey furnaces this fall.

CHARLES A. MUTTON, dealer in stoves, ranges and tinware, is about to remove from 29 West Seventh street, Canton, Ohio, to 73 North Market street. Mr. Mutton will take possession of his new quarters on January 1.

The invoice should show the different sizes, qualities and makes of goods so that an outsider could verify the dealer's prices if necessary.

#### UNSALABLE MERCHANDISE.

Another important consideration in invoicing is that of cleaning out slow and unsalable merchandise. We freinvoicing is that of cleaning out slow and unsalable merchandise. We frequently lose sight of goods in a year's business. We find goods in taking stock we could have sold had we known they were in stock, also damaged goods, goods with broken parts and goods with missing parts. The writer once invoiced a stock of pumps and plumbers' supplies that was fully half unsalable because of the lack of parts robbed to supply customers wanting repairs. We regard as the greatest good derived from invoicing the putting of everything in salable condition.

#### SELLING OLD GOODS.

If there are any goods that have remained on our shelves over two years, we put them in a junk pile in our front show window and offer them to our customers at their own prices, calling the attention of every one; that comes

into the store to them.

We had a lot of cut brads and finish pails on hand when the change to wire nails took place, and we could not get rid of them at any price, but by mixing in some 8d, 10d and 20d nails we sold them all as mixed nails at not much below cost. It is better to sell old shop worn unsalable goods at half cost than to carry them year after year, and this method has been so successful that our customers look forward to our annual invoice sale of bargains.

We also find it policy to put in such staple goods as we may be overstocked on at about cost to help clean up the old stayers.

#### A SPECIAL WANT LIST

should be made while invoicing, also a list of things to be done, such as polishing tarnished plated ware, fitting up odd locks with keys and escntcheons, making changes in the display and arrangement of goods, mounting wheelbarrows and grindstones, &c., things you cannot do while invoicing, but can easily attend to during the dull period. When ready to make our spring orders our ready to make our spring orders our want list shows the sizes and varieties of tools and other merchandise required to keep our stock up to our standard completeness. There are a hundred ideas for improving stock and of wants that come to our knowledge when invoicing that should be recorded and carried out. Many large stocks of goods become in a large part unsalable, as the changes in styles and prices go on, from a want of proper consideration of the real advantages to be gained by the annual house cleaning and inventory.

#### ONE WAY OF TAKING STOCK.

We have found in our climate and business conditions that the best time to invoice is the week between Christmas and New Year's. Our new year begins with January 1, and as we never close our store to the trade while invoicing, a dull week is desirable.

We have tried taking the invoice in two books, straightening up the goods, two books, straightening up the goods, invoicing and cleaning out as we go, taking section by section until all are finished, beginning with the goods least likely to be called for by the trade, keeping a list of all invoiced goods sold before the 1st and of all not invoiced after the 1st. We do not know how generally this plan is adopted, but it has so many objections we will not try it again. Its only advantage is that it saves rewriting the invoice. writing the invoice.

#### OBJECTIONS.

One objection is that the invoice books are hard to keep in good shape; that some kinds of goods are frequently listed and priced more than once, as they are found in different parts of the store, making a longer invoice. Another difficulty is in keeping a cortaking of stock generally lasts a week or ten days. Another is that goods are not so apt to be properly listed and specified on the books as they should

#### THE BEST PLAN.

We believe the best plan, and the one we think is usually adopted, is to go through the stock, carefully put-ting all in shape and getting all goods of a kind together, counting and mak-ing lists and attaching to each box or compartment, upon which all sales and changes can be noted up to the time of actual invoice. In this way the stock can all be called off and put on one book in a comparatively short time.

#### ESTIMATING.

In the detail work of invoicing there are many things that require more time than their value will justify, such time than their value will justify, such as counting loose screws in case and loose bolts in rack. We have always estimated these by half or full package, as the case may be. There is such a thing as being "penny wise and pound foolish" in more ways than one, and one is to think you have to one, and one is to think you have to get cost out of old junk stock before you can part with it. Don't keep it. Haul off old iron stuff that lays around and can't be sold and is only

taking up valuable storage room, and

part with it at any price.

Invoicing is for the purpose of separating the salable from the unsal-We all make mistakes in buying and all get overstocked at times.

Taxes, interest and rent act on un-salable stock like unimproved real estate, eating up the original investment and all the profits.

We have never used any special blanks for inventory, but where the invoice is practically made before it is called off, we think some kind of a tag or label, easily attached or removed, large enough to show the contents of a broken box or package, with a space for goods sold before invoice is taken. would be very desirable.

#### Taking Stock.

#### BY C. T. ROSENTHAL.

Stock should be taken at least once each year; in some cases it may be advantageous to take it oftener.

The purpose of taking stock is: 1. To arrive at the present true value

of goods on hand. To have goods thoroughly cleaned

and properly arranged.

3. To take note of stock in general so as to be able to determine which goods or line of goods should be discontinued, to bring forward slow sellers, &c.

#### TIME FOR STOCK-TAKING.

Stock should preferably be taken at a season when there is the smallest amount of goods on hand, or when the employees have the least other work to do; and should coincide with the general or annual closing of books of the firm. The majority of houses do this on or about December 31; if the above mentioned conditions prevail at this time it is well enough, but when this is not the case, the time should be changed, as there is no good reason why the business year should be the same as the calendar year.

#### PREPARATION FOR STOCK-TAKING.

Get goods in order; have damaged articles repaired, order such parts of stoves, machines, &c., as are necessary to complete them, cut the broken glass into regular stock sizes, that there may be no delay when work on stock commences,
TAKING STOCK.

Commence early enough so as to finish on the day selected. Begin with slow selling goods first; this saves work in keeping account of goods sold during stock-taking. Start at a certain place and take the stock right through, proper care being taken to omit nothproper care being taken to omit nothing. If there is enough help available two or more parties, of two or three persons each, may be at work at the same time. Goods should be taken out of the shelves or bins, goods and shelves, &c., well dusted, broken packages opened and contents counted, weighed or measured, as the case may be, and then some one familiar with the goods should call them off to another person to write down.

#### ARRANGEMENTS.

Any kind of ruled paper, say tablets 7 x 10 inches in size, will do for this. Take a tlat box, fasten the tablet on top of it to form a movable desk; also a covered pasteboard box in which to put the sheets of paper when written on. Where there is a "line" of goods take down the smallest size or number first, and follow this up until the largest size or number is reached. Leave two or three blank lines between the different kinds of goods, except where there is a "line" of goods, i. e., goods of the same kind, only different sizes or numbers. Write on one side of the paper only—when a sheet is filled, tear Write on one side of the it off and place it in the pasteboard box and keep on till all the stock is taken.

#### FILING SLIPS.

Take the stock sheets and tear them off at the dotted lines, as shown herewith:

					Inches.
	ndar	đ Belle	nes.		 82
22	+4	4.4			 84
1	6.4	4.4			 36
					 Pounds.
1 Pa	ala A	Invil			70
1 2578	geez				 41
1 .					 
					 Pounds
1 \$0	Ha Re	x Tise	9		 35

195	4.6	4.6	4.4		 6
375	44	4.4	6.4		 ~
	44	44			 8
550					 

Each slip thus torn off contains only one kind of goods, or a "line" of them: assort these slips according to alphabet, using an indexed file 9 x 12 inches in size or something similar to put the slips in. When all the slips are in, take another indexed file of the same kind, take the A's out of the first file and assort them into the second file alphabetically, according to the second letter, and then copy them into second letter, and then copy them the stock book, strictly according to alphabet, similar to the manner of a dictionary; then take the B's and proced in the same style to the end. The slips containing the same goods, in whatever part of the house they may have been, will always come fogether at the time of copying into the stock book. Use a sampute stock stock book. Use a separate stock book for each invoicing, a book 10 x 12 inches, 200 pages, or more if necessary, is a convenient size.

#### ALPHABETICALLY ARRANGED.

If, in copying, several slips containing the same goods are found, the dif-ferent quantities will be added, and copied into the stock book in the aggregate. Duplicate stock is transferred, as here shown, by changing the quantity—this page indicating stock taken in one place with quantities in the warehouse added:

PRICING.

Pricing the stock book should be done carefully by a competent person, and the aim should be to arrive at the present lowest market prices, not what the goods have cost. Proper deductions should be made for defective and unsalable goods

Stove fixtures should be taken at a reduction, say 5 to 10 per cent., from prices of former inventory, to compensate for wear and tear.

Each page of the stock book should

be added separate, so that if a correction has to be made, the page in ques-tion only has to be changed, while if the amount is forwarded from page to page, the corrections would have to be made on quite a number of pages.

Enter the amounts of all the pages at the end of the stock book and add them—this is the cost of the goods at the place of shipment. Next deter-mine the per cent, of cost of laying goods down in the store in the following manner :

FREIGHT, DRAYAGE AND BOXING.

Find total amount of goods bought during the year; next total amount paid for freight, drayage and boxing during the same period, and this will give the per cent. of expense of laying down the goods in the house, which rate should be added to the inventory.

During stock-taking, account must be kept of goods sold after they are wri? ten down, and the cost price or approximate thereof of the goods thus sold should be deducted from total amount of inventory, and the remainder is the value of the goods on band.

#### GENERAL REMARKS.

After the inventory is taken the same should be carefully gone over. Goods that have been on hand a long time should be marked down, and the sale of them pushed, so as to get rid of them. Note should also be made of such goods as have proved unsatisfactory, and means devised to make them more profitable, or to discard them more profitable, or to discard them altogether. Goods that have proved profitable might have consideration with a view of enlarging stock, variety and sale of same.

The writer is aware that the system of arranging the stock book in alphabetical order is not practiced generally, and will grant that there is more work involved in doing it. This additional work, however, is a small item, considering the following advantages:

No need of index for stock book. Goods more easily found in book Less liability of goods being omitted

or taken twice.

The goods taken may be in a good many different places in the house—in the stock book they are all together in the aggregate.

More ease in comparing stocks taken at different times.

Easier to price (if a price book is

kept).

If annual sales book is kept, saves half the time of entering stock on

hand. Neater and more orderly appearance of stock book.

#### Improved Freezer Can and Hoop.

The cuts here shown represent improvements in the manufacture of ice cream freezers, introduced by North Brothers Mfg. Company, Philadelphia, for whom John II. Graham & Co., 113 Chambers street, New York, are agents. In Fig. 1 is shown a can, with a bottom made of heavy sheet steel, drawn into shape by presses. The lower edge of the body or alde of the can is spun out to form a shoulder, against which the

bottom reats, and is then spun over the lower edge of the bottom. It is explained that the caus are made of fine quality bright charcoal tin plate of heavy gauge, and that they are folded and wired at the top, with a lock seam on the side, soldered both inside and

Fig. 1.-Drawn Steel Bottom Freezer Can.

outside. The manufacturers claim that the bottom cannot fall out or be displaced, that it cannot break and that it does not leak. Cans of this construc-tion are used in their Lightning, Gem and Blizzard freezers. In Fig. 2 is

Fig. 2.-Electric Weld Wire Hoop.

shown the hoops used on the company's freezer pails. They are made of galvanized wire, welded by electricity and Imbedded in grooves in the pail. The Imbedded in grooves in the pail. The company claim that this style of hoop is twice as strong as the ordinary flat hoop, and are guaranteed by them not to fall off.

#### Milk Can Novelties.

The Chicago Stamping Company, Congress and Green streets, Chicago, have made a number of improvements in milk can stock, two of which are illustrated herewith. The first is a new handle named the Improved Chicago Milk Can Handle. This is stamped

with heavy mittens. The other improvement is a seamless rlm setter can cover. This is for setter cans to be submerged. Covers for these cans, as heretofore made, have been shallow

Fig. 2.—Seamless Rim Setter Can Cover.

and composed of two pieces. The new cover is stamped from one piece and is of such a depth that a much tighter fit is assured. These goods and others are shown in the company's new catalogue E, which has just been issued.

The November fire loss of the United States and Canada, as estimated by the Journal of Commerce, was \$12,135,800, an increase of nearly \$650,000 over the figures for November, 1893. This loss is the largest of any month in this year except July, and exceeds the October figures by \$4,000,000. During Novemher the fires of a greater destructiveness than \$10,000 each reached the large total of 187. So far, the losses for 1894 are, however, over \$26,000,000 less than for the same period of 1893. The current year appears to be the best the fire companies have experienced for a very long period, and the opinion in insurance circles is that the better class of companies will accure a considerable profit in the year 1894.

Estimates for river and harbor improvements under the War Department in the fiscal year ending June 30, 1896, include \$500,000 for improving the Hudson River and \$1,000,000 for improving the harbor between Philadelphia and Camden, N. J.

An electrical deal of some magnitude was consummated last week in Philadelphia, by which the Electric Storage Battery Company of that city virtually obtain control of all their former com-petitors in the business of supplying atorage batteries and put an end to all litigation over patent rights. The Elec-

Fig. 1.-Improved Chicago Milk Can Handle.

from one plece of metal, and is so formed that it fits the hand perfectly and at the same time the metal drawn under the handle makes a brace against the sides as a protection against jamming when the can is accidentally bumped. Extra heavy sheet metal is also used for the same reason. The handle is made of large size so that it can be readily grasped by hands covered tric Storage Company, who will have a paid up capital of \$500,000, have acquired all the battery patents and rights of the Consolidated Electric Storage Company, the Brush Electric Company of Cleveland, the Convent Electric of Cleveland, the General Electric Company, the General Electric Launch Company, the Electric Launch and Navigation Company, and the Accumulator Company.

## PLUMBING and GAS FITTING.

#### The Shepherd Trap.

The illustrations presented herewith show a downward opening trap, of which Fig. 1 Is a general view, that is being put on the market by the Shepherd Sewerage System Company, 51 Beekman street, New York. The trap is intended to be used as a front wall trap, and is made in several different

good flushing movement. When the trap is flushed the locking device is tripped, letting the valve open, and after the discharge the weight is sufficient to restore the valve to its place and be locked, while yet sufficient water is running to ensure a water seal in the trap, so that this trap is protected by both a metal and water seal against the entrance of sewer air to

SHEFHERD SEWERAGE
SYSTEM
Druin
Co.
Suiring new
Saver

The Shepherd Trap,-Fig. 1,-General View.

sizes for that purpose. The trap is provided with an anti-corrosive valve and seat, which is arranged with an automatic lock that prevents its discharge until sufficient water has accumulated to overcome the locking catch, when the discharge takes place with a strong flushing movement, drawing the air through the house drains by its action. It is said that the air from at least 12 feet of the house drains is exhausted positively at every flushing of the trap,

the building. At the office of the company the trap is shown in operation, and an elaborate arrangement of lead lined tanks, flush tanks and tripping devices are used to show perfectly the action of the trap.

#### Sewage Plant at Reading, Pa.

The city authorities of Reading, Pa., have awarded a contract for the erection of a disposal plant for the treat-

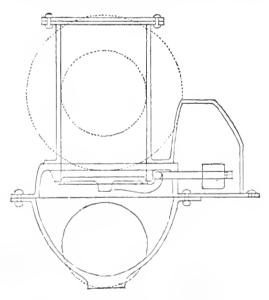

Fig. 2,-Sectional View.

and by this means the drain pipes are kept in much more sanitary condition than with the ordinary traps in use. Fig. 2 of the cuts is a sectional view of the trap at the valve seat, and shows the weighted lever which keeps the valve in place. This weight may be adjusted so that the quantity of water that must accumulate in the pipe above the trap will be sufficient to insure a

ment of the city's sewage. A tract of land on the east bank of the Schuylkill river, one mile below Reading, has been chosen for this purpose. The plant, as described, will consist of a system of artificial filter beds, arranged one above the other, through which the sewage will pass through layers of filtering material and air spaces alternately. It is claimed that the material will be puri-

fied and all the organic matter contained in it rendered innecessable action and oxygenation. It will be the first attempt to treat sewage on a large scale by this plan, and the results are awalted with interest. The sewage will be pumped to the plant from the collecting station through large mains laid along the towpath of the Schuylkill Canal. The plant is intended in the beginning to take care of 5,000,000 gallons of sewage a day, and is so arranged that it can be enlarged from time to time as required.

## Empire Double Acting Force Pumps.

The Goulds Mfg. Company, Seneca Falls, N. Y., are introducing double acting force pumps, as shown in the accompanying cuts, adapted to use in shallow wells, deep wells, drive wells

Fig. 1.—Empire Double Acting Well Force Pump.

or easing wells. The pump consists of a standard with the bearer top in one piece, cast in two half sections, strongly bolted and holding securely in place the two supporting pipes which form respectively the air chamber and discharge pipes connecting with the upper cylinder, as in Figs. 1 and 3. Fig. 1 shows the pump arranged for shallow wells, and Fig. 3 the pump arranged for deep wells. It is stated that the upper cylinder, Fig. 2, is brass lined and has a differential plunger, giving one-half the displacement of the lower working cylinder and contributing to an even and uniform discharge of water. It is pointed out that all stuffing boxes or glands are dispensed with by this construction; that all undue friction is avoided, and that an easy working pump

is secured. For lower working cylinder either the company's standard pattern iron brass lined cylinder or their brass body cylinder is used to adapt pumps for shallow wells of 25 to 30 feet, or for deep wells of 75 to 100 feet. Unless otherwise ordered, all Empire pumps

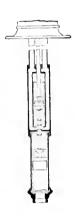

Fig. 2.—Detail of Cylinder for Shallow Wells.

are shipped put up for shallow wells as in Fig. 1, with the lower working cylinder screwed into the upper cylinder, and the universal bushing for the bottom of the upper cylinder and the top attachment for the lower cylinder tied on. To adapt the pump for deep wells the lower cylinder is unscrewed from the upper cylinder and the universal

Fig. 3.-Empire Double Acting Well Force Pump.

bushing is attached to the bottom of the upper cylinder, and the top cap is attached to the lower cylinder, and the cylinders are connected with the pipe and rod required for any depth of well, as shown in Figs. 3 and 4. In addition to the universal bushing a strainer and hose connection are furnished with each pump, for which no extra charge is The selection of an Empire made. pump, it is remarked, is governed by the style of the bearer top wanted and

whether a three-way cock with a rod for distributing the water may be re-quired. In other particulars, it is stated,

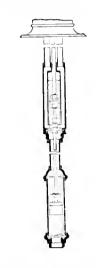

Fig. 4.—Detail of Cylinder for Deep Wells.

the pump may be adapted for various uses, as already explained.

#### TRAPS AND VENTS.

THE ANNUAL MEETING of the Master Plumbers' Assocation of Washington, D. C., was held at the Commercial Club last week, and after electing officers for the year and transacting regular bus-iness an oyster roast was indulged in. The election resulted as follows: President, James Nolan; first vice-president, D. J. Murphy; second vice president, Norman Pruitt; secretary, Edmond Mallet, Jr.; treasurer, James Ragan, and sergeant at arms, Donald William-

THE STORE of Smith & Clare, Philadelphia, Pa., dealers in plumbing supplies, was damaged to the amount of \$1000 by a fire last week.

THE SMITH & STROUSE PLUMBING AND HEATING COMPANY have been incorporated at Louisville, Ky.

A PLUMBER went to a suburban home, says an Indianapolis paper, to make some changes in gas pipes. The housekeeper was preparing "home made mince meat" which commended itself to the plumber. He induced the woman of the house to sell him 2 gallons. When the plumber was through his work he was invited to present his bill.

"Well, only \$4," he said. "By the way," he parenthetically remarked, "how much is that mince meat?"
"Well, only \$4."

THE MASTER PLUMBERS' ASSOCIA TION of Milwaukee, Wis., says a local paper, is about to apply to the Common Council for a change in the plumb. ers' license law. The Board of Public Works has been given the authority to recommend the granting of licenses by the Common Council, but it is contended by the plumbers that any person who can certify by witnesses that he is competent to conduct a buslness can obtain a license, whether he has ever served at the trade or not. The Journeymen's Association is also secking the ensetment of an ordinance requiring all members of the trade to be registered.

THE REGULAR MEETING of the Northeastern Master Plumbers' Association was held at Green Bay, Wis., last week.

Among business of importance transacted was the issuing of a call for a meeting of Wisconsin master plumbers at Milwaukee in January, for the purpose of organizing a State association.

THE CITY OF ROCKVILLE, CONN., Will ask the Legislature for permission to issue bonds to the amount of \$150,000 with which to build a complete system of sewerage.

THE THOMAS II. RADCLIFFE PLUMB-ING COMPANY of Brooklyn have certified to the State Department that half of their capital stock, which amounts to \$5000, has been subscribed for.

E. C. MANKIN, Norfolk, Neb., recently had his plumbing and steam fitting establishment damaged by fire.

V. J. Tolley, one of the plumbing inspectors of Sacramento, Cal., has been making a very thorough canvass recently and has had some defective plumbing rearranged.

"IT OUGHT TO BE JUST AS DIFFI-CULT," says the London Globe, "for a man to let an unsanitary house as it is for him to sell rotten fruit or decaying mest."

EAST RIVER LEAD COMPANY'S WORKS, 525 East Nineteenth street, New York City, are running to their fullest capacity, in order to meet orders now on their books. The proprietors report a very satisfactory demand for lead pipe considering the season, and they look for an excellent business after the turn of the year.

WOLFF'S DRAWN LEAD PIPES are the by the L. Wolff Mig. Company, 93 West Lake street, Chicago. The firm announce to the trade that they are making drawn lead traps and bends, both regular and special, and are presented to the property of covery description. psred to furnish traps of every description and in any quantity, they having a completely equipped plant in operation for their manufacture. They point out that the trap and vent screws are secured to the lead in such a manner that a perfect and permanent joint is assured. They do not project on the inside of the trap, and consequently give a full, clear waterway. From the statement that there are over 50 illustrations in the catalogue it will be seen that a great variety of traps may be obtained from this firm. The firm carry every degree of angle and bend and the accompany. ing lists show the various sizes in which they are made, together with prices. Along with the list prices are given telegraphic code words, which makes ordering by wire very simple.

THE WALPOLE CHEMICAL COMPANY, Walpole, Mass., are distributing circulars calling attention to the Walpole soldering fluid and the Walpole soldering salts which they manufacture. The fluid is referred to as a complete substitute for muristic acid and zinc, the objections to which are referred to. soldering salts are the same as the fluid, except that they are in a solld state and are thus much easier of transportation. The fluid is sold in different sized bottles and in carboys and barrels, while the salts are similarly sold in bottles and 25-pound jars and in barrels.

THE EXCELSION FAUCET MFO. COM-PANY of Yonkers, N. Y., were granted articles of incorporation at Albany on December 17. The capital stock of the new company is given as \$50,000; and the directors named are: Thos. E. Wing, Jr., and Sebastian Van Hanny of Yonkers; A. Hadley and Edward B. Montague of New York city; David

H. Smith, Joseph Tripp and others of Brooklyn.

Ossian Johnson, a graduate of last year's day plumbing class of the New York Trade School, is working with a New York plumber and has had his tools for three months. Previous to coming to the school he had no knowledge of plumbing, having worked at the carpenter's trade.

F. J. OTT, of the 1894 day plumbing class of the New York Trade School, visited the school this week. He is working regularly at the plumbing trade at Peekskill.

"Renalds & Co., Manufacturers of Fine Plumbing Materials," is on a new sign of raised gilt letters against a black background that extends across 52, 54 and 56 Cliff street, New York. The firm are increasing their quarters by taking the store at 52 and making a large opening from their other stores into it. The new room will be used for the display of manufactured lead goods, pipes, traps, bends, &c. This will enable a better display of their line of copper boilers and sinks. Some handsome lavatories and baths are arranged in their principal shownoom for the delectation of the plumber.

THE MASTER PLUMBERS' ASSOCIA-TION of New York city has asked associations throughout the State to arrange for a committee to visit Albany this winter to ask the enactment of a lien law similar to that in force in New Jersey.

THE EXCELSIOR FAUCET MFG. COMPANY have been incorporated to manufacture faucets in Yonkers, N. Y., with a capital of \$50,000. Directors: Thomas E. Wing, Jr., and Sebastian Van Henny of Yonkers; A. Hadley and Edward B. Montague of New York City; David H. Smith, Joseph Tripp and others of Brooklyn.

The members of the Central Supply Association, representing the manufacturers and wholesale dealers in steam fitting and plumbing material, met in quarterly session at the Hollenden in Cleveland, Ohio, last week. Seventy-seven members, the entire strength of the association, were present. President John F. Wolf of Chicago called the meeting to order and addressed the convention. He congratulated the association on the work already accomplished and on the large attendance present. After transacting its business, before adjourning the association passed a resolution sending their compliments to the Eastern Supply Association and its officers.

A PHILADELPHIA PLUMBER was aent to the house of a wealthy stock broker to make repairs. He was taken by the butler into the dining room and was beginning his work when the lady of the house entercd. "John," said she with a suspicious glance toward the plumber, "remove the silver from the sideboard and lock it up at once." The man of lead was in nowise disconcerted. "Tom," said he to his apprentice, who accompanied him, "take my watch and my chain and these few coppers home to my missus at once. There acems to be shady people about this house."

JUSTICE FOLLET of the General Term, first department, of the Court sitting at Auburn, N. Y., has handed down an interesting decision in that it affects the plumbing law of which so much has been said in that city. Judge Follet holds that it is the intent of the law to make only master plumbers who

are defined by the statutes as employers of other plumbers, pass an examination and obtain a certificate of competency.

LOUIS AND FRED DITTMAR have purchased the plumbing business of Matt E. Dun, Williamsport, Pa., and will conduct it hereafter. Mr. Dun will continue with them until April 1, and all the old men will be retained.

### Heating and Lighting of Windsor Castle.

A chatty account in a London paper of Windsor Castle, the chief palace and usual winter residence of Queen Victoria, contains the following in regard to the question of the heating and lighting of the castle:

For lighting the castle four methods are available, all of which are more or less in operation—vlz, gas, oil, candles, and the electric light; while for warming and cooking, wood, coal and gas are used. During the residence of the court some hundreds of persons are in the castle besides the royal family and the visitors; consequently, the adequate provision of all these processes is of a somewhat gigantic nature, keeping many servants constantly employed.

For the general lighting and heating. gas and coal are adopted; but this is not so in the Queen's own rooms, nor in many other of the royal apartments. In the matter of fires for her own rooms the Queen strictly banishes coal. She has a confirmed preference for wood only. Special supplies of wood have to be obtained for this purpose from the thickly timbered hills a few miles up the river above Windsor, where a number of workmen are regularly employed on this task. The timber, when felled and roughly trimmed on the spot, is brought down to a wharf on the river side, where it is dressed and cut up into blocks of fixed sizes; it is then stacked to get seasoned, and as required supplies are brought down to the castle for consumption in the Queen's rooms.

Gas and oil are excluded from her Majesty's apartments. Here light is provided by means of wax candies, all of one special pattern, their daily re-moval being the duty of a special official. In some of the other apartments gas is utilized, and in other parts oil lamps are burned, gas supplying the quarters of the staff generally. Moreover, although the Queen bars all but candles for her own private use, she has permitted the introduction of an e ectric light plant. This is placed un-derneath the north terrace, and is in charge of a special engineer, under the general supervision of a prominent electrician. This plant has never been largely used, but the light has been led into and applied to the main corridors, to one or two of the royal apartments and to the library. A year or so ago the original plant was replaced by newer and more powerful machinery, which would probably suffice to light the whole of the castle if the Queen so willed; but this has not yet occurred, nor is she llkely to sanction it. Electric bells and telephones abound throughout the castle, but electric light is allowed very limited play. The coal required for Windsor Castle

The coal required for Windsor Castle chiefly comes from certain collieries in North Wales, brought in train loads of perhaps 500 tons at a time. From the station it is carted to the Castle, in various parts of which are deep and spacious cellars into which it is tipped. Thence it is conveyed as required to the differ-

ent rooms and offices, numbering some hundreds.

Lifts are almost unknown in the Castle, consequently the coal has to be hoisted from the cavernous cellars and carried hither and thither by coal porters. The replenishing of the tires is carried out upon a most careful and efficient plan, footmen and other higher servants receiving the coal from the porters and passing it on to the royal apartments at interva's throughout the day.

Each official connected with heating and lighting the eastle has his allotted duties and recognized position, and thus the residence of the highest lady in the land is lighted and warmed in an efficient manner by many and various processes.

#### Paint for Metallic Surfaces.

At the recent meeting of the American Society of Mechanical Engineers a discussion was held on the preservative painting of metals, in the course of which M. P. Wood stated that graphite mixed with pure linseed oil, boiled, to which a small percentage of litharge, red lead, manganese, or other metallic salt has been added at the time of boiling to aid in its exidation, forms a most effective paint for metallic surfaces, as well as for wood and fiber; and some recent experiments with such paint applied to boiler tubes show it to be very effective in preventing the formation of scale. He commends the system of requiring all iron and steel intended for structural uses to be pickled and cleansed from mill scale, declaring it to be an absolutely indispensable condition for all material of the kind intended to be preserved from rust by painting, and it should then be painted two coats with pure raw linseed oil and red lead, after which the metal will stand the weather for 50 years without further treatment. A gallon of good red lead paint contains 5 pounds of oil and 18 pounds of red lead, and it will cover for a first coat about 500 square feet, and as a second coat about 600 square feet.

The real estate market in New York City gives satisfactory indications of a revival of business confidence in this section. Real estate men generally refer to their business as healthy and to the outlook as remarkably premising. A great deal of idle money is seeking this form of investment. Over \$3,000,-000 of business was effected last week in private sales alone, and it is known that a large number of substantial deals are on the point of consummation. Prices of real estate are firm. Business property is particularly sought after, but the demand embraces flats and apartment houses, vacant lots and dwelling houses, and a marked feature of the trading is the rapid reselling of property at a profit. The increase which le being made in transit facilities has given strength to uptown property, but the largest factor in the present im-provement is undoubtedly the result of the late elections, which have insured three years of clean government to the city.

On a dark day in London no fewer than 18,000 tons of coal are used in making the gas consumed.

Telephonic communication has been established between Berlin and Vienna.

## ROOFING AND CORNICE.

Pattern for a Pediment Miter on an Inclined Wash.

From J. T. B., Valdosta, Ga.—Will The Metal Worker present a method for obtaining the profite of an ogee molding in the return of a pediment—that is, to miter with the luclined molding, part of which intersects with an inclined wash. I send a sketch showing part of the pediment, the return molding, and part of the pattern. Is my method correct for obtaining the pattern?

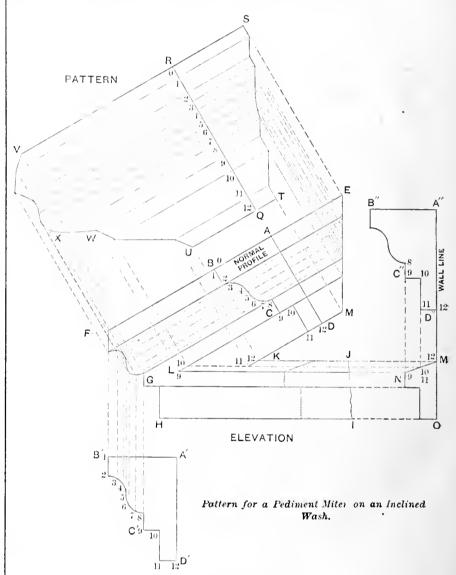

Answer .- In the accompanying illustration let E F H I include the elevation of the pediment. The normal profile A B C D occurs in the inclined molding F E M K, and the corresponding return molding is indicated by FG. The part G H of return is similar to C D of normal profile. The profile of inclined wash is shown by M N O, and the corresponding miter line in pediment by L K. Our correspondent has obtained the part of pattern indicated by T S from the miter line M E in the manner shown in the engraving, thus securing a correct result. An inspection of the engraving will show that it is only necessary to modify the part B C of normal profile, as shown by F G, A D representing the line of wall. Then to obtain the profile F G, proceed as

Draw a duplicate of the normal profile A B C D above or below the foot of cornice and in line with the horizontal molding, all as shown by A' B' C' D'. Divide the covered portions of the profile B C into any convenient number of equal parts, and through the points thus obtained draw lines parallel to the lines of the raking cornice. Divide B' C' in the same manner as B C, and from the points thus obtained in B' C' carry vertical lines cutting lines of similar number drawn from the points in B C. Through the points of intersection trace a line, as shown by F G.

To obtain the miter line on wash, as shown by L K, draw the profile of wash, M N O, above which draw a duplicate of the normal profile A B C D, as shown by A" B" C" D". In practice, it is only necessary to draw as much of the normal profile above the wash as is to miter on same, as C D. From the points in C" D" drop perpendiculars cutting N M, and from the points thus obtained in N M carry horizontal lines cutting lines of similar number drawn through C D, as indicated by the small figures. Through the points thus obtained trace a line, as shown by L K. It will be observed that U W of pattern is obtained from K L of elevation, and X V of pattern is obtained from G F of elevation. S T of pattern is obtained in a similar manner from E M of elevation. Then to obtain the pattern shown, proceed as follows: At right angles to the lines of raking molding, and at any convenient point, lay off a stretchout of the normal profile A B C D, as shown by Q R, through the points in which draw the usual measuring

#### FLASHINGS.

The Decatur Cornice Works, Decatur, Ill., favor us with a copy of their calendar for the year 1895, which they are sending to the trade. It is a card prettily decorated with a snow scene for the winter season and jwith rosebuda for the summer. The calendar proper is in sheets attached to the lower part of the card. The firm are

lines. Place the T-square parallel with the stretchout line QR, and, bringing it successively against the points in FGLK, cut measuring lines of similar number. In a similar manner bring the T-square against the points in ME, and cut lines of similar number in TS. Lines traced through the points of intersection, as shown by UWX V and ST, will produce the required pattern. Our correspondent may find the problem presented in The Metal Worker of February 3, 1894, of interest in connection with this.

manufacturers of sheet metal work, including galvanized iron and copper cornices, building fronts, door and window caps, &c.

The Caldwell & Peterson Mfo. Company, Wheeling, W. Va., manufacture continuous tin roofing, painted on one or both sides and made from 20 x 28 inch terne plates with double lock joints. The material is put up in rolls ready to lay on the roof, containing enough tin to finish one square on plain roof of  $\frac{\pi}{4}$  inch double seam roofing.

DISLEY & WEVAND, Waterbury, Conn., have taken the contract for the copper work on the new High School Building

at Middletown, the turret skylights on the Washington School, Waterbury, the metal panels, finials, tin roof and plumbing in the New Zehner block in Union City, and the ventilators and roofing of the Waterbury Button Company's new boiler house.

THE ATLANTIC HOTEL at Bridgeport, Conn., which is to be remodeled will have metal ceilings.

THE NATIONAL SHEET METAL ROOFING COMPANY, Jersey City, N. J., are building a new factory on a lot, 50 x 115 feet, fronting on Grand atreet, near Jersey avenue, of which they expect to take possession about February 1. In addition to their present line of roofing and roofing sundries the company will then handle a line of pressed and spun zinc ornaments for the trade. They also propose placing several other new articles of manufacture in the market at the same time.

THE PENN IRON ROOFING AND COR-RUGATING COMPANY, LIMITED, Twentythird and Hamilton streets. Philadelphia, are very busy just now. Their works are running at night to fill orders in hand for their roofing specialties.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., advise us that their trade during the past three months has been the heaviest in the history of their business, the demand for corrugated iron for roofing and siding showing a marked increase over previous years. They also refer to the demand for building papers, metallic cement, &c., as being more than satisfactory.

THE ACME ROOFING COMPANY, Canton, Ohio, have changed their corporate name to the Acme Roching & Supply Company. Their business has been steadily growing, and they now propose to carry a full stock of tinners' and roofers' tools and supplies, and to meet the increasing demand for their goods have enlarged their facilities by a number of additions to their main buildings. The dimensions of the various buildings of their works are as follows: The office is 30 x 45 feet, two stories in hight; cornice shop, which is a room back of the office, 36 x 140 feet; the main building, in which are the eave trough and onductor pipe departments, 75 x 150 feet. The next building is 36 x 150 feet, the lower story of which is occupied by the stamping and spinning department, and the upper story is used as a made up stock room. Next to this is another building, 50 x 140 feet, in the lower story of which is the paint room and the upper story is likewise employed for made up stock. The boiler room measurements are 36 x 50 feet. The company have recently pur-chased a valuable piece of ground on the opposite side of the railroad, 150 fect square, on which they propose to erect a two-story building for their cornice shop and architectural work.

KNORR & BLOCKS, 165 Wells street, Chicago, are to furnish the cornices, skylights and corrugated iron work for the flat building of Julius Felcum, Sedgwick street and North avenue.

THE KNISELY & WELDHAM COMPANY, 68-74 West Monroe street, Chicago, are to furnish the galvanized iron cornices, tin work, skylights, ventllators and slate roofing for the pumping station at Kenosha, Wis.

Mexican Custom House returns show that the exports of coffee from the Republic during the fiscal year just closed

were 7,500,000 pounds, the major part of which went to the United States. A large proportion of the present season's abundant coffee crop is said to be in danger of being lost through the lack of labor in certain districts.

Electric Lighting in Loudon.

The preliminary efforts of the city authorities of London culminated, in 1891, in the formation of the Clty of London Ploneer Company, the necessity for which may not be obvious to our readers at first sight. Its formation was due to the fact that a certain date had been fixed for the commencement of the works, and that if an actual commencement had not been made before that time the powers would have lapsed, iavolving the entire loss of the money that had been spent in obtaining the provisional order and in other ways. This company were afterward absorbed by the City of London Electric Lighting Company with a capital of \$4,000,-000. The construction companies had to open and place the cables in 17 miles of trench, extending through 53 streets, between August, 1891, and February, 1892. The conduits consisted partly of the Callender-Webber bituminous casing and partly of iron pipe condults. These latter were used for the high tension mains, and the bituminous conduits for the low tension distributing system. Each separate conduit was placed in a separate way. Great pains were taken to exclude gas from the street boxes. To this end the boxes were constructed of glazed brick laid in Portland cement. and the joints between the conduits and the walls of the boxes were carefully sealed in. All idle ways were plugged, and no drainage of the box was attempted, save in cases where the pipes laid for this purpose were certain not to serve as ducts for gas.

As laid the conduits contained room for mains capable of supplying 340,197 eight candle power lamps. This output will, of course, not be reached for some years, but the works have been designed so as to permit of this load being dealt with without involving any change in the aystem of distribution as originally designed. Forty-four converting points were selected, each of which is intended to serve a compact district immediately around it Great difficulty was found in securing sites for these, as in the richer parts of the district, such as Lombard street, a square yard of ground space is valued at £1000, and in many other cases exorbitant rents were demanded for way leaves to give access to the converter houses, which It was intended to place underground. In two instances a way leave was obtained to construct an entrance to these stations through old graveyards, the actual substation being excavated under the adjoining footpath and roadway, and thus a fairly satisfactory site was secured. These stations were designed for a maximum output of 450 kilowatta each, and cost, including the capital value of the rent, about £3476.

The lamps erected in the city are big enough for a man to get inside. To give access for trimming and cleaning, the posts have holes alternately on either side, into which the trimmer puts eight portable steps of light steel, by means of which he mounts, and which he removes as he comes down. As the result of some experiments, rippled glass has been used in the lamp tops, which, while cheaper than the ground and opal glass, also tested, absorbs less light—viz., 21.73 per cent., as against 25.18 per cent. for the opal,

and 40.24 per cent, for the ground glass. The glass used is 1 inch thick, and is thus not very liable to accidental injury. The bases of the posts are of an ornamental character.

Himetailic Telephone Lines.

It has long been known that a wire composed of a steel core and a thick copper coating has greater electric conductivity than copper alone, besides possessing greater strength. The first use made of the bimetallic wire was in telegraphy, and afterward it was tried for tele-phone service with equally good results. The general fact was brought out a year or two ago by General Eckert, now prosident of the Western Union Telegraph Company, that if a single wire of this sort were employed in telephoning, with the earth for a means of returning the current, conversation would be more distinct than if copper alone was resorted to, and there were two wires, forming a complete metallic circuit. Some interesting details corroborative of that statement are afforded in the recently issued report of the Chief Signal Officer of the United States Army. General Greely tried bimetallic wire laying on wet grass and in a half mile of mud, had a few turns of it made about an iron bar driven into the ground at a point on the route, made a connection with a burled water pipe, and otherwise gave the electric current a good chance to escape, and yet without materially affecting conversation over the line. It was only when the bare wire was immersed in a lake that communication was stopped. Experiments were also made with a silicon bronze wire, which withstood still more severe tests. The line could be cut and the ends inserted into the ground, not merely a few inches, but aeveral feet apart, without effect. Six such breaks, short ones, were made in a line 150 yards long, and one break nearly or quite 45 feet long in another line, and in both instances signals were audible, though faint.

It is current report in New York that a suit will be begun in the United States Courts against the National Lead Company for the recovery of some \$25,000, alleged to have been unlawfully obtained from the Government in drawbacks upon exports of pig lead. Charges to this effect were made last winter by a discharged employee of the Lead Company and the affair was investigated by the Treasury Department. Colonel Thompson, the president of the company, says, however, that the Treasury Department had already exonerated the company and that no papers in a suit had been served.

The latest report of the Director of the United States Mint places the world's gold production for the calendar year at \$170,000,000. This estimate, however, is a very conservative one, and Director Preston is of the opinion that the figures are likely to be considerably larger when the official returns are issued. Reports from the special Treasury agents point to the conclusion that there will be an increase of not less than \$7,000,000 in the domestic product over that of last year, which was \$35,955,000. The total production throughout the world in 1893 was \$157,000,000. The estimated increase in the production of the precious metal, outside of the United States, is \$10,000,000; in South Africa, \$3,000,000.

# TIN PLATES.

#### Criticism of Welsh Methods.

A correspondent of the London Iron and Steel Trades Journal, writing from Chicago on the foreign and domestic tin plate trade, refers to the causes which tend to the decline of the importation of tin plates into this country, and which at the present time, he says, are giving the American manufacturers a firm grip on the trade which it will be impossible hereafter to loosen. The chief of these causes he refers to as follows:

First, the irregularity of the shipments from Wales. It is a source of universal complaint all over the United States that no tin plates are shipped on time according to contracts. We know, as a matter of fact, that many orders for tin plates which were placed in May and June last are still unfulfilled, and as for the orders sent forward during July, August and September the percentage of the plates thus ordered that has come forward is indeed very small.

This is a state of business that the American purchasers of tin plates will not long continue to submit to. In sending their orders to Wales they have to buy in comparatively large quantities and place their orders considerably ahead of their requirements, thus taking the risk of the market, and for the past two years this has been a great source of loss to them, whereas if they placed their orders with the local manufacturers they can buy in much smaller quantities and can depend upon a much earlier delivery, and although they may have in some cases to pay a higher price, yet they are quite willing to do so, as the advantage thus gained is of more value to them.

And further: The local terms of payment are very much more advantageous than the import terms, the latter being, as a rule, "Cash against documents," while the former are from 60 to 90 days, or less 1 or 2 per cent. discount for cash in ten days.

Another great cause for complaint is the irregularity in the quality of the plates shipped. The low price of plates now prevailing has tempted many manufacturers to skin down the quality of the plates to such an extent that they cannot now be depended upon, and of late there have been very frequent complaints that the plates packed in the same boxes vary very considerable as to weight and thickness; and also that the boxes in which the plates are packed, being so light and so badly nailed together, are utterly incapable of standing the handling incidental to such long transmission, and on arrival at destination it is found that a large per-centage of the boxes are broken and the plates damaged.

#### SCRAP.

AT A SPECIAL MEETING of the Baltimore Steel, Iron & Tin Plate Company, Baltimore, Md., held last Saturday, it was decided, owing to the recent large increase in the business of the company, to increase the capital stock from \$50,000 to \$100,000.

MATTHAI, INGRAM & Co., Baltimore, Md., advise us that they have discontinued the manufacture of tin plates since the passage of the new Tariff, having found it unprofitable. The firm only made tin plate for their own use.

WE ARE FAVORED by the Old Dominion Iron & Nail Works Company, Richmond, Va., of which Arthur B. Clarke is the president, with a neat folder containing information relating to the American tin and terne plates manufactured by the firm. These include eight brands of roofing ternes, which are already on the market, and two brands each of coke and charcoal bright plates, which, they state, will be ready in the course of a few weeks. The company have at present two tinning pots in operation. They contemplate making their own black plates in the near future.

THE BRITISH CONSUL at Barcelona, Spain, reports to his Government that the tin plates made at Bilbao, in the north of Spain, are driving the Welsh product out of that market. The Bilbao B. I. and B. II., 14 x 20, equivalent to Welsh coke, are exclusively used in Barcelona and its vicinity, leaving the Welsh plates limited to the purchase of IC, 20 x 28. The Bilbao plate, he says, although rougher than the Welsh material, is cheaper and serves the purpose.

The American Tin Plate Machine & Meg. Company, Linfield, Pa., are kept husy in the production of their special continuous roofing terms. They have at present two Buckman continuous machines and two 20 x 28 tinning pota in constant operation, and have decided to duplicate all their machinery.

KIRKPATRICK & Co., Limited, Pittsburgh, Pa., have ceased the manufacture of black plates for tinning.

STRATION & TERSTEGGE, manufacturers of thware and tinners' supplies, Louisville, Ky, inform us that there is no truth in a report which has been circulated in the daily press to the effect that they are about to establish a tin plate plant. The erroneous report arose, they suppose, from the fact of the firm having purchased the Wrampelmeier furniture factory in Louisville, where they have started up their tinware plant, which was destroyed in July last.

Notices were posted last week at the Upper Forest and Worcester Tin Plate Works, Morriston; at the Llwydarth Works, Maesteg, and at the Victoria, Baglan Bay, and Vernon works, Britton Ferry, South Wales, that operation would be suspended at the close of this month.

According to the official returns of the quantities and values of dutiable goods remaining in the bonded warehouses of New York City on November 30 it appears that 6,547,262 pounds of tin and terne plates, valued at \$152,205, were thus held. On the last day of the previous month the figures were 6,237,584 pounds, of the value of \$148,413; and on November 30, 1893, 6,416,

061 pounds, valued at \$138,979. The above statistics show that current stocks awaiting distribution are about normal in volume.

Kann Bros., 525 East Nineteenth atreet, New York, closed down their tin plate plant after the coming into effect of the new tariff on October 1, and it has since remained idle. The firm claim that they cannot coat the plates and sell them in competition with the imported article at the prices now ruling.

THE NEW TIN HOUSE in course of erection by the Wheeling Corrugating Company, Wheeling, W. Va., is rapidly approaching completion, but as yet it is uncertain when the plant will be ready for operations.

Work is progressing satisfactorily and rapidly on the new black sheet mill and tin plate plant of the Crescent Sheet & Tin Plate Company, Cleveland, Ohio, and it is expected that the production of black sheets will be begun by April 1 next. The company will operate this department of their works first, confining their product to a superior quality of black sheets for tinning. Later on the manufacture of tin and terne plates will be taken in hand. The buildings now in course of erection are a hot mill building, all steel, 105 x 175 feet, and a combination building containing the annealing, pickling, cold rolling, tinning and warehouse departments, which will be all steel and brick, 105 x 168 feet, with a wing measuring 48 x 48 feet. The buildings are being put up by the Shiffler Bridge Company of Pittsburgh. The Rankin & Fritsch Foundry & Machine Company, St. Louis, are supplying four Corliss engines; the Frank-Kneeland Machine Company of Pittsburgh are making four stand of hot mills, and four cold mills, roll lathe, doubling bar, and squaring shears. The Industrial Works, Bay City, Mich., have the contract for the supply of two electric cranes, and the Elwell-Parker Electric Company, Cleveland, Ohio, will furnish a generator to run these cranes, together with 15 are and 60 incandescent lights. The H. E. Teachout Company, Cleveland, will furnish six tubular boilers 72 inches by 18 feet.

LATEST ADVICES from the other side indicate that the example of the Morewood Company, in agreeing to a reduction of 10 per cent. for three months in the wages of their workmen, has not yet been followed by the other Welsh tin plate manufacturers. The wage question continues as far as ever from settlement, in the industry generally; and it is regarded as more than probable that the majority of the works will be closed for an indefinite period after the Christmas holidays.

N. & G. TAYLOR COMPANY, Philadelphia, manufacturers of tin plates, are turning out a fine quality of bright tin plate called "Brilliant." They describe it as extra heavy coated and extra fine finish, especially adapted for high grade work. They advise us that they use in its manufacture a special brand of pig iron and the finest quality

of materials, the sheets being all packed in tissue paper and the boxes strapped with hoop iron, the plates being made in all sizes and thicknesses.

THE BLAINA TIN PLATE WORKS, Blains, Monmouthshire, are to close down indefinitely on Saturday, pending better prices and the settlement of the labor question. Other works in the West of Eagland are preparing to follow suit.

THE SCOTTDALE IRON & STEEL COM-PANY, Limited, Scottdale, Pa., have increased their output of light sheets this year from 8000 to 12,000 tons.

THE CLEVELAND TIN PLATE COM-PANY, Cleveland, Ohio, have sold their machinery and trade mark—"Buckeye"—to the Britton Rolling Mill Company of that city, and have discontinued the business of manufacturing tin plates.

WE ARE INFORMED by the St. Louis Stamping Company, St. Louis, Mo., that their tin plate plant is now running full on a non-union basis, and turning out plate equal to anything they have ever produced.

### HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

G. A. STANSFIELD & Co., Marietta, Ohio, are putting the heating apparatus in the City Hall.

THE STEAM HEATING PLANT for the new South Bethiehem National Bank Building has been completed and put in operation by Edward Laufer, 22 East Third street, South Bethlehem, Pa. There are 30 radiators in the building.

THE MODEL HEATING COMPANY, New York, have recently installed steam heating plants at Pisinfield, N. J., in the residence of S. Edsall and in the Muhlenburgh Hospital, in a hotel at Finderne, N. J., and hot water heating plants in the residences of S. Daniels, Roseville, N. J.; J. Schwenk, Ludlow, N. Y., and Rev. J. Daniels, Ocean Grove, N. J.

JAMES H. JOHNSTON, Washington, N. J., has secured the contract for heating the Presbyterian parsonage, and will use an Auburn boiler.

St. Mary's Roman Catholic Church, at Mentgomery, N. Y., is to be heated by steam, the contract having been given to James Wallace of Pine Bush.

ROBERT CAMPBELL, 305 Pearl street, New York, is completing a hot air heating system in a hotel at Liberty, N. Y.; steam heating plants in the school at Unionville, N. J., and in the residence of M. T. Richardson, at Orange, N. J.

S. E. Kumler and F. H. Rike of Dayton, Ohio, were recently at Westerville, arranging to put heating apparatus in the new Christian Association Building.

JOHN FRANKLIN, New Haven, Conn., is building a store and five tenements, each having five rooms, to have a plumbing system.

J. R. Morrison & Co., 51 Charleston street, Boston, Mass., are using a Humber hot water heater in the building of Mandell & Libbey, at Dorchester, Mass.

Mandell & Libbey, at Dorchester, Mass.
J. J. LAWTON, New Haven, Conn.,
will erect a residence, to be heated by
hot water and several fire places and to
have a fine system of plumbing.

FRED. J. BLISS of Hartford, Conn., is to build a residence that will have a hot water heating system, a fine job of open work plumbing and five fire places.

JAS. T. KAY, Meriden, Conn., has the contract for heating the Liberty Street School House.

THE ATLANTIC HOTEL, at Bridgeport, Conn., is to be remodeled and will have a new heating plant and new bathrooms.

JOHN McSHARRY, Bridgeport, Conn., will erect two flats, which will have four rooms each, with water closets, wash trays, &c.

H. BEUTELSPACHER of Bridgeport, Conn., has the contract for fitting up the building on Middle street, which is to be occupied by the Meyer, Jonasson Company. The contract includes gas piping for 500 lights, several water ciosets, sinks and bowls and other fixtures.

THE CONTRACT for heating and plumbing in the new school house on Washington street, Central Falls, R. I., was awarded to the Union Steam & Gas Pipe Company of Pawtucket.

THE CONTRACT for heating and ventilating apparatus for the new school house at Milford, Mass., has been awarded to the Fuller & Warren Heating & Ventilating Company.

CHAS. E. BOND, Newark, N. J., is doing the plumbing in the new house being erected by Eugene Banen.

THEODORE GEISER. Newark, N. J., is doing a fine job of plumbing in a new house for Mrs. Mattson.

W. Zeliff, Newark, N. J., has the contract for a \$1000 plumbing job in the saloon of Christian Gisch, where the Directo closet will be used.

H. M. NORTON, Easton, Pa., has just completed a steam plant in the First Presbyterian Church in Phillipsburg, N. J. The boiler used was a No. 47 Double Florids.

THE THEO. JACOBS COMPANY, 72-74 Market street, Chicago, have the contract for hot water heating in the residence of A. N. Reece, 4317 Drexel boulevard.

M. J. Cornov, 78 Dearborn street, Chicago, has the contract for plumbing, gas fitting and sewerage in the residence of M. Burke, 2815 Michigan avenue.

PURVES & BROCKWAY, 215 Fifth avenue, Chicago, are to install a hot water heating plant in the residence of Architect J. C. Lewellyn, La Grange, Ill.

THE SAMUEL I. POPE COMPANY, 237 Fifth avenue, Chicago, have the contract for steam heating in the school building, Champlain avenue and Sixty-fifth street.

The L. H. Prentice Company, 203-205 Van Buren atreet, Chicago, have the contract for ateam heating in the Chicago Horse & Carriage Exchange, 1635-1637 Wabash avenue.

THE JOHN DAVIS COMPANY, 69-79 Michigan street, Chicago, are to install a steam heating plant in the hotel building of A. J. & J. P. Smith, West Pullman, Ill.

T. R. BLAKESLEE, New Haven, Conn., is to build a flat to be heated by hot water and have a plumbing system.

THE FULLER & WARREN COMPANY, 147-149 Lake street, Chicago, are to place a combination of hot water and

warm air heating in the residence of E. T. Malone, Oak Park, Ili.

GEO. B. COBB & Co., New York, are installing a No. 1 Advance boiler and a hot water system in the residence of H. F. Coats, Brooklyn.

Apgar Bros., 2085 Seventh avenue, New York, are using a No. 54 American boiler for heating the Paulsen Flats.

T. F. WILLIAMS, Woodport, N. J., is installing the heating plant, using a Solcil bolier, in the hotel of Thomas Bright, at Pompton Lakes, N. J.

Thos. Conlon, 3905 Cottage Grove avenue, Chicago, has the contract for the plumbing, gas fitting and sewerage in the residence of E. F. Baley, Fortyninth street and Forestville avenue.

TUCKER BROS. & Co., 4255 Cottage Grove avenue, Chicago, are to Install a hot water heating plant in the residence of F. H. Barnes, 4315 Langley avenue.

BRYNE & RYAN, 252 Forty-third street, Chicago, have the contract for the plumbing, gas fitting and sewerage in the residences of N. Mayer and S. Block, Drexel boulevard and Forty-third street.

WM BOWDEN, 233 Twenty-fifth street, Chicago, has the contract for the plumbing, gas fitting and sewerage in the residence of A. Junge, 4542 Michigan avenue. The L. Woiff Mfg. Company's goods are to be used exclusively.

THE BOARD OF EDUCATION Of Muscatine, Iowa, has awarded the contract for water and sewer connections and putting in extra pipes for steam heating in the Third ward to Barry Mfg. Company for \$194.

EDWARD E. PARKER, Woburn, Mass., has secured the contract for heating the new Cambridge street schoolhouse at \$615, and will use a large size Richmond sectional steam boiler.

THE COMMITTEE ON FIRE DEPARTMENT reported to the City Council of Somerville, Mass., that a contract had been made with Albert B. Franklin, Boston, for heating and ventilating apparatus in the new hook and ladder truck house at a cost of \$494, and with 8mith & Anthony, Boston, for the new central fire station at a cost of \$993.

WEATHERLY & PULTE, Grand Rapids, Mich., have been awarded the heating and ventilating contract for the new high school building at Appleton, Wis. They now have a force of men engaged on a similar job at Galva, Ill.

THE BOARD OF ALDERMEN OF Taunton, Mass., have ordered that the city expend \$11,000 to put a new sanitary and heating apparatus into the High School Building. The system to be used is the Fulier & Warren.

Secretary Herbert has notified the Cramps of the preliminary acceptance of the new cruiser "Minneapolis." The vessel will not be finally accepted and paid for, however, until, under the terms of the contract, she has demonstrated her efficiency by five months' trial in actual naval service. She will be placed in commission at the League Island Navy Yard this week. The Cramps have been paid the apeed premium of \$414,600 earned by the "Minneapolis."

Shipbuilders of Bath, Maine, express themselves as strongly opposed to the proposed free ship legislation in Congress.

## STOVE TRADE NOTES.

#### The New York Stove Trade.

The local stove trade for the past month has been very dull, demonstrating the fact, as referred to before, that the people will yield to no argument and no pressure to buy a stove except when suffering from cold. The business of the year 1894 is practically done. Sales from now on will bear very lightly on the result, and the Intervening time between now and January 1 will be spent in waiting for that date to take account of stock and balance the books, a proceeding which, with many concerns, will be no less melancholy than it was a year ago, if it is not even more so. Despite the belief of many that the business of the country would rally from the panic of 1893 quite as readily as it was prostrated by it, and despite the predictions that 12 calendar months from the time it started would practically embrace the period of business depression, it has extended throughout the entire year, and, to the amazement of many, eclipsed the record of last year for diminished sales.

The stroke to business was one of paralysis rather than a mere shock or faint. The quotation that " Hope springs eternal in the human breast" applies to no part of the human family more than to stove men, and they have hoped (and apparently with good reason) for a fair year's business in spite of the generally adverse conditions. The record of heat during the summer seemed to furnish excellent ground to expect an unusually cold autumn and a brisk fall business, but the work of equalizing temperatures has been as dull as everything else, and apparently has been postponed indefinitely. The weather in November was colder than It was in November last year, but was poorly distributed to aid the stove business; cold waves lasted but a day at a time and were frequently followed by rain, and during December the weather has been unusually warm.

In one respect only has there been improvement in conditions that last year worked seriously against profits in the stove business, and that is in the number of failures, of which there have been fewer this year, and losses from bad debts will be less. Losses of this nat ure being nearer the normal point, diminished profits will be due to the reduced sales and, among manufacturers, the suspension of foundry work. Concerns which have been the most fortunate in not contracting bad accounts may have enough to the good on ac-

count of it to offset diminished profits due to reduced sales, and show a result very little different from last year. But cutting of prices, which, though not done systematically through the year, was resorted to occasionally in the dullest months, will cut a figure, the size of which can only be ascertained when accounts are all cast up.

Yet will the stove man not abandon hope. Inded there is no need to do so. Some unfortunates will fall out of the ranks, but there is a future for the stove business and a bright one, and there is scarcely a line of trade which will share more abundantly in the prosperity which the country at large awaits than the stove industry. The dilapidated and forlorn looking specimens of stoves which in ordinary times would have been cast out after the winter of 1892 and 1893, but which, owing to the hard times, are still doing duty to the best of their ability, will go to the dirt heaps as soon as prosperity returns.

#### The Philadelphia Stove Trade.

The stove trade in Philadelphia and vicinity is in a very unsatisfactory condition. The volume of business for the month of November compared unfavorably with that for the corresponding month of last year, and the indications are that the business for the present month will be exceptionally light. The weather is an important factor in the stove trade of this section, and the extremely mild weather which has prevailed this season has not conduced to the consumption of heating goods; consequently the demand for them is not very good. Such orders as come in are wofully small and suggestive of a few holes in retailers' stocks of staples which must be filled. Most of the business offering is from the agricultural districts, which fact is evidence that as yet there is little improvement in the condition of the wage earners, or that the slight improvement in business in general has come too late to benefit the stove trade this season. The trade in heating goods is largely dependent upon the working classes, and when the industrial condition of the country is depressed the demand for these goods is much reduced. The introduction of cheap lines of furnaces, too, has affected sales somewhat, especially of high priced goods.

Cook stoves and ranges are in fair demand, but retailers seem unwilling to shoulder much in the way of stock.

The furnace trade may be considered

satisfactory as far as demand is concerned. The number of dwellings erected within the city limits during the year is in close proximity to the number erected in 1893. There is possibly a considerable falling off in the aggregate value of the buildings, as operations have been, for the most part, confined to the typee of two and three story houses for which the city is famed. The fact that all these houses are heated by hot air would seem to furnish the reason for the good condition of the furnace trade.

The production of the foundries in this city and in the Schuylkill Valley amounts in the aggregate to about half the total capacity, which is ample for the present requirements of the trade. It is not unlikely that this production will be curtailed somewhat after the commencement of the new year. Founders realize that the season is too far advanced to expect much improvement, but if cold weather should set in and continue, the season may be extended. Prices seem to be strong, and little or no cutting is heard of. With the small specifications dealers are able to offer there is little inducement to abate prices.

#### The Ohio Stove Trade.

The fall season in the stove and range industy is about over, and from now on only desultory sorts of orders can be expected. The open winter thus far experienced has carried the trade beyond the usual limits, and a summing up of the season's business, all the discouraging and favorable events being weighed, shows a relatively satisfactory volume, and altogether the year has not been conspicuous for profits, yet compared with the preceding year the gain has been perceptible and the outlook for the spring season of 1895 is brighter than at any time during the past year.

Some manufacturers having contracts for liberal quantities of pig 1ron have requested furnaces to delay deliveries, there being less disposition to melt iron until after the turn of the new year, and we have information that some foundries have shut down entirely, at least until after the holiday sesson.

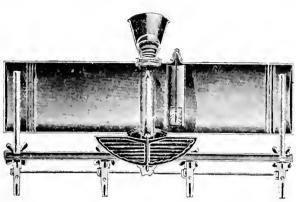

If people were as able as they are willing to purchase there would be a rapid recuperation in all lines; as it is, there are indications of a gradual resumption of work by wage earners, but no marked improvement is anticipated before the end of the holidays.

One factor which has been noted, but which is worthy of repetition, is the getting out of new patterns and designs and the improvement of old styles. Each mail from the manufacturers brings fresh evidence of a constant effort to keep pace with modern ideas.

A regulation of prices seems a necessity in some quarters, and doubtless a reformation may be necessary, as it can be readily seen that the peculiar conditions of the past financial and business crisis have given rise to abuses which could only grow in an abnormal soil.

Upon the whole, however, the past

lighted a short time the heated air delivered through the air tube to the evaporator expels the absorbed fluid and leaves the asbestos dry, ready for the next lighting. At the base of the burner is an effective and ingenious feature in the shape of a controllable sub fire. We understand it is the purpose of the makers of this stove to dispense with the use of a sub-fire as much as possible, and to that end they have always kept in view a construction favoring a quick heating of the parts of the buruer and tubes, and thus avoid all occasion for the use a sub fire in the summer. To provide against the un-

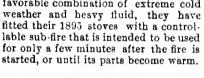

Constructive Features of the New Process Vapor Store. - Fig. 1. - Vertical Longitudinal Section of 1895 Tank.

six months have contributed trade beyond the general expectation and have revived hope and encouragement for the coming spring season.

#### Constructive Features of the New Process Vapor Stove.

In a recent issue we called attention to some of the features which would be found in the 1895 pattern of the New Process vapor stove, as manufactured by the Standard Lighting Company of 100-118 Perkins avenue, Cleveland, Ohio. We have pleasure at this time in presenting sectional views, one of which shows the construction of the 1895 tank and the other the drip and hot air tubes, removable glass sight feed, brass evaporator, center tube, burner cap, burner drum with controlable sub-fire, cast iron reinforcing ring and cast heat collector. One of the dis. tinguishing features of the reservoir, a section of which is shown in Fig. 1, is a brass float which maintains a uniform fluid level in the float chamber, regardless of the quantity of fluid in the reservoir. The object of this is to keep the flames from shrinking until the reservoir is completely exhausted. Another feature is a removable strainer which can be taken out for cleaning, while a third point of interest is the vent tubes, designed to draw off any vapor which may form about the points of the needle valves and interfere with the drip of the feed. The moving parts of the reservoir are made of brass, are non-corrosive and practically indestructible. The sectional cut represented in Fig. 2 of the illustrations shows the interior of the vapor tube and burner, and reveals almost at a glance the simplicity of the construction employed. In the upper or "funnel" end of the tube is a brass evaporator resting on a cylinder of asbestos paper, the office of which is to absorb and retain temporarily any excess of fluid that may not evaporate when the stove is started in cool weather. After the stove has been

favorable combination of extreme cold weather and heavy fluid, they have fitted their 1895 stoves with a controllable sub-fire that is intended to be used for only a few minutes after the fire is

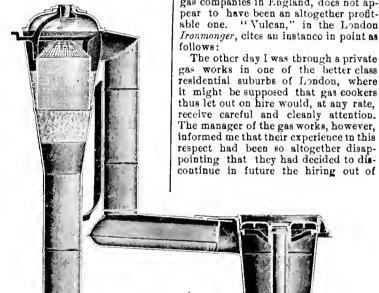

Fig. 2.—Sectional View, Showing Interior Construction of Tubes and Burner.

The simple shifting of a knob then extinguishes the sub fire. The makers of the New Process claim as the result of five seasons' experience and hard work that the stove is now constructed with a view to its easy manipulation, "and in

either gas stoves or cookers. He showed me at the works a number of gas cookers which had been returned as imperfect, but which were simply blocked up with grease and fatty matter from the cooking, and which seemed as if there every sense as complete and finished an | had been no attempt at either cleaning

article of kitchen furniture as it is possible for skill, pluck and money to produce."

#### A Bogus Check Man.

We have received from W. T. Twltmire, Bellefonte, Pa., the following letter that will be read with interest by the trade: "Last February I sent you a notice to put in The Metal Worker in regard to a bogus check man who was working the stove trade. After you published the notice I had quite a lot of letters from stove men in this and other States, who thought I had struck the plan to stop his operations, and we did stop him, as you will see by the inclosed letter from a sheriff in Connectieut. I thought that parties who had been stuck would like to hear from the old man, as they will remember him for a long time. Several who wrote me are out \$50, but if they had made use of The Metal Worker three months sooner some of us would have been in our cost. I wrote you the next week after I was stuck."

Inclosed with the letter from Mr. Twitmire is another from the sheriff of Lakeville, Conn., which reads as follows: "I inclose the bogus check that I received from you last April, and the old man has gone to our Connecticut State Prison for five years, but have enough against him here in this State to keep him in during his life. He was only tried on one count."

#### Hiring Out of Gas Stoves by Gas Companies.

The system of hiring out of gas stoves for heating and cooking which was introduced some time ago by some of the gas companies in England, does not appear to have been an altogether profitable one. "Vulcan," in the London Ironmonger, cites an instance in point as

gas works in one of the better class residential suburbs of London, where it might be supposed that gas cookers thus let out on hire would, at any rate, receive careful and cleanly attention. The manager of the gas works, however, informed me that their experience in this respect had been so altogether disappointing that they had decided to discontinue in future the hiring out of

the stoves or the utensils accompanying them since they were sent out. The great expense, he added, which was incurred in simply cleaning the gas stoves and cookers which were sent back to them, and which, except for this, were otherwise perfect, more than overbalanced any profit they secured in the supply of the gas, and they had therefore determined that users who wished to be sup-

#### Cupola Tuyeres.\*-ii.

BY DR. EDWARD KIRK.

#### Hlakeney Tuyere.

In Fig. 6 is seen the Blakeney tuyere used in the Blakeney cupola constructed by a Steel Company in Springfield, Ohio. This tuyere is a modification or an improvement on the sheet

mits the blast freely and evenly to the cupola and very good melting is done with it. All the tuyeres I have described may be used with elther coal or coke

#### Horizontal and Vertical Slot Tuyere.

In Fig. 7 is seen the horizontal and vertical slot tuyere. This was designed

CUPOLA TUYERES.

plied with gas stoves or cookers would have to buy them on their own account, as they would now discontinue altogether the hiring out system, which had proved anything but profitable.

THE VAN WIE GAS STOVE COMPANY of Rockford, Ill., are about resuming operations at their works in the Knowlton Building.

blast tuyere, and extends all the way around the cupola. It is supplied from an outside belt air chamber riveted to the shell. The blast is conducted to the air chamber through one pipe, and, striking the blank spaces sidewise in rear of chamber, passes all around through the curved tuyeres into the center of the furnace. This tuyere ad-

for coke, and I have never seen it used in but one cupols, a 40-inch one. One tuyere was placed on each side of the cupols. The horizontal slot of each tuyere, 1 inch wide, extended one-third the way around the cupols, and the vertical slots, 1 inch wide and 12 inches long, were placed above it as shown. The tuyere did excellent melting, and the cupols could be run for a long time without bridging.

<sup>\*</sup> Copyrighted, 1894, by Edward Kirk.

#### Reversed T Tuyere.

In Fig. 8 is seen a vertical and horizontal slot or reversed T tuyere, also used for coke. The slots in this tuyere are from 2 to 3 inches wide and 10 to 12 inches long. From two to eight of these tuyeres are placed in a cupola, according to the diameter. This tuyere has been extensively used, and is said to be an excellent tuyere for coke melting.

In Figs. 9 and 10 are seen the vertical slot tuyeres used principally in cupolas of small diameter to prevent bridging. They are made from 2 to 3 inches wide and 10 to 12 inches long, and two or more are placed in a cupola at equal distances apart.

#### Truesdaie Reducing Tuyere.

In Fig. 11 is seen the Truesdale reducing tuyere designed by a Mr. Trues-dale of Cincinnati, Ohio, and extensively used in cupolas in that vicinity about 1874. The tuyere consisted of one opening or tuyere placed directly over another until six, eight or ten tuyeres were put in. The lower tuyere was made 3 or 4 inches in diameter, and tuyeres above it were placed 1 inch apart, and each one made of a smaller diameter until they were reduced to 1 inch. The bottom row of tuyeres were placed 2, 4 or 6 inches apart, and the tuyeres in each succeeding row were placed further apart, were of a smaller diameter and admitted less blast to the cupola toward the top of the bed than at the bottom. The cupolas were generally boshed, and the tuyeres supplied from an inside belt air chamber, formed of cast iron staves, to which the tuyeres were attached by cleats or dovetails cast on the staves. Very fast melting was done in cupolas with this tuyere, but the tendency to bridge in cupolas of small diameter was so great that it could not be used. In large cupolas, however, it gave excellent results, and is still in use in numerous foundries.

#### Lawrance Reducing Tnyere.

In Fig. 12 is seen the Lawrance reducing tuyere designed by Frank Lawrance of Philadelphia, Pa., and used in the Lawrance cupola, built by him. This tuyere was designed for either coal or coke melting, and works equally well with either. The opening at the bottom is from 3 to 4 inches square, and the slot from 10 to 12 inches long, from 1 to 11 inches wide at the bottom, and tapers to a point at the top. They are placed in the cupula from 6 to 12 inches apart, and supplied from a belt air chamber inside the casing. The air chamber in this cupols was first formed with cast iron staves, and the tuyeres held in place by cleats cast upon the staves. But the staves were found to break after repeated heating and cooling, and a boiler iron casing is now used for the air chamber. This tuyere and cupola does excellent melting, and a great many of them are now in 118e.

#### Triangular Tuyere.

In Fig. 13 is seen the triangular tuyere, designed by the writer over 20 years ago to prevent bridging in small cupolas and extensively used in both small and large cupolas, with either coal or coke. This tuyere may be made with the base and sides of the tuyere of an equal length, forming an equi-lateral triangle, or the sides may be made longer than the base, bringing the tuyere up to a sharp point at the top to prevent bridging; or the sides may be extended up to a sufficient hight to form a reducing tuyere.

The Magee Furnace Company, Boa-

ton, Mass., placed this tuyere in their large cupols, constructed to melt iron for atove plate, about 12 years ago and it has been in constant use ever since, giving excellent results in melting with coal and coke. In this cupola, which is 5 feet 4 inches diameter at the melting point, the tuyere is 9 inches wide at the base and 16 inches high. It was not thought best to extend the tuyere up to a point at so sharp an angle and the top was cut off, leaving the opening 2 inches wide at the top. This tuyere has been arranged to take the place of the Truesdale reducing tuyere, and has been made from 6 to 8 inches wide at base and 24 to 30 inches high, running up to a point. It has also been used in imitation of the Lawrance reducing tuyere and made from 3 to 4 inches wide at base and 12 to 16 inches high.

Water Tuyere.

In Fig. 14 is seen the water tuyere. This tuyere is designed to be used in cupolas or furnaces where the whole or part of the tuyere is exposed to an intense heat and liable to be melted or injured, as is the case with tuyeres placed in the bottom of a cupola or in furnaces where a hot blast is used.

The tuyere or metal surrounding the tuyere opening is cast hollow and filled with water, or one end is left open and a apray thrown against the end exposed to the heat from a small pipe, as shown in illustration. The tuyere is also made with a coil of gas pipe cast inside the tuyere through which water constantly The water tuyere is never used in cupolas when the tuyeres are placed in the sides of the cupols, but it has been used in cupolas in which the tuyere was placed in the bottom and exposed to the heat of molten iron, cinder and slag. When used in this way the tuyere is placed in the center of the bottom and is made from 1 to 3 feet long, the mouth being placed at a sufficient hight above the sand bottom to prevent molten iron or alag overflowing into it. The part of the tuyere extending up in the cupola and exposed to the heat is protected and prevented from melting by the stream of water. For this purpose the coil gas pipe tuyere is better than the hollow or spray tuyere just described.

#### Colliau Tuyere.

In Fig. 15 is seen the Collian double tuyere designed by the late Victor Colliau of Detroit, Mich., and used in the Colliau cupola. In this cupola the tuyeres are placed in two rows one above the other in place of one row as in the ordinary cupola. The first row is placed at about the same hight above the sand bottom as in the ordinary cupola and the second row from 12 to 18 inches above the first row. The first row are flat, slightly expanded tuyeres similar to that shown in Fig. 2 and are made from 2 to 4 inches wide and 6 to 14 inches long, according to the size of the cupola. The tuyeres in the second row are made round and from 2 to 4 inches dismeter. The tuyeres in the first row passatraight into the cupola through the lining and those in the second row are pointed downward at a sharp angle, as shown in the cut. The object of the second row is to furnish sufficient oxygen to consume the escaping gases and create a more intense heat at the melting point than is obtained with the single row of tuyeres from the same amount of fuel.

#### Whiting Tuyere.

The Whiting tuyere, used in the Whiting cupola, manufactured by the

Whiting Foundry Equipment Company, Chicago, Ill., was designed by Mr. Whiting, a practical foundryman of Detroit, Mich., as an improvement on the Colliau tuyere. The Whiting tuyere is a double tuyere, but differs somewhat in arrangement from the The first row are flat, Colliau tuvere. slightly expanded tuyeres and the second row are of the same shape and made larger in proportion to the lower row than the Colliau, and the two rows are not placed at so great a distance apart. Both the upper and lower row pass straight into the cupols.

#### ODD PLATES.

THE SUPERIOR STOVE WORKS OF SUperior, Wis., are rapidly disposing of their stock of stoves, and manager Green states that it is the expectation to resume operations by the first of the year.

MONARCH STOVE COMPANY, Mansfield, Ohio, will be represented during 1995 in various sections of the country as follows: Southern Ohio, Southern Indiana, Kentucky, West Virginia and Tennessee by E. II. Hucnefeld; Northern Illinois and Wisconsin by D. S. Cook of Chicago, Ill.; the State of Michigan by George W. Fl-field; Northern Ohio and Northern Indiana by Charles E. Bartenbach; Central Illinois and Central Indiana by W. H. Moore; Minnesota and Dakota by George W. Cahoon, and the New England States, Eastern Pennsylvania and New York by the Danville Stove & Mig. Company.

THE EXCELSION MFG. COMPANY OF St. Louis, Mo., have in accordance with a custom established some years ago issued an almanac for 1895. It is known as the Charter Oak, and in its general style and make up is in keeping with the publications of other yeara. It will prove interesting reading to all into whose hands a copy may come. In addition to the astronomical data contained within the covera of the almanac, will be found a great deal of what may be termed light reading as well as numerous recipes for the housewife. Another feature which adds to the interest of the volume is full page reproductions from pictures by prominent artists. Incidentally there is reference to Charter Oak atovea and ranges, with the merits of which the trade are familiar.

THE A. C. BARLEN MFG. COMPANY of Chicago, Ill., have just issued a circular, one corner of which is embellished with a little picture of quaint conception entitled "After the Bath." The text is made up largely of testimonial letters from some of those who have used Barler's ideal oil heaters. The approach side of the circular hears a opposite side of the circular bears a letter from and a picture of E. E. Rexford, floral editor of The Ladies' Home Journal, Philadelphia, together with a testimonial letter from the manager of Walter Baker & Co., Boston, and the statement that Barler's Ideal oil heaters were used to heat the beautiful pavilions of the Walter M. Lowney Company and Walter Baker & Co. on the Court of Honor at the World's Fair. It is stated that this exhibit was admired by over 20,000,000 people.

THE LANSING CO OPERATIVE STOVE, FURNACE AND FUEL COMPANY have recently established themselves at No. 502 Franklin street, East Lansing, Mich., where they are busily engaged in making patterns of their new stove. The company have under way a number of stores in which will be placed their new fire box and dampers. The company's pattern maker is also at work on the patterns for a new tubular boiler and heater, which when completed, it is said, will be a great improvement over the ordinary furnace heater, in that it will be very economical in the use of fuel

A REPRESENTATIVE of the Chattanooga Stove Company, Chattanooga, Tenn., is reported by a local paper as expressing expectations of a good winter and spring trade. The company are planning to push their sales in Texas and expect to extend their field over the entire State. They already have customers in Galveston. Collections are rather slow just at present, owing to the very low price of cotton. Thus far the present year business has not been much, if any, in excess of the volume a year ago.

THE FRIENDS in Syracuse of J. Emery Eaton will regret to learn of his death, which occurred last week in New York City. He was born in West Winfield, Herklmer County, but spent the greater portion of his later life in Utica, N. Y., where he was engaged in the manufacture of matches. He was prominently connected with the Diamond Match Company from its organization, and was for several years manager of one of its largest factories. He was also identified with business enterprises in Syracuse, and for a number of years was president of the Syracuse Stove Company.

THE CENTURY STOVE COMPANY of Dighton, Mass., are distributing a very attractive calendar for the new year. The main feature consists of a piece of cardboard measuring about 11 x 14 inches, upon which is mounted a rep resentation of a horse and rider embossed in colors. The work is done in a way to give a realistic effect, and conatitutes an attractive picture. Attached to the lower edge of the card by means of a silken cord is the calendar proper, consisting of 13 sheets, there being one for each month of the year and one for the year complete. In addition to the days of the week and month, each sheet gives the moon's phases. The calendar bears the name and address of the company, and is provided with a blue cord for hanging it upon the wall.

THE HERO gas radiator, made by F. & L. Kahn, Hamilton, Ohio, occupies a conspicuous position on the sample floor of Sam S. Utter, 113 Beekman street, New York. The base is ornamental in design and nickel plated, with a large mica illumination and jeweled decorations. The burner is of the illu minating type, placed above a copper reflector. The heating columns are of Russia iron, with a handsome nickel plated dome. Beside it is a Bantam gas stove, making a striking contrast in power and size, though equally hand-some in appearance. The Denver house of Cribben, Sexton & Co. are Western distributing agents for the Bantam Game oil stoves and Bantam gas goods, as well as the line of Game oil heating and cooking stoves. The popularity of the goods in that section, we are advised, has made it profitable to take advantage of the low freight rates in carload lots, and an assorted car has been shipped at different times.

THE EXCELSION MFG, COMPANY St. Louis, Mo., layor us with copies of their vest pocket calendar for 1895 which they are sending out to the

trade. The calendar is tastily decorated, the front cover carrying appropriate designs for the different seasons of the year. The advertising matter is confined to a small trade-mark and a reference to the Charter Oak stoves and ranges as leading all others in uniform excellence, workmanship and perfect operation.

THE FERROSTEEL COMPANY, Cleveland, Ohio, have recently purchased the patterns and good will of the F. B. Fox Register Mfg. Company of that city and will add registers to their lines of manufacture. The company state that they have found ferrosteel well adapted for the production of high grade registers, as well as ranges, for the reason that it brings out "in a superior manner the delicate ornamentation and tracery peculiar to handsome designs in registers, and the castings, light and heavy, have unusal strength."

A. L. CANFIELD, manager of the New York branch of the Danville Stove Works of Danville, Pa., reports that notwithstanding the depression in business the year closes with a satisfactory record. For the season of 1895 the company contemplate making extensive improvements in their works and will add extensively to their ranges and furnaces. They have now in course of construction and expect to put on the market in a short time a new line of gas stoves, a new four-hole range, a new line of modern furnaces, and two lines of right and left hand ranges made both brick set and portable form.

F. E DRURY, president of the Cleveland Foundry Company, Cleveland, Ohio, was in the city during the past week calling on his friends in the trade. He made his headquarters at the company's New York branch, which is under the management of H. Waterman. Mr. Drury states that the company have had a good trade this season and that the portion of their factory which was burned has been rebuilt and many improvements incorporated.

A NEAT FOLDER, handsomely embellished in bronze and green with a design of unique character, reaches us from the Fuller-Warren Company of Milwaukce, Wis. The folder announces that C. H. Conner will represent the company's interests in the territory named during the year 1895, and in due season will call upon deslers to negotiate for the agency of Stewart stoves and ranges.

A. N. BLANCHARD, rspreaenting Rathbone, Sard & Co., Albany, N. Y., visited New York the past week, and during his sojourn was the guest of Mr. Marvin, the company's New York agent. Mr. Blanchard was introduced to the trade by Mr. Marvin, and later returned to Albany much pleased with his visit.

The Dangler Stove & Mfg. Company, Cleveland, Ohio, favor us with a copy of an exceedingly attractive catalogue which they have issued, illustrating and describing the Dangler vapor stoves and ranges for the season of 1895. It is the sixteenth annual catalogue which the company have issued, and in it attention is invited to the leading lines manufactured, and also to improvements and changes which have been made since the last edition was brought out. One of the aims of the company has been to furnish the trade with a stove possessing a perfectly operating and powerful burner, economical in the consumption of gasoline. In this they state they have suc-

cecded even beyond their expectations, in their New Gem atove. This is made with the company's removable tank and other features which render it satisfactory in all particulars. The Delight cabinet range occupies the leading place, followed by the Cabinet Process range, the Dangler Process and the Surprise. A varied assortment of other atoves are then considered, closing with juniors of various descriptions. Ovens, waffle irons, torches, burners, price lists and telegraphic code are other features of the volume.

THE LEHIGH STOVE & MFG. COMPANY of Lehighton, Pa., are distributing a folder calling the attention of the trade to the Lehigh range, which is offered in four sizes. This is a six-hole construction, which has been upon the market for nearly five years and has established for itself an enviable reputation. It has sheet flue construction, large oven, patent oven door opener, triplex grate and ample flues. The decorative features are rich and the general appearance of the stove substantial and satisfactory. The Lehigh is offered in 32 varieties.

The Monarch Stove Company, successors to the Baxter Stove Company in the manufacture of Monarch vapor and gas atoves, Manafield, Ohio, are distributing to their friends in the trade a beautiful Christmas souvenir as a prelude to their campsign of 1895. The company state that they have devised a number of new and original features which will interest the trade and place the Monarch atoves in the front rank of excellence. They have a new catalogue in process of preparation, and expect to have it ready to send out about January 10. The Christmas souvenir is a card measuring  $8 \times 11\frac{1}{2}$  inches, printed in colors, the central feature being a group of little folks with the inscription, "We are happy, because our mammas cook our meals on Monarch vapor stoves." In the lower right hand corner of the card is a picture of one of these stoves.

THE FAULTLESS, No. 17, 1895, is a new range that has just made its appearance on the sample floor of Graff & Co., 208 Water street, New York. The design is one of considerable attractiveness and brightened by a polished nickel plated oven shelf. It has an oven 16 x 16 x 12½ inches, around which are flues of generous capacity. The fire box is provided with a large water back and a triplex grate. There is a sifter grate, and under it a substantial ash pan. A warming closet under the oven is another of its conveniences. The range has heavy covers and a strong top adapted for supporting the brackets for a horizontal boiler, and can be set between 30 inch jambs.

THE NEW YORK HOUSE of the Central Ollgas Company are making an attractive display of oil and gas heating atoves to invite the Christmas buyer. Their line embraces a variety of styles from the smallest lamp heater to the large powerful parlor dome heater which has proven very popular this year.

THE MONARCH STOVE COMPANY of Mansfield, Ohio, have in process of completion a handsome catalogue of their line of Monarch gas and vapor stoves for 1895. It is now expected that the catalogue will be ready for distribution to the trade about January 1. It will make mention of the company's goods for 1895, among which are several new lines, while old ones have been improved in various ways.

THE CENTRAL OILGAS STOVE COM-PANY promise the trace something of a surprise. In addition to their varied, very popular and extensive lines, they will place on the market specialties in new goods, more particularly in the line of cooking and lamp stoves, which the manufacturers say are bound to prove popular, both by reason of low prices and their many attractive and desirable features. In addition to these lines they will have something entirely new in Oilgas cook stoves, containing their new burners that are giving such perfect satisfaction. They call especial attention to their new catalogue for 1895, that they will have ready for distribution within a few weeks.

THE PROPER ventilation and heating of school rooms has, says a Kingston, N. Y, paper, since Plumbing Inspector Dunn's exhaustive report on the subject, called forth considerable attention, not only from the public, but especially among those identified with school work. Recently School Commissioner Moran has had printed circulars which he intends to forward to the secretaries and trustees of the districts, calling their attention to a system that is used with auccess in over 50 of the rural achools of Montgomery County, New York. If the school room has a good stove of proper size with zinc beneath it and a pipe connecting it tightly with the chimney, the cost of furnishing a jacket, ventilating shaft and fresh air aupply is but trilling. This system is especially appropriate for country

Two EXQUISITE calendars have been received from the Michigan Stove Company. They are composed of heavy cardboard, creased so as to stand in four folds, thus making an ornament for a mantel piece or table. The calendara are 61 inches high. Oue shows a group of dainty little maids in various attitudes, while the other shows four youthful figures, bedecked with garlands and entertained by birds. figures are painted in colors, so skillfully done as to closely resemble water colors. Along the lower edge of each card runs the calendar by months, each month framed in gilt. On the reverse side of the cards is a beautifully lithographed tribute to the excellence of the Garland stoves and ranges.

THE MICA MFG. COMPANY, 89 Fulton atreet, New York, are tssuing a circular of a portable gas heating and cooking stove. It is designed tor use in connection with a gas lighting fixture, preferably with a gas light such as is used on a table by means of a hose. It is arranged with a heating drum and also with a stand to support a vessel for cooking.

THE AURORA VAPOR STOVE COMPANY of Cleveland, Ohio, have just is sued from the press an exceedingly attractive 48-page catalogue showing the lines of gas and gasoline stoves which they manufacture. The volume is profusely illustrated, and is bound in colored paper covers, with a side title in silver lettering. The frontispiece consists of a bird's-eye view of the company's works, following which is a greeting for 1895. The company are entering upon their fifteenth year in the manufacture of gasoline and gas stoves, and state that notwithstanding the general depression in business circles during the past year they have made and sold more Aurora stoves than during any of the previous seasons. The leading place in the catalogue is given

to the Aurora evaporating range, which is shown in several varieties. Attention is also given to the Aurora generating range and to a varied assortment of junior stoves. A feature of the catalogue will be found in the special in structions given for operating the stoves made by the company. Gas stoves, ovens and miscellaneous goods occupy a number of pages, while a price list and telegraphic code complete the volume.

A RECENT ISSUE of the Evening Wisconsin of Milwaukee, Wis., says: Milwaukee Gas Stove Company have just put out a handsome and complete catalogue of the various atyles of ranges, gas heaters and grates being manufactured by the company at their extensive establishment on Erie street. The company, although not more than two years old, under their present management and enlarged scope of operations are rapidly reaching out for the best trade in the country, and a few days ago they received the contract, after a competition with all the gas ranges, heaters and grates made in the country, for supplying the large new building of flats of Mrs. K. E. P. Roberts in Chicago, who ordered for the modern building 80 of the Milwaukee Company's Perfection ranges. 80 Perfection grates, 80 Perfection radiators and 80 Perfection gas heaters, the award being given after a thorough test by disinterested parties with the makes of a large number of companies. The Milwaukee Company also received from the San Francisco Gaslight Company a request for 500 photographic views of their ornamental Perfection grate fronts and combination mantels, to be used by the San Francisco Company in designs which it desires to furnish architects in the country as being the most attractive and acceptable for use in plans for new residences. One of the great advantages claimed for all the Perfection stoves and grates of the Milwankee Company is the special devices for securing the proper gas and air pressure, which the company have reduced to a scientific perfection applicable to all kinds of varying gas main pressures. Their Star burners also come in for praise everywhere."

WE LEARN from the Paisley Stove Company, Beaver Falls, Pa., that they are closing out their stove business owing to the death, over a year ago, of Robert Paisley, and wish to dispose of their plant and patterns to some one desiring to continue the business.

The Ridoway Furnace Company have recently arranged an attractive show window display at their store, 76 Union street, Boston, consisting of a bandsome nickel plated model of the Ridgway revolving open fire pot furnace, which is placed before a striking background and revolved continuously by means of an electric motor.

WE RECEIVE from the Dayton Furnace Company, Dayton, Ohlo, a 20-page catalogue of the Abbott gas hea\*ers, ranges and burners and special gas and coal furnaces. The first Illustration is of the Abbott gas heater for use with either natural gas or coal. The next three pages show the Abbott gas ranges which are made with oven and broiler. besides top burners, and are furnished with coils for heating water or reser-These are followed by a special voirs. furnace adapted for either gas or coal, in which the Abbott furnace burner and mixer for natural gas are used. Several pages are devoted to the Progress selffeeding coal furnace, showing the parts separately, followed by testimonials.

### Trade Notes.

The mesiniss of Serios Baos, & Co., copper and sheet iron workers, New Orleans, La., who have dissolved partnership, will be carried ev. it is an ounced, by Joseph Pabs:

THE RAHWAY CAR VENTHALION COMPANY of New York, is a concern that has recently been incorporated with a capital of \$15,000. The directors are: J. B. Newcome, Frank McAuliffe and Wm. E. Newcome of New York City.

THE HERD REFRIGIRATOR COMPANY, at New Duluth, Minn, have started up their factory to make stock for the spring trade.

KERRPATRICK & Co., LIMITED, of Pittaburgh, operating the Leechburg Iron Works, Lecchburg, Pa., manufacturers of fine Sheet Iron and Sheet Steel, have lately bought out the business of J. S. Ingalls & Co. of Troy, Ohio. This concern have been making Planished Steel for a number of years, but the plant has been removed to Leechburg and some important additions made, and operations were commenced a few days ago. The product is known as "Craig Polished Steel," and was made by J. S. Ingalls & Co. for eight years at Troy, Ohio, Kirkpatrlek & Co., Limited, have also bought the patents under which Ingalls & Co. operated, and Mr. Craig, patentce of the process, has charge of this branch of the business for Kirkpatrick & Co., Limited.

A GOOD DEMAND for Galvanized Iron and Tin Plate in that section is reported from St. Louis, Mo.

A NEAT little hand book of 75 pages, containing interesting statistics relating to the history, location, manufacturing industries, &c., and other information concerning the city of New Bedford. Mass., together with a well executed map of the place, comes to us with the compliments of the New Bedford Copper Company of that city. The company manufacture Cold Rolled Patent Leveled Cornice Copper, Tinned and Polished Copper Sheets, Soldering Irons, Bolt and Bar Copper and Sheathing, &c.

THE TINWARE FACTORY of Frederick Haberman, Second atreet and Drigga avenue, Brooklyn, N. Y., which has been closed since the retirement of the concern from the Central Stamping Company, will start up again after January 1, employing about 500 hands.

THE F. H. LAWSON COMPANY, 188-190 Main street, Cincinnati, Ohio, have purchased the extensive plant of the late George D. Winchell Mfg. Company, and have added new improved machinery, increasing the capacity for turning out goods in larger quantitles. In an announcement of this aequisition they refer to the high grade of the goods made by the Winchell concern, which include Pieced Tinware, Japanned Ware, Galvanized Ironware, Toilet Ware, Water Coolers, Coal Vases, Street Lamps, Galvanized Iron Oll Tanks and other specialties.

THOMAS SANDS of Middletown, Pa., is putting in plants for galvanlzing by the "Flandera" improved process for the Marshall Foundry Company, at Troy, N. Y., and also for the Laconia Car Company, at Laconia, N. H. Contracts have been secured for three other plants in Pennsylvania and Ohio.

Galvanized iron makers in England are about to form an association for the benefit of their trade.

# TRADE REPORT.

#### The Iron Market.

Rumors of pools are exceedingly numerous. One story has it that the leading Lake Superior Ore interests have effected an arrangement by which some of the mines will close down for a consideration and prices will be advanced. In other quarters it is stated that the Orc companies have merely agreed not to sell for next year at present prices. Another report is current concerning an attempt to reach an understanding among the furnaces of the two Valleys. Then the Barb Wire makers, undaunted by their recent failure in keeping a newly born combination from prompt collapse, are again at work patching up their difficulties. In the Raii trade movements are on foot which look to clearing away possible sources of danger in the Central and Far West.

It is not astonishing that means are eagerly sought to escape from the present desperate condition of affairs. In many branches prices are lower than they have ever been before. While the volume of work is fair compared with some periods during the past two years, it threatens to fall off during the next few months. There have even been a few aigns of lack of confidence in better things to come for spring and summer.

The whole condition of affairs is putting producers into a frame of mind when they listen more patiently to proposals of peace with its prospect of modest returns on investment and for labor and skill.

In Foundry Iron reports are conflicting. Wall atreet has been informed that the leading Southern Company has 172,000 tons of orders on its books, and proposes to ask an advance of \$1 per ton. Other sellers, North and South, are not showing any disposition to heatow the flattery which imitation implies. On the contrary, Cincinnati has been quite a lively battle ground, with values irregular and lower. Philadelphia reports a somewhat better feeling.

Pig Iron.—The week has been uneventful in the New York market, there having been no sales of magnitude. Consumption in this section continues light, and occasionally a demand is even made to delay deliveries. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2, and \$10.50 @ \$11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

Our Philadeiphia representative reports as foilows on the Pig Iron market at that center: A good deal of Iron has been taken during the past week and prices have been well maintained. The increase in production and the increase in stocks appear to have had no appreciable influence thus far, and if the market can be held two or three weeks longer there may be a chance for better prices. At present sellers meet the demand quite

freely, but there is no disposition to make concessions, so that if consumers want Iron there is no alternative but to pay quoted rates. Furnaces in this vicinity are well sold up, and as most of the Southern furnaces make similar pretensions, there is no necessity for sales that would involve concessions. The weakest markets appear to be those west of the Alleghanies, but they are not low enough to permit shipments to this market at current rates of freight. Under present conditions it is hardly likely that any upward movement can be started, but recent transactions will tend to steady the market, and it is hoped will prevent any tendency toward further weakness. Meanwhile orders are easily placed at the inside quoted rates for large lots, but on favorite brands, or for small lots, medium to outside figures are obtained for delivery equivalent to Philadelphia, with 25¢ to 40¢ less at points within a radius of 100 miles South or West:

 Standard No. 1 Foundry X...
 \$12.50
 \$13.00

 Standard No. 2 Foundry X...
 11.50
 \$11.75

 No. 2 Plaio...
 10.75
 \$11.00

 No. 1 Soft...
 11.50
 \$61.10

 No. 2 Soft...
 10.75
 \$61.10

Only a few firms in the Chicago district are reporting any business. Here and there some Iron is being bought to finish up the work of the year, but in a general way consumers are deferring purchases until after the beginning of 1895. The local furnace companies have booked so much business that the prospect of their maintaining prices is excellent. Lake Superior Charcoal continues in only moderate demand. Quotations are given as follows for cash.

and Prior and Totto un Tot i	DUNCAL		
Lake Superior Charcoal	\$13.00	0	\$14.00
Local Coke Foundry, No. 1.	10.25	0	10.50
Local Coke Foundry, No. 2	9.75	0	-10.00

Jackson County Silvery	15,50	0	16.00
Other Ohio Silvery	14.25	0	14.50

Advices from Pittsburgh indicate that the Pig Iron market is unsatisfactory, both as regards demand and prices. Foundry Iron is duli in demand and weak in price. Reports are going of sales of several round lots at extremely low figures. Quotations are as follows:

No. 1 Foundry..........\$11.00 @ 11.25, Cash. No. 2 Foundry.......... 10.50 @ 10.65

There has been an increased demand for Pig Iron in the Cincinnati market during the week under review from large buyers, resulting in liberal sales, and there are still some large contracts pending. But while there has been more activity there has been a weaker feeling; at least there have been lower prices accepted to move round lots. Outside of the Pipe works and a few other large foundries who have been free buyers there has been some disposition on the part of consumers to delay deliveries, and this fact has had a tendency to aggregate the accumulation of some grades and given rise to the disposition to shade prices on such lots. But wherever buy-

ers have found a yielding market they have bought more liberally, the result being that the volume of business during the week has been considerably increased. Pipe works have purchased from 2000 to 3000 tons and other large general foundries have bought 3000 to 4000 tons additional in 1000 ton lots. There have also been several sales of 500 to 600 ton lots, as well as an increased number of small purchases of both Northern and Southern make. It is stated that the Southern Pipe Works, which are melting heavily, are in the market for between 20,000 and 30,000 tons of Iron, but these contracts are usually placed direct with the furnaces. The fact, however, that large buyers are entering the market upon the heels of an already large consumption gives an improved tone to the market, making buyers freer purchasers and counteracting the influence of irregular prices. Quotations are as follows:

Southern Coke, No. 1	\$9.75 @	\$10.00
Southern Coke, No. 2	9.00 @	9,25
Southern Coke, No. 3	8,50 @	8.75
Ohio Soft Stone Coal, No. 1	14.50 @	15.00
Ohio Soft Stone Coal, No. 2	14.00 @	14.50

Hanging Rock Charcoal, No. 1	16.00 @	16.50
Hanging Rock Charcoal, No. 2	15.50 @	16.00
Tennessee Charcoal, No. 1		13.50
Tennessee Charcoal, No. 2	12.00	12.50
Bessemer	11.65 @	12.00
ctandard Southern Car Wheel	15.75 (2	16.75
Lake Superior Car Wheel and		
Malleable	14.85 @	14.75

Transactions in Pig Iron in the St. Louis market have been unusually light during the past week. Inquiries are scarce and it requires persistent work to close sales. No. 2 Foundry is firmly held at \$7, f.o.b. Birmingham, notwithstanding the effort made in some quarters to create the impression that this price can be shaded. No large business is anticipated until after the turn of the year, and unless all signs fail a higher range of prices will prevail after the new year sets in. Sales during the past week are hardly worth recording. We quote as follows for cash, f.o.b. cars St. Louis:

#### Metal Market.

In the Metal trade Tin has again declined under heavy speculative transactions. There have been round sales at 10¢ for Lake Copper, to consumers, for the first quarter of 1895. The story that the Anaconds Company had agreed to moderate its pace to the rate of production of the Calumct and Hecla is denied. Lead has been more active than for some time past.

Pig Tin.—Prices have almost steadily declined during the week. From top prices reached last week a decline of about  $0.50\phi$  per pound has taken place in the wholesale rate. In speculative circles the turnover

of contracts was large and involved The amount 1,000 tons or more. The amount of actual tin that changed hands was doubtless much less, yet problematical. That there is enough to go around is very clear, and that future supplies will be abundant is evidenced in the advices of Straits shipments during the first half of the month. These aggregated 2540 tons, of which 1900 were destined to London, 120 to the United States and 520 to Continental Europe. Liberal deliveries to consumers have been made on former contracts, but new purchases have been moderate, although small lots were quite frequently quoted out at prices very close to those prevalent in the speculative line for 5 tons and larger quantities. Late in the week the market bore a somewhat firmer aspect, owing to better London advices, but prices made no noteworthy advance.

Copper.-There is no confirmation of a European report that the Anaconda Company have decided to reduce their output one-half during the coming year. Evidence is wanting also of anything in the nature of a general agreement among producers. That the output during the winter months will be below the average is very probable, however, and that fact, along with a firmer stand taken by the mining companies, has led to some further advance in prices. Quite a liberal business has been done with home consumers, involving deliveries during the first quarter of the coming year. Retail business has been very moderate and prices show no variation from those quoted for the past few weeks. Lake Ingot in small parcels weeks. Lake ingot in small parcels from store is sold at about 10½¢ % lb. There has been a very fair business doing in Common Casting Copper. The demand for Sheet Copper is tame and prices unchanged.

Lead.—Dealings have been on a somewhat more liberal scale, but at slightly lower prices. Probably 1000 tons were sold here for January and later delivery. American Pig. In small lots, sell from store at 3&\$\phi \end{array} \text{3} & 3&\$\phi \text{7} & 1\text{1}\$, with a fair run of order, though mostly of comparatively small proportions.

Lead Pipe and Sheet.—Lead Pipe manufacturers report that the demand for their product seems to be improving. The works in this section are generally busy, and prospects for the near future are regarded as more promising, both for the volume of business and for prices. The list prices for Pipe and Sheet are well maintained in this market.

Spelter.—There has been no improvement in business or in the demand, and the market shows poor form at the moment. Consumers are buying very indifferently, and prices exhibit no change.

Antimony. — The market remains quiet, with prices for small parcela steady at 9½¢ for Cookson's and 8¢ for Hallett's.

Tin Plates.—Little business is passing, except in the shape of small retail purchases destined for immediate consumption. Early in the week a little business was done in future deliverles, and the inquiry in this field showed some increase; but the terms offered by would be buyers were in the main so far below the views of holders that the results were hardly worthy of mention. The stagnation that usually marks the last weeks of the year in the Tin Plate market has settled down thereon, and little or no busineess is looked for before the turn of the year. Transactions are, if anything, rather below the aver-

age for the season. Prices continue rather easy and stocks moderate. The wage question is still unsettled on both sides of the Atlantic, so that the cuttook is wrapped in a mist of uncertainty

Advices from Chicago refer to the Tin Plate market in the West as follows: The importers of Tin Plates have recently named extremely low prices here on lots for importation. The foreign manufacturers are doing their utmost to retain this market. Tin Plate freights from Swansea to Western points are as low as ever, notwithstanding the recent published withdrawal of through freight quotations by transportation companies. The domestic makers, however, are getting their works in full operation again, and the result of the contest will hardly leave the foreign Tin Plates in possession of the field.

A special London eable dispatch of December 19 to The Iron Age reports on the British Tin Plate market in the following terms: Tin Plate has been rather dull, and the market is weakish at last week's prices. There is a fair inquiry for forward deliveries, but buyers' offers are so much below makers' views that the makers prefer to wait. Stocks at shipping points are increasing in the face of quite heavy outward movement. Sellers' quotations at Swansea are as follows:

Bessemer Cokes, IC 14 x 20		
Siemens Cokes, IC 14 x 20		10
J. B. Steel Cokes, IC 14 x 20		
Ternes, 20 x 28	18,6 @	21/
Charcoals, IC 14 x 20	10,6 6	12, 6

Sheet Iron.—A moderate business only is being done in Black and Galvanized Sheets. The inquiry for future deliveries is fair, and a number of contracts for material in the first months of the coming year are pending. While prices show no quotable change the market is somewhat weaker in tone.

### Chicago Report.

Scrap.—Business is very quiet, with the end of the year approaching. Dealers quote their buying prices as follows, Chicago delivery:

D		Don H
	iet ton.	
No. 1 Wrought Scrap	\$7.00

#### CONDITION OF THE

## Hardware Trade.

THE TRADE is beginning to feel more decidedly the effect of the near approach of the holiday season and the end of the year. Manufacturers are therefore intermiting for a little their efforts to secure trade, their representatives being for the most part withdrawn from the road and their own activity devoted to the closing up of the year's annual inventory. Some of the representatives of the jobbing houses are still on the road, but most of them will be home by the end of the present week. Retailers who carry goods suited to the holiday trade are occupied principally on these lines, but winter goods come in also for a fair share of attention. The moderate weather which has prevailed in many parts of the country has, however, had the effect of diminishing somewhat the movement of this class of goods. In the matter of prices there is little new to report, the market continuing to be characterized by a tone which is rather weak; but connected with this condition there have been few declines and in some lines a slightly better feeling is perceptible. The unsatisfactory condition of the Iron market does not tend to strengthen the tone of Hardware products, but the possibility of a better state of things, owing to higher prices of ore, is deserving the attention of such members of the trade as are watching closely the course of things influencing the cost of goods.

cost of goods.

Advices from Chicago.—Some of the Shelf Hardware jobbers report a slight diminution in orders, but others state that their volume of business is fully as large as it has been. Much trouble is being experienced by some houses in taking their inventory. on account of the continued influx of good business. The metal trade is par-ticularly active. Tin Plates, Galvanized fron and all sorts of metal products are moving out quite freely. Seasonable goods are also in excellent demand. The holiday trade keeps up remarkably well. Salesmen have not yet come in from the road, but next week will see them arriving from all quarters, and it is expected that the Hardware business will then be practically ended for this year. Considerable interest is being taken in the matter of price revision, which usually occurs before salesmen are started out again, but of course it is not known yet as to what the nature is not known yet as to what the nature of this revision may be. A few lines will undoubtedly show a little stiffening owing to the better working of combinations, while perhaps other lines may show a slightly lower tendency on account of the weakening in staple goods. The Heavy flardware trade has experienced an improvement during the past week owing to an increased demand from manufacturing consumers. The volmanufacturing consumers. The voladded to this there had come the usual

demand for season goods, such as sleigh material, the Heavy Hardware trade would have been classed as most excellent.

#### Notes on Prices.

Wire Nails.—The market for Wire Nails shows but little change since our last report. There is a good deal of inquiry and a fair volume of business. The mills, however, are not as full of orders as they would like to be, as they are desirous of having enough on their books to occupy them during the next month or two. Some of the large buyers, however, notwithstanding the low prices current, are disposed to hold off, apparently not being apprehensive of an early rise in values. Most of the orders which are placed are to supply current demands, and in many cases they indicate that the stock in merchants hands is light. This is niquestionably the policy which the trade are disposed to pursue. Small lots from store in New York are held at \$1.15 (a) \$1.20

at \$1.15 (a \$1.20.

Advices from Chicago.—The local trade appears to be almost entirely in the hands of local manufacturers. They have booked heavy orders for dellvery during the first three months of next year, and jobbers are now quoting their customers for future delivery on the basis of present prices. Outside manufacturers are asking somewhat higher prices for Western business than those prevailing in this immediate vicinity. They say that their inquiries have latterly been improving, and their business from other sections is ateadily growing larger. The demand from jobbers for mixed carloads of Barb Wire and Wire Naila has recently been quite heavy. Quotations are continued at \$1.05 for small lots from stock and \$1.05 for small lots from factory.

Cut Nalls.—The condition of the Cut Nall market is similar to that of Wire Nails, the current business being limited to the early requirements of the trade. There is little change in the matter of prices. Small lots from store are quoted at 90 to 95 cents.

Advices from Chicago.—This branch of the trade continues in precisely the same condition as reported for several months. Orders are small, but continue to be received with regularity. Quotations are unchanged. Small lots from stock are conted at \$1

from stock are quoted at \$1.

Barb Wire.—There is, considering the advanced stage of the season, a fair business doing in Barb Wire, with little change in current quotations or in the general tone of the market. The quotation of \$1.85 to \$1.96 for Four-Point Galvanized in carload lots at mill still represents the market, but concessions are made in special cases.

Advices from Chicago.—Manufacturers report a much larger trade, capecially on the higher grades of Barb Wire. These grades have been in remarkable demand, considering the difference in price as compared with standard Wire. Manufacturers of the latter have also been able to secure a great deal of business, and their output is practically covered for at least the first three months of next year. Quotations are continued at \$2.05 for small lots from factory, Several large transactions have recently occurred on Plain Wire for delivery during the early months of next year. The character of these transactions is such as to indicate that some of the shrewdest buyers now believe that the market has touched its lowest point.

Cordage.—As usual at this season there is very little doing, and the market

is sluggish and quotations are to a large extent nominal. The market is also without atrength and ruling prices are more or less freely shaded. The market is represented by the following quotations, which are subject only to the discount of 1½ per cent. for cash, terms f.o.b. factory or New York:

	(	ents per m.
Manila, 7-16 in base		71/ to 71/2
Sisal, 7-16 in base		41, to 4%
New Zealand, 7-16 iu base		

Old Metals —The demand for Old Metals shows some material improvement, but prices are virtually unchanged. Smelting and refining works in this vicinity are fairly well supplied with material, but look for a greatly enlarged business after January 1, and are consequently more ready to buy. There is little doing in Scrap Iron just now, but a few inquiries exist for deliveries after the turn of the year. Prices are ateady. The following quotations represent the current rates paid by dealers in the city:

Heavy Copper
Light and Tinned Copper 2 1 61/6
Heavy Brass 10 484
Light Brass The 384
Lead 1 15 28/4
Tea Lead 1 1 21/40
Zinc 1b 2½8¢

White Syringes, # b	0	.03%

Surveya are being made for the line of a new railroad to be constructed from Santa F6, near Guthrie, Oklahoma Territory, east through the timber and coal regions of the Indian Territory, to Fort Smith, Ark., with the idea of eventually extending the road to Memphia on the East and Albuquerque on the West. The backers of the scheme are said to be financially strong.

# THE METAL WORKER.

### NEW YORK AND CHICAGO.

Saturday, December 29, 1894.

DAVID WILLIAMS, - PUBLISHER

#### BUSINESS OFFICES:

BRITISH AGENCY: The 1ronmonger, 42 Cannon street, London, England.

#### Comfortable Temperature.

In the heating of any building in which persons of various ages and temperaments, conditions of health and home surroundings are congregated, there will always be found a considerable difference of opinion as to the most comfortable temperature. The young, healthy and vigorous may find a temperature of 68° as comfortable as the old and feeble find one of 75°. Just how to meet these diverse conditions and opinions is one of the most serious questions presented to the heating engineer. It is stated that the National House of Representatives is the most difficult room in the United States to heat. There are gathered men from North and South, men brought up under the most varied conditions, and, above all, men who have the right to call the attention of the House to any discomfort of their own, and thereby make it the more pronounced. Public opinion, however, seems to accept 70° as a fair average, against which no one should complain. The effect of lower temperatures may be easily studied in a crowded theater without personal conversation with the audience. At a temperature of 66° to 67° a few will be noticed as throwing coats or cloaks over their shoulders. At 65° the practice becomes quite general, while at 62° to 63° the general discomfort becomes decidedly evident, and its continuance or a still further drop in the temperature is likely to result in unpleasant complaints at the manager's office. In an ordinary theater, completely filled, the animal heat of the audience is sufficient to raise the temperature of the room 6° above the normal—70°. It therefore becomes necessary to admit the air at least 6° lower in temperature than would be the case were the theater empty. When it is warm ontside this empty. When it is warm outside this means a reduction of the entering temperature to 64° or 65°, and consequently the greatest care in the introduction of this air so as to avoid drafts or the placing of a person in an atmosphere which has only this low

temperature. The most complete subdivision of the air supply is then absolutely necessary to success.

Inadequate Safety Valves.

In the spring of 1889, an animated discussion in The Metal Worker regarding the safety of low pressure systems of steam heating was conducted by correspondents in various parts of the country. The fact was brought out that serious accidents with this kind of heating apparatus are exceedingly rare, and that when explosions occur they are attributable almost universally to want of skill in construction and erection. In our issue for December 1 such an accident is recorded, which was primarily due to two causes. There was a faulty design of the boiler and a deficient connection for the safety valve. That a safety valve should be of a size to relieve a boiler of all surplus pressure is so obvious as hardly to need saying. The relief of surplus pressure by permitting free escape of steam is its sole function, and if too small to perform this function it becomes a worse than useless attachment, because it gives a tacit promise of socurity under conditions of insecurity. Since the action of a safety valve is a perfectly simple thing to understand, and easy rules for proportioning such valves to the steaming capacity of boilers are found in every hand book on steam engineering, there is not the slightest excuse for putting on a valve which is too small. In any case where this is done there is culpable neglect or culpable ignorance. Usually safety valves are supplied by the manufacturers of heating boilers as part of the appurtenances thereof, and all the steam fitter has to do is to connect the valve and adjustait. It is questionable whether many steam fitquestionable whether many steam nt-ters, in putting on safety valves, ever give a thought to their sufficiency; they usually take this on trust. But there are cases where boilers are supplied with safety valves by steam fit-ters independently of the manufact-urer, and the case in point seems to have been one in which a too small connection was made. That accidents to low pressure steam heating appara-tus, in spite of the prevalence of ignorance and carelessuess, are so rare, is perhaps the best evidence of the inherent safety of this method of warming buildings.

#### Nomenclainre.

"What's in a name? L'mburger cheese by any other name would smell as rank."

This quotation, which shows both erudition and invention, is selected as a text for this "I say," which is not intended in mercantile phrase "to supply a long felt want," for if so it must—while acknowledging the constant demand for names and the backneyed use of our present stock—offer or suggest some of original coinage. It is sometimes less work to produce the animate or inert construction than to

find a suitable name for it. This difficulty is of early origin, if we may believe tradition, which says that Adam, the first, set out to furnish family names for his descendants. Although he had a monopoly of the job, with a clear field for imagination, he became weary of dictation after a week or two of close attention to business and finished the contract by saying: "Let all the rest be named Smith."

Everything must have a name, from the new baby to the latest invention, and these are not seldom missits which the recipient is not responsible

for.

"What d'ye s'pose I call my dog Bose' for?" said Hayseed. "Don' know'm sure," said Clod. "Well, the reason is 'cause that's his name." This answer to the conundrum was conclusive if not satisfactory and as good as a majority of spensors could The subject of nomeaclature has so large a spread that we must take a reef in it and consider only its application to a limited number of things, among which the "calling" of domestic articles is prominent. Of course every cooking and heating apparatus needs a distinguishing appellation, but why so named is a thing "no fellow can find out," except for Hayseed's reason. Several of the modern catalogues seem to have adopted special family names to which are prefixed such pronouns as fancy may dictate, or being established like a keynote in music any desired tune may follow. But if the maker chooses to call his product by the generic name of "Nut" with the sub-divisions of Walnut, Peanut, Chestnut. &c., we may, perhaps, find the question of why do ye so? a hard nut to crack.

When we sit in zero weather by some glowing east fron raiser of temperature and read its label of Scorcher, Torrid, Blister, or possibly Sheel, there is a sense of fitness which tends to contentment; but if instead we read Trailing Arbutus, or find the kitchen range, redelent of onions and cabbage, marked Heliotrope, it may appear slightly inharmonious to our seithetic sensibilities. Whether or not the customer is impressed by the name is an open question, but if so it is usually as a result of some other one's experience and recom

mendations.

We sold a stove once which suited the bnyer in all points of construction and operation. But," said he, "If I had noticed the name in time I would not have had i brought into the house." The name was "General Grant," and the customer a rabld opposition politictan. Our limited experience has not shown us such incongruous titles as the Ice Berg, Arctic or Freezer, but unless we return to the names of the stoves of our daddies the demand will continue to be supplied with something equily disco dant. This paper growl does not question the right of any one to call their products, whether stoves or children, by what names they please, and the writer would suggest as an unworked mine of names the labeled bottles and drawers of the druggist. These would be as appropriate as the present list, and perhaps more suggest. ive of internal caloric.

Fossil

# THE LETTER BOX.

Insufficient Air Supply.

From E. E. Dunning, Milwaukee .-In regard to the difficulty experienced A II." of this city, in heating the residence with a furnace, described in The Metal Worker, December 15, I think If the readers of The Metal Worker could know of the details it would be easily solved. It would be plainer if "A. II" had made a diagram "drawn to a scale" of the building, showing lo cation of furnace and registers and how the pipes are run in the basement and locations of grates and ventilating flues, doors and windows, also walls in basement, as all these are material in the workings of the furnace; also dimensions of the furnace. It is evident that there is not a sufficient supply of cold air, although the duct enters from the right direction. The duct should be two thirds of the combined area of the hot air pipes, or at least 15 x 36 inside measurement, with a tight regulating damper and a door that can be opened into the basement. Many times the cold air will not flow into the duct during winds of certain directions, and if the furnace basement is large and kept clean during such times the sir can be taken in successfully through this door. A basement window might be opened a little. I have found a cold air room in the basement made of dry matched lumber and tight, even no larger than 4 x 6 feet square, a much surer means of supplying the furnace with cold air at all tlmes.

I note that in this residence all doors are opened into the reception hall, both above and below, allowing a free circulation of air, in which case a circulating register from the hall is a very good thing; but as you cannot successfully take the air from the hall and from the outside at the same time, this register should be equal to two thirds of the combined area of the hot air pipes, or a 24 x 30 register and a of equal capacity, constructed as near air tight as possible. I prefer to take cold air from outside to under the base ring of a furnace, and from inside above the base ring. The from inside above the base ring. 14 inch pipe was not much of an improvement. I should place a pit under the base plate of a furnace wherever pessible, as I believe the air is better distributed around the furnace. In my opinion the filling up of the plt was a move in the wreng direction. It may be that some of these hot air pipes run from the furnace basement through a brick wall into a colder basement so the air in the pipe is chilled. It is often very difficult to carry the heat under these circumstances. Asbestos paper, covered two or three thicknesses, would help somewhat; but better still is the double pipe, both air tight, with about an inch air space between all around and the outside pipe open into the furnace basement. Angles in hot pipes should be avoided. If necessary, should be near the surface. If this furnace is not centrally located and the registers placed so the hot air pipes are short and equally distributed around the furnace, there could certainly be an improvement in this way. Locations would also have

much to do as to whether the furnace was really of sufficient capacity. I think if "A. II." will use such of the above suggestions as will apply to this building he will have no further trouble.

From "Justice."—In reading the troubles of "A. II.," at Milwaukee, Wis., in reference to the furnace and your advice to him, in The Metal Worker, December 15, we are somewhat amused. He does not state whether the ventilating openings are upstsirs or down cellar, which is very important. Grate openings are the best ventilators known when fire is burning in them. Your explanation as to the supply of cold air is correct, or in accord with our experience. The suggestion as to lack of space between the raditor and casings is worthy of close investigation. In our opinion the openings to the ventilators should be at the floor, or, if not, they should be closed at certain times in order to get the rooms warmed. We have followed this industry for many years and frequently have had much trouble in getting good results. In one instance the writer bought a lot of toy balloons and took them to a church where we had placed a number of hot air furnaces. After firing up we dem-onstrated the action, or direction, of the air currents to our full satisfaction. There is much to be learned by actual experience in this direction, and we find that there are no two furnaces that will operate alike, although the houses where they are placed may be the same s'ze and shape. Air currents make quite a difference. In this locality our winds come from the west and northwest, and we advise taking the outside air supply from the east side of the house, but have had much better success by taking it from the halls and exhaust ing the cold air from the inside in this manner. This gush about pure sir is all moonshine, as the writer knews by 20 years' experience in his own home.

## Kerosene as a Wood Preservative.

From G. S., Summit Station. N. Y.—Can any of the readers of The Metal Worker give me information as to the effect of kerosene oil on wood as a preservative agent? I wish to use 2 x 4 inch hemlock for posts driven into the ground a depth of 2 feet. Would a mixture of kerosene oil and coal tar be better than either alone? Would crude or refined oil be the best?

#### Name of Chimney Partitions.

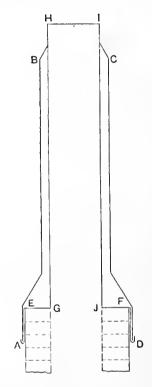

From A. A., Brooklyn, N. Y.—What is the proper name of the partition between the tlues of chimneys? If it is "with" I cannot find it in Webster.

Answer.—Perhaps the reason our correspondent did not find the word in Webster was because of the spelling he gave it. In the international edition of Webster's dictionary he will find that "withe" is in architecture a partition

between flues in a chimney. We have also consulted an old architectural dictionary in which this passage occurs, under Chimneys: "When there are two or more chimneys in the same wall, the divisions between them or the solid parts of the brick, stone or metal are called withs."

#### Double Chimney Top.

From E. A. B., Mayville, N. D.—I find many articles in the Letter Box that are of value to the tradesman, on account of the wide range of subjects

Double Chimney Top.—Fig. 1.—Form Suggested by "E. A. B.," Mayville, N.D.

treated. Wishing to return some of the favors received, I submit to the readers of The Metal Worker a double chimney top I have been making for a number of years. This top does away with all condensation, and has given satisfaction when used. As shown by the inclosed sketch the top is made double throughout. I would like to be informed if this kind of chimney top has been made by others.

Answer.—In Fig. 1 is shown a sectional view of the top, as derived from our correspondent's sketch. A B C D represents the outer part of top, and G H I J the inner. The upper part of chimney is covered by iron, as shown by A E F D. The outer part of top is joined to this iron, as shown at A D, while the inner pipe is connected at G J. The two pipes can be connected at the top by a flaring collar, as indicated at B C. In The Metal Worker of

March 2, 1889, there was published an engraving of a double chimney top from "S. S.," Cincinnati. This top is shown in Fig. 2, and, while it is made double, the parts are joined in a dif-

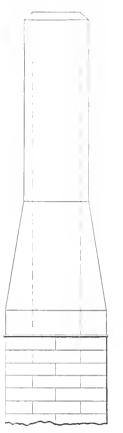

Fig. 2.-Form Suggested by "S. S.," Cincinnati.

ferent manner. The description he printed was as follows: Chimney tops as usually constructed are defective, as during cold weather the smoke is cooled

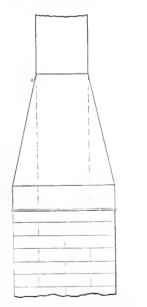

Fig. 3.—Form Suggested by "A. G.,"
Philadelphia.

to such an extent as to interfere with the draft, or with some kinds of fuel the moisture in the smoke is condensed, and soon eats away the iron of which the top is made, dissolves the mortar in the chimney and perhaps spoils the

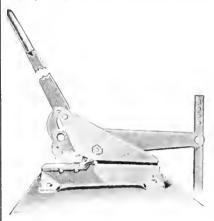

roof. This may be a rather gloomy history of the chimney top, but in many cases it is true. In The Metal Worker of January 19, "A. G.," of Philadelphia, describes a double chimney top (see Fig. 3) that partially obviates this difficulty, lnasmuch as the lower part of the top is made double, but the pipe above the base is single. This form of top is preferable to those single tops made to go over the chimney, as the original size of the flue is retained, and there is no enlarged space above the top of the chimney to impede the draft. It would appear to me that in a chimney top, properly constructed, the pipe as well as the base should be made double, as shown in the engraving, Fig. 2; then the inner pipe would be protected from the cold, and being surrounded by warm air the draft would be greatly improved. The inside pipe could extend into the chimney, as shown by the dotted lines, and by having a flange riveted on a level with the top of the brick, by placing mortar on the top of the chimney before the top was put on a tight joint would be the result. The space between the two pipes at the top should be closed as shown, and any kind of cap desired used to prevent wind or rain from entering.

#### Is It a Leak?

From JNO, Charleston, W. Va — When I read a letter in your issue of December 1 from a subscriber asking why a column of mercury standing 24 hours fell 2 inches, I sighed a sigh of nours ieil z inches, i sighed a sigh of satisfaction and thanked my Maker that during my struggle of 12 years with gas piping I never had met a man who had the littleness to require a test of over 15 minutes. If the mercury stands at a given hight for from 15 to 20 minutes and does this repeatedly, there is no leak that any man can find or is no leak that any man can find or detect with any appliance that I have knowledge of. I often have had my men report to me that the mercury, after standing some time, will rise if the atmosphere became warmer while we were testing. Just so will it fall toward evening, if it is pumped up during the afternoon or while the atmosphere is warm, which goes to show that the expansion or contraction of the air in the pipe affects the mercury. I once had a leak in a small gas job that two men worked faithfully for ten hours to find. The mercury would fall about 3 inch in 15 minutes, showthat there was a very small leak. We could detect a slight smell of ether on a piece of \(\frac{1}{2}\)-inch pipe, 18 inches long. We lathered it but could get no bubble. I turned the gas on it but found that it would not burn through the hole. I had the pipe removed and a sound one put In. This did the work, effectually euring the leak, and proving that a very slight leak on a mercury column will show in a short time. afterward tested the defective place of pipe, and under 40 pounds water pressure it would sweat a drop about once every minute through a hole that you could not see. Our friend has a tight job, in my opinion, if the mercury will stand 15 minutes with a round bead on top. I trust he will tell us how he got top. I trust he will tell us how he got his money for this job.

#### Combination Shear.

R. M. Clough, Tolland, Conn., is just placing on the market a new bench shear, which can be furnished in either style—as a hand or foot power shear, or a combined hard and foot power shear. It is easily changed from one to the other by simply withdrawing a pin. The hand shear will cut 1.5 inch stock and the foot shear 1/2 inch stock. The shears are made with 4 and 6 inch blades, the former being recessed so that wide sheets can be readily cut, the edge passing through the recess. There

Combination Shear.

are two gauges, one for slitting up to 6 inches wide and one for squaring and angular work, the table being graduated into  $90^{\circ}$ ,  $75^{\circ}$ ,  $60^{\circ}$ ,  $45^{\circ}$  and  $30^{\circ}$ .

Mr. Monditt of Caen, France, has published a process for bronzing copper, which is as follows: After the metal has been secured, it is covered with the following mixture by means of a brush—easter oil, 20 parts; alcohol, 80 parts; soft soap, 40 parts; water, 40 parts. The mixture is left on till the required shade is obtained, then dried with hot sawdust, and coated with a very dilute varnish. The depth of tone can be regulated by the length of time the metal is exposed to the solution.

A process has been invented by M. Greune for decorating aluminum by means of earbon. M. Greune works on the principle that earbon unites with aluminum at a high temperature and forms a durable coating. An alcoholic solution of earbonaceous matter, such as oil, is painted over the metal and then charred, and the carbon thus obtained is further united to the aluminum by heating to a dark red. To vary the shade of the coating certain metallic salts may also be added to the solution.

Late statistics place the number of incandescent lamps in the United States at 4,000,000, about 2,500,000 being in central station plants and 1,500,000 in lsolated plants.

A new coal and coke company have recently been organized at Charleston, West Va., with a capital of \$1,000,000, to control the output of coal and coke in the Kanawha and New River coal fields.

New York Importers and exporters engaged in the Central and South American trade are discussing the deslrability of forming a trading combination or trust.

#### The Will Foundry Sifting-Machine.

A sand sifting machine has been dealgned by Edwin C. Will, foreman of the foundry of Russell & Co. of Massillon, Ohio, where it has been in con-tinuous operation for the last 12 months. It is used to aift sand, mix and aift facings. To operate the machine, the handle on the cylinder shaft, shown in Fig. 1, is turned, when the elevators take the sand from the floor or heap and dump it on top of the sieve, which is a cylinder made of any desired mesh of wire. The method of operating the elevator shaft by a chain from a sprocket wheel on the cylinder shaft

been sifted the machine can be run backward over the heap to an out-of-One man can mix and the-way place. sift an average of 25 shovelfuls per minute. It is stated that before the introduction of this machine it required the services of two men and cost \$30 for the old style sieves per year, in order to sift the same quantity.

#### Aluminum Cooking Utensils.

Prof. Joseph W. Richards, in the annual report of the "Mineral Industry of the United States," for 1893, refers to the employment of aluminum in the manufacture of cooking utensils in the

applied to ordinary household purposes. Lightness, durability, cleanliness, remarkable heat-retaining capabilities and imperviousness to rust or corrosion through chemical action, are some of the qualities claimed for kitchen utensils made of pure aluminum, and, so far as can be gathered, their posses sion of these attributes is not disputed.

#### GROWTH OF MANUFACTURE.

Small wonder is it, therefore, to learn that the demand for aluminum utensils is growing by leaps and bounds and threatens shortly to outstrip the and threatens shortly to outstrip the existing output of the metal. Some half a dozen or more substantial concerns in various parts of the United States are now actively engaged in

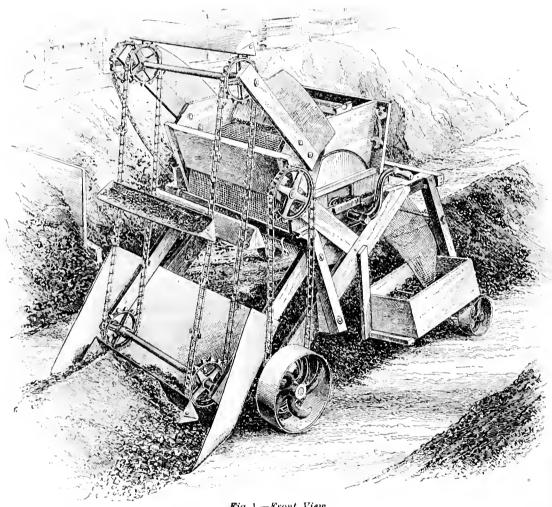

Fig. 1 - Front View.

#### THE WILL FOUNDRY SIFTING-MACHINE.

is shown in Fig. 2. As the cylinder is revolved the sand is sifted twice by going through first the top and then the bottom of the cylinder. A brush extends the full length of the sieve and serves the double purpose of crushing all lumps and cleaning the sieve every time the cylinder moves. Nails, scrap, &c., pass under the brush and are caught by a second sieve, Flg. 2, which stands at an angle, and has a motion imparted to it by an eccentric and spring. All refuse thus caught travels down into the box shown.

The forward and backward motion of the machine is controlled by the chain gear shown in Fig. 1. The operator turns the sieve with his right hand and moves the machine with his left hand by means of the chain connecting with the forward axle. The fender in front aweeps the floor clean and is hung at such an angle that when the sand has following terms: "America has certainly taken the lead in this utilization of aluminum, which, I believe, will become the most extensive application of the pure metal that will ever develop." Judging by the extraordinary strides it has made in popularity during the past year, aluminum, in the shape of culinary and household utensils generally, has already gone far to justify this positive opinion.

#### SPECIAL RECOMMENDATIONS.

Up to within a comparatively short time ago, aluminum utensils were held in the popular regard more as a kind of fad or curiosity than as articles of real utility and domestic value. In the earlier days of the aluminum craze the metal became so identified with fancy ornamental articles and jewelry, that it has been a task of no small difficulty to instil into the public mind the fact that it is a metal which affords peculiar facilities and advantages when

this branch of manufacture, and they are constantly extending their lines. They include such well-known names They include such well-known names as the Illinois Pure Aluminum Company of Lemont, Ill.; Sidney Shepard & Co. of Buffalo, N. Y.; C. Sidney Shepard & Co. and the Wohler Aluminum Company of Chicago, Silver & Co. of Brooklyn, and the Griswold Mfg. Company of Erie, Pa. The manufacturing requirements of these firms absorb a large proportion of the output absorb a large proportion of the output of the Pittsburgh Reduction Company, who at the present time furnish, from their works at New Kensington, Pa., nearly the entire volume of commercial aluminum on this market.

The aggregate output of aluminum ware is growing to be very large and increases week by week. Almost every house furnishing store of any size and all the large department stores now keep this ware in stock, and are generous customers of the manufacturers. The exhibits of aluminum articles at the Chicago World's Fair no doubt served to stimulate the public interest in the metal. Persons who there bought single pieces of aluminum kitchen ware for experimental purposes or from curiosity are now, after practical experience of their utility, in many cases substituting aluminum utensils for those of other kinds as the latter wear out; and this process is growing and spreading, as the merits of the new ware become better known. Already a very full line of kitchen and household utensils is made in the metal, including Kettles, Sancepans, Frying Pans, Tea and Coffee

pared with that of other ware. But, it is claimed, that the little larger initial outlay is more than effect by the practical indestructibility of the aluminum culinary articles, as compared with those of tin, copper or enameled iron. Alfred E. Hunt of the Pittsburgh Reduction Company states that he has had aluminum cooking utensils in use in his own home for the past five years, and articles which have been in constant service for the entire period seem to be as durable and as little worn as when first put into use. Similar testimony is given by others who have had intimate experience of such ware for several years.

object of securing this desideration that the Pittsburgh Reduction Company are now building large works at Niagara Falls. At the present time it is calculated that the cost of producing I pound of aluminam corresponds approximately to the cost of I herse power for ten hours. Thus as the necessary power becomes changer, the price of the metal will cheapen proportionately. Until that time aluminum utensits will continue to be rather more expensive than others

ERRONEOUS IDEAS AS TO PROPERTIES.

Many misapprehensions exist, also, in regard to the properties of aluminum utensils. Some exaggerated ideas are

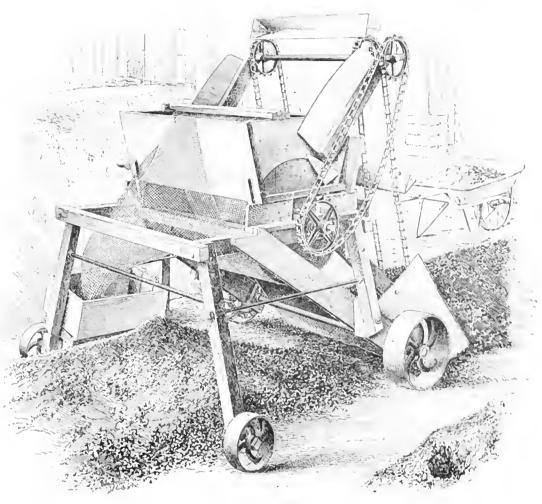

Fig. 2.—Rear View.

#### THE WILL FOUNDRY SIFTING-MACHINE.

Pots and numberless other domestic appliances. For field and camp cooking outfits especially, this metal has proved most valuable, as reducing the weight to be carried, while hospitals and institutions generally are said to be gradually adopting the use of aluminum articles for the preparation of food, on account of its sanitary qualities. The Government have lately placed an order for a 60-gallon aluminum kettle for each of the cruisers "San Francisco" and "Montgomery."

#### CONSIDERATION OF EXPENSE.

The question of expense has been until recently the principal bar to the more rapid popularization of aluminum ware for househeld use; and, although the price of the metal has been of late very materially reduced, so that pure ingot aluminum is now quoted under 60 cents a pound, the expense is still an obstacle when com-

PROSPECTIVE PRICE OF ALUMINUM.

While speaking of the price, it may be well to correct an erroneous impression that is abroad. It is assumed that, as aluminum has come down in value from \$2 to 60 cents a pound in three years, the price is likely to continue falling, so that within a short time it will approximate to that of copper or tin. This, we are assured, is not within the range of probability, so far as can be at present judged. The process of extracting the metal from the clay in which it is found is a costly one. Until this cost can be very materially cut down the price of the metal will not sink appreciably lower than its present level. Undoubtedly the cost will be reduced in time, but the drop is likely to come very gradually and will be in close touch with any prospective lessening in the cost of the power which produces the electricity needed for the reduction of the metal. It is with the

entertained as to their absolute exemption from tarnishing, for instance. On the occasion of a recent visit to the factory of Silver & Co., in Brooklyn, the writer noticed a large aluminum saucepan of the firm's make bearing signs of hard usage, and which was badly blackened on the inside, and on inquiry was informed that this utensil had been returned from a large department store, one of whose customers had bought it on the assurance of the vender that it would never discolor. It had discolored, and the purchaser had indignantly returned it as not being what it was claimed to be. W. H. Silver, vice-president and general manager of the company, explained that this was not an uncommon occurrence, and that it arose from the ignorance of the persons who sold and handled the goods.

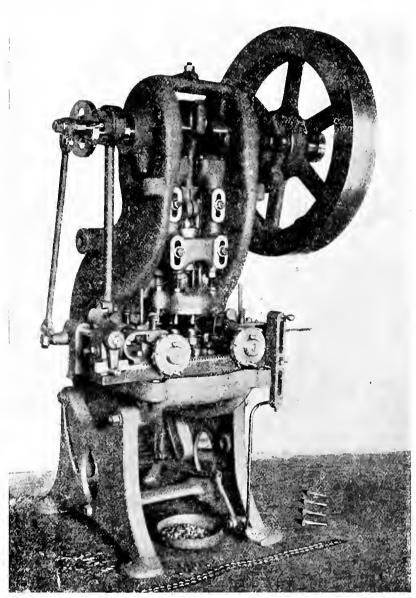

"We do not claim for aluminum utensils," said Mr. Silver, "that they are not subject to discoloration. They do tarnish under certain conditions. For instance, when unfiltered water is boiled for any length of time in the vessel, the sediment of the water will cling to it. Water containing a large proportion of lime, or well water impregnated with iron, will also discolor the ntensil. But this discoloration is not injurious; it does not attack the metal at all, and it can be readily removed with soap and water. A simpler and equally effective way, however, is to boil the utensil in a quart of water mixed with a dessert spoonful of common washing soda. This will clean off all discoloration at once, and leave

Pittsburgh Reduction Company are very emphatic. They give an assurance that the pure metal furnished by them contains no impurities beyond a very minute proportion of silicon and iron. The metal that is used in the manufacture of cooking utensils runs at least 98½ per cent, pure aluminum, much of it nearly 99½ per cent, with from 0.10 per cent, to 0.25 per cent, of metallic iron, and 1 per cent, or at the most t½ per cent, of silicon. There is no lead, arsenic, or other injurious metal present in any of the Pittsburgh metal, of which practically all the aluminum cooking utensils

dition of 2 per cent. to 5 per cent. of copper and nickel in accordance with the amount of stiffness and hardness required

required.

The metal which is rolled into sheets, on the other hand, and afterward stamped and spun, is so hardened in the process as to need only from 1 per cent to at most 3 per cent. of alloy of hardening metals. The sheets supplied to manufacturers come of three qualities, denominated soft, hard and halfhard, according to the proportion of alloy contained in them. The pliability of aluminum makes it peculiarly easy of manipulation in the drawing presses

THE FERRACUTE DOUBLE ACTION DRAWING PRESS.

the metal untarnished and unaffected. In these cases absolutely no chemical action takes place producing anything injurious,

"The metal does not corrode or rust, nor is it at all affected by fruit or similar acids, and of this fact the concerns who handle our goods and those of other makers of pure aluminum articles may absolutely assure their customers. But they should not give them false impressions as to their immunity from tarnishing. Aluminum cooking utensils are, however, remarkably easy to keep clean. They weigh only about one-third as much as the ordinary culinary utensils, will not burn or scorch their contents, and do not break, crack or chip, being pure metal throughout."

PURITY AND ALLOYS.

The wholesomeness of aluminum is questioned by some. On this point the

now made are formed. One of the great advantages claimed for these vessels is this fact of absolute purity, as welt as its homogeneity of substance, there being no plating to wear off. What little wear there is is practically pure aluminum, and such infinitesimal proportion of nickel, copper, silicon or iron as is entirely inert and of no poisonous power on the human system.

SHEET AND CAST WARE,

The form of metal from which aluminum utensils are made is either sheets, which are afterward stamped and spun, or ingots, which are cast into Frying Pans, Tea Kettles and similar articles. Pure aluminum has been found to be too soft for casting purposes, and to dent too easily to give the best results. Consequently the metal is hardened in castings with an ad-

and on the spinning lathe, where it does not require the constant annealing necessary when working in brass or copper.

## The Ferracute Double Action Drawing Press.

The Ferracute Machine Company of Bridgeton, N. J., recently built for the United States Arsensl at Frankford, Pa., a double action drawing press fitted with double feed rolls, acrap clipper, gang dies for cutting and drawing cartridge cups. &c.

cartridge cups, &c.

Considering it first without the attachments the press proper is one of a series of five sizes belonging to what the makers call their "class D" drawing presses. Being of the fourth size

it is known as "press D1." As shown it is driven by a tly wheel direct, but when the same press is arranged for back gearing it is then known as "press DG4," G being the gearing symbol for all presses of this make. Its dimensions are as follows: Round hole through bed, 10 inches: throat, from ram center back to frame, 9 inches; hight, bed to ram, with ram up, 12 inches; stroke of ram, 2½ inches; adjust-ment of ditto, 3 inches; hight, bed to plunger, when up, 17 linches; stroke of plunger, 5 linches; adjustment of plunger, 3 inches; fly wheel, 42 x 6 inches, and weight of same 1150 pounds; speed of fly wheel, 80 revolutions per minute; thickness of bolster, 3 inches, and round hole in same 71 inches; pressure safely exerted by ram, 52 tons; maximum dismeter of work, 7 inches, and depth 2 inches; maximum blank diameter, 11 inches. This machine is built with a frame so mounted upon its lega as to be quickly inclinable to any desired angle by a convenient geared ele-

vating screw and proper clamping nuts for securing the same. The spring ram lifter is arranged with an equalizing lever so that the lifting is practically equal all the way up, together with a positive lifting device connected with the pitman so that the cams cannot leave the rollers in case the spring lifter should fail. The ram has a very large hole for deep punches to pass into, and yet has solid metal whereto upper dies may be fastened by the hooked clamps provided, together with a plunger having a large and long hole for shanks of punches, with a locking arrangement which moves them positively up and down, but allows sufficient play so they may enter their dies accurately and centrally, while at the same time leaving room to put in bushings to fit various odd punches which may be required. The bolster is provided with a deep and heavy truss ex-tending down into the bed of the press so that it may remain perfectly flat and yet can be tipped slightly out of level at its different corners by four sliding wedges driven by screws and nuts, while at the same time its thin and elastic edges are firmly clamped to the bid, thus enabling dies to be accurately aligned to each other to prevent wrinkling of work. A pair of stay rods are furnished which can be quickly inserted in the frame, thus making the preas nearly as stiff as a straight column press upon certain occasions where great rigidity is required, and where it is not necessary to pass long sheets through sidewise, as is usually done in "throated" presses. The shaft is of forged steel with large and long journals. In an enlargement of its solid metal is mounted an automatic stop clutch of extreme simplicity, and which has its different members so interlocked with each other in the process of assembling as to require no nuts or acrews whatever-these being objectionable in a device of this kind where the tendency is constantly to knock them loose. This clutch is provided with a loose. This clutch is provided with a safety lock which can be so manipulated as to prevent the press from starting while dies are being set, &c. A new feature consists in a so-called "brake plate," carrying the tripping device, which is adjustable around the shait's axis, thus allowing the clutch to be tripped either earlier or later than the normal, to accommodate itself to varying degrees of momentum dependent upon the conditions of speed, lubrication, extra weights upon the shaft (as cams, gears, pulleys, &c.), and other circumstances which usually have to be controlled entirely by a brake. thus in many cases losing a large amount of power. To the plate in question is attached an adju table brake, which, however, is usually set with but slight pressure.

In general, this machine is characterized by carefully proportioned parts, great weight and inertia in those submitted to heavy stresses, harmonious curves, heavily rounded corners, ab-sence of external ribs, case hardened bolts and nuts of large diameter, &c.

Three smaller and one larger sizes of presses of this same design are also built. The smallest weighs about 1200 pounds, and the largest about 7400 pounds, reckoned without feed attach-

ments, &c.

Any of these presses may be fitted with attachments of the general nature shown in the cut. The one in question. however, possesses certain special features of interest adapting it to the cartridge work referred to. One of these is a set of aix differential pawls upon the disk shown at the front end of each lower feed roll These are arranged to act upon a ratchet wheel of 61 teeth in such a way that each pawl governs in auceession the stopping point of the feed, thus enabling variations of feed as small as  $_{155}$  inch by reason of each ratchet tooth being virtually divided into six parts, so to speak—a fineness which could not be incorporated in the ratchet itself, as such teeth would be too small Were the for atrength and durability. ratchet to have 60 teeth it is evident that all the pawls would engage simultaneously. By adding one tooth, however, to 60, the differential effect above mentioned is obtained.

In this double roll feed attachment is shown the rack and pinion connection generally used in presses of this make, this being, it is claimed, an improve-ment upon the old system of a pitman attached to levers, Inasmuch asit allows any desired angular motion of the rolls, even more than one whole turn if necessary, thus giving a considerable length of feed. By the old system not more than about one-third of a revolution can be obtained, which, where long feeds are desired, necessitates an inconveniently large diameter of roll. rack system also permits the feed rolls, with their housings, to be adjusted bodily right and left, either nearer to or further from each other, to suit that size of the dies which must be placed between them.

The length of feed required is obtained by adjusting the crank pin in its disk as usual, this being done at the extreme left end of the main shaft. Just to the right of the crank disk is shown another pltman driven by an eccentric which works a small shears for clipping the scrap into short pieces as it comes from the rolls, thus making it very con-

venient to handle.

At the right of the press bed is shown an attachment for automatically releasing the treadle of the press from its locked down position when the strip of metal comes to an end. This is accomplished by a light, bent lever (shown extending above the right hand rolls) which rests upon the metal, but falls by its own weight when the same is not present. It thus releases a delicate catch which allows the weighted bar to drop, with the result of unlocking the treadle. A large number of an older design of press by the same makers have been running for some years in one of our cartridge factories, some of which are equipped with as many as 12 dies in a gang. They are run about 60 revolutions per minute, thus cutting

and drawing from the sheet in the neighborhood of 400,000 complete eartridge cups per day of ten hours. One operator can attend to several of them

#### A Big Magnet.

Probably the largest electro-magnet in the world has been constructed by Lieut Col. R. W. King, the commandant of the Government station at Willett's Point. It is made of an old Rodman gun, many mites of covered cable, and is excited by the current from two dynamos. Around the barrel of the gun, which is of east iron, has been wound 14 miles of insulated cable. The armature consists of six platform plates bolted together. When charged, the magnet will support five 325 pound eannon balls, suspended like a chain from the muzzle. From the New York Sun we take the following:

When the first one was hoisted within control of the magnet it aprang to the gun with a thump. As each cannon ball was moved toward the one above it, it sprang up and clung so fast that it could not be pulled away. For convenience in lifting these heavy weights within the influence of the magnet an iron pulley with { inch chain was used at first. It was found, however, that when the gun was magnetic the chain The chain and pulley were of no use. became as rigld as if it had been a bar of solid steel and was riveted to the

gun.

Another Interesting experiment that has been made with this magnet seems even more wonderful to the layman than the grip on the armature. dier standing 3 or 4 feet from the gun, with his back toward it, places an iron apike against his breast, and it stands out as straight as if the man himself were a magnet. The man then covers his chest with iron spikes until he looks like a porcupine. He feels no effect from it, and he simply has to resist the pushing of the iron spikes, which are very anxious to reach the gun. When the current is on, the whole gun carriage, which is also of iron, is charged.

Col. King has plotted out the lines of magnetic force from the muzzle of this gun. A table was placed in front of the gun and on this were placed a nunber of small pieces of wire. When the gun was magnetized he found the general direction of the curves of the magnetic force from the way in which the

wires poin'ed.

With its earriage this Rodman gun welghs about 80,000 pounds, and when it was all magnetic there was a good deal of speculation as to the radius of its appreciable influence. Col. King settled speculation on this subject re-He placed light compasses at cently. various distances from the gun before it was magnetic. They were set with the indicator pointing to zero. The electrical current was then turned on, and the big gun became a magnet. Its power was indicated by the compasses. Col. King found that at a distance of 71 feet the magnetism of the gun equalled that of the earth, and that the indicator was deflected 45 de-

At the distance of 200 feet the needle was deflected only three degrees. This should set at rest the fears of foreigners that compasses on vessels six miles away could be disarranged.

Recent rich gold strikes at Leadville, Col., are creating great excitement in that mining town.

## ROOFING AND CORNICE.

#### Conductor Heads .- 1.

BY CORNICE WORKER.

The variety of designs which may be produced of leader or conductor pipe heads is so large as to be practically without limit. Some of these designs

and pattern for the rear of the head. The three plans and elevations are not necessary in obtaining the patterns, but are given in order to make clear every step taken. All that would be necesary in obtaining the patterns would be the plan and elevation shown in Fig.

Fig. 1, represent the plan of the head, corresponding to K L M N of the elevation, and E the plan of the leader, corresponding to O of the elevation. As the profile of the head, shown by N M of the elevation, contains no curve and all lines are straight, only

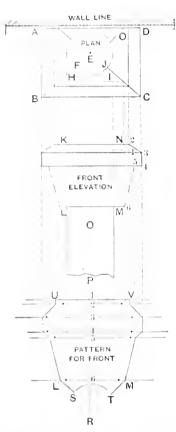

Fig. 1.—Plan, Elevation and Pattern for Leader Head with Round Pipe.

Fig. 6.—Appearance of Properly Flanged Tube or Pipe.

Fig. 7.—Improperly Flanged Tube.

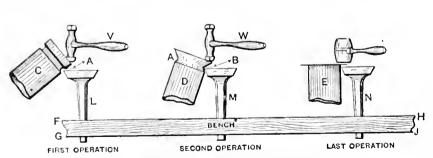

Fig. 5.-Method of Flanging the Round Pipe or Tube.

Fig. 9.—View of Leader Head Indicated in Fig. 1.

CONDUCTOR HEADS.-ILLUSTRATIONS SHOWING DEVELOPMENT OF PATIERNS.

are presented in the illustrations given herewith, as are also the methods of laying out the patterns. In Figs. 1, 2 and 3 are represented the methods of obtaining the patterns for a plain leader head, the first illustration representing the plan, elevation and pattern for the front, the second showing the plan, elevation and patterns for the sides, and the third figure the plan, elevation

1, and knowing how far the head projects over the wall line, as indicated in plan from D to C, or A to B, the front pattern would be used to mark the cut for the sides, and for the flat head in the back, indicated in the plan from A to D, the front elevation shown by K L M N would simply be pricked through onto the metal. Now, to make each step clear, let A B C D,

the corners of bends are numbered, as indicated by 1, 2, 3, 4, &c.

For the pattern of the front, corre-

For the pattern of the front, corresponding to the front elevation, preced as follows: At right angles to L M of the elevation draw the stretchout line P R, upon which place the stretchout of the profile N M of the elevation, as shown by 1, 2, 3, 4, &c, on the stretchout line P R. At right angles to P R,

and through the small figures, draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn from the amall figures in the elevation at right angles to I. M. A line traced through these intersections, as shown by U V L' M', will be the pattern for the front.

To obtain the pattern for the lower bend 6 M, as shown in elevation, Fig. 1, proceed as follows: Where the bottom of the head intersects the leader

represent the plan of the pipe or leader, corresponding to O of the side clevation. It will be noticed the plan and elevation of the side corresponds to that of the front, with the exception that it is viewed from the side in Fig. At right angles to L M of the side elevation, Fig. 2, draw the stretchout line P R, upon which place the stretchout of the profile K L of the side elevation (which also corresponds to M N of the front elevation Fig. 1), as shown

right angles to C B draw the dotted line X I, intersecting the wa'l line, as shown. Now take a duplicate of F X 1 J in plan, and place it in the pattern as shown by L M T S, which completes the pattern for the sides. have been allowed on pattern as shown by the dotted lines, and the small dots indicate the bends.

In Fig. 3 is shown the plan, elevation and pattern for rear of head, which corresponds to the plan and elevation shown

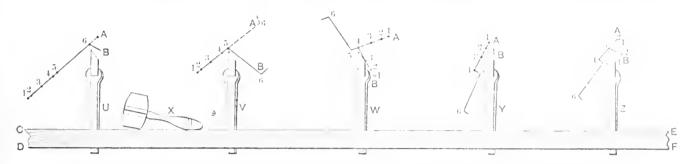

Fig. 8.—The Five Operations Necessary in Bonding on the Hatchet Stake, with the Millet, the Leader Read Indicated in Fig. 1.

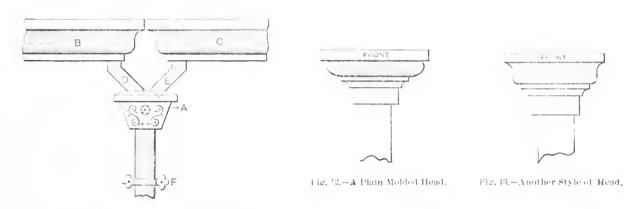

Fig. 10.-Showing Manner of Using the Leader Head.

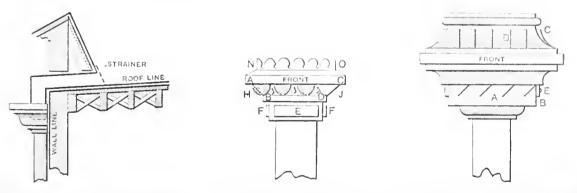

Fig. 11.—Section Showing a Valley Connected to an Elbow Passing through the Wall of a Building into a Leader Head.

Fig. 14 -A More Ornamental Leader Head.

Fig. 15,-A Still More Elaborate Design of Head.

#### CONDUCTOR HEADS, -DESIGNS AND METHODS OF EXECUTION.

head, as at M 6, draw upward from the by the small figures on the atretchout plan by I O and cutting the miter line J C at I. From the intersection I and at right angles to D C draw a dotted line cutting the miter line F B at H. Now take a duplicate of H I J F and transfer it to the pattern, as shown by L' M' T S, which completes the pattern. The small dots shown on the pattern indicate the bends.

For the pattern of the aides of the head, proceed as follows: Let A B C or bend 6, in the side elevation, draw a D of Fig. 2 represent the plan of the head, corresponding to the side elevation of the head, corresponding to the side elevation with the miter line C F in plan at tion shown by K L M N, and let E X. From the intersection X and at

bend 6 a dotted line, represented in the line P R. At right angles to P R and through the small figures draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn from the small figures in the profile of the side elevation at right angles to L M. A line traced through these Intersections, shown by L' M' V U, will be the required pattern.

For the pattern of the bottom bend, 6 L, proceed as follows: From the point

in Fig. 1, except that the plan and elevation in Flg. 3 are viewed from the rear. A BC D of Fig. 3 represent the plan of the head, corresponding to K L M N of the elevation, and E in the plan shows the pipe or leader, corresponding to O of the elevation. For the pattern for the rear of head, simply prick through the rear elevation direct upon the metal, by means of a scribe awl or prick punch and hammer, and the result will appear as shown in pattern by U V M' L'. Now, from the corner L in the rear elevation draw a dotted line upward at right angles to L M, cutting the miter line H F and the rear line D A in plan

at II. Draw a line from II parallel to D A cutting the miter line I J at I. Take a duplicate of II 1 J F in plan, and transfer it as shown in pattern by L' M' TS, which completes the pattern. The dots on the line L' M' in pattern indicate the bends. This completes the entire set of patterns required for the leader head shown in front, side and rear elevation in Figs. 1, 2 and 3; and these patterns could be used whether the leader was square, round or cetagon. The only change required on the pattern, providing the leaders were square or octagon, would be that the curve shown in the three patterns by S. T. would be a straight line for that given eize of square leader, or a portion of an octagon in shape for the given size of an octagon leader.

#### Sizes of Heads.

It is usual to make different sizes of heads to correspond to the different diameters of leaders used. The following will give a good proportion of the sizes of the leader heads used in connection with leaders of different diameters:

Diameter of																opening
leaders, in								ŧ.	)	ľ	1	ì	e	ad, i	$\mathbf{n}$	inches.
inches.													٠	ide.	F	ront.
3													,	416	X	512
4													,	ຸ່ບັ	X	7
5														616	X	8
6			ì											. 8 ~	X	9

#### Preparing and Flanging the Tube.

The patterns having been cut for the head, the next step is to prepare the tube, which is to be soldered into the head. Tube is usually made about 6 inches in length, and the diameter a little smaller than the size of leader used, so that the tube will easily slip into it. After rolling the tube, and soldering or riveting it, a flinge not less than & inch should be stretched upon it, which in turn is soldered to the leader head. In stretching any flange it is usual to run the pipe through the turning machine, thus giving the article a small groove, which guides the workman in stretching, and does away with the sharp corner, which is not necessary in work of this kind. In Fig. 4 is shown the appearance of a round tube after passing through the turning machine. It will be noticed that the groove A is dented inward, and in stretching is laid against the corner of the square stake shown at C of Fig. 5, thereby enabling the workman to have an even flange, as before explained. Fig. 5 shows the proper method of flanging a round tube. F G H J represent a wooden bench or bench plate; L, M and N, the square stakes; C, D and E, the tubes; V and W, the stretching hammers; and X, the wooden mallet. After the tube C of Fig. 5 is run through the turning machine, Fig 4, the groove in the tube is placed upon the square stake, as shown in Fig. 5, in the first operation, and with the use of the stretching hammer V, and gradually turning and striking the tube alternately, the flange is drawn out or stretched as much as is indicated by the arrow line  $\Lambda$ ; bearing in mind that the force of the blow should be the same at every stroke, or else the profile of the opening of the tube will not be a true circle. Now take the tube C and place it as shown at D in the second operation, striking and gradually turning the tube alternately, using the same stretching nam-mer as shown at W, until the flange is drawn out or stretched as indicated by the arrow line B. Finally, take the tube D and place it as shown at E in the last operation, and with the use of the wooden mallet X level the flange

until it has the appearance shown. Fig. 6 gives a perspective view of the same tube flanged out by the foregoing method, which is the proper way of doing work of this kind, the stretched flange being shown at A. In Fig. 7 is undicated the improper method of flanging the tube by means of notching with the shears and bending, the improper flange being shown at A.

#### Tools Required.

The turning machine, square stake, bench plate and stretching hammer, above referred to, can be purchased from wholesa'e dealers in tinners' supplies, the turning machines costing from \$8 to \$11, according to size, and the square stakes from \$2 to \$4. The bench plate is not necessary if the holes are properly cut into a solid bench, although the plate comes very handy, because it contains the different size openings required for different tools. The bench plate can be obtained in two sizes, costing from \$2 50 to \$4. Stretching hammers are usually sold by the pound or according to the size required, with or without handles.

#### Forming or Bending the Leader Head.

In Fig. 8 is shown the method of forming upon the hatchet stake with the use of a mallet the leader head represented in Fig. 1. Let C D F E represent the bench, U, V, W, Y, Z the hatchet stakes and X the wooden mallet. Let A J in the first operation represent one of the sides of the leader head shown in Fig. 1, the small figures on the line A J being similar to those on the two patterns shown in Figs. 1 and 2. A small strip of metal should be first formed so as to see which way the molding forms best. In this case we will commence at the lower bend 6. Now notice the first operation in Fig. 8. A J represents one of the sides of the leader head and is laid against the hatchet stake U in the position as shown, on the bend 6, and A 6 is bent over until it has the angle shown in the front elevation in Fig. 1 by 4 6 M, which is indicated in the first operation in Fig. 8 by 6 B. Now reverse the side and place the bend 5 upon the hatchet stake in the second operation in the position shown. Press down upon A and make the angle 4 5 B correspond to the angle 4 5 6 in the front elevation, Fig. 1, always bearing in mind to use the mallet X to obtain a sharp corner. Now reverse the side again, and place the bend 4 upon the hatchet stake in the third operation, placing it in the position shown and holding the bend 4 firmly against the hatchet stake. Use the mallet X and make a small crease along the bend 4 by firmly striking the mallet along the bend. Press down upon A, making the angle 5 4 B correspond to the angle 543 in the front elevation, Fig. 1. Now reverse the side again, placing the bend 2 upon the hatchet stake as shown in the fourth operation and using the mallet as before explained. Make the angle 3 2 1' correspond to the angle 3 2 1 in the front elevation, Fig. 1. Now place the side of the head upon the bend 3 (rot reversing it) on the hatchet stake in the fifth operation and make the angle 4 3 2' correspond to the angle 4 3 2 in the front elevation, Fig. 1, which completes the profile as shown by 1, 2', 3, 4, 5 and 6 in the fifth operation. The pattern for the rear has only one square bend upon the line 6, as shown in Fig. 3. After the entire head is formed it is soldered together water tight, and finally the tube shown in Fig. 6 Is also

soldered in place. When finished it has the appearance shown in Fig. 9, in which A shows the laps indicated on the pattern for sides in Fig. 2.

#### General Use of the Lender Head.

In Fig. 10 is represented a front elevation showing for what purpose the leader head is employed. B and C represent two molded gutters, connected to the two clbows D and E, which in turn pass into the leader head as shown. If desired, small scrolls could be cut from sheet metal, raised from 1 to 1 inch, and tacked with solder upon the face of the head, as indicated at A in Fig. 10. F represents a sheet metal band placed over the leader hook. Fig. 11 is a sectional view showing a valley connected to an elbow, passing through the wall of a building into a leader head, which is another illustration of the purpose for which the head can be employed. Designs.

There is no limit to the number of the designs which can be produced if the tinner will exercise a little patience. In Figs 12 and 13 are shown plain molded leader heads, the patterns of which are obtained in the same manner as shown in Figs. 1, 2 and 3. In Fig. 14 is shown a more ornamental leader head, having raised panels on front and sides indicated by F E F, egg and dart molding, as shown by H J, and a small scallop cut out at the top, as shown by The scallop would be cut out and simply tacked upon the top of the head. The egg and dart molding could be purchased from dealers in pressed zinc ornaments, costing from 6 to 20 cents per foot, according to the size required. If egg and dart molding was required, the head would be bent as shown from C to D and B to A, upon snown from C to D and B to A, upon which the egg molding J and H would be tacked with solder. The panel E would be pricked directly off the elevation, and the depth of the strlp shown at F and F added to it. In Fig. 15 is shown another form of leader head more elaborate in construction. Stripping it of all enrichment D and A. we have only moldings placed in proper proportions to give a pleasing effect to the eye, thereby showing that if the tinner will give a little time to drawing different moldings, so that each member is in proportion to the other, it will be worth the time invested in case other cornice work comes to hand. The enrichments shown at A and D in the front view in Fig. 15 are simply pricked from the face of the drawing by placing a piece of sheet metal under the drawing and pricking through the triangular dentil A, and adding to it the hight of the strlp B. The small ball shown at E would be obtained from pressed zinc ornament manufacturer, and tacked with solder on the dentil as shown. The dentils would be tacked against the sides and front of the head in the position as shown. For the projections on the top of the head, prick off the section C and solder on the face edge a strip as wide as indi-cated at D. The pattern would be obtained in the same manner as shown in Figs. 1, 2 and 3. Cases may arise where the leader head is required to be octagon or round, but this will be described in another issue.

THE KINNEAR & GAGER COMPANY, Columbus, Ohio, distribute a new catalogue of metal ceilings, borders, cornices, wainscotings, &c. Half-tone engravings show a variety of designs of this sort, and brief particulars are given re-

specting dimensions and finish. Attention is also called to Kinnear's fire proof shutters, paneled on both sides.

#### Decorative Art Metal Plates.

The illustrated catalogue and pricelist sent out by Gara, McGinley & Co, proprietors of the Austin Metal Cornice roprietors of the Austin Metal Connec & Roofing Works, Philadelphia, Pa., for the year 1895, is a notably handsome publication. It is of large size, for the purpose of presenting illustrations of sheet metal work in suitable proportions. The pamphlet measures 14 x 10 inches, contains over 60 pages and is profusely illustrated. In an introductory note they mention that they are not imitators of wall paper designs, but that their metal designs are reproductions of ancient carved or molded work, and add that their product is superior to the original, both in cost and durability. The decorative art steel sheets, which are illustrated in colors, show exceptionally fine effects. Zinc centers of various designs are illustrated, the engravings, it should be noticed, being notably well executed and printed on fine paper, so that all the details of ornamentation and decoration are clearly brought out. Some 15 pages are given up to work of this The next division relates to ceiling cornices and paneling. Enriched coves of various designs are shown; likewise moldings of all sorts. Plates for side wall finish are illustrated in a variety of designs, the pictures taking up many pages of the catalogue. Samples are given of the application of the work on stairways and interiors. Sectional views are presented showing the method of applying the ceiling plate, coves and cornices. Deep molding plates are illustrated in a number of engravings, both large and small. Altogether the book is a most attractive ore, and will be much appreciated by the great and increasing number of those who use sheet metal for interior work. Another catalogue issued by Gara, McGinley & Co. relates to sheet metal fronts, cornices, bay windows, finials, weather vanes, zinc ornaments,

#### FLASHINGS.

THE YOUNGSTOWN IRON & STEEL ROOFING COMPANY, Youngstown, Ohio, manufacturers of all kinds of iron and steel roofing and siding, recently received an order calling for about 90 tons of roofing, while from the East an additional order has been secured for 70 tons, and from one of the New England States the concern have received an order for 1000 squares of curved corrugated iron. This concern have been in business only a short time, and their plant is being operated to its utmost capacity on orders already received.

L. D. Berger, Philadelphia, finding his premises on Arch street inadequate for the requirements of his increasing trade, has removed to 59 North Second street, in that city, where he will carry a much larger stock of tinners' and roofers' supplies than heretofore.

DR. T. J. O'SULLIVAN, Derby, Conn., is to erect a business block that will have metal ceilings. F. B. Munson has the contract for the tin roofing.

GEO. McLevy & Sons, Bridgeport, Conn., have contracted for slating a house at Old Mill Green, one for Marsh Bros., the new barn for D. F. Hollister and Mr. Hollister's residence on Myrtle avenue, and they are also putting the

slate on the steeple of St. Augustine's Church.

II. RAPHAEL, New Haven, Copn., will erect a four-story building that will have metal cornices.

Rnodes, Dickelman & Co., Forest, Ohio, have recently added to their manufacturing establishment a fully equipped eaves trough and conductor plant, and are now erecting an exten sive warehouse for their own use. They also propose to add an improved cornice department, in which they will manufacture finials, crestings and other sheet metal goods. The company's entire plant is now operated by gas power, and is one of the most complete establishments of the kind in the country.

THE NEW YORK IRON ROOFING & CORRUGATING COMPANY, Jersey City, N. J., report that they have lately received aome heavy export orders for their roll steel roofing. One for galvanized corrugated sheets was filled for Corinto, Nicaragua, and another for galvanized corrugated and curved sheets for arches for Mexico. Some large orders have just been filled by the firm for corrugated iron roofing from Bristol and Providence, R. I., and Norfolk, Va. The company have recently added to their new plant new machinery for manufacturing galvanized iron gutters and conductor pipes in long lengths.

The Railroad Coal Operators' Association met in Pittsburgh last week to decide upon a new mining rate to take the place of the old 69-cent rate, which expired recently, according to the decision of the Interstate Board of Arbitra-tion. The new rate was to be either 62 cents, 60 cents or 55 cen's, and the latter rate was finally agreed upon. The resolution providing the new rate declares that 55 cents shall be the rate for thin vein coal going West; for coal going East, the rate shall the same as paid by the Penn and Westmoreland gas coal companies. The resolution pledges the operators to advance the mining rate when it can be maintained in competing mines. It states that the coal trade was never in such a serious condition as now, and that the only relief is through an equitable basis for different branches, to prevent cutting below legitimate profits. The operators will demand a rearrangement of freight rates, which is one of the lead. ing features of demoralization. allow Pittsburgh the benefit of her natural advantages the railroads must establish a rate on the mileage basis, measured by the coal producing districts. Giving the thick vein coal the same rates West, without allowing the thin vein coal to go East on the same terms, works to the disadvantage of the Pittsburgh operators, as the thick vein operators have a lower freight rate East and a lower mining rate.

A test of the strength of a 3 inch concrete floor, reinforced by a sheet of expanded metal embedded in it and hooked over the beams, was made December 15 by the Expanded Metal Fireproof Construction Company of New York, in the New Salvation Army Building on East Fourteenth street, New York. The floor is flat, but reinforced at intervals of about 5 feet by channel iron arches (laid with the flat side underneath) resting upon the lower flanges of the floor beams. The channel is filled with concrete and the

haunches of its arch filled in with concrete to the floor level. On a section of floor midway between the arches and beams, 12 inches square, a load of 3800 pounds of pig iron was piled without causing deflection or fracture, the test being discontinued on account of the falling over of the pile of pig iron. The expanded metal, as illustrated to cur issue of December 7, 1889, consists of a sheet of soft steel, slashed and opened out, forming a sort of net, with thin, deep meshes on edge.

The Best Material for Boiler Tubes. - A Committee of the American Railway Master Mechanics' Association, of which T. A. Lawes, of Indianapolis, is chairman, has sent out the following list of questions relating to boiler tubes: 1. What is the best material for locomotive tubes? 2. Please give your reasons for this preference. 3. In ordering tubes, do you furnish specifications? If so, please send a copy of same. 4. In your opinion, would a tube made of a fair quality of material, combined with a safe end made of a good quality of material, answer for all practical purposes? 5. What is the maximum length of locomotive tubes of different diameters? 6. What should be the thickness of metal for tubes of different diameters? 7. How often may tubes be pieced out with advantage and safety? 8. When and for what causes should tubes be coudemued? 9. How do you test tubes and safe ends? 10. In making specifications for tubes, is the effect on them of the water used taken into consideration? 11. Describe your methods of fastening tubes at front and back end; say whether copper ferrules, and what kind of tools are used for calking and turning over the ends of tubes.

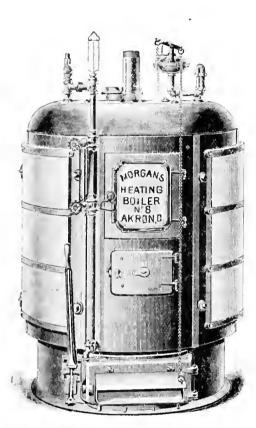

The General Electric Company are now building at their Schenectady works one of the largest alternating current generators ever constructed. The gengenerators ever constructed. The generator is to be installed at St. Louis, Mo., in the station of the Edison Elac tric Illuminating Company, and will supply current for incandescent and arc lighting and for motor service. The generator is of 800-kilowatts capacity, has 80 poles, and is to be driven by a Hamilton Corliss engine at 90 revolutions per minute. On account of the great size of the frame difficulties were to be expected in producing the castings, but thanks to the facilities of the Schenectady works, no trouble was experienced in pouring even the large frame casting shown. This single large frame casting shown. piece, made up in part of wrought iron embedded in the castings, weighs 35 tons and measures 24 feet over all. The armsture is iron clad and is 16 feet in diameter, weighing nearly 100,000 pounds. The armsture will be supported on a 22 inch shaft. The completed generator will supply, when at full load, 667 ampères at 1,200 volts, equivalent to 16,000 16-c. p. lamps. In connection with this it should be stated that the great size of the generator was necessitated by the requirements under which the machine is to be operated, chief of which is the low speed of revo-

The Massillon, Ohio, district miners' organization issued a statement on Saturday that the miners accepted the recent award of the Board of Arbitration under protest, reserving the right to ask for a new settlement when opportunity offers.

## STEAM AND HOT WATER.

The Morgan Surface Feed Steam Boiler.

We show in the accompanying illustrations the Morgan surface feed steam boiler put on the market by the D. F. Morgan Boiler Company, with factory at Akron, Ohio, and western branch at feetly capable of doing. The products of combustion pass into a revertible flue, and, during their passage downward over the baile plates are cooled, by coming in contact with the colder water at the bottom of the boiler, to a tempera-ture between the heat of the main steam pipe and the lesser heat of the main rethem themselves in view of their increasing business. They have accordingly bought ground in the western part of Detroit, on which they are erecting fac-tory buildings which include a foundry about 100 x 200 feet; machine shop 50 x 175 feet, and warehouse 50 x 70 feet, above which will be the offices.

Morgan Surface Feed Steam Boiler .- Fig. 1. - General View of Boiler.

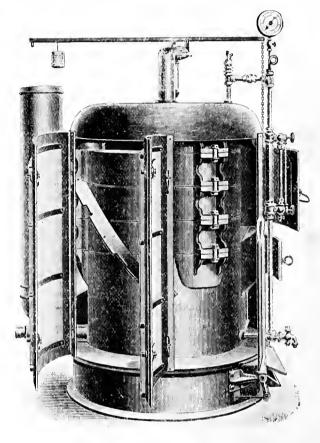

Fig. 2.-Side View with Doors Open.

23-25 West Lake street, Chicago, Iil. A general view of the boiler la illustrated in Fig. 1, showing the fire and clean out on Fig. 1, showing the fire and clean out door for interior aurfaces and the front and alde doors for cleaning exterior aurfaces, ash pit door, &c. Fig. 2 gives a side view with all the doors open, showing the accessibility for cleaning exterior aurfaces, and also showing the ordinary arrangement of baille plates as aultable for flues of low velocity of draft. The baille plates, however, for drafts of high velocity can be arranged horizontally, so as to increase the resistance and delay the travel of the hot gasea. A general view of one of the boller sections in shown in Fig. 3. It is pointed out that the openings between the arms are of greater area than the arms themselves, thus allowing radiant heat from the fire to penetrate to the dome and also give space for the ignition of all the unburned gases. The principal claims made by the manufacturers for this boiler are, that all fire surfaces can be readily cleaned, after the boiler is set complete, by awlnging back the outside casing and opening the doors to the interior, this being a work that an ordinary servant is per-

hood to the chimney flue. This, it is said, effects a very great saving. The easa with which the boiler can be cleaned, that there is no danger of the company

turn pipe, before escaping through the | The buildings are arranged so that they hood to the chimney flue. This, it is | can be extended when necessary, and

the manufacturers point out, makes it particularly well adapted for the use of soft or bltuminous as well as anthracite

THE UNITED STATES HEATER COM-PANY, Detroit, Mich., who have heretofore had their heaters manufactured under contract, have decided to make finding themselves cramped for room in the future. Their new premises will be located on the Wabash Railroad near the Fort street electric street railway, and but a few blocks from the Detroit River.
The main shop is under contract to be completed by January 1, and the other portions of the plant will follow later on, but it is not planned to remove the effice from Randolph and Congress streets until May 1. We understand that in addition to their line of ateam and hot water heaters the compauy will bring out the Capitol warm air furnaces.

#### The Magee Water Heater.

We show in the accompanying illustrations two views of the Magee Water Heater that has just been brought out by the Magee Furnace Company of Boston, Mass. The manufacturers have been experimenting with it during the past year, and, having been fully satisfied with its work, are placing it on the market and intend to give it such prominence among the trade as its merits deserve. Fig. 1 is a general view of the heater, showing its exterior appearance, while Fig. 2 is a sectional view illustrating the location of The circulation, it waterways. will be noticed, is vertical, A A representing the waterway in the lower section, C C the upper section, D D the inner waterway and F F the hollow cross section through which the water flows from the lower section to the inner water chamber. It is partieularly noted that a large part of the heating surface is presented to the di-

ber, parallel with the outer one, and which is said to add very much to the heating power. The principle of the dash yellows and the ash pit also is large and roomy. The heater is easily eleaned, doors for the purpose

feature is the inner circu'ating cham- | sufficient to hold fire for 12 hours with-

being located as shown at H H of Fig. 2.

#### Pressure Hot Water Heating.

BY LISTENER.

Those who are not thoroughly acquainted with hot water heating are apt to be favorably impressed with the pressure system of hot water heating, particularly as a general opinion prevails that the house can be heated by this system at a somewhat less expensive outlay for the plant. An experienced fitter made the remark that if a house required 500 square feet of direct radiation with water at 180° it is possible that a saving of 40 per cent. of the radiation would be made by using a pressure system that would heat the water up to 250°, but insisted that a boiler of the same size would be required in either case and that in all probability more coal would be required in the pressure He gave as a reason that with system. He gave as a reason that with a brisk fire a high temperature would be maintained by the fire and that the water returning from the open system would be at a low temperature, and consequently absorb more heat from the fire and leave less to pass to the chimney than if it came back at a much higher temperature, as it would from the presa-It has been observed by ure system. practical men that a much more careful

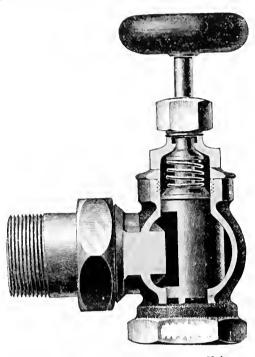

The Magee Water Heater,-Fig. 1.-General View.

rect action of the fire, and it is furthermore pointed out that the surfaces are so arranged that there is practically no horizontal circulation. The distinctive | The fire pot is deep and of a capacity

indirect draft is employed in the heater as well as the Dockash grate, both being features of all Magee goods. job of piping is necessary with a system of water under pressure than with an open tank system. It is further believed that water under pressure is much more erratic in its circulation. The general opinion of those who have had the lougest experience with both methods of water heating is that the pressure system has no advantages to recommend it and may be the cause of considerable disaster.

It is argued by some that if a man desires a high temperature system under pressure, steam is less likely to explode or burst, and is more desirable.

Recently, on a heating plant the steam registered a pressure of 45 pounds when the safety valve was set to blow off at 12 pounds, and on noting the high pressure indicated by the gauge the valve was examined and it was found that corrosion had fixed its seat permanently and that considerable power was required to release it. The owner of a building who was looking for a heating plant, in speaking to one of his friends whom he preferred to have do the work, but whose bid for the job was considerably above another bidder in price, told him that the con-

Exeter Hot Water Union Radiator Valve.

If a system worked under pressure should burst, an apartment is at once filled with steam, from the fact that water at a temperature anywhere above 212° will make steam on being liberated, and if at a temperature of 250° will have a much greater expansive power on being liberated than steam at the same temperature, and fill a greater space. In a dwelling the paper on the walls, the books that may be in the room, or any of the articles of furniture that may be affected by steam are likely to be severely damaged.

As a rule, an expansion tank is placed on a pressure system, which is more properly called an air chamber, and when correctly proportioned such an air chamber should have a capacity to hold at least one twelfth as much as the system contains of water. In filling the system, as soon as the water reaches the level of the bottom of this air chamber it should be shut off and the air chamber hermetically sealed, with a safety valve placed at the top. Then, as the water expands through the heat it compresses the air in the air chamber, and the system is under pressure and the water is heated to a higher temperature accordingly. The safety valve on the top of the air chamber is weighted to maintain a pressure as desired. The value of the safety valve largely depends upon the material used in its construction. The United States Government requires that all safety valves used on any apparatus in the Government service shall have nickel seats to prevent the valve from becoming stuck in its seat by corrosion. The safety valve used on the average heating plant is made of some alloy of brass.

tract was his if he would meet the price which was mentioned, and was about \$200, or 20 per cent. lower than his. The friend argued that the plant could not be installed to heat the house for the money, and that if he could get it done to go shead and no hard feelings would result. A pressure system was installed with the air chamber, in which was fixed a safety valve set at 60 pounds and from which a 1 inch overflow pipe ran to a sink in the kitchen, so that in case of heavy firing, the pressure being excessive, it might be detected by the water flowing in the sink and arrange-menta made to check the fire. The heating plant was fed with water from the city water supply, lead pipe of A A A gauge being used for the purpose, a heavy joint being wiped on the brasa nipple which connected with the boiler A stop cock was placed in the lead pipe a few inches from the boiler. After the system was filled the stop cock was closed, and one night after everybody was asleep, the weather moderating and the fire having been fixed for more severe weather, an excessive pressure was developed and, as a result, the lead pips between the brass nipple and the stop cock swelled to abnormal propor tions and finally burst, draining the whole heating plant of water. Fortunately considerable noise was made in doing it. After learning the cause of the trouble, this heating plant was remod. eled to one of the open tank character.

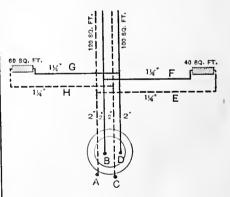

The reprehensible practice has been followed in some cases of overloading the safety valve, so that the water may be raised to a higher temperature to make up for insufficient radiation in some room.

## Exeter Hot Water Union Radiator Valve.

The Exeter Machine Works, 32 Oliver street, Boston, Mass., are putting on the market the Exeter quick opening hot water union radiator valve, a broken view of which is shown in the accompanying illustration. This valve is referred to as having all the merits of self packing, so the stuffing box can be packed at any time without shutting off the water. The body is heavy, symmetrical and of the best steam metal, consequently it is said there is no danger of twisting it to picces while connecting. The disk is cast brass, with by-pass to insure circulation. The general features of the valve will be understood by inspecting the cut. The valve is made in five sizes, from 4-inch to 2 inches, and in various finishes.

#### A Heating Problem.

From T. F. C., Port Henry, New York.—Please place the following inquiry in The Metal Worker. I submit a diagram of a part of a heating ayatem that gave trouble. The lines A and B show return and flow pipes, 2 inches in size, with 1½ inch branches to a 40-foot radiator, shown by the lines E and F, taken from the top of the main in a proper manner. The mains A and B continue on and supply two more radiators, containing 120 feet of surface. C and D are other 2-inch flow and return mains, from which the 1½-inch branches G and H are taken to a 60-foot radiator. In the pipes G and H is where the job fails to work. The mains C and D continue on and supply two radiators, containing 100 feet of surface. In firing up the system all pipes become hot, A and B working in fine style, but C and D become cold after supplying the first 60-foot radiator, and there the return becomes hot and acts as though it was the flow. This is the way I found the job. I would

A Heating Problem.

like to hear from the readers of The Metal Worker where the trouble lies and how to correct it.

#### HEATING NOTES.

A FOLDER issued by the Niagara Radlator Company of Buffalo, N. Y., with works at North Tonswands, N. Y., is a neat little publication that will be appreciated by the steam fitters and friends to whom it is addressed. Illustrations of the radiator are presented and a few particulars given of its construction, as well as the radiating surface per loop.

THE A. J. BENNETT PATENT RADIATOR ATTACHMENT COMPANY, Woonsocket, R. I., issue a neat price-llst of

the Comfort foot rest, of their manu-There are two notable things facture. about this list, the more important being that it announces a reduction in price of the Comfort foot rests on and after January 1. A table gives prices of the different parts in various finishes. The other notable thing about the announcement is the style of its presentment, being printed in gold upon a black card, giving a very handsome effect. In explaining the reduction in price they say it is not on account of poor sales, but because they are satisfied that the former list was too high and they are now prepared to manufacture the goods cheaper than heretofore. The circular may be had on application to the company.

THE FOWLER RADIATOR & MFG. COMPANY inform us of their intention to move their main office from 435 North Broad street, Philadelphia, to their radiator works at Norristown, Pa., on February 1.

A STRIKING ADVERTISING CARD is being distributed by the Cincinnati Screw & Tap Company, Cincinnati, Ohio. The 26 letters of the alphabet, printed in red, begin as many statements of this company concerning their product and the quality of their goods.

THE HOME HEATING & LIGHTING COMPANY of Toledo, Ohio, were incorporated by Homer T. Taryan, R. W. Smith, Irving B. Hiett, E. L. Barber, W. B. Geroe and J. F. Zahm. The capital is \$30,000.

THE F. W. LAMB COMPANY have been incorporated at Chicago, with a capital stock of \$20,000, for the manufacture of ateam and water warming apparatus. The incorporators are Eugene Garnett, Howard M. Carter and William Garnett, Jr.

THE W. H. PAGE BOILER COMPANY, Norwich, Conn., call attention to the omission of the address of their New York house, Dubois & Darrow, 61 and 63 Gold street, in the article describing the All Right and Volunteer boilers in The Metal Worker, December 15.

JAMES A. HARDING writes us from Vineyard Haven, Mass., that he has made an engagement with the Paul Steam System Company of Boston, Mass.

AT A MEETING of the Board of Managers of the American Society of Heating and Ventilating Engineers, on Wednesday evening, it was decided that the opening of their first convention should be on Tuesday evening, January 22, 1895. This arrangement is made in order to give out of town members a better opportunity to reach New York. It is probable that the president's address will be read at this session and that the other sessions will be in the afternoons. Communications to the society should be addressed to Post Offica Box 1818, New York.

The Standard Radiator Company, Buffalo, N. Y., have opened a branch house at No. 206 Centre street, New York City, in charge of John I. Leitch. C. F. Gessert, 42 Dey street, who has handled the Standard goods in this market as a jobber, will, however, continue to do so, having, we are advised, contracts with the company for 1895.

The British Columbia scaling vessels have made a record catch this year, bringing in 95,000 skins, valued at about \$1,250,000. Last year's catch did not exceed 70,000 skins.

#### SCRAP.

THE BRITTON ROLLING MILL COMPANY, Cleveland, Ohio, advise us that they have absorbed the Cleveland Tin Plate Company, purchasing their machinery and their trade-mark, "Buckeye." They have now a complete plant for the manufacture of tin plates, equipped in the best possible manner with all the latest improvements. The company will manufacture both bright and roefing plates in all grades, and will roll their own black sheets. They have two tin mills now in operation and two more in course of construction. Their plant will probably start up shortly on a non-union basis.

BLACK DIAMOND TIN PLATE WORKS, 51 and 53 Laurel street, Philadelphia, Henry W. Scattergood, proprietor, are running full with four improved tinning machines of home design, which are reported to be very efficient.

THE ERECTION of the tin plate plant of the Montpelier Sheet & Tin Plate Company, at Montpelier, Ind., is reported to be progressing satisfactorily under the direction of Superintendent Harry Herbert. The machinery is being rapidly installed, and the company hope to have their works running by February 1.

WALLACE, BANFIELD & Co., Limited, Irondale, Ohio, have about three-fourths of their plant in operation with nonunion workmen, and expect to have their entire works running on a similar system by the first week in January.

THE GREAT WESTERN TIN PLATE COMPANY of Chicago have leased the Joliet Sheet Rolling Mill Company's plant, at Joliet, Ill., which has been idle for the past year. They will commence the manufacture of tin plate there in the near future.

CHICAGO TIN PLATE MFG. COMPANY of Chicago have gone out of existence. The company were dippers of black plates.

THE TIN PLATE WORKS now being erected at New Kensington, Pa., by Goldsmith & Loewenberg are progressing rapidly. It is expected that they will be in operation by March next. The concern will incorporate under the title of the Pennsylvania Tin Plate Company.

THE TIN PLATE PLANT now being built by the La Belle Iron Works, Wheeling, W. Va., will be ready for operation about April 1.

A DISPATCH from Elwood, Ind., to the Cincinnati Commercial Gazette atatea that a large tin plate factory has been secured for that city, which will employ 300 men and manufacture 3000 boxes a week. The company, who are capitalized at \$200,000, are officered as follows: President, George L. Rouse, St. Louis; vice-president, J. H. De Hority, Elwood; treasurer, C. C. De Hority, Elwood; treasurer, Edwin F. Stevens, Elwood. The plant will be thoroughly equipped to manufacture the black plate from steel billets, and take the sheets through all the different processes until it is finished tin plate. The rolling mill department will, it is claimed, be the largest in the State.

THE ATLANTIC STEEL & TIN PLATE COMPANY, Atlanta, Ind., will have four of their eight tinning pots and three black plate milla, with a daily capacity of 450 boxes, in operation by January 1. The company expect to make only one brand of bright charcoal, coke and terne plates, to be named "Atlanta."

THE AMERICAN SHEET IRON COM-PANY, Phillipsburg, N. J., are now opperating their new mill for the manufacture of black plates for tinning and stamping purposes.

THE ELLWOOD TIN PLATE COMPANY, Ellwood, Pa., are seeking a large number of non-union workmen, including rollers, doublers and heaters, for their tin plate mill.

ALL THE OLD FASHIONED tin and terue machines at the works of the Phillips Tin Plate Company, Philadelphia, have been replaced by the Newbold Phillips automatic adjustable machines, by means of which a much finer finish is said to be given to the plates, while the product is doubled. The old style plekling vats are now being removed to give place to an automatic Newbold pickling machine, from which crates will be run overhead to each set.

THE LEWIS FOUNDRY & MACHINE COMPANY, Pittaburgh, Pa., have just finished shipment of all the machinery for the rolling mills of the Atlanta Steel & Tin Plate Company, Atlanta, Ind. This machinery is in all probability the heavlest ever placed in a tin mill, and the Atlanta company express themselves as being well pleased with the character and appearance of the work. The rolling mill building of the Atlanta Steel & Tin Plate Company is about completed. It is of iron, 80 x 300 feet in area.

THE National Labor Tribune, Plttaburgh, Pa., desires, says the Cincinnati Commercial Gazette, to correspond with tln mill rollers, doublers, heaters, machinists and blacksmiths who may deaire to take stock in a new co-operative tin mill soon to be started.

THE PLANT of the Ellwood Tin Plate Company, Ellwood City, Pa., has been put in operation with non-union men. At this writing the firm have from six to nine crews working and do not anticipate any serious trouble in getting sufficient skilled labor to operate their plant to full capacity. It is stated there is a very strong disposition among former union men to acknowledge their defeat and take positions in non-union mills away from their former location.

THE DEADLOCK in the Welsh tin plate industry continues. Seventeen manufacturers held another meeting, at Swansea, last week, at which they unanimously decided that unless the men accepted a reduction of 20 per cent. in their wages, they would be compelled to close their works at the end of the year. Late advices indicate, on the other hand, that many of the makers seem inclined to play for their own hand and make the best terms they can with their workmen.

A SHIPMENT of 545 tons of the plates, valued at over \$30,000, left Glasgow, Scotland, last week in a sailing vessel bound for Victoria, British Columbia. These plates will be used for packing salmon at the canneries on the Fraser River.

Immigration into the United Statea during the year just closing, judging by the reports of the Bureau of Statistics for the first 11 months, will be barely 250,000, or not more than half the average annual immigration for the past 25 years. So far, this year's immigration has been 233,890, as against 480,270 for the 11 months of last year ending November 30. The recent condition of depression in trade and industry is accountable for the falling off.

## PLUMBING and GAS FITTING.

## English and American Plumbing.

It is interesting to read the following remarks on the practice of plumbing bere and in England, that appeared in a recent issue of the London Decorators' Gazette:

Although one need have no hesitation in saying that in no other countries in the world has sanitary plumbing been brought to a greater state of perfection than in England and America, it would, however, entail a considerable amount of risk, probably, to attempt to decide which of the two nations takes the lead in these matters. There can be no doubt that our cousins claim the credit of "licking creation" in this as in most other things which they take in hand, and if we are to judge by the get up of many of their very elaborate sanitary fittings there is much to be done yet in England before it can be said that we are keeping pace with the Americans.

So far as the general systems adopted by each country are concerned, it is very remarkable to notice how the one differs from the other both in principle and practice; and more especially is this the case in the materials used for carrying out plumbers' work. Although the title of plumber is derived from the material with which he is supposed to be most familiar, were it not for the fact that the American workman inherited it from his English progenitors it would have but little meaning on the other side of the Atlantic, for, as compared with English plumbing, lead plays but a very insignificant part in American plumbera' work. Certainly some years ago lead was used to a considerable extent for waste, ventilating and service pipes, but of late years iron, copper and brass seem to have almost completely taken its place, while for roofing purposes it never appeared to commend itself to the architects of American cities.

Some few years ago there was some indication of a movement in this country, with the object of substituting iron for lead in first-class plumbers' work. Iron has, of course, been used very extensively in different parts of the United Kingdom for most of the purposes for which lead is used in plumbers' work. But it has almost invariably been regarded as simply an economical method of doing work on account of the iron being cheaper than lead. Not that it really is so when the work is done substantially, because when iron is used of a proper weight, having some sort of protective material to prevent rapid oxidation, and suitable fittings and connections are provided, it has been found that one material is not any more advantageous, from a financial standpoint, than the other. The result is that the use of iron soil pipes, for instance, on what is considered first-class work is now comparatively rare. In fact, the demand for lead in sanitary plumbing work in this country is undoubtedly greater than ever, notwithstanding the many objections which have been urged against its use. While no one can deny that there is a certain amount

of danger attending its use for cisterns for storage, and pipes for the distribu-tion of water for dietetic purposes, yet if it were decided to no longer use it for this purpose it would not materially affect the demand for lead, considering the many other parts of the work where it can be adopted with decided advantage. With regard to roof work, although z'nc at one time seemed to threaten to drive it out of the market, it still holds its own in all classes of work above what may be termed small property It must, however, be pointed out that recently a more expensive ma terial has become a rival to lead for roofing metal. Copper has been so extraordinarily cheap during the last few years that in several instances the coppersmith has ousted the plumber, and has laid copper in gutters and on flats of a substance, which, although much lighter than lead, is calculated to prove the more durable metal, and at the same time at less cost per foot. Many years ago copper was used to a very large extent on large and important buildings, where expense was no object, with excellent results, as many examples testify at the present day. But in those days, while lead work was less expensive, it was always looked upon as a substantial and particularly suitable material for all parts of roof work.

#### TRAPS AND VENTS.

THE PRICE LIST issued by the James Robertson Mfg. Company, 30 Hanover street, Baltimore, Md., informs the trade that the firm have just added to their plant one of the latest improved hydraulic machines for manufacturing lead traps and bends. The circular is a nest one of a dozen pages, presenting illustrations of the various forms of traps and bends, extra long traps and extension bends, together with full price-lists of the goods.

JULIUS E. BREITHAUPT died at his home, 51 North Genesee street, Utics, N.Y., isst week, of consumption in the forty-eighth year of his age. He came to this country from Germany in 1875 and has since been engaged in the plumbing business.

J. ARTHUR FULLER has purchased J. C. Sisby's interest in the stock, good will, & ..., of the firm of Silsby & Sirgent, Sunspee, N. H., this miths, plumbers and general hardware dealers.

PETER M. MOFFAT of 181 Keap street and J. J. O'Connell of 398 Dean street, Brooklyn, N. Y., are on the new elegible list for chief inspector of plumbing, the former with a rating of 95.33 and the latter with 92.33.

Joseph Irr, accretary and treasurer of the Examining and Supervising Board of Plumbers and Plumbing, Buffalo, N. Y., recently asked Corporation Counsel Laughlin if a plumber who passed a verbal examination last year, but to whom a certificate of competency was never issued, could be required to submit to a further examination before receiving such a certificate. Mr. Laughlin has replied by stating that until the

certificate of competency prescribed by the statute is actually issued and delivered, a plumber may be required to submit to such reasonable examinations as to his experience and qualifications as the board deems proper.

H. MUELLER MFG. COMPANY, Decatur, Ill., are contemplating the building of a larger factory in order to supply the demand for their line of plumbers' supplies, which, they state, is rapidly outgrowing the capacity of their present quarters.

The Airens & Off Mfo Company, Louisville, Ky., have recently added the manufacture of plumbers' enameled iron ware to their line. They are now making a high class of white enameled bathtubs, a new industry in the South.

R. M. Wilson, manufacturer of plumbers' supplies, Rome, N. Y., has erected a new three-story building, 60 x 100 feet, as an addition to his establishment.

CHARLES O. F. YOUNGSTROM, tinsmith and plumber, has removed his business from G.endale to Phenix, Ari., in order to have a larger field to cater to, and, we understand, is already meeting with very encouraging results.

STEEL CLAD BATHTUBS, the manufacture of which was instituted by George Booth of Toronto, Outario, are now made at four factories—one at Detroit, one in New York City, one in Toronto and one in London, England—and we are advised that the average output is about 1000 per month.

The Metal Worker acknowledges the receipt of an invitation, through the courtesy of Wm. Jacobi, to the First Promensde Concert and Ball of the Master Plumbers' Association of Newark, N. J., to be held at the Krueger Auditorium, on Tuesday evening, January 15, 1895.

In the article describing the Shepherd trap in *The Metal Worker*, December 22, an error occurred in the address of the manufacturers, the Shepherd Sewerage System Company, which is at 61 Beekman street, New York. In securing the valve against the seat, a special non-corrosive locking device is used which is not shown in the sectional view that appeared.

THE CALENDAR issued by the Folding Bath Tub Company of Marshall, Mich., is an exceptionally beautiful piece of color printing. A couple of children leaning over a fence are represented in a most artistic manner, the color being delicate and the drawing good. The bunch of forget-me nots that the small boy holds in his hand has, we presume, a bearing on the wares of the Folding Bath Tub Company.

MECHANICS' SUPPLY COMPANY, Quebec. send a combined foot rule and calendar, calling attention to their line of Tools and Supplies for plumbers, gas and steam fitters. The rule is of paper, four fold, tastefully printed with imitation brass ends; having inch markings on one side and the dates of the year on the other side.

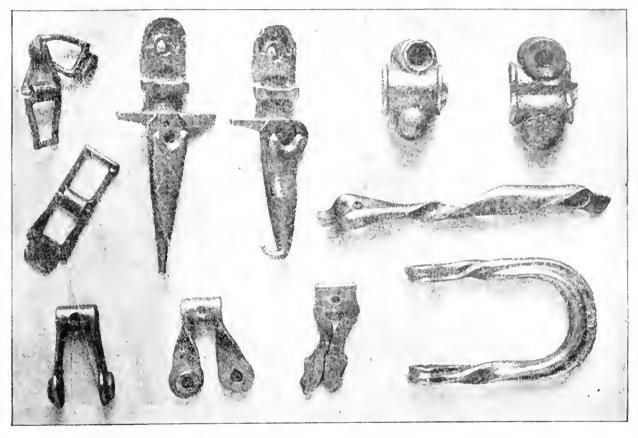

Malleable Castings from Coke Pig-Iron.

References have been made in these columns, says The Iron Age, from time to time regarding the increasing use of coke pig iron in producing malleable eastings. The prac-

point, which is that both the furnace men and the foundrymen co-operated with each other in the experiments made during the first stages of this new departure, and when it was necessary to be thoroughly satisfied upon every point.

Illustrations are presented herewith of a number of samples of malleable

ples were all hammered or twisted cold, and they were not selected, but were taken out of stock indiscriminately. These eastings contain 85 per cent, of coke fron, made by the Illinois Steel Company, for whom Pickands, Brown & Co. of Chicago are sole sales agents. They were piencers in introducing coke Bessemer to the malleable trade.

TESTS OF MALLEABLE IRON CASTINGS MADE FROM COKE IRON.

tice is not referred to as entirely new. Makers of malleable castings have for a long time experimented more or less with coke iron in the endeavor to substitute it for the considerably dearer Lake Superior charcoal iron. Nevertheless, it is but recently that coke iron has secured a substantial footing in the malleable trade. The beginning of this new growth dates back about three years to experiments made by Western malleable makers with coke Bessemer. Up to that time the attempt to use coke iron had been confined to the mixture of a high quality of foundry iron with the usual char coal brands, which sometimes gave fair results and at other times did not. But when Bessemer iron began to be introduced in the trade the good results became apparent immediately. Some little uncertainty exists as to the proper parties entitled to the credit of discovering the adaptability of Besse-mer pig iron for this purpose. The malleable foundrymen state that they first ascertained as nearly as possible the elements required in pig iron for their work, after which they began to experiment, and with the aid of the furnacemen achieved success. The furnacemen claim that they knew from their familiarity with the analysis of pig iron that coke Bessemer contained the same elements in about the same proportions as the best Lake Superior charcoal, and they, therefore, confidently pressed the former on the attention of malleable iron makers. However, there is no doubt upon the main |

castings made by the Northwestern Malleable Iron Company of Milwaukee, Wis. These castings are mainly shown in duplicate, a perfect casting being connected with one which has been

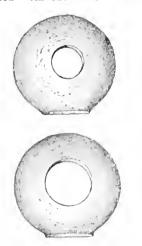

Fig. 2.—Hole Enlarged by Drifting.

aubjected to torture. It will be seen that the latter have endured very severe punishment without injury. They do not show the slightest indication of giving way at any point. The button, which has been swaged out, is considered a rsmarkable test. The hole has been enlarged nearly three times, and the dismeter of the button increased accordingly. The metal showa really wonderful tenacity. These sam-

Frederick W. Slvyer, president of the Northwestern Maileable Iron Company, who has kindly supplied these castings for our purpose, says: "We have made excellent castings wholly from coke iron, and see no reason why this is not practicable. Our experience has proved it to be so. With the cooperation of the furnaceman, and knowing the elements required, in our opinion coke iron is the ideal metal for maileable purposes. The composition of the metal we are using at the present time is about as follows: Silicon, 1.65; manganese, 0 60; phospherus, 0.00; sulphur, a trace. There are several advantagea in the use of this kind of metal, among which is a more uniform quality than we have secured with charcoal iron. Another advantage is the fact that the castings anneal more readily. With an analysis of every car of iron we receive we are enabled to handle our mixture intelligently and with uniform results. To insure accuracy we make a separate pile of each car as it is unloaded, the analysis eard being before us all the time when our mixture is being made up. After having proved the constituent elements which are necessary to accomplish the results desired, and depending on the reliability of the furnace for the analysis, we are thus enabled to produce a uniform quality of castings. We think the samples sent you, treated as they have been, should remove the prejudice which perhaps still exists in the minds of some as to the desirability of using coke iron for malleable purposes."

## THE RETAIL STORE,

The Wanted Oil Can.

Illustrations are presented herewith of a new oil can for domestic use which is being manufactured by Fred. F. Bisshown in Fig. 1, a rubber tube is used when filling a lamp from the can. Unscrewing the top of the can exposes the pump, as shown in Fig. 2. Special attention has been given to the pumping

Fig. 1 .- The Wanted Oil Can.

choff, Libertyville, Ill. The can is a system, so that the can is capable of made of the best No. 27 gauge steel, being used without any waste what-galvanized. In the can is capable of being used without any waste what-galvanized.

Fig. 2.—Use of Tube and Pump.

bossed, which is done to strengthen the body of the can, and at the same time for it durability, cheapness and econmakes it handsome in appearance. As | omy.

#### Brooklyn Lamp Radiator.

The cut here shown represents a lamp adiator, put on the market by Silver & Co., 304-310 Hewes atreet, Brooklyn, and 20 Warren street, New York. The radiator is designed to be placed on a lamp after removing the glass chimney. The radiator is described as having an incide of the street of t inside drum, which causes a forced draft of air to pass in and out between the cylinders, producing an active cir-

Brooklyn Lamp Radiotor.

culation of heated air. The top is of aluminum, removable for boiling water and for cooking purposes. Parlor lamp radiators are 14 inches high and 6 inches in diameter. For mammoth lamps the radiator is made 18 inches high and 7 inches in diameter. The manufacturers state that the radiators will comportable. atate that the radiators will comfortably heat a room 20 feet square in cold weather, and that they are designed for use in dining rooms, offices and summer resorts, and wherever a moderate heat is required without flue connection.

THE MERRY CHRISTMAS SOUVENIR sent us by the Sickles, Preston & Nutting Company, Davenport, Iowa, takes the form of a portfolio of six art studies, being reproductions of recent paintings. The work is beautifully done, and its subjects cover various scenes of country life and landscape.

#### P. & H. Lawn Sprinklers.

Plenger & Henger Mfg. Company, St. Louis, Mo., formerly the Ette & Menger Mfg. Company, are putting

Fig. 1.—Park Lawn Sprinkler.

lawn sprinklers on the market of which the accompanying cuts are representations. The Park Sprinkler, as shown

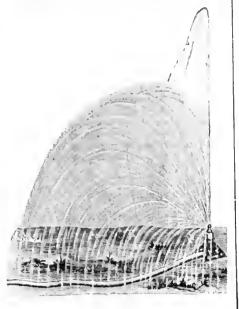

Fig. 2,-Half Circle Spray.

in Fig. 1, can be adjusted to throw a half or full circle apray, as in Figs. 2 and 3. It is remarked that the aprinkler has no revolving parts to leak

Fig. 3 .- Full Circle Spray.

or to wear out; that it can be adjusted to throw a spray as light as steam or as heavy as the area of the supply pipe will permit; that it has no small holes

to clog, and that it can be moved about the lawn while in operation without turning off the water. The sprinkler shown in Fig. 4 has the top and arms made of brass, polished, with japanned standard and legs. It is explained that the sprinkler is a combination of their Japanese and Pacific sprinklers, mak-

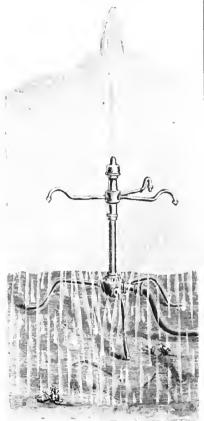

Fig. 4.—Imperial Combination Lawn Sprinkter.

ing a fine effect, and that each one is guaranteed to give satisfaction. The sprinkler is made with three and four arms; and is also made with a high stand.

#### MEMORANDA.

The Prodress Stove & Tin Works of Louisville, Ky., have issued from the press an illustrated catalogue devoted to some of their leading lines of manufacture. The volume is made up of 136 pages, and is of a size to permit the use of a number of cuts on a page. The engravings illustrate pieced, stamped and japanned tinware, wooden ware, granite iron ware, galvanized iron ware, wire goods, coffee mills, tinners' stamped trimmings and miscellaneous supplies; sheet iron, tin plate, metals, &c., stove hollow ware, coal vases, shovels, tongs, pokers, fire sets, refrigerators, fire clay chimney, flues, &c.

THE STAR MFG. COMPANY, Canton, Ohio, are placing on the market the Crystal Valve oil and gasoline cans, which, as their name implies, are of crystal glass. The novel feature is the valves, which consist of two small balls, one each in the vent at the top and in the spout, which automatically close these openings when the can is not in use, rendering both, it is said, air tight. Besides being automatically self closing they are referred to as non-explosive, air tight and clean, as well as of low price.

A CALENDAR that Grier Brothers, 60 Second avenue, Pittsburgh, Pa., are distributing to the trade for the coming

year is decorated with a realistic picture of a foot ball field. The calendar calls attention to tinware which Grier Brothers manufacture and a miner's lamp and dinner pail are a couple of articles illustrated. The 12 leaflets at the bottom show the days of the month and the moon's phases.

GATE CITY FILTER COMPANY, 35 Murray street, New York, are bringing out a medium grade of Pottery in connection with their Stone Filters, which is intended as a connecting link between their gray stoneware and china. It is stoneware, uniformly molded so that the several parts always fit, with a bluish tint and decoration, and is offered as a grade better than the common stoneware, much more attractive in appearance, at a moderate advance in cash.

Laird Clowes, one of the ablest English authorities on naval matters, has given his ideal of a new type of fighting vessel, a 101 gun ship. What is needed, he says, is great speed, moderately thick armor and numerous quick firing guns. The British have nothing of the kind in their navy, while the French have attempted it in five of their ships. This is Mr. Clowes' picture of the most efficient kind of modern fighting vessel: "A ship of from 10,000 to 12,000 tona diaplacement, carrying 6-inch ateel armor all over her, ateaming 22 or 23 knots, and mounting some such armament as 16 6-inch guns, 20 4.7 inch guns, 20 3-inch 12-pound guns, 20 6pound guns, all quick firers, with 25 Maxima of a caliber somewhat larger than the one in present service use. Then we should have a 101-gun ship, against which no man-of-war in existence could stand up and from which no man-of-war in existence could escape."

The estimates of appropriation required for the service of the fiscal year ending June 30, 1896, sent to Congress by the Secretary of the Treasury, aggregate \$410,435,079, as against \$411,879,041, estimated for the current fiscal year. The following table exhibits the estimates for the various departments for 1895-1896, together with those for the present fiscal year:

	Estimates	Appropriations
Departments.	for 1896.	for 1895.
Legislative	\$8,336,742	\$10,377,617
Executive		191,024
State		2,008,218
Treasury	138,487,281	133,786,362
War	54,855,629	55,296,820
Navy		26,726,752
Interior		173,825,971
Post Office		2,468,982
Agriculture		3,227,252
Labor		170,011
Justice		7,730,399
Grand totals	. \$110,435,679	\$415,760,943

A press cable dispatch from Liabon states that the Portuguese Government has decided to construct a navy, and with this object in view the aum of \$600,000 yearly will be provided for 20 years. Tenders will be invited from shipbuilders in the United States and other countries.

Secretary Herbert, acting on the recommendations of the bureaus of Steam Engineering and Construction, has decided to contract for the building of a submarine torpedo boat of the Holland type.

We are informed by the St. Louis Stamping Company, St. Louis, Mo., that their tin plate plant is now running full on a non-union basis, and turning out plate equal to anything they have ever produced.

## STOVE TRADE NOTES.

A Fleid for the Furnaceman.

In the opinion of a manufacturer of hot air furnaces, who also manufactures steam and hot water heaters, the furnaceman is especially well qualified to enter the field of steam and water heating. By training and experience his judgment of the difficulty of heating different rooms and buildings will naturally give him advantage in com parison with those who enter the field as expert pipe fitters but new to heat-This knowledge is an all important qualification, and some very suc-cessful men rely rather on their experience than upon the rules for calculating the surface required, though the rules are a basis that cannot be departed are a basis that cannot be departed from with safety, except by those having exceptionally well trained judgment. If a building would require a large furnace, which the furnaceman would soon discover, it would require a large boiler. A large boiler, like a large furnace, will carry large piping, and a room that would require a large hot air pipe would certainly require a large steam or water pipe. If any advantage would be gained by a short hot air pipe, and it was necessary, the same would be true of the other sys tems. Hot water and hot air rise and flow in a very similar way, their movement being due to gravity; yet a plumb-er made the mistake of running a main from a boiler up near the ceiling of a cellar, then dipped down to pass under a deep girder, making a trap. This was done to gain head room in the celiar and prevented the job from working, and a hot water expert was summoned who was also a hot air expert. His comment was that a furnaceman would never have made such a mistake. Yet it is natural in carrying the cold water supply pipes through a building, and would have made no trouble. The same rules for direct runs, and the avoidance of friction in the hot air pipes by a sharp pitch, hold good in hot water pipe fitting. It is true that any man who enters this field will have much to learn, and will have to go slowly and consult with experienced men, and it is equally true that a successful hot air furnaceman has many invaluable qualifications for the work.

#### The St. Paul Stove Works,

with office and salesroom at 71-73 West Seventh street, and foundry at Arthur avenue and Concord street, St. Paul, Minn., have issued an attractive catalogue of 40 pages relating to the Early Breskfast stoves, ranges, heaters and furnaces. The binding is in paper covers, with side title of typographical design. The opening pages are devoted to a few testimonials from some of those who have used the company's goods, followed by directions for burning lignite on the patent grate used in connection with the company's goods. This grate is a special feature of the company's specialtics, and is designed for burning the native coal of North Dakota. It is stated that this lignite

"makes an intensely hot fire without scot, smoke or smell, and burns up clean, leaving only a fine ash." The grate employed is illustrated and described at some length, after which attention is invited to the Early Break-fast lignite steel range, having six boiler holes, 14 inch feed or broiler door, capacious oven and ample flue. The stove is made in several varieties, three of which are shown in the cata logue. A new cast iron range which the company brought out the past season, and with the fire pot so constructed as to use the lignite grate, is the B Series of the Early Breakfast line. This is made in five sizes and a number of modifications. The F Series is a fourho'e cook with large square oven, and with doors on each side. The M Series, which has been on the market for some time, is a four-hole cook intended for burning soft coal. This is made in three sizes and the usual modifications. Among the heating stoves we rotice the Lion Oak, made with patent lignite grate, heavy fire pot, large feed doors with separate upper mica section, substantial square base and large ash pan. The Lignite Faultless is a surface burning base heater, made in three sizes and embodying the latest improvements. Another surface burner is known as the Another surface burner is known as the Faultless, and is also made in three sizes, while the Art Faultless, a direct draft surface burner; the Frost Killer, a sheet iron cylinder stove, and the Faultless Cannon, complete the assort ment. The Stafford hot air furnace is likewise illustrated and described. An announcement at the close states that the goods illustrated in this catalogue are only a small portion of the extensive line of Early Breakfast stoves and Faultless heaters manufactured by the company.

## The Western Stove & Mfg. Company

of Milwaukee, Wis., send us a copy of their first illustrated catalogue and price-list of gasoline stoves. It is a price-list of gasoline stoves. It is a neatly arranged volume of 48 pages, illustrated with numerous engravings and bound in colored paper covers. In their greeting to the trade the makers refer to the fact that their machinery is of the latest and most improved design, that they employ skilled and experienced workmen and that they purchase the best materials. After referring to some of the special features embodied in the line of goods which the company manufacture, attention is given to the Governor low junior single valve gaso-line stove. This is made in several sizes ranging from one to three burners, and provided with the company's improved lift out safety tank. Next in order is the Governor high junior single valve stove, made with and without step; the Princess low and high junior stoves, made in a variety of sizes and embodying features which cannot fail to interest the trade. Several pages are then devoted to the Princess single generator gasoline stove, which is provided with a powerful burner of simple construction. It has a sub burner de-

vice which generates gas for the other burners and permits of any one burner on the stove being used without operating the generating burner on top of the stove. The single generator stoves are constructed of steel, making them strong and durable, and are neatly japanned and ornamented. All are provided with the makers' improved lift out tank, their patent burner cap and their regular grate. The Princess is shown in several sizes ranging from one to three burners, and with and without step at the side. Under the same name the company make a line of larger stoves embodying the latest features and arranged with two, three and four burners in the top plate, some sizes being made with and others without the step. Single and double valve burners are illustrated and a repair list given, by means of which duplicate parts can be ordered. Attention is also given to gasoline torches, ovens, &c. The catalogue concludes with a price-list of ovens and directions for taking care of gasoline stoves.

#### ODD PLATES.

THE CALENDAR FOR 1895, which is being distributed with the compliments of the estate of P. D. Beckwith, Dowagiac, Mich., is a handsome example of the printer's art. Running the long way of a card measuring 14 x 11 inches, is a view of Holy Cross Abbey, England, the picture being printed in colors. The effect is artistic and will serve to find for the calendar a place near the deak of the dealer, instead of the 12 leaves which constitute the calendar proper being torn off and the rest thrown in the waste basket. The typographical features are neat, the lettering being in clear type so that it can be seen at a distance. The 12 leaflets are printed in black on a white ground and occupy the lower central portion of the card, which may be hung up by a red silken cord provided for the purpose.

E. L. CALELEY, 945 Ridge avenue, Philadelphia, is using a series of six blotters, embellished with colored views of World's Fair buildings, to call attention to his facilities for turning out good stove patterns.

THE WILLIAM G. FISCHER MFG. COMPANY of Cincinnati, Ohio, are distributing to their friends in the trade a series of blotting pads relating to the Fischer steel ranges and stoves. The printing is in colors, and attention is called to the various sizes of goods made and to the fact that illustrations will be furnished upon application. They also furnish repairs for all kinds of cooking and heating stoves, ranges, &c.

WE HAVE RECEIVED, with the compliments of the Detroit Stove Works, Detroit, Chicago and Buffalo, a neat pocket memorandum book, carrying upon the inside covers calendars for the years 1895 and 1896. The little volume is of the style and character which is becoming so popular as an advertising medium, being known as the "daily re-

minder," copyrighted by the Matthews-Northrup Company of Buffalo, N. Y. It is in effect a caiendar, diary and memorandum combined, each page being ruled into seven spaces for the days of the week. At the outer edge of the page is printed the days of the week and month and also the number of those days in the year. Among the early pages are census statistics and rates of postage. There is also a leaf at the front and back of the little book calling attention to the Jewel stoves and ranges made by the Detroit Stove Company, together with information of interest to the trade.

S. CHENEY & Son of Manlius, N. Y., have issued an exceedingly neat calendar for the new year. The white card carries a marine view executed by John A. Lowell & Co., of Beston, and is known as No. 812. Below this are the name and address of the company, and still further down on the card are twelve leaflets for the months of the year, printed in clear black. In the upper left hand corner of the card is a fac-simile of the trade mark of the firm, and a white silken cord is provided for hanging up the calendar.

CARL RABEN, who has represented the Peninsular Stove Company in Iowa for the past three years, will continue to look after their interests in the same State during 1895.

The Barstow Stove Company of Providence, R. I, and with New York office at the corner of Beekman and Water streets, are distributing an illustrated circular of their Novel Bay State range, made in portable form and also for brick setting. The stove has heavy esstings, flat or duplex grate, large ash pan, oscillating oven shelf, right or left hand fire box, and can be furnished with or without plate rack and canopy. It is a substantial six-hole range of attractive appearance and is offered in one size, portable form, and one size for brick work.

Berry A. Baxter, superintendent of the Monarch Stove Company, Mansfield, Ohio, has just returned with Mrs. Baxter from a two weeks' visit to the East, in which he combined husiness with pleasure. Among other cities he visited New York, Philadelphia, Baltimore and Washington. He arranged with the Danville Stove Company of Danville, Pa., and Nos. 284-86 Pearl street, New York City, for a continuace of the agency for the company's goods in the States of Pennsylvania, New York, New Jersey and the New England States. The Danville Stove Company will open a branch in Boston, Mass., from which the trade in that vicinity will be more readily and conveniently supplied with Monarch gas and vapor goods.

The Excelsion Mfg. Company, St. Louis, Mo., advise us that while the weather conditions are against any large business in this country, their foreign trade is in excellent shape. They mention the receipt of an order from Costa Rica, and state that this will doubtless be followed by others from the same locality. Inquiries are also reported from Belgium, and a handsome order is expected from that locality very shortly.

D. M. THOMAS, secretary of the National Association of Stove Manufacturers, has been a very sick man since his return from the West, having been confined to the house and totally unable to attend to any business. He was, however, at his office this week, but he is far from well. His physician

recommends a complete rest for a few weeks and a run to the Bermudas. Mr. Thomas has devoted himself to furthering and projecting many good things for the benefit of the trade in the future, and the anxiety in these matters with constant railroad traveling has used him up. A change of scene and rest, however, will probably bring him around all right.

The Star Coupler Company, St. Louis, Mo., who have just completed their first year of actual business, report that the results have been far beyond their expectations. The increasing demand for their Star water back and boiler couplers has obliged the company to enlarge their factory in order to give increased facilities for the manufacture of these goods and to enable them to fill orders with greater promptitude.

THE HARDWARE FIRM of Barnard, Smith & Co. of Jackson, Mich., make a specialty of Peninsular wrought steel ranges, manufactured by the Peninsular Stove Company of Detroit, Mich. Dur ing the past week or two they have been giving a practical demonstration of the merits of these goods by means of public cooking operations, which were carried on in a large room on the second floor of the building occupied by the firm on West Main street. Expert cooks were busy each day preparing hot biscuits, coffee, &c., and showing interested visitors the manner in which the ranges worked. The daily exhibitions attracted large numbers to the store of the firm, with gratifying sales as a result.

FLOYD, WELLS & Co. of Royersford, Pa., distributed to their friends in the trade a Christmas greeting in the shape of an illustrated folder of unique design. The printing was in colors, and among other things reference was made to the company's line of stoves, ranges and heaters.

THE CHICAGO & ERIE STOVE COMPANY of Erie, Pa., have issued a pamphlet of several pages, illustrating and describing their line of Superb Helper steel ranges, which have been improved for 1895. These stoves are made in a number of atyles and sizes and adapted for all kinds of fuel. The constructive features are of the latest character.

THE ROCK ISLAND STOVE COMPANY of Rock Island, Ill., are to be represented during 1895, in the territory named, by the following salesmen: M. L. Morehouse, in the State of Kansas; A. C. Colton, in Nebraska; F. W. Houck, in northern Iowa, southern Dakota and Minnesota; A. B. T. Moore, in northeastern Iowa, southern Wisconsin and northern Illinois; Orrin Leonard, in central Iowa; S. D. Cleveland, in portions of Missouri, Iowa and Illinois, and A. D. Sparry, in central Illinois.

One of the recent letters received by the Fuller & Warren Company, Troy, N. Y., comes from a customer in Digby, N. S., and contains some flattering references to the company's goods. The writer, who is a wholesale druggist and dispensing chemist, states that he has had in use for 16 winters one of the company's No. 4 Ruby furnaces. He states that he had it stripped and taken apart a few days ago and found the iron work "as good as ever, fire pot sound, and the grate ditto, only they broke the handle by undue pressure."

THE ST. PAUL STOVE WORKS of St. | Paul, Minn., are meeting with a very

rratifying demand for their stoves and heaters, fitted with what are known as lignite grates. This grate has been especially designed to burn the native fuel of North Dakets, and since last July the company have Supped about 660 stoves fitted with these grates into the State named. They are receiving many testimenials of the merits of the stoves and heaters and of the general satisfaction which they have given.

The Michie as Stove Company are distributing adminism combs to their patrons. The combs are of good size and his dismey misds. They are inclosed in neat leather cases, with the company's compliments thereon in gilt letters. Each comb is packed in cotton in a wooden box, together with a highly artistic circular, Hustrated by one of the most famous artists of the day. The circular itself is a memento worth preserving. Appropriate sentiments are printed out the circular.

WE ARE INDEBTED to the Schneider & Trenkamp Company of Cleveland, Ohio, for a copy of an illustrated catalogue and price-list which they have just issued from the press. It is made up of over 70 pages of letterpress, profusely illustrated and bound in dark green paper covers, with side title em-bossed in silver letters. The company state that, as heretofore, they have made numerous improvements in their Reliable stoves for the coming year, and call attention to the fact that they are now manufacturing a full line of ovens which in point of finish and constructlon are in keeping with the high standard of their Reliable line. Among the early pages of the volume are found "eleven reasons why the Reliable gencrator la the best; " numerous illustrations of the device, directions for ordering repairs, price-list of repairs for process stoves, repairs for Reliable generator and individual burner stoves and directions for the care of generator gasoline stoves. The Reliable process stove for 1895 is fully described and illustrated with numerous engravings. Attention is also given to the Reliable process cabinet, the Reliable single generator stove, the Reliable individual burner stove, the Reliable Gem and an extensive assortment of Reliable Juniors. The closing pages are given up to furnaces of various kinds, illustrated descriptions of burners, torches, ovens, steam cookers, stew pans, sad iron heaters, broilers, toasters, &c. A telegraphic code is a feature of the catalogue.

FOLLOWING their Thanksgiving souvenir the Barstow Stove Company of Providence, R. I., last week distributed a Christmas novelty in the shape of a wax taper, intended, no doubt, for use on a Christmas tree. The taper, how-ever, proved to be hollow, and from one end we were able to extract a neat little circular, which upon opening was found to read as follows: "Our candle does not offer light to this wick ed world from the wick part of it, but is simply sent to let you know that we are thinking of you as the Christmas season comes on. We feel grateful for the very nice trade we have had during this generally dull business year of 1894, and we beg to state that our line of Bay State ranges, furnaces and parlor stoves will be more complete for the year 1895 than it has ever been heretofore." The circular concludes with wishes for a merry Christmas and the name and address of the company. This souvenir was designed by the same enterprising concern that was responsible for the other—namely, the Livermore & Knight Company of the city named.

THE PROGRESS STOVE & TIN WORKS of Louisville, Ky., are distributing a sheet metal sign intended for hanging up in the store of the desler. It is finished with a bright polish and embellished with a clock dial in the upper left hand corner, and a picture of the Progress cook stove in the lower right hand corner. An inscription across the top of the sign states that dinner is always on time when using the Progress stove, manufactured by the concern named. A short loop of chain is the means by which the sign is suspended.

The Danville Stove Works of Danville, Pa., are distributing, with their compliments, a very pretty calendar for the new year. It consists of a card messuring about 11\frac{2}{3} x 8 inches, printed in colors and embellished with a central design of rather unique character. This takes the shape of a panel, resting upon a cleverly treated background, while scattered about are little slips, measuring about 1 x \frac{1}{2} inch, carrying the days of the week and month. There are 12 of these, each being designated by the name of the month in bold red letters. Across the top of the card is the name of the company, while below the central picture is the date in red figures, 1895. The card is arranged with a lcop, so that it may be hung upon the wall.

THE ECLIPSE STOVE COMPANY, Mansfield, Ohio, will be represented by the following salesmen, who will cover the territory named: C. A. Munsell in Western New York, Western Pennsylvania and Eastern Ohio; J. S. Cadot in Western Ohio and Southern Michigan; M. J. Weldon in Indians; H. D. Bell in Illinois; W. J. McKay & Co. in Cook County; the Townley Stove Company in Southern Indians and Southern Illinoia; J. C. Bump in Wisconsin; H. N. Wilcox in Iowa and Northern Missouri. The company will have repositories in St. Anthony Park, Minn., under the management of H. E. Cook, who will look after the company's interests in Minnesots, North and South Dakota and in Omaha, Neb., under the management of Oscar Millsap, who will cover Nebraska, Western Iowa and the Black Hills. The Omaha arrangement is a new scheme for the company to reach trade in the territory named.

THE ECLIPSE GAS STOVE COMPANY of Rockford, Ill., have recently been incorporated with a capital stock of \$25,000. The incorporators are Kate B. Roper, George D. Roper and George S. Roper.

THE ROUND OAK STOVE WORKS, Dowagiac, Mich., after a shut down of several weeks resumed operations with a full force on Monday, December 17, at a reduction of 10 per cent. in wages.

A company of Western capitalists has been incorporated to seek for the wreck of the steamer "Pewabic," which was sunk in a collision on the lakes 25 years ago. The wreck is known to contain 500 tons of copper, and carried gold valued at \$300,000. It lies in about 16 fathoms of water, but hitherto all attempts to secure the treasure have failed.

The London Rothschilds are said to be arranging a Chinese loan for \$50,-000,000 on security of the Chinese customs

## HEATING SO PLUMBING.

#### NEW WORK AND CONTRACTS.

F. J. STURN, 926 Broad street, Newark, N. J., has signed a contract for plumbing and tinning the No. 4 Truck House, to be erected in that city. He also has the plumbing and tinning contract for a three-story flat to be erected by Dr. N. M. Robinson.

JOSEPH A. THAIN has prepared plans for an elegant residence on Drexel boulevard, near Forty-seventh street, Chicago, 1ll., for Louis Morris. It will be three stories and basement high, 40 x 65 feet, with stone exterior, slate roof, elaborate hardwood finish, electric light, hot water heating, marble work and all modern improvements, at a cost of \$40,000 to \$50,000.

M. ABBOTT'S SONS, 137 Elghth avenue, New York, have completed the plping in eight houses for Contractor William Sheeley of West Hoboken, N. J., in which he intends to put Abbott's hot air furnaces.

F. L. VESSERIAT, Alliance, Ohio, is placing ateam heaters in the business block of J. Murray Webb.

GEORGE F. MOTTER & Son. York, Ps., have the contract for putting in the steam pipe work at the new building of the York Card & Paper Company. It will require about 100,000 feet of pipe.

L. A. Weston, Adams, Mass., has been granted the contract of plumbing and heating the new Baptist church, to be constructed next apring.

PLANS for ventilating and heating the new High School at Scranton, Pa., were examined by the School Committee of the Board of Control last week. The system is the Smith heating and ventilating system and the inventor, Frederick Smith of New York City, was present at the meeting of the committee. It is estimated that the cost will approach \$20,000. At the next meeting of the board the committee will recommend that advertisement be made for proposals to erect the system under the supervision of Mr. Smith.

THE LOFTUS PLUMBING & HEATING COMPANY, North Adams, Mass., are putting in pipes and heating apparatus in the new Lincoln street shoc factory.

CLEGG & DOUOIERTY, Ottawa, Ill., have been awarded the contract for placing a steam heating plant in the Commercial Hotel at La Salle.

G. II. MARSH, Spencer, Mass., has taken the contract for plumbing the new building of Wright & Harper, at East Brookfield.

MRS. J. E. TEMPLE, New Haven, Conn., will erect a fine apartment house that will have all modern conveniences in elevators, plumbing and heating.

THE A. W. BURRITT COMPANY, Bridgeport, Conn., have the contract, amounting to \$30,000, to build the St. John's Episcopal Church, at New Haven. The heating and plumbing contracts have not yet been awarded.

F. L. Underwood will erect, at Litchfield, Conn., a \$30,000 residence that will have two bathrooms, aix fire places and a heating system.

THE MASSACHUSETTS MUTUAL LIFE INSURANCE COMPANY of Springfield Mass., will erect a 130 x 170 foot building with a heating plant in the basement.

- F. C. BLAKE, Mason City, Iowa, has secured the contract for the plumbing of the new Masonic Block.
- S. C. NIGHTINGALE & CHILDS of Boston, Mass., have a large contract for covering the boiler and pipes at the new boiler house of the Coe Brass Mfg. Company, Torrington, Conn., with their Magnesia covering. Sheahan & Groark, New Haven, Conn., the plumbers, are using the Magnesia covering on the steam pipes in the High School Building.

THE STATE BOARD of the Knights of Pythias Home met in special session at the Arcade Hotel, Springfield, Ohio, last week, to consider the recently received propositions for gas fixtures for the new building. The most important contract swarded was to Jardine & Flynn, Springfield, for a gas machine. The contracts for combination fixtures were awarded to W. H. Drayer, Middletown

THE SECOND CONOREGATIONAL CHURCH, at Waterbury Conn., is to erect a new parsonage that will have a plumbing system and will be heated by hot water or steam.

J. IRION is building an addition to his house for a bathroom. The Barlow Bros. Company will put in the plumbing, including a new noiseless closet.

WARD COE is building an \$8000 house at New Haven, Conn., for which J. W. Corbett has the plumbing contract and W. A. J. Smith will use two Kelsey hot air furnaces to heat it.

THE CONTRACT for heating the Masonic Temple, at Hartford, Conn., has been awarded to the Bosworth Heating & Supply Company of that city. They will use 3700 feet of radition and two steel wagon top tubular boilers, which are being built under the direction of Frank Allen, of the Hartford Steam Boiler Inspection & Insurance Company.

THE CONTRACT for plumbing the new Y. M. C. A. building has been awarded to R. E. Hannon, Amesbury, Mass.

J. D. CULVEH, Fairhaven, Vt., is having a steam heating apparatus placed in his building by Wood & Hotchkisa of Whitehall. David Rodd is in charge of the work of putting in the system.

Some Baltimore capitalists have secured letters of incorporation for a company who propose to utilize the water of the Susquehanna River as a means of generating electric power, to bo transmitted to Philadelphia, Baltimore, Wilmington and other points. The incorporators of the Susquehanna River Electric Company are: Moses A. Houseman, Geo. K. McGaw and Wintield J. Taylor of Baltimore, and Chas. R. McConkly of Peach Bottom, Pa. It is proposed to dam the Susquehanna near Conowlingo, Md., and to erect there is large electric power house similar to that at Niagara Falls. Large tracts of land have been purchased near Conowingo and the surveys have been completed for a very extensive plant. Work, it is announced, will be commenced on the dam as soon as the apring freshets are over, and is is ex-pected that the company will be able to furnish power to their subscribers by January 1, 1896.

The trolley mail car system has been extended in Brooklyn.

# TRADE REPORT.

#### The Iron Market.

Pig Iron.—The market in New Yerk is very dull, the demand being light. There is, on the other hand, no exceptional pressure to sell. Lately brokers have made a number of inquiries concerning prices for American Pig Iron for export, but as yet nothing seems to have come of it. We quote \$12 @ \$12.50 for No. 1: \$11 @ \$12 for No. 2, and \$10.50 @ \$11 for No. 2 Plain, standard brands, tidewster delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.50 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

In regard to the Philadelphia Pig Iron market, the indications are regarded as very favorable for a good demand, deliveries being called for with considerable urgency, and when work starts up after the holidaya it is expected that a good deal of buying will be done. At a time like this it is difficult to judge with any degree of certainty what the course of prices will be, but it is the general impression that in three months' time they will show aome improvement. Temporarily, dullness and possibly aome irregularity may be met with, but when business once gets fairly under way it is believed that prices will gradually work toward higher figures. Meanwhile quotations to-day are about as follows for Philadelphia, and at points within 100 miles South or West about 25¢ @ 40¢ less:

 Standard No. 1 Foundry X
 \$12.50
 \$13.00

 Standard No. 2 Foundry X

 11.00

The actual business placed during the past week in the Chicago market was not large and appears to have been rather evenly divided between Northern and Southern brands. The inquiries for Southern Soft Irons have latterly been increasing and the tonnage in sight is now quite encouraging The business now quite encouraging The business in prospect for Northern Irons, however, is very heavy for completion after the first of the year. Shipments are so heavy at present that the intervention of the holidays is regarded as an advantage to furnacemen, as many foundries will then be closed down for a few days, which will enable furnace stocks to ac-Southern furnaces cumulate a little. seem to be closely run in the matter of shipments, also, as orders are being received for Northern Iron to take the place of undelivered Southern even at a higher price. The market is very firm on everything except two or three of the less known Southern brands. Quotations are given as follows for

Lake Superior Charcoal	\$13,00	0	\$14.00
Local Coke Foundry, No. 1.	10.25	0

In the Pittsburgh district buyers generally are deferring purchases until the new year. Very few sales of Pig Iron are being made and these only for small lota that are needed at once. Foundry Irons are quiet, with prices weak, but unchanged. Several round lots of Foundry Iron for delivery into a considerable part of next year have been sold at very low prices. Quotations are given as follows:

The record of the Cinclnnatti Pig Iron market during the week is devoid of interesting features. In the general run orders have been small individually and insignificant in the aggregate. Pricea are without quotable change, but at the lower level noted last week there seems to be more firmness. There is more confidence and a firmer feeling, and while buyers may be holding off until the middle of January, it is known that large contracts will be placed about that time. Reports from Pipe works and general foundries continue encouraging; the former capecially are running heavy heats. Mills, however, are not conspicuous for activity. Quotations are as follows:

Sonthern Coke, No. 1	89.75 @	
Southern Coke, No. 2	9.03 @	
Southern Coke, No. 3	8.50 @	8.75
Ohio Soft Stone Coal, No. 1	14.50 @	15.0⊍

standard Southern Car Wheel	15.75 @	10.75
Lake Superior Car Wheel and		
Malleable	14.25 @	14.75
and community of the contract		

The St. Louis Pig Iron market is practically dead. Consumers are deferring their purchases until the new year. There is no change in prices; the effort which was made to shade No. 2 Foundry below \$7 does not appear to have been successful, and this price is now accepted as bot tom. Furnaces have taken the stand that a reduction in prices would not result in any increased business and have wisely refused to shade current quotations. We quote as follows for cash, f.o.b. cara St. Louis:

Bronson & Near, Cleveland, Ohio, and 35 Warren street. New York, have just closed a contract to furnish the Wrought Iron Range Company, St. Louis, Mo., during 1895 over 100,000 pieces of Steel Hollow Ware, which will be supplied with the company's Home Comfort Ranges. This ware is manufactured for Bronson & Near by the Novelty Stamping Company of Bellaire, Ohio, who manufacture also a line of Enameled Ware, for which Bronson & Near are the general selling agents. The above order was secured by A. E. Bronson when in St. Loois last week.

#### Metal Market.

Plg Tln.—The suspension of business during the holiday season in London has operated as a check upon speculation in the New York market. This, in turn, has prevented any wide movement in prices, so that upon the whole affairs have presented a rather flat appearance. Deliveries on contracts have been fairly large, but consumers and interior trade have purchased moderately, and more or less accumulation of stock in first hands has doubtless taken place. Thus far this month about 1678 tons have been landed here. Prices for small lots of Straits Pig from store are unchanged at  $16\frac{1}{2} \oint \bigoplus_{i=1}^{n} 17 \oint_{i=1}^{n} 10$ .

Copper.—Transactions in lngots have tailen off somewhat latterly, and the buying interest is scarcely as brisk as it was during the early part of the month. Still the demand continues sufficient to keep wholesale prices firm. The current quotation for small retail parcels of Lake Ingot is 10½¢. Manufactured Copper is quiet, the demand being confined to small lots for immediate consumption.

Pig Lead.—Some good-sized lots have been sold at the lowest wholesale prices quoted last week. The sales, it is understood, were in good part by speculative holders and a few operators who are interested in forcing prices down to facilitate the covering of outstanding short contracts. Jobbing business has been of a restricted character. For small lots of American Pig 3\$\phi \@ 3\$\phi\$ is about the ruling price. Stocks in Western producers' hands are said to be comparatively moderate. Sheet Lead and Lead Pipe is in fairly active demand, and list prices are well maintained.

Spelter.—Hardly any change has taken place in the market during the week. The demand has been moderate and limited mainly to small quantities, for which 4¢ @ 4‡¢ is asked by jobbing houses and retailers.

Antimony.—Jobbing business is fair and prices vary but little, although leaning somewhat in buyers' favor. About of is quoted for Hailett's and 914 @ 914 for Cookson's, small lots.

Tin Plates.—The market has been dull throughout the week. Orders for future delivery seem to have fallen off to the finest point, while purchases of spot stock have been merely of the hand-to-mouth character looked for at this season. The volume of inquiry is also rather disappointing, and the market, as a whole, exhibits a far from satisfactory nature. Prices, while showing no quotable change, are somewhat irregular, and are inclined to be easy. Stocks in hand, however, are not thought to be at all excessive, and it is probable that any sudden revival in the demand would find the market in somewhat poor shape to meet any heavy call. The feeling seems to exist in the trade that an improvement in the demand for Plates may be looked for after the first of the year, many consumers having postponed buying until that time.

A special Landon cab'e dispatch of December 20 to The Irim Age reports on the British Tin Plate market as follows: Tin Plate business has been extremely lin fiel and the demand is disappointing. Dullness is part'y due to holidays. Westers, bold in fair demand, are exceptionally sleady as to price. The quotations, f.o.b. Swansea, are as follows:

Sheet Iron—There is a fair demand for Black and Galvanized Sheets, and a heavier volume of business is looked for after the first of the year. Inquiries are pretty numerous for future deliveries, but makers are chary of contracting for far ahead at the present prices. The mills are all reported to be husy, and some increase is noted in the inquiry for Black Plates for trimming purposes. No. 27 Common Iron, in small quantities from store, is quoted by j bbers in this city at 2.60¢. 2.65¢, while Galvaniz d Sheers in small lots rule at about 75 and 7½ % off.

### Chicago Report.

Scrap. — The demand is light, as usual at the holiday season. Dealers quote their buying prices as follows, Chicago delivery:

• •		
Peri	net ton.	Per fb
No. 1 Wrought Scrap

#### CONDITION OF THE

### Hardware Trade.

TOLIDAY FESTIVITIES and the usual routine of the closing days of the year have interfered largely with the volume of business. Merchants are naturally deferring as far as possible the jid ing of orders for goods and their unreleases response. goods, and their purchases are accordingly limited to their actual necessities. The market is unchanged in its tone in the matter of prices, the weakness which has prevail d and the tendency to lower values still continuing, being telt in some lines which have not heretofore been much affected. With the decline in the price of goods which has taken place during the year, in making the annual inventory, it will be with many mer-chants necessary to enter at less than cost many goods which have been carried for any considerable time, and this shrinkage in values will, unless the business has been characterized by close and judicious buying, be no inconsiderable factor in reducing the profits of the year. It is, however, a matter of congratulation that the Hardware trade has endured so well the long continued depression, and the new year will be entered upon in a more hopeful spirit, and with the expectation of a gradual if not rapid return to normal business conditions.

Advices from Chicago.—The Hardware jobbing trade has fallen off to some extent with the approach of the holidays, but is by no means as dull as had been expected. Orders continue to be received for all kinds of goods, showing that retailers are obliged to keep repleuishing their stocks. Inventory taking this year will be pursued under difficulties, as the attention of clerks cannot be given unreservedly to that absorbing occupation. Traveling salesmen are now in, for the purpose of making their annual arrangements and receiving instructions upon the points to be specially observed in the campaign of 1895. A novel feeling is observed among them. Usually they are in no hurry to get out on the road, but this year they are impatient to visit their trade. This is due to the promises given them of orders to be placed after January 1. If the orders then secured shall realize expectations, the New Year will start off with a heavy volume of business. Staple goods appear to be principally covered by the promises which are referred to. As they always carry with them more or less Hardware, the outlook is regarded as exceptionally favorable; very much better than that of last year at this time.

#### Notes on Prices.

Wire Nails.—The past week has been characterized by a continued inquiry for Wire Nails, which is good, considering the season. The mills also report a fair volume of business. In the matter of prices there is little change, but on the whole the market is steady and inclines to firmness. Small lots from store in New York are held at \$1.15 to \$1.20. Reports indicate that stocks in dealers' hands throughout the country are almost uniformly light, and the mills have not yet begun to accumulate Nails to any great extent.

Advices from Chicago. — Manufacturers report an increasing business, which is chicily among outlying districts. The city trade appears to be well supplied. Jobbers report a much better inquiry from their customers and look forward

to a large carload trade in January. Quotations are continued at \$1.10 for small lots from stock, and \$1.05 for small lots from factory.

Cut Nails.—The Cut Nail market is quict, transactions being limited to the immediate requirements of the trade. Its tore is unchanged. Small lots from store, New York, are held at 90 to 95 cents.

Advices from Chicago.—The local factory is now closed for repairs, but will be again in operation early in January, as orders are being received which will compel the resumption of work. The past week has been more fruitful in this respect than any for a considerable time. Some of the orders thus booked are of the old-time magnitude. Small lots from stock stand at \$1.

Barb Wire.—The demand for Barb Wire is moderate, many orders having been already placed, and some houses being disposed to wait until the new year opens in order to observe the course of the market. There are some who think that possibly orders may be placed at lower figures than those now current, but many well-informed houses recognize the importance of having orders booked in good season so as to assure delivery of Wire in time to meet the demands of business. Prices are, as they have been for several weeks, on a basis of \$1.85 to \$1.90 for Four-Point Galvanized in carload lots at mill, but on large ordera concessions are obtainable.

Advices from Chicago. - Manufacturers report a light business, as their salesmen are now at home for the holidays and orders are not coming in unsolicited. Jobbers have also done very little of late, but expect to do well after January 1, if inquiries now received develop into actual orders, as they have every reason to expect. Quotations are continued of \$2 10 for small lots of Galvanized and \$1.75 for Painted from stock, \$2.05 for Galvanized and \$1.70 for Painted from factory. In connection with the rumor now in circulation regarding rumor now in circulation regarding the probability of reviving the recent attempt to form a Barb Wire organization, it may be of interest to the trade to give a hitherto unpublished reason for the audden termination of what at the time seemed to be a most successful plan of operation. It is said that one of the largest companies, and, therefore, most deeply interested in the maintenance of prices, insisted upon concessions which were wholly disproportionate to its past business. The majority of manufacturers were so desirous of turning the unprofitable condition of the trade into one which would give them at least a slight return on their investment, that they were willing to concede what was asked for the aske of harmony, but a few could not bring themselves into a frame of mind to submit to what they deemed an unjust demand. Their consent to the plan being withheld or withdrawn, the scheme fell to the ground. Its failure is deplored by all who have knowledge of the hasis upon which it was founded, as it would probably have insured beneficial results to the entire trade.

Brass and Copper Tubes.—The manufacturers of Seamless Brass and Copper Tubes have issued under date December 7 revised prices on these goods. The new lists are given herewith. It will be observed that a reduction of 2 cents per pound is made on Brass and Copper Tubes, and on the Iron Pipe sizes of Brass Tubes a reduction of 3 cents per pound. The prices given in the lists are

net cash 30 daya without discount. The lists herewith given have been adopted both by the associated manufacturers and those outside. Randolph & Clowes, Waterbury, Conn., in sending out the new lists, give prices also on extra sizes of Seamless Brass and Copper Tubes, of which they are the only manufacturers in this country, as fol-

Brass Condenser Tubes, 55 to 1 inch, inclusive, 19 cents per pound, to No. 18, 8, W. G.; 2 cents per pound extra for each W. G. number thinner. No charge for tinning. Tinning Tubes other than Condenser Tubes, 3 cents per pound extra.

Heater and Illuminator. - In our issue of December 15 we gave an illustrated description of the Domestic Gas Light Heater and Illuminator, put on the market by the Hameley Metal Roofing Company, 18 Cliff street, New York. This article is sold to the trade at \$4.50, subject to a discount of 40 per

Glass. - The Glass market is characterized by the quietness which is expected to pervade trade during the holiday season. Little Glass is changing hands, and such orders as are received by jobbers are for small quanti-It is reported that the orders which have been taken by manufact-urers at the low prices which have been ruling are of such volume that factories will be quite busily employed in filling them for the coming two months. The low prices at which jobbers have placed orders for large quantities of Glass may give them control of spring prices, as present demand is limited. Manufacturers will produce stock for themselves

neatly bound in colored paper, and contains a very extensive assortment of Tinware and miscellaneous goods. The sections into which the catalogue is divided are as follows: Pieced Tinware, covering 16 pages; Japanned Ware, 15 pages; Black and Galvanized Iron Ware, Granite Ware; deep Stamped Ware; shallow Stamped Ware; Stamped Trimmings; Wooden and Willow Ware; miscellaneous goods; Indurated Fiber Ware; Hollow Ware and Tinners' Stock.

THE JOSEPH DIXON CRUCIBLE COM-PANY, Jersey City, N. J., who manu-facture graphite goods in great variety for metallurgical purposes, also prepare what are known as phosphorizers, used for the phosphorus additions in making phosphor-bronze.

J. WOOD & BROS,' COMPANY, Conshohocken, Pa., are turning their attention a most exclusively to the production of Soft Steel Sheets and Plates. They have abandoned some 15 double

puddling furnaces and erected a number of heating furnaces, Messrs. Wood are also operating the Plymouth Rolling Mill, at Conshohocken, under lease.

Among concerns recently incorporated in New York State is the Brooklyn Brass Mfg. Company, to manufacture and sell Metal Goods and Specialties in Brooklyn. The capital of the company is \$50,000, and the directors are Andrew II. Hogg of Brooklyn, John G. Lyon and J. E. G. Yalden of New York Clty.

P. B. CALVERT & Co., Philadelphia, arc, in our advertising columns, calling attention to the Nash Ventilator which they placed on the market a short time ago. The Ventilator, they claim, is the only one of its kind in the market. The ventilating disk revolves, thus causing a continual upward draft. The disk pin or pivot has a bearing of graphite situated within the base, the bearing being protected from soot, smoke and dust, by a cap or cover attached to the disk. The bearing, from its nature, is selflubricating and prevents the slightest noise. The makers claim that the Ventilator will run for years, with almost imperceptible wear; will positively prevent a down draft, and, having no solder in its construction, will not be affected by heat. Two styles are made, one as shown in the advertisement, another having an extended cover so arranged, the makers say, as to make a down draft absolutely impossible under any conditions. The Ventilators are made in sizes running from 4 inches to 60 inches, and all sizes above 20 inches have ball bearings.

THE INTERNATIONAL METAL PICK-LING COMPANY of Chicago were incorporated last week with a capital stock of \$60,000. The incorporators are Alex. N. Eamage, Elias S. Beck, Geo. W. Roberts, V. P. Sherwin, and Ed. S. White.

H. WETTER MEG. COMPANY, Memphis, Tenn., have lately added a retinning department to their Tinware factory, and are now establishing a galvanizing plaut.

The American Sheet Iron Com-Pany, Phillipsburg, N. J., issue cards calling attention to the Sheet Iron and Sheet Steel of their manufacture, their specialty being American R. G. Cleaned.

The Sherwood Mfg. Company, 34-36 Washington street, Buffalo, N. Y., publish illustrated catalogues and pricellsta relating to Injectors and Lubricators of their manufacture. A varlety of goods of this sort are noted and include among them such goods as Celiar Drainers, Oil Pumps, Pressure Gauges, Whistles, Ratchet Drilla, &c.

The Star Coupler Company, St. Louis, Mo., report a steady increase in the demand for their Star Couplers. As an extra inducement to the trade they advise us they will ship the first order received on 30 to 60 days' trial, and, if the couplers are not satisfactory, same can be returned at the company's expense.

The Grand Rapids Refrigerator Company, Grand Rapids, Mich., show in their announcement elsewhere in this issue the works of the concern, which they describe as the largest in the world. Views of two factories are presented and also of two warehouses. The capacity of manufacture is 50,000 Refrigerators per annum.

An announcement appears in our advertising columns of Pheips, Dodge & Company, 11 Cliff stret, New York,

relating to Tin Plates, Pig Tin, Sheet Iron, Sheet Zinc, &c. The roofing trade will also note the reference to Phelpa' triple coated roofing.

THE Hise Sanitary Refrigerator Company have been incorporated at Chicago with a capital stock of \$250,000. The incorporators are David W. Coons, O. S. Baylies and H. E. Hart.

THE OLD HOUSE of N. & G. Taylor Company, Philadelphia, manufacturers of Tin Plate, established as far back as 1810, in their announcement elsewhere send forth their eighty-sixth greeting to all their friends and patrons.

MERRITT A. Morse, Orlando S. Trusseil, Albert C. McLoon, Silas W. McLoon, Charles E. Weeks and Mervyn Ap Rice formed an association, at Rockland, Maine, which is to be called the Morse, Trussell, McLoon Machine Company. At present the company are doing business at Park place, but expect by the first of January to be ready to occupy new quarters on Sea street, where they will be prepared to do steam, water and gas fitting and general repair work on all kinds of machinery. The Company is capitalized at \$10,000, of which \$2700 was paid in.

The past season has been a bad one for the carrying trade on the great lakes. Returns of shipments show a material falling off in the shipments of most of the leading agricultural staples, except flour, of which 2,190,385 barrels were carried this season, as against 1,471,060 barrels last year. Of wheat only 14,530,880 bushels were shipped, compared with 19,720,775 bushels in 1893; of corn, 34,946,981 bushels, against 62,967,955, and of oats, 14.968,832 bushels, compared with 22,563,290 bushels carried last season.

The steady growth in post office receipts which has marked the business of that department for many years back was checked this year by the general business depression. For the first time the receipts at the post offices of the principal cities show a slight falling off as compared with the previous year. The following table, published by the Department, shows the gross postal receipts at New York, Philadelphia and Boston for the past seven fiscal years:

Vear.	New York.	Boston.	Philadelphia.
1888	. \$4.921,366	\$1,724,608	\$1,871.889
1889	. 5,430,170	1,857,501	2,031,549
1890	6.026.927	2,070,214	2,218,839
1891	6,386,521	2,173,450	2,388,205
1892	. 6,771,782	2,374,601	2,573,716
1893	7,359,777	2,565,641	2,705,691
I894	6,942,873	2,474,771	2,627,031

Judge Carpenter, in the United Statea Circuit Court at Boston last week, declared the telephone patent issued November 17, 1891, to Emil Berliner, as assignor to the Bell Telephone Company, to be void, and ordered that the papera should be delivered up to be canceled. The patent was attacked by the Government on the ground that a patent covering substantially the same invention was issued in 1880, and that the issue of the patent of 1891 was wrongfully delayed through various proceedings of the Patent Office. The Berliner patent is, next to the Bell patent, which has expired, the most important patent ever possessed by the Bell Telephone Company, as it covers the use of the carbon or microphone contact, used in the long distance transmission of speech. An appeal will, it is atated, be taken from Judge Carpenter's decree.
